

Agno Comprehensive API & Cookbook Guide

Generated on 2025-11-12.

This document consolidates Agno’s official documentation, auto-generated API reference, and runnable cookbook examples into a single beginner-friendly resource.

How to Use this Guide

- Start with the *Getting Started* section to configure your environment.
- Skim the *Official Documentation Digest* to see what topics are available online.
- Dive into the *Auto-Generated API Reference* when you need precise signatures.
- Explore the *Cookbook Walkthrough* and *Examples Overview* for runnable code.
- Refer to the *Appendix* for the raw documentation export and quick-searching.

Performance tip: Create agents once and reuse them; avoid instantiating agents inside loops. Structure your responses with `output_schema` when you need typed results.

Getting Started Quickly

1. Install dependencies

```
python3 -m venv .venv
source .venv/bin/activate
pip install -U agno openai ddgs yfinance sqlalchemy "fastapi[standard]"
```

2. Export provider credentials

```
export OPENAI_API_KEY=sk-...
```

3. Create your first agent

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat

agent = Agent(
    model=OpenAIChat(id="gpt-4o"),
    instructions="You are a helpful assistant",
    markdown=True,
)
agent.print_response("Hello Agno!", stream=True)
```

4. Add tools or knowledge progressively.

Start with a single agent, introduce tool integrations as needed, and switch to teams or workflows only when coordination or branching logic becomes essential.

Official Documentation Digest

Headings below originate from the published Agno documentation. Skim this list to understand the breadth of topics before diving into the API reference.

- **AgentUI** – An Open Source AgentUI for your AgentOS Agno provides a beautiful UI for interacting with your agents, completely open source, free to use and build on top of. It’s a simple interface that allows you to chat with your agents, view their memory, knowledge, and more. The AgentOS only uses data in your database. No data is sent to Agno. The Open Source Agent UI is built with Next.js and TypeScript. Aa€
- **Get Started with Agent UI** – To clone the Agent UI, run the following command in your terminal: `bash npx create-agent-ui@latest`
- **Connect your AgentOS** – The Agent UI needs to connect to a AgentOS server, which you can run locally or on any cloud provider. Let’s start with a local AgentOS server. Create a file `agentos.py` `python agentos.py` from `agno.agent import Agent`
- **Store the agent sessions in a sqlite database** – `db=SqliteDb(db_file=agent_storage),`
- **Adds the current date and time to the context** – `add_datetime_to_context=True,`
- **Adds the history of the conversation to the messages** – `add_history_to_context=True,`
- **Number of history responses to add to the messages** – `num_history_runs=5,`
- **Adds markdown formatting to the messages** – `markdown=True,`) `finance_agent = Agent( name=“Finance Agent”,`
- **View the AgentUI** – * Open <http://localhost:3000> to view the Agent UI * Enter the `localhost:7777` endpoint on the left sidebar and start chatting with your agents and teams!
- **AgentOS API** – Learn how to use the AgentOS API to interact with your agentic system AgentOS is a RESTful API that provides access to your agentic system. It allows you to: * **Run Agents / Teams / Workflows:** Create new runs for your agents, teams and workflows, either with a new session or a existing one.
- **Authentication** – AgentOS supports bearer-token authentication to secure your instance. When a Security Key is configured, all API routes require an `Authorization: Bearer <token>` header for access. Without a key configured, authentication is disabled. For more details, see the [AgentOS Security](#) guide.
- **Running your Agent / Team / Workflow** – The AgentOS API provides endpoints: * **Run an Agent:** `POST /agents/{agent_id}/runs` (See the [API reference](#)) * **Run a Team:** `POST /teams/{team_id}/runs` (See the [API reference](#)) * **Run a Workflow:** `POST /workflows/{workflow_id}/runs` (See the [API reference](#)/`/reference-api/schema/workflows/execute`)
- **Setup the database** – `db = PostgresDb(id=“basic-db”, db_url=“postgresql+psycopg://ai:ai@localhost:5532/ai”)`
- **Setup basic agents, teams and workflows** – `story_writer = Agent( id=“story-writer-agent”, name=“Story Writer Agent”, db=db,`
- **Setup our AgentOS app** – `agent_os = AgentOS( description=“Example AgentOS to show how to pass dependencies to an agent”, agents=[story_writer], )`
- **Connecting Your AgentOS** – Step-by-step guide to connect your local AgentOS to the AgentOS Control Plane
- **Overview** – Connecting your AgentOS is the critical first step to using the AgentOS Control Plane. This process establishes a connection between your running AgentOS instance and the Control Plane, allowing you to manage, monitor, and interact with your agents through the browser. **Prerequisites:** You need a running AgentOS instance before you can connect it to the Control Plane. If you haven’t created one!
- **Step-by-Step Connection Process** – ### 1. Access the Connection Dialog In the Agno platform: 1. Click on the team/organization dropdown in the top navigation bar 2. Click the **+ (plus)** button next to **Add new OS**
- **Verifying Your Connection** – Once connected, you should see: 1. **OS Status:** **Running** indicator in the platform 2. **Available Features:** Chat, Knowledge, Memory, Sessions, etc. should be accessible 3. **Agent List:** Your configured agents should appear in the chat interface
- **Securing Your Connection** – Protect your AgentOS APIs and Control Plane access with bearer-token authentication. Security keys provide essential protection for both development and production environments. **Key Features:** * Generate unique security keys per AgentOS instance * Rotate keys easily through the organization settings
- **Managing Connected OS Instances** – ### Switching Between OS Instances 1. Use the dropdown in the top navigation bar 2. Select the OS instance you want to work with 3. All platform features will now connect to the selected OS
- **Next Steps** – Once your AgentOS is successfully connected: Start having conversations with your connected agents Upload and organize your knowledge bases Track and analyze your agent interactions
- **Control Plane** – The main web interface for interacting with and managing your AgentOS instances The AgentOS Control Plane is your primary web interface for accessing and managing all AgentOS features. This intuitive dashboard serves as the central hub where you interact with your agents, manage knowledge bases, track sessions, monitor performance, and control user access.
- **OS Management** – Connect and inspect your OS runtimes from a single interface. Switch between local development and live production instances, monitor connection health, and configure endpoints for your different environments.
