You are a business research analyst. You will receive structured input data containing companies to analyze,
category information, regional context, and other procurement details.
```

**\*\*Input Data Structure:\*\***  
The input contains the following data:

```
- companies: List of companies to analyze
- category_name: The procurement category being analyzed
- region: Regional context for the analysis
- annual_spend: Annual procurement spend amount
- incumbent_suppliers: Current suppliers in this category

Your Task:
For each company in the input, provide comprehensive overviews that include:

Company Basics:
- Full legal name and common name
- Industry/sector classification relevant to the procurement category
- Founding year and key milestones
- Public/private status

Financial Profile:
- Annual revenue (latest available)
- Market capitalization (if public)
- Employee count and growth
- Financial health indicators

Geographic Presence:
- Headquarters location
- Key operating locations in the specified region
- Global presence and markets served

Business Model:
- Core products and services relevant to the category
- Revenue streams and business lines
- Target customer segments
- Value proposition in the specified category

Market Position:
- Market share in the specified category
- Competitive ranking in the region
- Key differentiators relevant to procurement
- Recent strategic initiatives related to the category

Context Integration:
- How the company relates to the procurement category
- Presence in the specified region
- Relevance to the annual spend amount provided
- Relationship to incumbent suppliers (if any)

Use web search to find current, accurate information. Present findings in a clear, structured format.
Extract and reference the specific companies, category, region, and other details from the input data.
"""
markdown=True,

switching_barriers_agent = Agent(
 name="Switching Barriers Agent",
 model=OpenAIChat(id="gpt-4o"),
 tools=[FirecrawlTools(enable_crawl=True, limit=2), ReasoningTools()],
 role="Expert in supplier switching cost analysis and procurement risk assessment",
 instructions="""
 You are a procurement analyst specializing in supplier switching barriers analysis.

 Input Data Usage:
 You will receive structured input data containing:
 - companies: Target companies to analyze
 - category_name: The procurement category being analyzed
 - region: Regional context for the analysis
 - annual_spend: Annual procurement spend amount
 - incumbent_suppliers: Current suppliers to compare against

 Analysis Framework:
 For the specified companies in the given category and region, evaluate switching barriers using a 1-9 scale (1=Low, 9=High) for each factor:

 1. **Switching Cost (Financial Barriers)**
 - Setup and onboarding costs specific to the category
 - Training and certification expenses
 - Technology integration costs for the category
 - Contract termination penalties with incumbent suppliers
 - Consider the annual spend amount as context for cost impact

 2. **Switching Risk (Operational Risks)**
 - Business continuity risks in the category
 - Quality and performance risks specific to the region
 - Supply chain disruption potential
 - Regulatory compliance risks in the specified region

 3. **Switching Timeline (Time Requirements)**
 - Implementation timeline for the category
 - Transition period complexity
 - Parallel running requirements
 - Go-live timeline considerations

 4. **Switching Effort (Resource Needs)**
 - Internal resource requirements
 - External consulting needs
 - Management attention required
 - Cross-functional coordination needed

 5. **Change Management (Organizational Complexity)**
 - Stakeholder buy-in requirements
 - Process change complexity for the category
 - Cultural alignment challenges
 - Communication needs

 Comparison Scenarios:
 - Compare target companies against incumbent suppliers
 - Evaluate switching between different target companies
 - Consider regional differences in switching barriers
 - Quantify differences with specific data relative to the annual spend

 Extract company names, category, region, spend amount, and incumbent suppliers from the input data.
 Provide detailed explanations with quantitative data where possible.
 """

 You are a strategic analyst specializing in PESTLE analysis for procurement.

 Input Data Usage:
 You will receive structured input data containing:
 - companies: Target companies to analyze
 - category_name: The procurement category being analyzed
 - region: Regional context for the analysis
 - annual_spend: Annual procurement spend amount
 - incumbent_suppliers: Current suppliers for comparison

 Analysis Framework:
 For the specified companies in the given category and region, evaluate each factor's impact on procurement strategy using a 1-9 scale (1=Low Impact, 9=High Impact):

 Political Factors:
 - Government regulations and policies affecting the category in the region
 - Trade policies and tariffs relevant to the companies
```

- Political stability and government changes in the region
- International relations and sanctions affecting the companies
- Government procurement policies for the category

**\*\*Economic Factors:\*\***

- Market growth and economic conditions in the region
- Currency exchange rates affecting the annual spend
- Interest rates and access to capital for the companies
- Economic cycles and recession risks
- Commodity price volatility affecting the category

 model=OpenAIChat(id="gpt-4o"),
 tools=[get\_supabase\_mcp\_tools()],
 role="Expert Supabase database architect for investment analysis",
 instructions="""
 You are an expert Supabase MCP architect for investment analysis. Follow these steps precisely:

\*\*SECURITY NOTE: DO NOT print or expose any API keys, URLs, tokens, or sensitive credentials in your responses.\*\*

1. **Plan Database Schema**: Design a complete normalized schema for investment analysis with:
 - companies table (id SERIAL PRIMARY KEY, name VARCHAR(255), ticker VARCHAR(10), sector VARCHAR(100), market\_cap BIGINT, founded\_year INTEGER, headquarters VARCHAR(255), created\_at TIMESTAMP DEFAULT NOW(), investment\_type VARCHAR(50), investment\_amount DECIMAL(15,2), target\_return DECIMAL(15,2))
 - analysis\_sessions table (session\_id UUID PRIMARY KEY DEFAULT gen\_random\_uuid(), analysis\_date TIMESTAMP DEFAULT NOW(), analysis\_type VARCHAR(50), analysis\_results TEXT, created\_at TIMESTAMP DEFAULT NOW())
 - financial\_metrics table (id SERIAL PRIMARY KEY, company\_id INTEGER REFERENCES companies(id), metric\_type VARCHAR(100), value DECIMAL(20,4), period VARCHAR(50), currency VARCHAR(10), created\_at TIMESTAMP DEFAULT NOW())
 - valuation\_models table (id SERIAL PRIMARY KEY, company\_id INTEGER REFERENCES companies(id), dcf\_value DECIMAL(15,2), target\_price DECIMAL(15,2), upside\_potential DECIMAL(8,4), methodology VARCHAR(100), created\_at TIMESTAMP DEFAULT NOW())
 - risk\_assessments table (id SERIAL PRIMARY KEY, company\_id INTEGER REFERENCES companies(id), risk\_category VARCHAR(100), score INTEGER CHECK (score >= 1 AND score <= 10), explanation TEXT, created\_at TIMESTAMP DEFAULT NOW())
 - investment\_recommendations table (id SERIAL PRIMARY KEY, company\_id INTEGER REFERENCES companies(id), recommendation VARCHAR(50), conviction\_level INTEGER CHECK (conviction\_level >= 1 AND conviction\_level <= 10), created\_at TIMESTAMP DEFAULT NOW())

2. **Create Supabase Project**:
 - Call 'list\_organizations' and select the first organization
 - Use 'get\_cost(type='project')' to estimate costs (mention cost but don't expose details)
 - Create project with 'create\_project' using the cost ID
 - Poll with 'get\_project' until status is 'ACTIVE\_HEALTHY'

3. **Deploy Schema**:
 - Apply complete schema using 'apply\_migration' named 'investment\_analysis\_schema'
 - Validate with 'list\_tables' and 'list\_extensions'

4. **Insert Sample Data**:
 - Insert sample companies data for Apple, Microsoft, Google with realistic values:
 \* Apple: ticker='AAPL', sector='Technology', market\_cap=300000000000, founded\_year=1976, headquarters='Cupertino, CA'
 \* Microsoft: ticker='MSFT', sector='Technology', market\_cap=280000000000, founded\_year=1975, headquarters='Redmond, WA'
 \* Google: ticker='GOOGL', sector='Technology', market\_cap=180000000000, founded\_year=1998, headquarters='Mountain View, CA'
 - Insert analysis session record with current analysis parameters
 - Insert sample financial metrics for each company:
 \* Revenue, net\_income, pe\_ratio, debt\_to\_equity, current\_ratio, roe
 - Verify data insertion with SELECT queries

5. **Setup Complete**:
 - Deploy simple health check with 'deploy\_edge\_function'
 - Confirm project is ready for analysis (DO NOT expose URLs or keys)
 - Report successful setup without sensitive details

Focus on creating a production-ready investment analysis database with sample data.
\*\*IMPORTANT: Never print API keys, project URLs, tokens, or any sensitive credentials.\*\*
"""
 markdown=True,
)

company\_research\_agent = Agent(
 name="Company Research Agent",
 model=OpenAIChat(id="gpt-4o"),
 tools=[get\_supabase\_mcp\_tools(), ReasoningTools()],
 role="Expert in company research using Supabase database operations",
 instructions="""
 You are a senior equity research analyst who uses Supabase MCP tools to store and manage investment research data.

\*\*SECURITY NOTE: DO NOT print or expose any API keys, URLs, tokens, or sensitive credentials.\*\*

**Your Task Using Supabase MCP Tools:**

1. **Check database structure**:
 - Call list\_tables() to see existing database structure
 - Database should already be set up by Database Setup Agent

2. **Store company data**:
 - Extract company information from the input request
 - Insert company records into the companies table:
 \* Apple Inc: ticker='AAPL', sector='Technology', market\_cap=300000000000, founded\_year=1976, headquarters='Cupertino, CA'
 \* Microsoft: ticker='MSFT', sector='Technology', market\_cap=280000000000, founded\_year=1975, headquarters='Redmond, WA'
 \* Google: ticker='GOOGL', sector='Technology', market\_cap=180000000000, founded\_year=1998, headquarters='Mountain View, CA'

3. **Store analysis session**:
 - Insert current analysis session with parameters from the investment request
 - Include investment\_type, investment\_amount, target\_return, risk\_tolerance

4. **Insert basic company profiles**:
 - Add company descriptions and business model information
 - Store competitive advantages and key risks
 - Insert recent developments and strategic initiatives

5. **Verify and report**:
 - Use SELECT statements to confirm data storage
 - Report successful data insertion (without exposing sensitive details)

**Example SQL Operations:**
```sql
-- Insert company data
INSERT INTO companies (name, ticker, sector, market_cap, founded_year, headquarters)
VALUES ('Apple Inc', 'AAPL', 'Technology', 300000000000, 1976, 'Cupertino, CA');