- **User Management** – Manage your organization members and their access to AgentOS features. Configure your organization name, invite team members, and control permissions from a centralized interface. ### Inviting Members Add new team members to your organization by entering their email addresses. You can invite multiple users at once by separating emails with commas or pressing **Enter/Tab** between addresses. ### Member!
- **General Settings** – Configure your account preferences and organization settings. Access your profile information, manage billing and subscription details, and adjust organization-wide preferences from a centralized settings interface.
- **Feature Access** – The control plane provides direct access to all main AgentOS capabilities through an intuitive interface: **Getting Started Tip:** The control plane is your gateway to all AgentOS features. Start by connecting your OS instance, then explore each feature section to familiarize yourself with the interface.

- **Next Steps** â€” Ready to get started? Start with the AgentOS control plane? Hereâ€™s what you need to do: Set up a new AgentOS instance from scratch using our templates Learn how to connect your local development environment to the platform
 - **Create Your First AgentOS** â€” Quick setup guide to get your first AgentOS instance running locally Get started with AgentOS by setting up a minimal local instance. This guide will have you running your first agent in minutes, with optional paths to add advanced features through our examples. AgentOS is a FastAPI app that you can run locally or in your cloud. If you want to build AgentOS using an existing FastAPI app, check outâ€¦
 - **Prerequisites** â€” * Python 3.9+ * An LLM provider API key (e.g., OPENAI_API_KEY)
 - **Installation** â€” Create and activate a virtual environment: `bash Mac`
 - **Create virtual environment** â€” `python -m venv venv`
 - **Activate virtual environment** â€” `source venv/bin/activate bash Windows`
 - **Create virtual environment** â€” `python -m venv venv`
 - **Activate virtual environment** â€” `venvInstall dependencies: bash`
 - **Minimal Setup** â€” Create `my_os.py`: `python from agno.agent import Agent from agno.models.openai import OpenAIChat`
 - **Default port is 7777; change with port=â€¦** â€” `agent_os.serve(app=â€¦my_os:appâ€¦, reload=True)`
 - **Running Your OS** â€” Start your AgentOS: `bash python my_os.py`
 - **Connecting to the Control Plane** â€” With your AgentOS now running locally (`http://localhost:7777`), you can connect it to the AgentOS control plane for an enhanced management experience. The control plane provides a centralized interface to interact with your agents, manage knowledge bases, track sessions, and monitor performance.
 - **Next Steps** â€” Connect your running OS to the AgentOS control plane interface Explore comprehensive examples for advanced AgentOS configurations
 - **AgentOS Configuration** â€” Learn how to check and adjust your AgentOS configuration For most cases, your AgentOS is configured with a default set of settings. However, you can configure your AgentOS to your liking.
 - **Configuring your AgentOS** â€” What can be configured? * **Display names**: You can specify the display name for your AgentOS pages (Sessions, Memory, etc). This is very useful when using multiple databases, to clearly communicate to users which data is being displayed. * **Quick prompts**: You can provide one to three quick prompts for each one of your agents, teams and workflows. These are the prompts that display on the Chatâ€¦
 - **The /config endpoint** â€” You can use the `/config` endpoint to inspect your AgentOS configuration that is served to the AgentOS Control Plane. This is the information you will find there: * **OS ID**: The ID of your AgentOS (automatically generated if not set) * **Description**: The description of your AgentOS
 - **Bring Your Own FastAPI App** â€” Learn how to use your own FastAPI app in your AgentOS AgentOS is built on FastAPI, which means you can easily integrate your existing FastAPI applications or add custom routes and routers to extend your agentâ€™s capabilities.
 - **Quick Start** â€” The simplest way to bring your own FastAPI app is to pass it to the AgentOS constructor: `python from fastapi import FastAPI from agno.agent import Agent`
 - **Create your custom FastAPI app** â€” `app = FastAPI(title=â€¦My Custom Appâ€¦)`
 - **Add your custom routes** â€” `@app.get(â€¦/statusâ€¦) async def status_check(): return {â€¦statusâ€¦: â€¦healthyâ€¦}`
 - **Pass your app to AgentOS** â€” `agent_os = AgentOS( agents=[Agent(id=â€¦basic-agentâ€¦, model=OpenAIChat(id=â€¦gpt-5-miniâ€¦))], base_app=app # Your custom FastAPI app )`
 - **Get the combined app with both AgentOS and your routes** â€” `app = agent_os.get_app()` Your custom FastAPI app can have its own middleware and dependencies. If you have your own CORS middleware, it will be updated to include the AgentOS allowed origins, to make the AgentOS instance compatible with the Control Plane.
 - **Adding Custom Routers** â€” For better organization, use FastAPI routers to group related endpoints: `python custom_fastapi_app.py from agno.agent import Agent from agno.db.sqlite import SqliteDb`
 - **Setup the database** â€” `db = SqliteDb(db_file=â€¦tmp/agentos.dbâ€¦)`
 - **Setup basic agents, teams and workflows** â€” `web_research_agent = Agent( name=â€¦Basic Agentâ€¦, model=Claude(id=â€¦claude-sonnet-4-0â€¦), db=db,`
 - **Custom FastAPI app** â€” `app: FastAPI = FastAPI( title=â€¦Custom FastAPI Appâ€¦, version=â€¦1.0.0â€¦, )`
 - **Add your own routes** â€” `@app.post(â€¦/customersâ€¦) async def get_customers(): return [ {`
 - **Setup our AgentOS app by passing your FastAPI app** â€” `agent_os = AgentOS( description=â€¦Example app with custom routersâ€¦, agents=[web_research_agent], base_app=app,`
 - **Alternatively, add all routes from AgentOS app to the current app**
 - **for route in agent_os.get_routes():**
 - **app.router.routes.append(route)** â€” `app = agent_os.get_app()` if `name == â€¦mainâ€¦`: â€¦Run our AgentOS. You can see the docs at:
 - **Middleware and Dependencies** â€” You can add middleware and dependencies to your custom FastAPI app: `python from fastapi import FastAPI, Depends, HTTPException from fastapi.middleware.cors import CORSMiddleware`
 - **Add CORS middleware** â€” `app.add_middleware( CORSMiddleware, allow_origins=[â€¦https://yourdomain.comâ€¦], allow_credentials=True,`
 - **Security dependency** â€” `security = HTTPBearer() async def verify_token(token: str = Depends(security)): if token.credentials != â€¦your-secret-tokenâ€¦: raise HTTPException(status_code=401, detail=â€¦Invalid tokenâ€¦)`
 - **Protected route** â€” `@app.get(â€¦/protectedâ€¦, dependencies=[Depends(verify_token)]) async def protected_endpoint(): return {â€¦messageâ€¦: â€¦Access grantedâ€¦}`
 - **Integrate with AgentOS** â€” `agent_os = AgentOS( agents=[Agent(id=â€¦basic-agentâ€¦, model=OpenAIChat(id=â€¦gpt-5-miniâ€¦))], base_app=app )`
 - **Access AgentOS Routes** â€” You can programmatically access and inspect the routes added by AgentOS: `python agent_os = AgentOS(agents=agent) app = agent_os.get_app()`
 - **Get all routes** â€” `routes = agent_os.get_routes()` for `route in routes`: `print(fâ€¦Route: {route.path}â€¦ if hasattr(route, â€¦methodsâ€¦)):`
 - **Developer Resources** â€” * [AgentOS Reference](#) * [Full Example](#) * [FastAPI Documentation](#)
 - **Custom Middleware** â€” Create and add your own middleware to AgentOS applications AgentOS supports any FastAPI/Starlette middleware. You can create custom middleware for logging, rate limiting, monitoring, security, and more.
 - **Creating Custom Middleware** â€” Custom middleware in AgentOS follows the FastAPI/Starlette middleware pattern using `BaseHTTPMiddleware`: `python from starlette.middleware.base import BaseHTTPMiddleware from fastapi import Request, Response`
 - **Before request processing** â€” `start_time = time.time()`
 - **Process request** â€” `response = await call_next(request)`
 - **After request processing** â€” `process_time = time.time() - start_time response.headers[â€¦X-Process-Timeâ€¦] = str(process_time) return response`
 - **Common Use Cases** â€” These are some examples demonstrating how to add some common custom middlewares: `python Rate Limiting â€¦Rate limiting middleware that limits requests per IP address â€¦import time`
 - **Clean old requests** â€” `history = self.request_history[client_ip] while history and current_time - history[0] > 60: history.popleft()`
 - **Check rate limit** â€” `if len(history) >= self.requests_per_minute: return JSONResponse( status_code=429, content={â€¦detailâ€¦: â€¦Rate limit exceededâ€¦}`
 - **Log request** â€” `self.logger.info(fâ€¦Request: {request.method} {request.url.path} from {client_ip}â€¦)`
 - **Optionally log body** â€” `if self.log_body and request.method in [â€¦POSTâ€¦, â€¦PUTâ€¦, â€¦PATCHâ€¦]: body = await request.body() if body: self.logger.info(fâ€¦Body: {body.decode()}â€¦)`
 - **Log response** â€” `duration = (time.time() - start_time) * 1000 self.logger.info(fâ€¦Response: {response.status_code} in {duration:.1f}msâ€¦) return response`
 - **Add security headers** â€” `response.headers[â€¦X-Content-Type-Optionsâ€¦] = â€¦nosniffâ€¦ response.headers[â€¦X-Frame-Optionsâ€¦] = â€¦DENYâ€¦ response.headers[â€¦X-XSS-Protectionâ€¦] = â€¦1; mode=blockâ€¦ response.headers[â€¦Strict-Transport-Securityâ€¦] = â€¦max-age=31536000; includeSubDomainsâ€¦`
 - **Generate unique request ID** â€” `request_id = str(uuid.uuid4())`
 - **Store in request state** â€” `request.state.request_id = request_id`
 - **Process request** â€” `response = await call_next(request)`

- [illegible]

Auto-Generated API Reference

This reference is created via static analysis of the Agno source tree. Only public members (respecting `__all__` when provided) are listed. Docstrings are included verbatim to preserve the original guidance.

Module agno.agent.agent

- **Source:** `libs/agno/agno/agent/agent.py`

Classes

- class Agent
 - **Methods:**
 - `async acli_app(self, input: Optional[str]=None, session_id: Optional[str]=None, user_id: Optional[str]=None, user: str='User', emoji: str=':sunglasses:', stream: bool=False, markdown: bool=False, exit_on: Optional[List[str]]=None, **kwargs: Any) -> None` Run an interactive command-line interface to interact with the agent. Works with agent dependencies requiring async logic.
 - `async acontinue_run(self, run_response: Optional[RunOutput]=None, *, stream: Literal[False]=False, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, run_id: Optional[str]=None, updated_tools: Optional[List[ToolExecution]]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, retries: Optional[int]=None, knowledge_filters: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None) -> RunOutput`
 - `async run(self, run_response: Optional[RunOutput]=None, *, stream: Literal[True]=True, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, run_id:`

Optional[str]=None, updated_tools: Optional[List[ToolExecution]]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, retries: Optional[int]=None, knowledge_filters: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None) -> AsyncIterator[Union[RunOutputEvent, RunOutput]] â€œ No docstring provided.

- `acontinue_run(self, run_response: Optional[RunOutput]=None, *, run_id: Optional[str]=None, updated_tools: Optional[List[ToolExecution]]=None, stream: Optional[bool]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, run_context: Optional[RunContext]=None, retries: Optional[int]=None, knowledge_filters: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, yield_run_output: bool=False, **kwargs) -> Union[RunOutput, AsyncIterator[Union[RunOutputEvent, RunOutput]]]` â€œ Continue a previous run. Args: `run_response`: The run response to continue. `run_id`: The run id to continue. Alternative to passing `run_response`. `updated_tools`: The updated tools to use for the run. Required to be used with `run_id`. `stream`: Whether to stream the response. `stream_events`: Whether to stream all events. `user_id`: The user id to continue the run for. `session_id`: The session id to continue the run for. `run_context`: The run context to use for the run. `retries`: The number of retries to continue the run for. `knowledge_filters`: The knowledge filters to use for the run. `dependencies`: The dependencies to use for continuing the run. `metadata`: The metadata to use for continuing the run. `debug_mode`: Whether to enable debug mode. `yield_run_output`: Whether to yield the run response. (deprecated) `stream_intermediate_steps`: Whether to stream all steps.
- `add_to_knowledge(self, query: str, result: str) -> str` â€œ Use this function to add information to the knowledge base for future use. Args: `query`: The query to add. `result`: The result of the query. Returns: `str`: A string indicating the status of the addition.
- `add_tool(self, tool: Union[Toolkit, Callable, Function, Dict])` â€œ No docstring provided.