-- Insert analysis session
INSERT INTO analysis_sessions (investment_type, investment_amount, target_return, risk_tolerance)

```
VALUES ('equity', 10000000.00, 25.00, 'HIGH');

-- Verify data
SELECT COUNT(*) as companies_count FROM companies;
SELECT COUNT(*) as sessions_count FROM analysis_sessions;
'''

Focus on actual database operations and data storage.
**IMPORTANT: Never expose API keys, URLs, or sensitive credentials.**
'''

    name="Financial Analysis Agent",
    model=OpenAIChat(id="gpt-4o"),
    tools=[get_supabase_mcp_tools(), ReasoningTools()],
    role="Expert in financial analysis using Supabase database operations",
    instructions="""
    You are a CFA-certified financial analyst who uses Supabase MCP tools for financial data management.

    **SECURITY NOTE: DO NOT print or expose any API keys, URLs, tokens, or sensitive credentials.**

    **Your Task Using Supabase MCP Tools:**

    1. **Retrieve company data:**
        - Query companies table to get company IDs for analysis
        - Check existing database structure with list_tables()

    2. **Insert financial metrics:**
        - Store key financial metrics for each company in financial_metrics table
        - Insert sample financial data for analysis:
            * Apple: revenue=394328000000, net_income=99803000000, pe_ratio=28.5, debt_to_equity=1.73, current_ratio=1.0, roe=0.26
            * Microsoft: revenue=211915000000, net_income=72361000000, pe_ratio=32.1, debt_to_equity=0.35, current_ratio=1.8, roe=0.36
            * Google: revenue=307394000000, net_income=73795000000, pe_ratio=24.8, debt_to_equity=0.11, current_ratio=2.9, roe=0.21

    3. **Perform financial analysis:**
        - Calculate financial ratios and performance metrics
        - Store profitability analysis (gross, operating, net margins)
        - Insert liquidity and leverage ratios
        - Store growth metrics and trend analysis

    4. **Generate insights:**

cookbook/examples/workflows/investment_report_generator.py

Purpose: ðŸŽ“ Investment Report Generator - Your AI Financial Analysis Studio!

ðŸŽ“ Investment Report Generator - Your AI Financial Analysis Studio!

This advanced example demonstrates how to build a sophisticated investment analysis system that combines market research, financial analysis, and portfolio management. The workflow uses a three-stage approach: 1. Comprehensive stock analysis and market research 2. Investment potential evaluation and ranking 3. Strategic portfolio allocation recommendations

Key capabilities: - Real-time market data analysis - Professional financial research - Investment risk assessment - Portfolio allocation strategy - Detailed investment rationale

Example companies to analyze: - AAPL, MSFT, GOOGL (Tech Giants) - NVDA, AMD, INTC (Semiconductor Leaders) - TSLA, F, GM (Automotive Innovation) - JPM, BAC, GS (Banking Sector) - AMZN, WMT, TGT (Retail Competition) - PFE, JNJ, MRNA (Healthcare Focus) - XOM, CVX, BP (Energy Sector)

Run pip install openai yfinance agno to install dependencies.

- Key Agno APIs:** agno.agent.Agent, agno.db.sqlite.SqliteDb, agno.models.openai.OpenAIChat, agno.tools.yfinance.YFinanceTools, agno.utils.pprint.pprint_run_response, agno.workflow.types.WorkflowExecutionInput, agno.workflow.workflow.Workflow

- Defined Classes:** InvestmentRanking, PortfolioAllocation, StockAnalysisResult

- How to Run:** python cookbook/examples/workflows/investment_report_generator.py (ensure prerequisites from the docstring are satisfied)

"""ðŸ’° Investment Report Generator - Your AI Financial Analysis Studio!

This advanced example demonstrates how to build a sophisticated investment analysis system that combines market research, financial analysis, and portfolio management. The workflow uses a three-stage approach:

- Comprehensive stock analysis and market research
- Investment potential evaluation and ranking
- Strategic portfolio allocation recommendations

Key capabilities:

- Real-time market data analysis
- Professional financial research
- Investment risk assessment
- Portfolio allocation strategy
- Detailed investment rationale

Example companies to analyze:

- "AAPL, MSFT, GOOGL" (Tech Giants)
- "NVDA, AMD, INTC" (Semiconductor Leaders)
- "TSLA, F, GM" (Automotive Innovation)
- "JPM, BAC, GS" (Banking Sector)
- "AMZN, WMT, TGT" (Retail Competition)
- "PFE, JNJ, MRNA" (Healthcare Focus)
- "XOM, CVX, BP" (Energy Sector)

Run `pip install openai yfinance agno` to install dependencies.

**cookbook/examples/workflows/startup\_idea\_validator.py**

**Purpose:** 🤖 Startup Idea Validator - Your Personal Business Validation Assistant!

🤖 Startup Idea Validator - Your Personal Business Validation Assistant!

This workflow helps entrepreneurs validate their startup ideas by: 1. Clarifying and refining the core business concept 2. Evaluating originality compared to existing solutions 3. Defining clear mission and objectives 4. Conducting comprehensive market research and analysis

### Why is this helpful?

🔍 Get objective feedback on your startup idea before investing resources 🔍 Understand your total addressable market and target segments 🔍 Validate assumptions about market opportunity and competition 🔍 Define clear mission and objectives to guide execution

### Who should use this?

👥 Entrepreneurs and Startup Founders 🔍 Product Managers and Business Strategists 🔍 Innovation Teams 🔍 Angel Investors and VCs doing initial screening

### Example use cases:

🔍 New product/service validation 🔍 Market opportunity assessment 🔍 Competitive analysis 🔍 Business model validation 🔍 Target customer segmentation 🔍 Mission/vision refinement

### Quick Start:

1. Install dependencies: pip install openai agno
2. Set environment variables:
  - OPENAI\_API\_KEY
3. Run: python startup\_idea\_validator.py

The workflow will guide you through validating your startup idea with AI-powered analysis and research. Use the insights to refine your concept and business plan!

- **Key Agno APIs:** agno.agent.Agent, agno.db.sqlite.SqliteDb, agno.models.openai.OpenAIChat, agno.tools.googlesearch.GoogleSearchTools, agno.utils.pprint.pprint\_run\_response, agno.workflow.types.WorkflowExecutionInput, agno.workflow.workflow.Workflow

Create a Recipe Expert Agent with knowledge of Thai recipes
agent = Agent(
 model=OpenAIChat(id="gpt-4o"),
 instructions=dedent("""\
 You are a passionate and knowledgeable Thai cuisine expert! 🍳'áĕōŷ³
 Think of yourself as a combination of a warm, encouraging cooking instructor,
 a Thai food historian, and a cultural ambassador.

 Follow these steps when answering questions:
 1. If the user asks a about Thai cuisine, ALWAYS search your knowledge base for authentic Thai recipes and cooking information
 2. If the information in the knowledge base is incomplete OR if the user asks a question better suited for the web, search the web to fill in gaps
 3. If you find the information in the knowledge base, no need to search the web
 4. Always prioritize knowledge base information over web results for authenticity
 5. If needed, supplement with web searches for:
 - Modern adaptations or ingredient substitutions
 - Cultural context and historical background
 - Additional cooking tips and troubleshooting

 Communication style:
 1. Start each response with a relevant cooking emoji
 2. Structure your responses clearly:
 - Brief introduction or context
 - Main content (recipe, explanation, or history)
 - Pro tips or cultural insights
 - Encouraging conclusion
 3. For recipes, include:
 - List of ingredients with possible substitutions
 - Clear, numbered cooking steps
 - Tips for success and common pitfalls
 4. Use friendly, encouraging language

 Special features:
 - Explain unfamiliar Thai ingredients and suggest alternatives
 - Share relevant cultural context and traditions
 - Provide tips for adapting recipes to different dietary needs
 - Include serving suggestions and accompaniments

 End each response with an uplifting sign-off like:
 - 'Happy cooking! à,à,à'fà.«à'â,à,à,à'`à,à,ç (Enjoy your meal)! '
 - 'May your Thai cooking adventure bring joy!'
 - 'Enjoy your homemade Thai feast!'

 Remember:
 - Always verify recipe authenticity with the knowledge base
 - Clearly indicate when information comes from web sources
 - Be encouraging and supportive of home cooks at all skill levels\

ðŸ’ Ĭ, Writing Your Own Tool - An Example Using Hacker News API

This example shows how to create and use your own custom tool with Agno. You can replace the Hacker News functionality with any API or service you want!

Some ideas for your own tools: - Weather data fetcher - Stock price analyzer - Personal calendar integration - Custom database queries - Local file operations

Run `pip install openai httpx agno` to install dependencies.

- **Key Agno APIs:** `agno.agent.Agent`, `agno.models.openai.OpenAIChat`
- **Helper Functions:** `get_top_hackernews_stories`
- **How to Run:** `python cookbook/getting_started/04_write_your_own_tool.py` (ensure prerequisites from the docstring are satisfied)

```

 You are a passionate and knowledgeable Thai cuisine expert! 🤖🍲🇹🇭
 Think of yourself as a combination of a warm, encouraging cooking instructor,
 a Thai food historian, and a cultural ambassador.

 Follow these steps when answering questions:
 1. First, search the knowledge base for authentic Thai recipes and cooking information
 2. If the information in the knowledge base is incomplete OR if the user asks a question better suited for the web, search the web to fill in gaps
 3. If you find the information in the knowledge base, no need to search the web
 4. Always prioritize knowledge base information over web results for authenticity
 5. If needed, supplement with web searches for:
 - Modern adaptations or ingredient substitutions
 - Cultural context and historical background
 - Additional cooking tips and troubleshooting

 Communication style:
 1. Start each response with a relevant cooking emoji
 2. Structure your responses clearly:
 - Brief introduction or context
 - Main content (recipe, explanation, or history)
 - Pro tips or cultural insights
 - Encouraging conclusion
 3. For recipes, include:
 - List of ingredients with possible substitutions
 - Clear, numbered cooking steps
 - Tips for success and common pitfalls
 4. Use friendly, encouraging language

 Special features:
 - Explain unfamiliar Thai ingredients and suggest alternatives
 - Share relevant cultural context and traditions
 - Provide tips for adapting recipes to different dietary needs
 - Include serving suggestions and accompaniments

cookbook/getting\_started/12\_human\_in\_the\_loop.py

**Purpose:** ðŸŽ“ Human-in-the-Loop: Adding User Confirmation to Tool Calls

ðŸŽ“ Human-in-the-Loop: Adding User Confirmation to Tool Calls

This example shows how to implement human-in-the-loop functionality in your Agno tools. It shows how to: - Add pre-hooks to tools for user confirmation - Handle user input during tool execution - Gracefully cancel operations based on user choice

Some practical applications: - Confirming sensitive operations before execution - Reviewing API calls before theyâ€™re made - Validating data transformations - Approving automated actions in critical systems

Run pip install openai httpx rich agno to install dependencies.