- `async adelete_session(self, session_id: str)` â€œ Delete the current session and save to storage
- `async aget_chat_history(self, session_id: Optional[str]=None) -> List[Message]` â€œ Read the chat history from the session Args: `session_id`: The session ID to get the chat history for. If not provided, the current cached session ID is used. Returns: `List[Message]`: The chat history from the session.
- `async aget_culture_knowledge(self) -> Optional[List[CulturalKnowledge]]` â€œ Get the cultural knowledge the agent has access to Returns: `Optional[List[CulturalKnowledge]]`: The cultural knowledge.
- `async aget_last_run_output(self, session_id: Optional[str]=None) -> Optional[RunOutput]` â€œ Get the last run response from the database. Args: `session_id` (Optional[str]): The session_id to load from storage. Returns: `Optional[RunOutput]`: The last run response from the database or None if not found.
- `async aget_messages_for_session(self, session_id: Optional[str]=None) -> List[Message]` â€œ Get messages for a session Args: `session_id`: The session ID to get the messages for. If not provided, the current cached session ID is used. Returns: `List[Message]`: The messages for the session.
- `async aget_relevant_docs_from_knowledge(self, query: str, num_documents: Optional[int]=None, filters: Optional[Dict[str, Any]]=None, **kwargs) -> Optional[List[Union[Dict[str, Any], str]]]` â€œ Get relevant documents from knowledge base asynchronously.
- `async aget_run_output(self, run_id: str, session_id: Optional[str]=None) -> Optional[RunOutput]` â€œ Get a RunOutput from the database. Args: `run_id` (str): The run_id to load from storage. `session_id` (Optional[str]): The session_id to load from storage. Returns: `Optional[RunOutput]`: The RunOutput from the database or None if not found.
- `async aget_session(self, session_id: Optional[str]=None) -> Optional[AgentSession]` â€œ Load an AgentSession from database or cache. Args: `session_id`: The session_id to load from storage. Returns: `AgentSession`: The AgentSession loaded from the database/cache or None if not found.
- `async aget_session_metrics(self, session_id: Optional[str]=None) -> Optional[Metrics]` â€œ Get the session metrics for the given session ID. Args: `session_id`: The session ID to get the metrics for. If not provided, the current cached session ID is used. Returns: `Optional[Metrics]`: The session metrics.
- `async aget_session_name(self, session_id: Optional[str]=None) -> str` â€œ Get the session name for the given session ID. Args: `session_id`: The session ID to get the name for. If not provided, the current cached session ID is used. Returns: `str`: The session name.
- `async aget_session_state(self, session_id: Optional[str]=None) -> Dict[str, Any]` â€œ Get the session state for the given session ID. Args: `session_id`: The session ID to get the state for. If not provided, the current cached session ID is used. Returns: `Dict[str, Any]`: The session state.
- `async aget_session_summary(self, session_id: Optional[str]=None) -> Optional[SessionSummary]` â€œ Get the session summary for the given session ID and user ID. Args: `session_id`: The session ID to get the summary for. If not provided, the current cached session ID is used. Returns: `SessionSummary`: The session summary.
- `async aget_system_message(self, session: AgentSession, run_context: Optional[RunContext]=None, user_id: Optional[str]=None, tools: Optional[List[Union[Function, dict]]]=None, add_session_state_to_context: Optional[bool]=None, session_state: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None) -> Optional[Message]` â€œ Return the system message for the Agent. 1. If the system_message is provided, use that. 2. If build_context is False, return None. 3. Build and return the default system message for the Agent.
- `async aget_tools(self, run_response: RunOutput, run_context: RunContext, session: AgentSession, user_id: Optional[str]=None, knowledge_filters: Optional[Dict[str, Any]]=None, check_mcp_tools: bool=True) -> List[Union[Toolkit, Callable, Function, Dict]]` â€œ No docstring provided.
- `async aget_user_memories(self, user_id: Optional[str]=None) -> Optional[List[UserMemory]]` â€œ Get the user memories for the given user ID. Args: `user_id`: The user ID to get the memories for. If not provided, the current cached user ID is used. Returns: `Optional[List[UserMemory]]`: The user memories.
- `async aprint_response(self, input: Union[List, Dict, str, Message, BaseModel, List[Message]], *, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, stream: Optional[bool]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, markdown: Optional[bool]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, show_message: bool=True, show_reasoning: bool=True, show_full_reasoning: bool=False, console: Optional[Any]=None, tags_to_include_in_markdown: Optional[Set[str]]=None, **kwargs: Any) -> None` â€œ No docstring provided.
- `async arun(self, input: Union[str, List, Dict, Message, BaseModel, List[Message]], *, stream: Literal[False]=False, user_id: Optional[str]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, run_context: Optional[RunContext]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, retries: Optional[int]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, **kwargs: Any) -> RunOutput` â€œ No docstring provided.
- `arun(self, input: Union[str, List, Dict, Message, BaseModel, List[Message]], *, stream: Literal[True]=True, user_id: Optional[str]=None, session_id: Optional[str]=None, run_context: Optional[RunContext]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, retries: Optional[int]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, **kwargs: Any) -> AsyncIterator[Union[RunOutputEvent, RunOutput]]` â€œ No docstring provided.
- `arun(self, input: Union[str, List, Dict, Message, BaseModel, List[Message]], *, stream: Optional[bool]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, run_context: Optional[RunContext]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, retries: Optional[int]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, yield_run_response: Optional[bool]=None, yield_run_output: Optional[bool]=None, debug_mode: Optional[bool]=None, **kwargs: Any) -> Union[RunOutput, AsyncIterator[RunOutputEvent]]` â€œ Async Run the Agent and return the response.
- `async asave_session(self, session: AgentSession) -> None` â€œ Save the AgentSession to storage
- `async aset_session_name(self, session_id: Optional[str]=None, autogenerate: bool=False, session_name: Optional[str]=None) -> AgentSession` â€œ Set the session name and save to storage Args: `session_id`: The session ID to set the name for. If not provided, the current cached session ID is used. `autogenerate`: Whether to autogenerate the session name. `session_name`: The session name to set. If not provided, the session name will be autogenerated. Returns: `AgentSession`: The updated session.
- `async aupdate_session_state(self, session_state_updates: Dict[str, Any], session_id: Optional[str]=None) -> str` â€œ Update the session state for the given session ID and user ID. Args: `session_state_updates`: The updates to apply to the session state. Should be a dictionary of key-value pairs. `session_id`: The session ID to update. If not provided, the current cached session ID is used. Returns: `dict`: The updated session state.
- `background_executor(self) -> Any` â€œ Lazy initialization of shared thread pool executor for background tasks. Handles both memory creation and cultural knowledge updates concurrently. Initialized only on first use (runtime, not instantiation) and reused across runs.
- `cached_session(self) -> Optional[AgentSession]` â€œ No docstring provided.
- `cancel_run(run_id: str) -> bool` â€œ Cancel a running agent execution. Args: `run_id` (str): The run_id to cancel. Returns: `bool`: True if the run was found and marked for cancellation, False otherwise.
- `cli_app(self, input: Optional[str]=None, session_id: Optional[str]=None, user_id: Optional[str]=None, user: str='User', emoji: str=':sunglasses:', stream: bool=False, markdown: bool=False, exit_on: Optional[List[str]]=None, **kwargs: Any) -> None` â€œ Run an interactive command-line interface to interact with the agent.
- `continue_run(self, run_response: Optional[RunOutput]=None, *, run_id: Optional[str]=None, updated_tools: Optional[List[ToolExecution]]=None, stream: Literal[False]=False, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, retries: Optional[int]=None, knowledge_filters: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None) -> RunOutput` â€œ No docstring provided.
- `continue_run(self, run_response: Optional[RunOutput]=None, *, run_id: Optional[str]=None, updated_tools: Optional[List[ToolExecution]]=None, stream: Literal[True]=True, stream_events: Optional[bool]=False, stream_intermediate_steps: Optional[bool]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, retries: Optional[int]=None, knowledge_filters: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None) -> Iterator[RunOutputEvent]` â€œ No docstring provided.
- `continue_run(self, run_response: Optional[RunOutput]=None, *, run_id: Optional[str]=None, updated_tools: Optional[List[ToolExecution]]=None, stream: Optional[bool]=None, stream_events: Optional[bool]=False, stream_intermediate_steps: Optional[bool]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, run_context: Optional[RunContext]=None, retries: Optional[int]=None, knowledge_filters: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None) -> AsyncIterator[Union[RunOutputEvent, RunOutput]]`

Optional[bool]=None, **kwargs) -> Union[RunOutput, Iterator[RunOutputEvent]] â€œ Continue a previous run. Args: run_response: The run response to continue. run_id: The run id to continue. Alternative to passing run_response. updated_tools: The updated tools to use for the run. Required to be used with run_id. stream: Whether to stream the response. stream_events: Whether to stream all events. user_id: The user id to continue the run for. session_id: The session id to continue the run for. run_context: The run context to use for the run. retries: The number of retries to continue the run for. knowledge_filters: The knowledge filters to use for the run. dependencies: The dependencies to use for the run. metadata: The metadata to use for the run. debug_mode: Whether to enable debug mode. (deprecated) stream_intermediate_steps: Whether to stream all steps.

- deep_copy(self, *, update: Optional[Dict[str, Any]]=None) -> Agent â€œ Create and return a deep copy of this Agent, optionally updating fields. Args: update (Optional[Dict[str, Any]]): Optional dictionary of fields for the new Agent. Returns: Agent: A new Agent instance.
- delete_session(self, session_id: str) â€œ Delete the current session and save to storage
- generate_session_name(self, session: AgentSession) -> str â€œ Generate a name for the session using the first 6 messages from the memory Args: session (AgentSession): The session to generate a name for. Returns: str: The generated session name.
- get_chat_history(self, session_id: Optional[str]=None) -> List[Message] â€œ Read the chat history from the session Args: session_id: The session ID to get the chat history for. If not provided, the current cached session ID is used. Returns: List[Message]: The chat history from the session.
- get_culture_knowledge(self) -> Optional[List[CulturalKnowledge]] â€œ Get the cultural knowledge the agent has access to Returns: Optional[List[CulturalKnowledge]]: The cultural knowledge.
- get_last_run_output(self, session_id: Optional[str]=None) -> Optional[RunOutput] â€œ Get the last run response from the database. Args: session_id (Optional[str]): The session_id to load from storage. Returns: Optional[RunOutput]: The last run response from the database or None if not found.
- get_messages_for_session(self, session_id: Optional[str]=None) -> List[Message] â€œ Get messages for a session Args: session_id: The session ID to get the messages for. If not provided, the current cached session ID is used. Returns: List[Message]: The messages for the session.
- get_relevant_docs_from_knowledge(self, query: str, num_documents: Optional[int]=None, filters: Optional[Dict[str, Any]]=None, **kwargs) -> Optional[List[Union[Dict[str, Any], str]]] â€œ Get relevant docs from the knowledge base to answer a query. Args: query (str): The query to search for. num_documents (Optional[int]): Number of documents to return. filters (Optional[Dict[str, Any]]): Filters to apply to the search. **kwargs: Additional keyword arguments. Returns: Optional[List[Dict[str, Any]]]: List of relevant document dicts.
- get_run_output(self, run_id: str, session_id: Optional[str]=None) -> Optional[RunOutput] â€œ Get a RunOutput from the database. Args: run_id (str): The run_id to load from storage. session_id (Optional[str]): The session_id to load from storage. Returns: Optional[RunOutput]: The RunOutput from the database or None if not found.
- get_session(self, session_id: Optional[str]=None) -> Optional[AgentSession] â€œ Load an AgentSession from database or cache. Args: session_id: The session_id to load from storage. Returns: AgentSession: The AgentSession loaded from the database/cache or None if not found.
- get_session_metrics(self, session_id: Optional[str]=None) -> Optional[Metrics] â€œ Get the session metrics for the given session ID. Args: session_id: The session ID to get the metrics for. If not provided, the current cached session ID is used. Returns: Optional[Metrics]: The session metrics.
- get_session_name(self, session_id: Optional[str]=None) -> str â€œ Get the session name for the given session ID. Args: session_id: The session ID to get the name for. If not provided, the current cached session ID is used. Returns: str: The session name.
- get_session_state(self, session_id: Optional[str]=None) -> Dict[str, Any] â€œ Get the session state for the given session ID. Args: session_id: The session ID to get the state for. If not provided, the current cached session ID is used. Returns: Dict[str, Any]: The session state.