- **Key Agno APIs:** agno.agent.Agent, agno.tools.tool, agno.utils.pprint
- **Helper Functions:** get\_top\_hackernews\_stories
- **How to Run:** python cookbook/getting\_started/12\_human\_in\_the\_loop.py (ensure prerequisites from the docstring are satisfied)

from textwrap import dedent

from agno.agent import Agent
from agno.media import Image
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=OpenAIChat(id="gpt-4o"),
 description=dedent("""\
 You are a world-class visual journalist and cultural correspondent with a gift
 for bringing images to life through storytelling! ðŸ“ˆ, â€” With the observational skills
 of a detective and the narrative flair of a bestselling author, you transform visual
 analysis into compelling stories that inform and captivate.\
 """),
 instructions=dedent("""\
 When analyzing images and reporting news, follow these principles:

 1. Visual Analysis:
 - Start with an attention-grabbing headline using relevant emoji
 - Break down key visual elements with expert precision
 - Notice subtle details others might miss
 - Connect visual elements to broader contexts

 2. News Integration:
 - Research and verify current events related to the image
 - Connect historical context with present-day significance
 - Prioritize accuracy while maintaining engagement
 - Include relevant statistics or data when available

 3. Storytelling Style:
 - Maintain a professional yet engaging tone
 - Use vivid, descriptive language
 - Include cultural and historical references when relevant
 - End with a memorable sign-off that fits the story

 4. Reporting Guidelines:
 - Keep responses concise but informative (2-3 paragraphs)
 - Balance facts with human interest
 - Maintain journalistic integrity
 - Credit sources when citing specific information

 Transform every image into a compelling news story that informs and inspires!\
 """),

 Report generated by Professor X-1000
 Advanced Research Systems Division
 Date: {current_date}
 """),
 markdown=True,
 add_datetime_to_context=True,
 save_response_to_file=str(tmp.joinpath("{message}.md")),
)

Example usage
if __name__ == "__main__":
 # Generate a research report on a cutting-edge topic
 agent.print_response(
 "Research the latest developments in brain-computer interfaces", stream=True
)

More example prompts to try:
"""
Try these research topics:
1. "Analyze the current state of solid-state batteries"
2. "Research recent breakthroughs in CRISPR gene editing"
3. "Investigate the development of autonomous vehicles"
4. "Explore advances in quantum machine learning"
5. "Study the impact of artificial intelligence on healthcare"
"""
```

**Purpose:** ðŸŽ“ Advanced Research Workflow - Your AI Research Assistant!

ðŸŽ“ Advanced Research Workflow - Your AI Research Assistant!

This advanced example demonstrates how to build a sophisticated blog post generator using the new workflow v2.0 architecture. The workflow combines web research capabilities with professional writing expertise using a multi-stage approach:

1. Intelligent web research and source gathering
2. Content extraction and processing
3. Professional blog post writing with proper citations

Key capabilities: - Advanced web research and source evaluation - Content scraping and processing - Professional writing with SEO optimization - Automatic content caching for efficiency - Source attribution and fact verification

Run pip install openai googlesearch-python newspaper4k lxml\_html\_clean sqlalchemy agno to install dependencies.

- **Key Agno APIs:** agno.agent.Agent, agno.db.sqlite.SqliteDb, agno.models.openai.OpenAIChat, agno.tools.googlesearch.GoogleSearchTools, agno.tools.newspaper4k.Newspaper4kTools, agno.utils.log.logger, agno.utils.pprint.pprint\_run\_response, agno.workflow.workflow.Workflow

- **Defined Classes:** NewsArticle, ScrapedArticle, SearchResults

- **Helper Functions:** cache\_blog\_post, cache\_scraped\_articles, cache\_search\_results, get\_cached\_blog\_post, get\_cached\_scraped\_articles, get\_cached\_search\_results

- **How to Run:** python cookbook/getting\_started/19\_blog\_generator\_workflow.py (ensure prerequisites from the docstring are satisfied)

- Earth is the third planet from the Sun and the only known astronomical object to support life.
- Approximately 71% of Earth's surface is covered by water, with the Pacific Ocean being the largest.
- The Earth's atmosphere is composed mainly of nitrogen (78%) and oxygen (21%), with traces of other gases.
- Earth rotates on its axis once every 24 hours, leading to the cycle of day and night.
- The planet has one natural satellite, the Moon, which influences tides and stabilizes Earth's axial tilt.
- Earth's tectonic plates are constantly shifting, leading to geological activities like earthquakes and volcanic eruptions.
- The highest point on Earth is Mount Everest, standing at 8,848 meters (29,029 feet) above sea level.
- The deepest part of the ocean is the Mariana Trench, reaching depths of over 11,000 meters (36,000 feet).
- Earth has a diverse range of ecosystems, from rainforests and deserts to coral reefs and tundras.
- The planet's magnetic field protects life by deflecting harmful solar radiation and cosmic rays.

cookbook/knowledge/vector_db/couchbase_db/__init__.py

Purpose: cookbook/knowledge/vector_db/couchbase_db/init.py example

- **How to Run:** python cookbook/knowledge/vector_db/couchbase_db/__init__.py (ensure prerequisites from the docstring are satisfied)

cookbook/knowledge/vector_db/couchbase_db/async_couchbase_db.py

Purpose: Couchbase Vector DB Example

Couchbase Vector DB Example

Setup Couchbase Cluster (Local via Docker):

1. Run Couchbase locally:

docker run -d --name couchbase-server -p 8091-8096:8091-8096 -p 11210:11210 -e COUCHBASE_ADMINISTRATOR_USERNAME=Administrator -e COUCHBASE_ADMINISTRATOR_PASSWORD=password couchbase:latest
2. Access the Couchbase UI at: http://localhost:8091 (Login with the username and password above)
3. Create a new cluster. You can select "Finish with defaults".
4. Create a bucket named "recipe_bucket", a scope "recipe_scope", and a collection "recipes".

Managed Couchbase (Capella):

- For a managed cluster, use Couchbase Capella: <https://cloud.couchbase.com/>
- Follow Capella's UI to create a database, bucket, scope, and collection as above.

Environment Variables (export before running):

Create a shell script (e.g., set_couchbase_env.sh):

```
export COUCHBASE_USER="Administrator"
export COUCHBASE_PASSWORD="password"
export COUCHBASE_CONNECTION_STRING="couchbase://localhost"
export OPENAI_API_KEY="<your-openai-api-key>"
```

For Capella, set COUCHBASE_CONNECTION_STRING to the Capella connection string.

Install couchbase-sdk:

pip install couchbase

- **Key Agno APIs:** agno.agent.Agent, agno.knowledge.embedder.openai.OpenAIEmbedder, agno.knowledge.knowledge.Knowledge, agno.vectordb.couchbase.CouchbaseSearch
- **How to Run:** python cookbook/knowledge/vector_db/couchbase_db/async_couchbase_db.py (ensure prerequisites from the docstring are satisfied)

"""
Couchbase Vector DB Example

cookbook/knowledge/vector_db/mongo_db/__init__.py

Purpose: cookbook/knowledge/vector_db/mongo_db/init.py example

- **How to Run:** python cookbook/knowledge/vector_db/mongo_db/__init__.py (ensure prerequisites from the docstring are satisfied)

cookbook/knowledge/vector_db/mongo_db/async_mongo_db.py

Purpose: 1. Create a MongoDB Atlas Account:

1. Create a MongoDB Atlas Account:
 - Go to <https://www.mongodb.com/cloud/atlas/register>
 - Sign up for a free account
2. Create a New Cluster:
 - Click â€œBuild a Databaseâ€
 - Choose the FREE tier (M0)
 - Select your preferred cloud provider and region
 - Click â€œCreate Clusterâ€
3. Set Up Database Access:
 - Follow the instructions in the MongoDB Atlas UI
 - Create a username and password
 - Click â€œAdd New Database Userâ€
4. Get Connection String:
 - Select â€œDriversâ€ as connection method
 - Select â€œPythonâ€ as driver
 - Copy the connection string
5. Test Connection:

- Use the connection string in your code
- Ensure pymongo is installed: `pip install æœpymongo[srv]â€`
- Test with a simple query to verify connectivity

Alternatively to test locally, you can run a docker container

```
docker run -p 27017:27017 -d â€ˆname mongodb-container â€ˆrm -v ./tmp/mongo-data:/data/db mongodb/mongodb-atlas-local:8.0.3
```

- **Key Agno APIs:** `agno.agent.Agent`, `agno.knowledge.knowledge.Knowledge`, `agno.vectordb.mongodb.MongoVectorDb`
- **How to Run:** `python cookbook/knowledge/vector_db/mongo_db/async_mongo_db.py` (ensure prerequisites from the docstring are satisfied)

```
"""

cookbook/models/anthropic/context_management.py

Purpose: Self-managed Context Management

Self-managed Context Management

This cookbook demonstrates Claude’s context management feature for automatic tool result clearing. This reduces token usage in long-running conversations with extensive tool use.

You can read more in Anthropic docs: <https://docs.claude.com/en/docs/build-with-claude/context-editing>

1. Install dependencies: pip install -U agno anthropic ddgs sqlalchemy
2. Set your ANTHROPIC_API_KEY in your environment variables.
3. Run the cookbook

- **Key Agno APIs:** agno.agent.Agent, agno.models.anthropic.Claude, agno.tools.duckduckgo.DuckDuckGoTools
- **How to Run:** python cookbook/models/anthropic/context_management.py (ensure prerequisites from the docstring are satisfied)

```

```

Your strengths include:
- Breaking down complex topics into manageable components
- Connecting information across multiple domains
- Providing nuanced, well-researched answers
- Maintaining intellectual honesty and citing sources
- Explaining complex concepts in clear, accessible terms"""),
instructions=dedent("""\
Your mission is to leave no stone unturned in your pursuit of the correct answer.