- get_session_summary(self, session_id: Optional[str]=None) -> Optional[SessionSummary] â€œ Get the session summary for the given session ID and user ID Args: session_id: The session ID to get the summary for. If not provided, the current cached session ID is used. Returns: SessionSummary: The session summary.
- get_system_message(self, session: AgentSession, run_context: Optional[RunContext]=None, user_id: Optional[str]=None, tools: Optional[List[Union[Function, dict]]]=None, add_session_state_to_context: Optional[bool]=None, session_state: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None) -> Optional[Message] â€œ Return the system message for the Agent. 1. If the system_message is provided, use that. 2. If build_context is False, return None. 3. Build and return the default system message for the Agent.
- get_tools(self, run_response: RunOutput, run_context: RunContext, session: AgentSession, user_id: Optional[str]=None, knowledge_filters: Optional[Dict[str, Any]]=None) -> List[Union[Toolkit, Callable, Function, Dict]] â€œ No docstring provided.
- get_user_memories(self, user_id: Optional[str]=None) -> Optional[List[UserMemory]] â€œ Get the user memories for the given user ID. Args: user_id: The user ID to get the memories for. If not provided, the current cached user ID is used. Returns: Optional[List[UserMemory]]: The user memories.
- initialize_agent(self, debug_mode: Optional[bool]=None) -> None â€œ No docstring provided.
- print_response(self, input: Union[List, Dict, str, Message, BaseModel, List[Message]], *, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, stream: Optional[bool]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, markdown: Optional[bool]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, add_session_state_to_context: Optional[bool]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, show_message: bool=True, show_reasoning: bool=True, show_full_reasoning: bool=False, console: Optional[Any]=None, tags_to_include_in_markdown: Optional[Set[str]]=None, **kwargs: Any) -> None â€œ No docstring provided.
- rename(self, name: str, session_id: Optional[str]=None) -> None â€œ Rename the Agent and save to storage Args: name (str): The new name for the Agent. session_id (Optional[str]): The session_id of the session where to store the new name. If not provided, the current cached session ID is used.
- run(self, input: Union[str, List, Dict, Message, BaseModel, List[Message]], *, stream: Literal[False]=False, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, run_context: Optional[RunContext]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, retries: Optional[int]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[Dict[str, Any]]=None, add_session_state_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, **kwargs: Any) -> RunOutput â€œ No docstring provided.
- run(self, input: Union[str, List, Dict, Message, BaseModel, List[Message]], *, stream: Literal[True]=True, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, run_context: Optional[RunContext]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, retries: Optional[int]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, yield_run_response: bool=False, yield_run_output: bool=False, debug_mode: Optional[bool]=None, **kwargs: Any) -> Iterator[Union[RunOutputEvent, RunOutput]] â€œ No docstring provided.
- run(self, input: Union[str, List, Dict, Message, BaseModel, List[Message]], *, stream: Optional[bool]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, run_context: Optional[RunContext]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, retries: Optional[int]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, yield_run_response: Optional[bool]=None, yield_run_output: Optional[bool]=None, debug_mode: Optional[bool]=None, **kwargs: Any) -> Union[RunOutput, Iterator[Union[RunOutputEvent, RunOutput]]] â€œ Run the Agent and return the response.
- save_run_response_to_file(self, run_response: RunOutput, input: Optional[Union[str, List, Dict, Message, List[Message]]]=None, session_id: Optional[str]=None, user_id: Optional[str]=None) -> None â€œ No docstring provided.
- save_session(self, session: AgentSession) -> None â€œ Save the AgentSession to storage
- set_id(self) -> None â€œ No docstring provided.
- set_session_name(self, session_id: Optional[str]=None, autogenerate: bool=False, session_name: Optional[str]=None) -> AgentSession â€œ Set the session name and save to storage Args: session_id: The session ID to set the name for. If not provided, the current cached session ID is used. autogenerate: Whether to autogenerate the session name. session_name: The session name to set. If not provided, the session name will be autogenerated. Returns: AgentSession: The updated session.
- set_tools(self, tools: Sequence[Union[Toolkit, Callable, Function, Dict]]) â€œ No docstring provided.
- should_parse_structured_output(self) -> bool â€œ No docstring provided.
- update_session_state(self, session_state_updates: Dict[str, Any], session_id: Optional[str]=None) -> str â€œ Update the session state for the given session ID and user ID. Args: session_state_updates: The updates to apply to the session state. Should be a dictionary of key-value pairs. session_id: The session ID to update. If not provided, the current cached session ID is used. Returns: dict: The updated session state.

Module agno.api.agent

- **Source:** libs/agno/agno/api/agent.py

Functions

- `async create_agent_run(run: AgentRunCreate) -> None` â€œ Telemetry recording for async Agent runs
- `create_agent_run(run: AgentRunCreate) -> None` â€œ Telemetry recording for Agent runs

Module agno.api.api

- **Source:** libs/agno/agno/api/api.py

Classes

- class Api
 - **Methods:**
 - AsyncClient(self) -> HttpAsyncClient â€” No docstring provided.
 - Client(self) -> HttpClient â€” No docstring provided.

Functions

- invalid_response(r: Response) -> bool â€” Returns true if the response is invalid

Module agno.api.evals

- **Source:** libs/agno/agno/api/evals.py

Functions

- async_async_create_eval_run_telemetry(eval_run: EvalRunCreate) -> None â€” Telemetry recording for async Eval runs
- create_eval_run_telemetry(eval_run: EvalRunCreate) -> None â€” Telemetry recording for Eval runs

Module agno.api.os

- **Source:** libs/agno/agno/api/os.py

Functions

- log_os_telemetry(launch: OSLaunch) -> None â€” Telemetry recording for OS launches

Module agno.api.routes

- **Source:** libs/agno/agno/api/routes.py

Classes

- class ApiRoutes
 - API routes for telemetry recordings

Module agno.api.schemas.agent

- **Source:** libs/agno/agno/api/schemas/agent.py

Classes

- class AgentRunCreate (bases: BaseModel)
 - Data sent to API to create an Agent Run

Module agno.api.schemas.evals

- **Source:** libs/agno/agno/api/schemas/evals.py

Classes

- class EvalRunCreate (bases: BaseModel)
 - Data sent to the telemetry API to create an Eval run event

Module agno.api.schemas.os

- **Source:** libs/agno/agno/api/schemas/os.py

Classes

- class OSLaunch (bases: BaseModel)
 - Data sent to API to create an OS Launch

Module agno.api.schemas.response

- **Source:** libs/agno/agno/api/schemas/response.py

Classes

- class ApiResponseSchema (bases: BaseModel)

Module agno.api.schemas.team

- **Source:** libs/agno/agno/api/schemas/team.py

Classes

- class TeamRunCreate (bases: BaseModel)
 - Data sent to API to create a Team Run

Module agno.api.schemas.utils

- **Source:** libs/agno/agno/api/schemas/utils.py

Classes

- class TelemetryRunEventType (bases: str, Enum)

Functions

- get_sdk_version() -> str â€” Return the installed agno SDK version from package metadata. Falls back to â€œunknownâ€ if the package metadata isnâ€™t available.

Module agno.api.schemas.workflows

- **Source:** libs/agno/agno/api/schemas/workflows.py

Classes

- class WorkflowRunCreate (bases: BaseModel)
 - Data sent to API to create a Workflow Run

Module agno.api.settings

- **Source:** libs/agno/agno/api/settings.py

Classes

- **class** `AgnoAPISettings` (bases: `BaseSettings`)
 - **Methods:**
 - `gate_alpha_feature(self)` â€” No docstring provided.
 - `update_api_url(cls, v, info: ValidationInfo)` â€” No docstring provided.
 - `validate_runtime_env(cls, v)` â€” Validate api_runtime.

Module `agno.api.team`

- **Source:** `libs/agno/agno/api/team.py`

Functions

- `async acreate_team_run(run: TeamRunCreate) -> None` â€” Telemetry recording for async Team runs
- `create_team_run(run: TeamRunCreate) -> None` â€” Telemetry recording for Team runs

Module `agno.api.workflow`

- **Source:** `libs/agno/agno/api/workflow.py`

Functions

- `async acreate_workflow_run(workflow: WorkflowRunCreate) -> None` â€” Telemetry recording for async Workflow runs
- `create_workflow_run(workflow: WorkflowRunCreate) -> None` â€” Telemetry recording for Workflow runs

Module `agno.cloud.aws.base`

- **Source:** `libs/agno/agno/cloud/aws/base.py`

Classes

- **class** `AwsResource` (bases: `BaseModel`)
 - Base class for AWS Resources.
 - **Methods:**
 - `create(self, aws_client: Optional[AwsApiClient]=None) -> bool` â€” Creates the resource on Aws
 - `delete(self, aws_client: Optional[AwsApiClient]=None) -> bool` â€” Deletes the resource from Aws
 - `get_aws_client(self) -> AwsApiClient` â€” No docstring provided.
 - `get_aws_profile(self) -> Optional[str]` â€” No docstring provided.
 - `get_aws_region(self) -> Optional[str]` â€” No docstring provided.
 - `get_resource_name(self) -> str` â€” No docstring provided.
 - `get_resource_type(self) -> str` â€” No docstring provided.
 - `get_service_client(self, aws_client: AwsApiClient)` â€” No docstring provided.
 - `get_service_resource(self, aws_client: AwsApiClient)` â€” No docstring provided.
 - `is_active(self, aws_client: AwsApiClient) -> bool` â€” Returns True if the resource is active on Aws
 - `post_create(self, aws_client: AwsApiClient) -> bool` â€” No docstring provided.
 - `post_delete(self, aws_client: AwsApiClient) -> bool` â€” No docstring provided.
 - `post_update(self, aws_client: AwsApiClient) -> bool` â€” No docstring provided.
 - `read(self, aws_client: Optional[AwsApiClient]=None) -> Any` â€” Reads the resource from Aws
 - `update(self, aws_client: Optional[AwsApiClient]=None) -> bool` â€” Updates the resource on Aws

Module `agno.cloud.aws.s3.api_client`

- **Source:** `libs/agno/agno/cloud/aws/s3/api_client.py`

Classes

- **class** `AwsApiClient`
 - **Methods:**
 - `boto3_session(self) -> Optional[Any]` â€” No docstring provided.
 - `create_boto3_session(self) -> Optional[Any]` â€” Create a boto3 session

Module `agno.cloud.aws.s3.bucket`

- **Source:** `libs/agno/agno/cloud/aws/s3/bucket.py`

Classes

- **class** `S3Bucket` (bases: `AwsResource`)
 - Reference:
- <https://boto3.amazonaws.com/v1/documentation/api/latest/reference/services/s3.html#service-resource>
 - **Methods:**
 - `get_objects(self, aws_client: Optional[AwsApiClient]=None, prefix: Optional[str]=None) -> List[Any]` â€” Returns a list of s3.Object objects for the s3.Bucket Args: aws_client: The AwsApiClient for the current cluster prefix: Prefix to filter objects by
 - `get_resource(self, aws_client: Optional[AwsApiClient]=None) -> Optional[Any]` â€” Returns the s3.Bucket Args: aws_client: The AwsApiClient for the current cluster
 - `post_create(self, aws_client: AwsApiClient) -> bool` â€” No docstring provided.
 - `uri(self) -> str` â€” Returns the URI of the s3.Bucket Returns: str: The URI of the s3.Bucket

Module `agno.cloud.aws.s3.object`

- **Source:** `libs/agno/agno/cloud/aws/s3/object.py`

Classes

- **class** `S3Object` (bases: `AwsResource`)
 - Reference:
- <https://boto3.amazonaws.com/v1/documentation/api/latest/reference/services/s3/object/index.html>

- **Methods:**

- `download(self, path: Path, aws_client: Optional[AwsApiClient]=None) -> None` â€” Downloads the s3.Object to the specified path Args: path: The path to download the s3.Object to aws_client: The AwsApiClient for the current cluster
- `get_resource(self, aws_client: Optional[AwsApiClient]=None) -> Any` â€” Returns the s3.Object Args: aws_client: The AwsApiClient for the current cluster Returns: The s3.Object
- `uri(self) -> str` â€” Returns the URI of the s3.Object Returns: str: The URI of the s3.Object

Module `agno.culture.manager`

- **Source:** `libs/agno/agno/culture/manager.py`

Classes

- **class** `CultureManager`
 - Culture Manager

Notice: Culture is an experimental feature and is subject to change.