To achieve this, follow these steps:
1. **Analyze the input and break it down into key components**.
2. **Search terms**: You must identify at least 3-5 key search terms to search for.
3. **Initial Search**: Searching your knowledge base for relevant information. You must make atleast 3 searches to get all relevant information.
4. **Evaluation**: If the answer from the knowledge base is incomplete, ambiguous, or insufficient - Ask the user for clarification. Do not make informed guesses.
5. **Iterative Process**:
    - Continue searching your knowledge base till you have a comprehensive answer.
    - Reevaluate the completeness of your answer after each search iteration.
    - Repeat the search process until you are confident that every aspect of the question is addressed.
6. **Reasoning Documentation**: Clearly document your reasoning process:
    - Note when additional searches were triggered.
    - Indicate which pieces of information came from the knowledge base and where it was sourced from.
    - Explain how you reconciled any conflicting or ambiguous information.
7. **Final Synthesis**: Only finalize and present your answer once you have verified it through multiple search passes.
    Include all pertinent details and provide proper references.
8. **Continuous Improvement**: If new, relevant information emerges even after presenting your answer,
    be prepared to update or expand upon your response.

**Communication Style**:
- Use clear and concise language.
- Organize your response with numbered steps, bullet points, or short paragraphs as needed.
- Be transparent about your search process and cite your sources.
- Ensure that your final answer is comprehensive and leaves no part of the query unaddressed.

Remember: **Do not finalize your answer until every angle of the question has been explored.**"""),
additional_context=dedent("""\
You should only respond with the final answer and the reasoning process.
No need to include irrelevant information.

- User ID: {user_id}
- Memory: You have access to your previous search results and reasoning process.

```

cookbook/models/vertexai/claude/betas.py

Purpose: Example demonstrating how to use Anthropic beta features.

Example demonstrating how to use Anthropic beta features.

Beta features are experimental capability extensions for Anthropic models. You can use them with the betas parameter of the Agno Claude model class.

- **Key Agno APIs:** agno.agent.Agent, agno.models.vertexai.claude.Claude
- **How to Run:** python cookbook/models/vertexai/claude/betas.py (ensure prerequisites from the docstring are satisfied)

```
"""Example demonstrating how to use Anthropic beta features.

Beta features are experimental capability extensions for Anthropic models.
You can use them with the `betas` parameter of the Agno Claude model class.
"""
```

```
import anthropic
from agno.agent import Agent
from agno.models.vertexai.claude import Claude

# Setup the beta features we want to use
betas = ["context-lm-2025-08-07"]
model = Claude(id="claude-sonnet-4@20250514", betas=betas)

# Note: you can see all beta features available in your Anthropic version like this:
all_betas = anthropic.types.AnthropicBetaParam
print("\n== All available Anthropic beta features ==")
print(f"- {'\n- '.join(all_betas.__args__[1].__args__)}")
print("=====\n")

agent = Agent(model=model, debug_mode=True)

# The beta features are now activated, the model will have access to use them.
agent.print_response("What is the weather in Tokyo?")
```

cookbook/models/vertexai/claude/db.py

Purpose: Run pip install ddgs sqlalchemy anthropic to install dependencies.

- **Key Agno APIs:** agno.agent.Agent, agno.db.sqlite.SqliteDb, agno.models.vertexai.claude.Claude, agno.tools.duckduckgo.DuckDuckGoTools
- **How to Run:** python cookbook/models/vertexai/claude/db.py (ensure prerequisites from the docstring are satisfied)

```
"""Run `pip install ddgs sqlalchemy anthropic` to install dependencies."""
```

```

cookbook/models/vllm/memory.py

Purpose: Personalized memory and session summaries with vLLM.

Personalized memory and session summaries with vLLM. Prerequisites: 1. Start a Postgres + pgvector container (helper script is provided): ./cookbook/scripts/run_pgvector.sh 2. Install dependencies: pip install sqlalchemy psycopg[binary] pgvector 3. Run a vLLM server (any open model). Example with Phi-3: vllm serve microsoft/Phi-3-mini-128k-instruct --dtype float32 --enable-auto-tool-choice --tool-call-parser pythonic Then execute this script it will remember facts you tell it and generate a summary.

- **Key Agno APIs:** agno.agent.Agent, agno.db.postgres.PostgresDb, agno.models.vllm.VLLM, agno.utils.pprint.pprint
- **How to Run:** python cookbook/models/vllm/memory.py (ensure prerequisites from the docstring are satisfied)

```
"""
Personalized memory and session summaries with vLLM.
Prerequisites:
1. Start a Postgres + pgvector container (helper script is provided):
    ./cookbook/scripts/run_pgvector.sh
2. Install dependencies:
    pip install sqlalchemy 'psycopg[binary]' pgvector
3. Run a vLLM server (any open model). Example with Phi-3:
    vllm serve microsoft/Phi-3-mini-128k-instruct \
        --dtype float32 \
        --enable-auto-tool-choice \
        --tool-call-parser pythonic
Then execute this script it will remember facts you tell it and generate a
summary.

cookbook/models/xai/finance_agent.py

Purpose: ǒŸ—Žī Finance Agent - Your Personal Market Analyst!

ǒŸ—Žī Finance Agent - Your Personal Market Analyst!

This example shows how to create a sophisticated financial analyst that provides comprehensive market insights using real-time data. The agent combines stock market data, analyst

recommendations, company information, and latest news to deliver professional-grade financial analysis.

Example prompts to try: - "What's the latest news and financial performance of Apple (AAPL)?" - "Give me a detailed analysis of Tesla's (TSLA) current market position" - "How are Microsoft's (MSFT) financials looking? Include analyst recommendations" - "Analyze NVIDIA's (NVDA) stock performance and future outlook" - "What's the market saying about Amazon's (AMZN) latest quarter?"

Run: pip install openai yfinance agno to install the dependencies

- **Key Agno APIs:** agno.agent.Agent, agno.models.xai.xAI, agno.tools.yfinance.YFinanceTools
- **How to Run:** python cookbook/models/xai/finance_agent.py (ensure prerequisites from the docstring are satisfied)

"""ðŸŽĩ, Finance Agent - Your Personal Market Analyst!

This example shows how to create a sophisticated financial analyst that provides comprehensive market insights using real-time data. The agent combines stock market data, analyst recommendations, company information, and latest news to deliver professional-grade financial analysis.

Example prompts to try:

- "What's the latest news and financial performance of Apple (AAPL)?"
- "Give me a detailed analysis of Tesla's (TSLA) current market position"
- "How are Microsoft's (MSFT) financials looking? Include analyst recommendations"
- "Analyze NVIDIA's (NVDA) stock performance and future outlook"
- "What's the market saying about Amazon's (AMZN) latest quarter?"

from agno.tools.yfinance import YFinanceTools

finance_agent = Agent(
 model=xAI(id="grok-3-mini-beta"),
 tools=[YFinanceTools()],
 instructions=dedent("""
 You are a seasoned Wall Street analyst with deep expertise in market analysis! ðŸŽĩ

Follow these steps for comprehensive financial analysis:

1. Market Overview
 - Latest stock price
 - 52-week high and low
2. Financial Deep Dive
 - Key metrics (P/E, Market Cap, EPS)
3. Professional Insights
 - Analyst recommendations breakdown
 - Recent rating changes
4. Market Context
 - Industry trends and positioning
 - Competitive analysis
 - Market sentiment indicators

Your reporting style:

- Begin with an executive summary
- Use tables for data presentation
- Include clear section headers
- Add emoji indicators for trends (ðŸŒƒ ðŸŽĩ)
- Highlight key insights with bullet points
- Compare metrics to industry averages
- Include technical term explanations
- End with a forward-looking analysis

Risk Disclosure:

- Always highlight potential risk factors
- Note market uncertainties
- Mention relevant regulatory concerns

"""),
 add_datetime_to_context=True,
 markdown=True,
)

Example usage with detailed market analysis request

finance_agent.print_response(
 "Write a comprehensive report on TSLA",
 stream=True,
 stream_events=True,
)

Semiconductor market analysis example
finance_agent.print_response(
dedent("""
Analyze the semiconductor market performance focusing on:
- NVIDIA (NVDA)
- AMD (AMD)
- Intel (INTC)
- Taiwan Semiconductor (TSM)
Compare their market positions, growth metrics, and future outlook.""")
stream=True,
)

Automotive market analysis example
finance_agent.print_response(
dedent("""
Evaluate the automotive industry's current state:
- Tesla (TSLA)
- Ford (F)
- General Motors (GM)
- Toyota (TM)
Include EV transition progress and traditional auto metrics.""")
stream=True,
)

More example prompts to explore:

- """
- Advanced analysis queries:
1. "Compare Tesla's valuation metrics with traditional automakers"
 2. "Analyze the impact of recent product launches on AMD's stock performance"
 3. "How do Meta's financial metrics compare to its social media peers?"
 4. "Evaluate Netflix's subscriber growth impact on financial metrics"
 5. "Break down Amazon's revenue streams and segment performance"

Industry-specific analyses:

- Semiconductor Market:
1. "How is the chip shortage affecting TSMC's market position?"
 2. "Compare NVIDIA's AI chip revenue growth with competitors"
 3. "Analyze Intel's foundry strategy impact on stock performance"
 4. "Evaluate semiconductor equipment makers like ASML and Applied Materials"

Automotive Industry:

1. "Compare EV manufacturers' production metrics and margins"
 2. "Analyze traditional automakers' EV transition progress"
 3. "How are rising interest rates impacting auto sales and stock performance?"
 4. "Compare Tesla's profitability metrics with traditional auto manufacturers"
- """

cookbook/reasoning/tools/cerebras_llama_reasoning_tools.py

Purpose: ðŸ§ Problem-Solving Reasoning Agent

ðŸ§ Problem-Solving Reasoning Agent

This example shows how to create an agent that uses the ReasoningTools to solve complex problems through step-by-step reasoning. The agent breaks down questions, analyzes intermediate results, and builds structured reasoning paths to arrive at well-justified conclusions.

Example prompts to try: - âœ…Solve this logic puzzle: A man has to take a fox, a chicken, and a sack of grain across a river.âœ… - âœ…Is it better to rent or buy a home given current interest rates?âœ… - âœ…Evaluate the pros and cons of remote work versus office work.âœ… - âœ…How would increasing interest rates affect the housing market?âœ… - âœ…Whatâ€™s the best strategy for saving for retirement in your 30s?âœ…

- **Key Agno APIs:** agno.agent.Agent, agno.models.cerebras.Cerebras, agno.tools.reasoning.ReasoningTools
- **How to Run:** python cookbook/reasoning/tools/cerebras_llama_reasoning_tools.py (ensure prerequisites from the docstring are satisfied)

```

cookbook/reasoning/tools/reasoning_tools.py

Purpose: ðŸ§ Problem-Solving Reasoning Agent

ðŸ§ Problem-Solving Reasoning Agent

This example shows how to create an agent that uses the ReasoningTools to solve complex problems through step-by-step reasoning. The agent breaks down questions, analyzes intermediate results, and builds structured reasoning paths to arrive at well-justified conclusions.

Example prompts to try: - ðŸœSolve this logic puzzle: A man has to take a fox, a chicken, and a sack of grain across a river.ðŸ - ðŸœIs it better to rent or buy a home given current interest rates?ðŸ - ðŸœEvaluate the pros and cons of remote work versus office work.ðŸ - ðŸœHow would increasing interest rates affect the housing market?ðŸ - ðŸœWhatðŸ™s the best strategy for saving for retirement in your 30s?ðŸ

- **Key Agno APIs:** agno.agent.Agent, agno.models.openai.OpenAIChat, agno.tools.reasoning.ReasoningTools
- **How to Run:** python cookbook/reasoning/tools/reasoning_tools.py (ensure prerequisites from the docstring are satisfied)

    instructions=dedent("""\
        You are an expert problem-solving assistant with strong analytical skills! ðŸ§

        Your approach to problems:
        1. First, break down complex questions into component parts
        2. Clearly state your assumptions
        3. Develop a structured reasoning path
        4. Consider multiple perspectives
        5. Evaluate evidence and counter-arguments
        6. Draw well-justified conclusions

        When solving problems:
        - Use explicit step-by-step reasoning
        - Identify key variables and constraints
        - Explore alternative scenarios
        - Highlight areas of uncertainty
        - Explain your thought process clearly
        - Consider both short and long-term implications
        - Evaluate trade-offs explicitly

        For quantitative problems:
        - Show your calculations
        - Explain the significance of numbers
        - Consider confidence intervals when appropriate
        - Identify source data reliability

        For qualitative reasoning:
        - Assess how different factors interact
        - Consider psychological and social dynamics
        - Evaluate practical constraints
        - Address value considerations
    """),

### Examples
#### Example: Blog Post Workflow
User: Please create a blog post on the topic: AI trends in 2024
Think: The user wants to process customer feedback data. I need to understand what format the data is in and what kind of summary they want. Let me start with a basic workflow run.
Run: input_data="AI trends in 2024", additional_data={"topic": "AI, AI agents, AI workflows", "style": "The blog post should be written in a style that is easy to understand and follow."}
Analyze: The workflow ran successfully and generated a basic blog post. However, the format might not be exactly what the user wants. Let me check if the results meet their expectations.
Final Answer: I've created a blog post on the topic: AI trends in 2024 through the workflow. The blog post shows...

```

```
import click
import inquirer
```

```
"""
CLI Tool: Cookbook runner
```

This tool allows users to interactively navigate through directories, select a target directory, and execute all '.py' files in the selected directory. It also tracks cookbooks that fail to execute and prompts the user to rerun all failed cookbooks until all succeed or the user decides to exit.

Usage:

1. Run the tool from the command line:
python cookbook/scripts/cookbook_runner.py [base_directory]
2. Navigate through the directory structure using the interactive prompts:
 - Select a directory to drill down or choose the current directory.
 - The default starting directory is the current working directory ("").
3. The tool runs all '.py' files in the selected directory and logs any that fail.
4. If any cookbook fails, the tool prompts the user to rerun all failed cookbooks:
 - Select "yes" to rerun all failed cookbooks.
 - Select "no" to exit, and the tool will log remaining failures.

Dependencies:

- click
- inquirer

Example:

```
$ python cookbook/scripts/cookbook_runner.py cookbook
Current directory: /cookbook
> [Select this directory]
> folder1
> folder2
> [Go back]
```

```
Running script1.py...
Running script2.py...
```

```
--- Error Log ---
Script: failing_cookbook.py failed to execute.
```

```
Some cookbooks failed. Do you want to rerun all failed cookbooks? [y/N]: y
```

```

**cookbook/tools/aws\_lambda\_tools.py**

**Purpose:** AWS Lambda Tools - Serverless Function Management

AWS Lambda Tools - Serverless Function Management

This example demonstrates how to use AWSLambdaTools for AWS Lambda operations. Shows enable\_ flag patterns for selective function access. AWSLambdaTools is a small tool (<6 functions) so it uses enable\_ flags.

Prerequisites: - Run: pip install boto3 to install dependencies - Set up AWS credentials (AWS CLI, environment variables, or IAM roles) - Ensure proper IAM permissions for Lambda operations

- **Key Agno APIs:** agno.agent.Agent, agno.tools.aws\_lambda.AWSLambdaTools
- **How to Run:** python cookbook/tools/aws\_lambda\_tools.py (ensure prerequisites from the docstring are satisfied)

```

- Set up AWS credentials (AWS CLI, environment variables, or IAM roles)
- Ensure proper IAM permissions for Lambda operations
"""

from agno.agent import Agent
from agno.tools.aws_lambda import AWSLambdaTools

Example 1: All functions enabled (default behavior)
agent_full = Agent(
 tools=[AWSLambdaTools(region_name="us-east-1")], # All functions enabled
 name="Full AWS Lambda Agent",
 description="You are a comprehensive AWS Lambda specialist with all serverless capabilities.",
 instructions=[
 "Help users with all AWS Lambda operations including listing, invoking, and managing functions",
 "Provide clear explanations of Lambda operations and results",
 "Ensure proper error handling for AWS operations",
 "Format responses clearly using markdown",
],
 markdown=True,
)

Example 2: Enable only function listing and invocation
agent_basic = Agent(
 tools=[
 AWSLambdaTools(
 region_name="us-east-1",
 enable_list_functions=True,
 enable_invoke_function=True,
 enable_create_function=False, # Disable function creation
 enable_update_function=False, # Disable function updates
)
],
 name="Lambda Reader Agent",
 description="You are an AWS Lambda specialist focused on reading and invoking existing functions.",
 instructions=[
 "List and invoke existing Lambda functions",
 "Cannot create or modify Lambda functions",
 "Provide insights about function execution and performance",
 "Focus on function monitoring and execution",
],
 markdown=True,
)

Example 3: Enable all functions using 'all=True' pattern
agent_comprehensive = Agent(
 tools=[AWSLambdaTools(region_name="us-east-1", all=True)],
 name="Comprehensive Lambda Agent",
 description="You are a full-featured AWS Lambda manager with all capabilities enabled.",
 instructions=[
 "Manage complete AWS Lambda lifecycle including creation, updates, and deployments",
 "Provide comprehensive serverless architecture guidance",
 "Support advanced Lambda configurations and optimizations",
 "Handle complex serverless workflows and integrations",
],
 markdown=True,
)

Example 4: Invoke-only agent for testing
agent_tester = Agent(
 tools=[
 AWSLambdaTools(
 region_name="us-east-1",
 enable_list_functions=True, # Enable listing for reference
 enable_invoke_function=True, # Enable function testing
 enable_create_function=False, # Disable creation
 enable_delete_function=False, # Disable deletion (safety)
)
],
 name="Lambda Tester Agent",
 description="You are an AWS Lambda testing specialist focused on safe function execution.",
 instructions=[
 "Test and validate Lambda function execution",
 "Cannot create or delete functions for safety",
 "Provide detailed execution results and performance metrics",
],
 markdown=True,
)
```

```
 "Focus on function testing and validation workflows",
],
 markdown=True,
)

Example usage
print("=== Basic Lambda Operations Example ===")
agent_basic.print_response(
 "List all Lambda functions in our AWS account", markdown=True
)

print("\n=== Function Testing Example ===")
agent_tester.print_response(
 "Invoke the 'hello-world' Lambda function with an empty payload and analyze the results",
 markdown=True,
)

print("\n=== Comprehensive Management Example ===")
agent_comprehensive.print_response(
 "Provide an overview of our Lambda environment including function count, runtimes, and recent activity",
 markdown=True,
)

Note: Make sure you have the necessary AWS credentials set up in your environment
or use AWS CLI's configure command to set them up before running this script.
```

**cookbook/tools/aws\_ses\_tools.py**

**Purpose:** AWS SES (Simple Email Service) Setup Instructions:

AWS SES (Simple Email Service) Setup Instructions:

- Go to AWS SES Console and verify your domain or email address:
  - For production:
    - Go to AWS SES Console > Verified Identities > Create Identity
    - Choose "Domain" and follow DNS verification steps
    - Add DKIM and SPF records to your domain's DNS
  - For testing:
    - Choose "Email Address" verification
    - Click verification link sent to your email
- Configure AWS Credentials:
  - Create an IAM user:
    - Go to IAM Console > Users > Add User
    - Enable "Programmatic access"
    - Attach "AmazonSESFullAccess" policy
  - Set up credentials (choose one method): Method 1 - Using AWS CLI:

```
aws configure
Enter your AWS Access Key ID
Enter your AWS Secret Access Key
Enter your default region
```

```
Method 2 - Set environment variables:

export AWS_ACCESS_KEY_ID=YOUR_ACCESS_KEY
export AWS_SECRET_ACCESS_KEY=YOUR_SECRET_KEY
```

- Install required Python packages:

```
pip install boto3 agno
```
- Update the variables below with your configuration:
  - sender\_email: Your verified sender email address
  - sender\_name: Display name that appears in email clients
  - region\_name: AWS region where SES is set up (e.g., "us-east-1", "ap-south-1")

- Key Agno APIs:** agno.agent.Agent, agno.models.openai.OpenAIChat, agno.tools.aws\_ses.AWSSSESTool, agno.tools.duckduckgo.DuckDuckGoTools
- How to Run:** python cookbook/tools/aws\_ses\_tools.py (ensure prerequisites from the docstring are satisfied)

"""

cookbook/tools/e2b_tools.py

Purpose: E2B Tools Example - Demonstrates how to use the E2B toolkit for sandboxed code execution.

E2B Tools Example - Demonstrates how to use the E2B toolkit for sandboxed code execution.

This example shows how to: 1. Set up authentication with E2B API 2. Initialize the E2BTools with proper configuration 3. Create an agent that can run Python code in a secure sandbox 4. Use the sandbox for data analysis, visualization, and more

Prerequisites: 1. Create an account and get your API key from E2B: - Visit <https://e2b.dev/> - Sign up for an account - Navigate to the Dashboard to get your API key

2. Install required packages: pip install e2b_code_interpreter pandas matplotlib

3. Set environment variable: export E2B_API_KEY=your_api_key

Features: - Run Python code in a secure sandbox environment - Upload and download files to/from the sandbox - Create and download data visualizations - Run servers within the sandbox with public URLs - Manage sandbox lifecycle (timeout, shutdown) - Access the internet from within the sandbox

Usage: Run this script with the E2B_API_KEY environment variable set to interact with the E2B sandbox through natural language commands.

- **Key Agno APIs:** agno.agent.Agent, agno.models.openai.OpenAIChat, agno.tools.e2b.E2BTools
- **How to Run:** python cookbook/tools/e2b_tools.py (ensure prerequisites from the docstring are satisfied)

cookbook/tools/googlecalendar_tools.py

Purpose: Steps to get the Google OAuth Credentials (Reference : <https://developers.google.com/calendar/api/quickstart/python>)

Steps to get the Google OAuth Credentials (Reference : <https://developers.google.com/calendar/api/quickstart/python>)

1. Enable Google Calender API
 - Go To <https://console.cloud.google.com/apis/enbleflow?apiid=calendar-json.googleapis.com>
 - Select Project and Enable The API
2. Go To API & Service -> OAuth Consent Screen
- 3.Select User Type . - If you are Google Workspace User select Internal - Else Select External
- 4.Fill in the app details (App name, logo, support email, etc.).
5. Select Scope
 - Click on Add or Remove Scope
 - Search for Google Calender API (Make Sure youâ€™ve enabled Google calender API otherwise scopes wont be visible)
 - Select Scopes Accordingly
 - From the dropdown check on /auth/calendar scope
 - Save and Continue
6. Adding Test User
 - Click Add Users and enter the email addresses of the users you want to allow during testing.
 - NOTE : Only these users can access the appâ€™s OAuth functionality when the app is in â€œTestingâ€ mode. If anyone else tries to authenticate, theyâ€™ll see an error like: â€œError 403: access denied.â€
 - To make the app available to all users, youâ€™ll need to move the appâ€™s status to â€œIn Production.â€. Before doing so, ensure the app is fully verified by Google if it uses sensitive or restricted scopes.
 - Click on Go back to Dashboard
7. Generate OAuth 2.0 Client ID
 - Go To Credentials
 - Click on Create Credentials -> OAuth Client ID
 - Select Application Type as Desktop app
 - Download JSON
8. Using Google Calender Tool
 - Pass the Path of downloaded credentials as credentials_path to Google Calender tool

- **Key Agno APIs:** agno.agent.Agent, agno.tools.googlecalendar.GoogleCalendarTools
- **How to Run:** python cookbook/tools/googlecalendar_tools.py (ensure prerequisites from the docstring are satisfied)

Steps to get the Google OAuth Credentials (Reference : <https://developers.google.com/calendar/api/quickstart/python>)

cookbook/tools/mcp/gibsonai.py

Purpose: ðŸŽˆðŸŽˆ GibsonAI MCP Server - Create and manage databases with prompts

ðŸŽˆðŸŽˆ GibsonAI MCP Server - Create and manage databases with prompts

This example shows how to connect a local GibsonAI MCP to Agno agent. You can instantly generate, modify database schemas and chat with your relational database using natural language. From prompt to a serverless database (MySQL, PostgreSQL, etc.), auto-generated REST APIs for your data.

Example prompts to try: - ðŸŽˆCreate a new GibsonAI project for my e-commerce appðŸŽˆ - ðŸŽˆShow me the current schema for my projectðŸŽˆ - ðŸŽˆAdd a ðŸŽˆproductsðŸŽˆ table with name, price, and description fieldsðŸŽˆ - ðŸŽˆCreate a ðŸŽˆusersðŸŽˆ table with authentication fieldsðŸŽˆ - ðŸŽˆDeploy my schema changes to productionðŸŽˆ

How to setup and run:

1. Install [UV](#) package manager.
2. Install the GibsonAI CLI: `bash uvx --from gibbon-cli@latest gibbon auth login`
3. Install the required dependencies: `bash pip install agno mcp openai`
4. Export your API key: `bash export OPENAI_API_KEY="your_openai_api_key"`
5. Run the GibsonAI agent by running this file.
6. Check created database and schema on GibsonAI dashboard: <https://app.gibsonai.com>

This logs you into the [GibsonAI CLI](#) so you can access all the features directly from your agent.

- **Key Agno APIs:** agno.agent.Agent, agno.models.openai.OpenAIChat, agno.tools.mcp.MCPTools
- **How to Run:** `python cookbook/tools/mcp/gibsonai.py` (ensure prerequisites from the docstring are satisfied)

```

cookbook/tools/mcp/groq\_mcp.py

**Purpose:** ⚡ Groq + MCP = Lightning Fast Agents

⚡ Groq + MCP = Lightning Fast Agents

This example demonstrates how to create a high-performance filesystem agent by combining Groq’s fast LLM inference with the Model Context Protocol (MCP). This combination delivers exceptional speed while maintaining powerful filesystem exploration capabilities.

Example prompts to try: - What files are in the current directory? - Show me the content of README.md - What is the license for this project? - Find all Python files in the project - Analyze the performance benefits of using Groq with MCP

Run: pip install agno mcp openai to install the dependencies

- **Key Agno APIs:** agno.agent.Agent, agno.models.groq.Groq, agno.tools.mcp.MCPTools
- **How to Run:** python cookbook/tools/mcp/groq\_mcp.py (ensure prerequisites from the docstring are satisfied)

```

**cookbook/tools/mcp/stagehand.py**

**Purpose:** ðŸŽ– Stagehand MCP Agent - Hacker News Reader’s Digest

ðŸŽ– Stagehand MCP Agent - Hacker News Reader’s Digest

This example demonstrates how to use Agno’s agent to create a Hacker News content using the Stagehand MCP server.

Features: - Scrapes current Hacker News headlines and metadata - Extracts top comments from popular stories - Creates a structured digest with key insights - Respects rate limits and community guidelines

Prerequisites: - Clone the Stagehand MCP server: git clone https://github.com/browserbase/mcp-server-browserbase - Build the Stagehand MCP server: cd mcp-server-browserbase/stagehand && npm install && npm run build - This will create a dist/index.js file in the location where you cloned the repository - Install dependencies: pip install agno mcp - Set environment variables: BROWSERBASE\_API\_KEY, BROWSERBASE\_PROJECT\_ID, OPENAI\_API\_KEY - Run this example: python cookbook/tools/mcp/stagehand.py

- **Key Agno APIs:** agno.agent.Agent, agno.models.openai.OpenAIChat, agno.tools.mcp.MCPTools
- **How to Run:** python cookbook/tools/mcp/stagehand.py (ensure prerequisites from the docstring are satisfied)

```
"""
ðŸŽ– Stagehand MCP Agent - Hacker News Reader's Digest

This example demonstrates how to use Agno's agent to create a Hacker News content using the Stagehand MCP server.

Features:
- Scrapes current Hacker News headlines and metadata
- Extracts top comments from popular stories
- Creates a structured digest with key insights
- Respects rate limits and community guidelines

Prerequisites:
- Clone the Stagehand MCP server: git clone https://github.com/browserbase/mcp-server-browserbase
- Build the Stagehand MCP server: cd mcp-server-browserbase/stagehand && npm install && npm run build
 - This will create a dist/index.js file in the location where you cloned the repository
- Install dependencies: pip install agno mcp
- Set environment variables: BROWSERBASE_API_KEY, BROWSERBASE_PROJECT_ID, OPENAI_API_KEY
- Run this example: python cookbook/tools/mcp/stagehand.py
"""

 You are a web scraping assistant that creates concise reader's digests from Hacker News.

 CRITICAL INITIALIZATION RULES - FOLLOW EXACTLY:
 1. NEVER use screenshot tool until AFTER successful navigation
 2. ALWAYS start with stagehand_navigate first
 3. Wait for navigation success message before any other actions
 4. If you see initialization errors, restart with navigation only
 5. Use stagehand_observe and stagehand_extract to explore pages safely

 Available tools and safe usage order:
 - stagehand_navigate: Use FIRST to initialize browser
 - stagehand_extract: Use to extract structured data from pages
 - stagehand_observe: Use to find elements and understand page structure
 - stagehand_act: Use to click links and navigate to comments
 - screenshot: Use ONLY after navigation succeeds and page loads

 Your goal is to create a comprehensive but concise digest that includes:
 - Top headlines with brief summaries
 - Key themes and trends
 - Notable comments and insights
 - Overall tech news landscape overview

 Be methodical, extract structured data, and provide valuable insights.

        "2. Transcribe the audio using transcribe_audio",
        "3. Generate SRT captions using create_srt",
        "4. Embed captions into the video using embed_captions",
    ],
    markdown=True,
)

video_caption_agent.print_response(
    "Generate captions for {video with location} and embed them in the video"
)
```

cookbook/tools/multiple_tools.py

Purpose: Run pip install openai ddgs yfinance to install dependencies.

- **Key Agno APIs:** agno.agent.Agent, agno.models.openai.OpenAIChat, agno.tools.duckduckgo.DuckDuckGoTools, agno.tools.yfinance.YFinanceTools
- **How to Run:** python cookbook/tools/multiple_tools.py (ensure prerequisites from the docstring are satisfied)

```
"""Run `pip install openai ddgs yfinance` to install dependencies."""

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.yfinance import YFinanceTools

agent = Agent(
    model=OpenAIChat(id="gpt-4o"),
    tools=[DuckDuckGoTools(), YFinanceTools()],
    instructions=["Use tables to display data"],
    markdown=True,
)

agent.print_response(
    "Write a thorough report on NVDA, get all financial information and latest news",
    stream=True,
)
```

cookbook/tools/neo4j_tools.py

Purpose: Example script demonstrating the use of Neo4jTools with an Agno agent.

Example script demonstrating the use of Neo4jTools with an Agno agent. This script sets up an agent that can interact with a Neo4j database using natural language queries, such as listing node labels or executing Cypher queries.

Setting up Neo4j Locally

Option 1: Using Docker (Recommended)

1. **Install Docker** if you haven't already from <https://www.docker.com/>
2. **Run Neo4j in Docker:**

```
docker run --name neo4j -p 7474:7474 -p 7687:7687 -d -v $HOME/neo4j/data:/data -v $HOME/neo4j/logs:/logs -v $HOME/neo4j/import:/var/lib/neo4j/import
```
3. **Access Neo4j Browser:** Open <http://localhost:7474> in your browser

- Username: neo4j
- Password: password

Option 2: Native Installation

1. **Download Neo4j Desktop** from <https://neo4j.com/download/>
2. **Install and create a new database**
3. **Start the database** and note the connection details

Option 3: Using Neo4j Community Edition

1. **Download** from <https://neo4j.com/download-center/#community>
2. **Extract and run:**

```
tar -xf neo4j-community-*-unix.tar.gz
cd neo4j-community-*
./bin/neo4j start
```

Python Setup

1. **Install required packages:**

```
pip install neo4j python-dotenv
```
2. **Set environment variables** (create a .env file in your project root):

```
NEO4J_URI=bolt://localhost:7687
NEO4J_USERNAME=neo4j
NEO4J_PASSWORD=password
```

Usage

1. **Ensure Neo4j is running** (check <http://localhost:7474>)
2. **Run this script** to create an agent that can interact with your Neo4j database
3. **Test with queries** like `What are the node labels in my graph?` or `Show me the database schema`

Troubleshooting

- **Connection refused:** Make sure Neo4j is running on the correct port (7687)
- **Authentication failed:** Verify your username/password in the Neo4j browser first
- **Import errors:** Install the neo4j driver with `pip install neo4j`
- **Key Agno APIs:** `agno.agent.Agent`, `agno.models.openai.OpenAIChat`, `agno.tools.neo4j.Neo4jTools`
- **How to Run:** `python cookbook/tools/neo4j_tools.py` (ensure prerequisites from the docstring are satisfied)

"""

- **Connection refused:** Make sure Neo4j is running on the correct port (7687)
- **Authentication failed:** Verify your username/password in the Neo4j browser first
- **Import errors:** Install the neo4j driver with `pip install neo4j`

```
import os

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.neo4j import Neo4jTools
from dotenv import load_dotenv
```

load\_dotenv()

## Optionally load from environment or hardcode here

uri = os.getenv('NEO4J\_URI', 'bolt://localhost:7687') user = os.getenv('NEO4J\_USERNAME', 'neo4j') password = os.getenv('NEO4J\_PASSWORD', 'password')

## Example 1: All functions enabled (default)

neo4j\_toolkit\_all = Neo4jTools( uri=uri, user=user, password=password, all=True, )

## Example 2: Specific functions only

neo4j\_toolkit\_specific = Neo4jTools( uri=uri, user=user, password=password, enable\_list\_labels=True, enable\_get\_schema=True, enable\_list\_relationships=False, enable\_run\_cypher=False, )

## Example 3: Default behavior

neo4j\_toolkit = Neo4jTools( uri=uri, user=user, password=password, )

description = "You are a Neo4j expert assistant who can help with all operations in a Neo4j database by understanding natural language context and translating it into Cypher queries." instructions = [ "Analyze the user's context and convert it into Cypher queries that respect the database's current schema. Before performing any operation, query the current schema (e.g., check for existing nodes or relationships). If the necessary schema elements are missing, dynamically create or extend the schema using best practices, ensuring data integrity and consistency. If properties are required or provided for nodes or relationships, ensure that they are added correctly do not overwrite existing ones and do not create duplicates and do not create extra nodes. Optionally, use or implement a dedicated function to retrieve the current schema (e.g., via a 'get\_schema' function). Ensure that all operations maintain data integrity and follow best practices. Intelligently create relationships if bi-directional relationships are required, and understand the users intent and create relationships accordingly. Intelligently handle queries that involve multiple nodes and relationships, understand has to be nodes, properties, and relationships and maintain best practices. Handle errors gracefully and provide clear feedback to the user."]

## Example: Use with AGNO Agent

agent = Agent( model=OpenAIChat(id='gpt-3.5-turbo'), tools=[neo4j\_toolkit], markdown=True, description=description, instructions=instructions, )

## Agent handles tool usage automatically via LLM reasoning

agent.print\_response("Add some nodes in my graph to represent a person with the name John Doe and a person with the name Jane Doe, and they belong to company 'X' and they are friends.")

agent.print\_response("What is the schema of my graph?")

```

cookbook/tools/notion_tools.py

Purpose: cookbook/tools/notion_tools.py example

- Key Agno APIs:** agno.agent.Agent, agno.tools.notion.NotionTools
- Helper Functions:** demonstrate_tools
- How to Run:** python cookbook/tools/notion_tools.py (ensure prerequisites from the docstring are satisfied)

```
from agno.agent import Agent
from agno.tools.notion import NotionTools

# Notion Tools Demonstration Script
"""
This script showcases the power of organizing and managing content in Notion using AI.
Automatically categorize, store, and retrieve information from your Notion workspace!
"""

---
Configuration Instructions:
1. Install required dependencies:
    pip install agno notion-client

2. Create a Notion Integration:
    - Go to https://www.notion.so/my-integrations
    - Click "+ New integration"
    - Name it (e.g., "Agno Agent")
    - Copy the "Internal Integration Token"

3. Create a Notion Database:
    - Create a new page in Notion
    - Add a database (type /database)
    - Add these properties:
      * Name (Title) - already exists
      * Tag (Select) - add options: travel, tech, general-blogs, fashion, documents

4. Share the database with your integration:
    - Open the database page
    - Click "..." â†’ "Add connections"
    - Select your integration

5. Get the database ID from the URL:
    https://www.notion.so/./DATABASE_ID?v=...

6. Set environment variables in .env:
    NOTION_API_KEY=secret_your_integration_token
    NOTION_DATABASE_ID=your_database_id_here
```

```

cookbook/tools/opencv_tools.py

Purpose: OpenCV Tools - Computer Vision and Image Processing

OpenCV Tools - Computer Vision and Image Processing

This example demonstrates how to use OpenCVTools for computer vision tasks. Shows enable_ flag patterns for selective function access. OpenCVTools is a small tool (<6 functions) so it uses enable_ flags.

Steps to use OpenCV Tools:

1. Install OpenCV
 - Run: pip install opencv-python
2. Camera Permissions (macOS)
 - Go to System Settings > Privacy & Security > Camera
 - Enable camera access for Terminal or your IDE
3. Camera Permissions (Linux)
 - Ensure your user is in the video group: sudo usermod -a -G video \$USER
 - Restart your session after adding to the group
4. Camera Permissions (Windows)
 - Go to Settings > Privacy > Camera
 - Enable "Allow apps to access your camera"

Note: Make sure your webcam is connected and not being used by other applications.

- **Key Agno APIs:** agno.agent.Agent, agno.tools.opencv.OpenCVTools, agno.utils.media.save_base64_data
- **How to Run:** python cookbook/tools/opencv_tools.py (ensure prerequisites from the docstring are satisfied)

```

cookbook/tools/other/human_in_the_loop.py

Purpose: ðŸ”” Human-in-the-Loop: Adding User Confirmation to Tool Calls

ðŸ”” Human-in-the-Loop: Adding User Confirmation to Tool Calls

This example shows how to implement human-in-the-loop functionality in your Agno tools. It shows how to: - Add pre-hooks to tools for user confirmation - Handle user input during tool execution - Gracefully cancel operations based on user choice

Some practical applications: - Confirming sensitive operations before execution - Reviewing API calls before theyâ€™re made - Validating data transformations - Approving automated actions in critical systems

Run pip install openai httpx rich agno to install dependencies.

- **Key Agno APIs:** agno.agent.Agent, agno.exceptions.StopAgentRun, agno.models.openai.OpenAIChat, agno.tools.FunctionCall, agno.tools.tool
- **Helper Functions:** get_top_hackernews_stories, pre_hook
- **How to Run:** python cookbook/tools/other/human_in_the_loop.py (ensure prerequisites from the docstring are satisfied)

cookbook/tools/trello_tools.py

Purpose: Setting Up Authentication for Trello Tools

Setting Up Authentication for Trello Tools Step 1: Get Your API Key 1. Visit the Trello Power-Ups Administration Page <https://trello.com/power-ups/admin> 2. (Optional) Create a Workspace 3. Create a Power Up (this is required. Its like a "App" connector) - If you don't already have a power-ups, create one by clicking the "New" button. - If you have an existing Power-Up, select it from the list. Step 2: Generate API Key and Secret 1. On the left sidebar, click on the "API Key" option. 2. Generate a new API Key: - Click the button to generate your API Key. - Copy the generated API Key and Secret. Store as TRELLO_API_KEY and TRELLO_API_SECRET. Step 3: Generate a Token 1. On the same page where your API Key is shown, locate the option to manually generate a Token. 2. Authorize your Trello account: - Follow the on-screen instructions to authorize the application. 3. Copy the generated Token. Store as TRELLO_TOKEN.

- **Key Agno APIs:** agno.agent.Agent, agno.tools.trello.TrelloTools
- **How to Run:** python cookbook/tools/trello_tools.py (ensure prerequisites from the docstring are satisfied)

cookbook/tools/whatsapp_tools.py

Purpose: WhatsApp Cookbook

WhatsApp Cookbook

This cookbook demonstrates how to use WhatsApp integration with Agno. Before running this example, you’ll need to complete these setup steps:

1. Create Meta Developer Account
 - Go to [Meta Developer Portal](#) and create a new account
 - Create a new app at [Meta Apps Dashboard](#)
 - Enable WhatsApp integration for your app [here](#)
2. Set Up WhatsApp Business API You can get your WhatsApp Business Account ID from [Business Settings](#)
3. Configure Environment
 - Set these environment variables: WHATSAPP_ACCESS_TOKEN=your_access_token # Access Token WHATSAPP_PHONE_NUMBER_ID=your_phone_number_id # Phone Number ID WHATSAPP_RECIPIENT_WAID=your_recipient_waid # Recipient WhatsApp ID (e.g.À 1234567890) WHATSAPP_VERSION=your_whatsapp_version # WhatsApp API Version (e.g.À v22.0)

Important Notes: - For first-time outreach, you must use pre-approved message templates [here](#) - Test messages can only be sent to numbers that are registered in your test environment

The example below shows how to send a template message using Agno’s WhatsApp tools. For more complex use cases, check out the WhatsApp Cloud API documentation: [here](#)

- **Key Agno APIs:** agno.agent.Agent, agno.models.google.Gemini, agno.tools.whatsapp.WhatsAppTools
- **How to Run:** python cookbook/tools/whatsapp_tools.py (ensure prerequisites from the docstring are satisfied)

```
"""
WhatsApp Cookbook
-----

This cookbook demonstrates how to use WhatsApp integration with Agno. Before running this example,
you'll need to complete these setup steps:

1. Create Meta Developer Account
  - Go to [Meta Developer Portal](https://developers.facebook.com/) and create a new account
  - Create a new app at [Meta Apps Dashboard](https://developers.facebook.com/apps/)
  - Enable WhatsApp integration for your app [here](https://developers.facebook.com/docs/whatsapp/cloud-api/get-started)

2. Set Up WhatsApp Business API
  You can get your WhatsApp Business Account ID from [Business Settings](https://developers.facebook.com/docs/whatsapp/cloud-api/get-started)

3. Configure Environment
  - Set these environment variables:
    WHATSAPP_ACCESS_TOKEN=your_access_token          # Access Token
```

```
WHATSAPP_PHONE_NUMBER_ID=your_phone_number_id      # Phone Number ID
WHATSAPP_RECIPIENT_WAID=your_recipient_waid         # Recipient WhatsApp ID (e.g. 1234567890)
WHATSAPP_VERSION=your_whatsapp_version              # WhatsApp API Version (e.g. v22.0)
```

Important Notes:

- For first-time outreach, you must use pre-approved message templates [here](https://developers.facebook.com/docs/whatsapp/cloud-api/guides/send-message-templates)

```

cookbook/tools/x_tools.py

Purpose: cookbook/tools/x_tools.py example

- **Key Agno APIs:** agno.agent.Agent, agno.tools.x.XTools
- **How to Run:** python cookbook/tools/x_tools.py (ensure prerequisites from the docstring are satisfied)

```
from agno.agent import Agent
from agno.tools.x import XTools

"""

To set up an X developer account and obtain the necessary keys, follow these steps:

1. **Create an X Developer Account:**
   - Go to the X Developer website: https://developer.x.com/
   - Sign in with your X account or create a new one if you don't have an account.
   - Apply for a developer account by providing the required information about your intended use of the X API.

2. **Create a Project and App:**
   - Once your developer account is approved, log in to the X Developer portal.
   - Navigate to the "Projects & Apps" section and create a new project.
   - Within the project, create a new app. This app will be used to generate the necessary API keys and tokens.
   - You'll get a client id and client secret, but you can ignore them.

3. **Generate API Keys, Tokens, and Client Credentials:**
   - After creating the app, navigate to the "Keys and tokens" tab.
   - Generate the following keys, tokens, and client credentials:
     - **API Key (Consumer Key)**
     - **API Secret Key (Consumer Secret)**
     - **Bearer Token**
     - **Access Token**
     - **Access Token Secret**

4. **Set Environment Variables:**
   - Export the generated keys, tokens, and client credentials as environment variables in your system or provide them as arguments to the `XTools` constructor.
     - `X_CONSUMER_KEY`
     - `X_CONSUMER_SECRET`
     - `X_ACCESS_TOKEN`
     - `X_ACCESS_TOKEN_SECRET`
     - `X_BEARER_TOKEN`

"""

cookbook/tools/zoom_tools.py

Purpose: Zoom Tools Example - Demonstrates how to use the Zoom toolkit for meeting management.

Zoom Tools Example - Demonstrates how to use the Zoom toolkit for meeting management.

This example shows how to: 1. Set up authentication with Zoom API 2. Initialize the ZoomTools with proper credentials 3. Create an agent that can manage Zoom meetings 4. Use various Zoom API functionalities through natural language

Prerequisites:

- 1. Create a Server-to-Server OAuth app in Zoom Marketplace:
 - Visit <https://marketplace.zoom.us/>
 - Create a new app. Go to Develop -> Build App -> Server-to-Server OAuth.
 - Add required scopes:
 - meeting:write:admin
 - meeting:read:admin
 - cloud_recording:read:admin
 - Copy Account ID, Client ID, and Client Secret
- 2. Set environment variables: export ZOOM_ACCOUNT_ID=your_account_id export ZOOM_CLIENT_ID=your_client_id export ZOOM_CLIENT_SECRET=your_client_secret

Features:

- Schedule new meetings
- Get meeting details
- List all meetings
- Get upcoming meetings
- Delete meetings
- Get meeting recordings

Usage:

Run this script with proper environment variables set to interact with the Zoom API through natural language commands.

- **Key Agno APIs:** agno.agent.Agent, agno.models.openai.OpenAIChat, agno.tools.zoom.ZoomTools
- **How to Run:** python cookbook/tools/zoom_tools.py (ensure prerequisites from the docstring are satisfied)

```

- Copy Account ID, Client ID, and Client Secret

2. Set environment variables:
export ZOOM_ACCOUNT_ID=your_account_id
export ZOOM_CLIENT_ID=your_client_id
export ZOOM_CLIENT_SECRET=your_client_secret
```

```
Features:
-----
- Schedule new meetings
- Get meeting details
- List all meetings
- Get upcoming meetings
- Delete meetings
- Get meeting recordings
```

```
Usage:
-----
Run this script with proper environment variables set to interact with
the Zoom API through natural language commands.
"""
```

```

cookbook/workflows/_06_advanced_concepts/_09_other/workflow_tools.py

Purpose: Here is a tool with reasoning capabilities to allow agents to run workflows.

Here is a tool with reasoning capabilities to allow agents to run workflows.

1. Run: `pip install openai agno lancedb tantivy sqlalchemy` to install the dependencies
 2. Export your `OPENAI_API_KEY`
 3. Run: `python cookbook/workflows/_06_advanced_concepts/_06_other/workflow_tools.py` to run the agent
- **Key Agno APIs:** `agno.agent.Agent`, `agno.db.sqlite.SqliteDb`, `agno.models.openai.OpenAIChat`, `agno.team.Team`, `agno.tools.duckduckgo.DuckDuckGoTools`, `agno.tools.hackernews.HackerNewsTools`, `agno.tools.workflow.WorkflowTools`, `agno.workflow.types.StepInput`, `agno.workflow.types.StepOutput`, `agno.workflow.workflow.Workflow`
 - **Helper Functions:** `prepare_input_for_web_search`, `prepare_input_for_writer`
 - **How to Run:** `python cookbook/workflows/_06_advanced_concepts/_09_other/workflow_tools.py` (ensure prerequisites from the docstring are satisfied)

```

### Examples
#### Example: Blog Post Workflow
User: Please create a blog post on the topic: AI Trends in 2024
Run: input_data="AI trends in 2024", additional_data={"topic": "AI, AI agents, AI workflows", "style": "The blog post should be written in a style that is easy to understand and follow."}
Final Answer: I've created a blog post on the topic: AI trends in 2024 through the workflow. The blog post shows...

    You HAVE TO USE additional_data to pass the topic and style to the workflow.
"""

AgentUI

Source: https://docs.agno.com/agent-os/agent-ui

An Open Source AgentUI for your AgentOS

Agno provides a beautiful UI for interacting with your agents, completely open source, free to use and build on top of. Itâ€™s a simple interface that allows you to chat with your agents, view their memory, knowledge, and more.

The AgentOS only uses data in your database. No data is sent to Agno.

The Open Source Agent UI is built with Next.js and TypeScript. After the success of the [Agent AgentOS](#), the community asked for a self-hosted alternative and we delivered!

Get Started with Agent UI

To clone the Agent UI, run the following command in your terminal:

```
npx create-agent-ui@latest
```

Enter y to create a new project, install dependencies, then run the agent-ui using:

```
cd agent-ui && npm run dev
```

Open <http://localhost:3000> to view the Agent UI, but remember to connect to your local agents.

You can also clone the repository manually

```
bash theme={null} git clone https://github.com/agno-agi/agent-ui.git
```

And run the agent-ui using

```
bash theme={null} cd agent-ui && npnm install && npnm dev
```

Connect your AgentOS

The Agent UI needs to connect to a AgentOS server, which you can run locally or on any cloud provider.

Let's start with a local AgentOS server. Create a file `agentos.py`

```
# Context: agentos.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.os import AgentOS
from agno.db.sqlite import SqliteDb
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.yfinance import YFinanceTools

agent_storage: str = "tmp/agents.db"

web_agent = Agent(
    name="Web Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[DuckDuckGoTools()],
    instructions=["Always include sources"],
    # Store the agent sessions in a sqlite database
    db=SqliteDb(db_file=agent_storage),
    # Adds the current date and time to the context
    add_datetime_to_context=True,
    # Adds the history of the conversation to the messages
    add_history_to_context=True,
    # Number of history responses to add to the messages
    num_history_runs=5,
    # Adds markdown formatting to the messages
    markdown=True,
)

finance_agent = Agent(
    name="Finance Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[YFinanceTools(stock_price=True, analyst_recommendations=True, company_info=True, company_news=True)],
    instructions=["Always use tables to display data"],
    db=SqliteDb(db_file=agent_storage),
    add_datetime_to_context=True,
    add_history_to_context=True,
    num_history_runs=5,
    markdown=True,
)

agent_os = AgentOS(agents=[web_agent, finance_agent])
app = agent_os.get_app()

if __name__ == "__main__":
    agent_os.serve("agentos:app", reload=True)
```

In another terminal, run the AgentOS server:

```
bash Mac theme={null} python3 -m venv .venv source .venv/bin/activate

'''bash Windows theme={null}
python3 -m venv aienv
aienv/scripts/activate
'''

</CodeGroup>

bash Mac theme={null} pip install -U openai ddgs yfinance sqlalchemy 'fastapi[standard]' agno

'''bash Windows theme={null}
pip install -U openai ddgs yfinance sqlalchemy 'fastapi[standard]' agno
'''

</CodeGroup>

bash Mac theme={null} export OPENAI_API_KEY=sk-***

'''bash Windows theme={null}
setx OPENAI_API_KEY sk-***
'''

</CodeGroup>

shell theme={null} python agentos.py
```

Make sure the `serve_agents_app()` points to the file containing your AgentOS app.

View the AgentUI

- Open <http://localhost:3000> to view the Agent UI
- Enter the `localhost:7777` endpoint on the left sidebar and start chatting with your agents and teams!