- **Methods:**
 - `async acreate_cultural_knowledge(self, message: Optional[str]=None, messages: Optional[List[Message]]=None) -> str` â€” Creates a cultural knowledge from a message or a list of messages
 - `async acreate_or_update_cultural_knowledge(self, messages: List[Message], existing_knowledge: List[Dict[str, Any]], db: AsyncBaseDb, update_knowledge: bool=True, add_knowledge: bool=True) -> str` â€” No docstring provided.
 - `add_cultural_knowledge(self, knowledge: CulturalKnowledge) -> Optional[str]` â€” Add a cultural knowledge Args: knowledge (CulturalKnowledge): The knowledge to add Returns: str: The id of the knowledge
 - `async aget_all_knowledge(self, name: Optional[str]=None) -> Optional[List[CulturalKnowledge]]` â€” Get all cultural knowledge in the database
 - `async aget_knowledge(self, id: str) -> Optional[CulturalKnowledge]` â€” Get the cultural knowledge by id
 - `async arun_cultural_knowledge_task(self, task: str, existing_knowledge: List[Dict[str, Any]], db: Union[BaseDb, AsyncBaseDb], delete_knowledge: bool=True, clear_knowledge: bool=True, update_knowledge: bool=True, add_knowledge: bool=True) -> str` â€” No docstring provided.
 - `async aupdate_culture_task(self, task: str) -> str` â€” Updates the culture with a task asynchronously
 - `clear_all_knowledge(self) -> None` â€” Clears all cultural knowledge.
 - `create_cultural_knowledge(self, message: Optional[str]=None, messages: Optional[List[Message]]=None) -> str` â€” Creates a cultural knowledge from a message or a list of messages
 - `create_or_update_cultural_knowledge(self, messages: List[Message], existing_knowledge: List[Dict[str, Any]], db: BaseDb, update_knowledge: bool=True, add_knowledge: bool=True) -> str` â€” No docstring provided.
 - `get_all_knowledge(self, name: Optional[str]=None) -> Optional[List[CulturalKnowledge]]` â€” Get all cultural knowledge in the database
 - `get_knowledge(self, id: str) -> Optional[CulturalKnowledge]` â€” Get the cultural knowledge by id
 - `get_model(self) -> Model` â€” No docstring provided.
 - `get_system_message(self, existing_knowledge: Optional[List[Dict[str, Any]]]=None, enable_delete_knowledge: bool=True, enable_clear_knowledge: bool=True, enable_update_knowledge: bool=True, enable_add_knowledge: bool=True) -> Message` â€” Build the system prompt that instructs the model how to maintain cultural knowledge.
 - `initialize(self)` â€” No docstring provided.
 - `run_cultural_knowledge_task(self, task: str, existing_knowledge: List[Dict[str, Any]], db: BaseDb, delete_knowledge: bool=True, update_knowledge: bool=True, add_knowledge: bool=True, clear_knowledge: bool=True) -> str` â€” No docstring provided.
 - `set_log_level(self)` â€” No docstring provided.
 - `update_culture_task(self, task: str) -> str` â€” Updates the culture with a task

Module `agno.db.base`

- **Source:** `libs/agno/agno/db/base.py`

Classes

- **class** `AsyncBaseDb` (bases: ABC)
 - Base abstract class for all our async database implementations.
 - **Methods:**
 - `async calculate_metrics(self) -> Optional[Any]` â€” No docstring provided.
 - `async clear_cultural_knowledge(self) -> None` â€” No docstring provided.
 - `async clear_memories(self) -> None` â€” No docstring provided.
 - `async create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord]` â€” No docstring provided.
 - `async delete_cultural_knowledge(self, id: str) -> None` â€” No docstring provided.
 - `async delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” No docstring provided.
 - `async delete_knowledge_content(self, id: str) â€” Delete a knowledge row from the database. Args: id (str): The ID of the knowledge row to delete.`
 - `async delete_session(self, session_id: str) -> bool` â€” No docstring provided.
 - `async delete_sessions(self, session_ids: List[str]) -> None` â€” No docstring provided.
 - `async delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None` â€” No docstring provided.
 - `async delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) -> None` â€” No docstring provided.
 - `async get_all_cultural_knowledge(self, name: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None) -> Optional[List[CulturalKnowledge]]` â€” No docstring provided.
 - `async get_all_memory_topics(self, user_id: Optional[str]=None) -> List[str]` â€” No docstring provided.
 - `async get_cultural_knowledge(self, id: str) -> Optional[CulturalKnowledge]` â€” No docstring provided.
 - `async get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” No docstring provided.
 - `async get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` â€” No docstring provided.
 - `async get_knowledge_content(self, id: str) -> Optional[KnowledgeRow]` â€” Get a knowledge row from the database. Args: id (str): The ID of the knowledge row to get. Returns: Optional[KnowledgeRow]: The knowledge row, or None if it doesnâ€™t exist.
 - `async get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int]` â€” Get all knowledge contents from the database. Args: limit (Optional[int]): The maximum number of knowledge contents to return. page (Optional[int]): The page number. sort_by (Optional[str]): The column to sort by. sort_order (Optional[str]): The order to sort by. Returns: Tuple[List[KnowledgeRow], int]: The knowledge contents and total count. Raises: Exception: If an error occurs during retrieval.
 - `async get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[Dict[str, Any]], Optional[int]]` â€” No docstring provided.
 - `async get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” No docstring provided.
 - `async get_sessions(self, session_type: SessionType, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None,`

- end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]] â€” No docstring provided.
 - async get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]] â€” No docstring provided.
 - async get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[Union[UserMemory, Dict[str, Any]]] â€” No docstring provided.
 - async get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None, user_id: Optional[str]=None) -> Tuple[List[Dict[str, Any]], int] â€” No docstring provided.
 - async rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]] â€” No docstring provided.
 - async rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]] â€” No docstring provided.
 - async table_exists(self, table_name: str) -> bool â€” Check if a table with the given name exists in this database. Default implementation returns True if the table name is configured. Subclasses should override this to perform actual existence checks. Args: table_name: Name of the table to check Returns: bool: True if the table exists, False otherwise
 - async upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge) -> Optional[CulturalKnowledge] â€” No docstring provided.
 - async upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€” Upsert knowledge content in the database. Args: knowledge_row (KnowledgeRow): The knowledge row to upsert. Returns: Optional[KnowledgeRow]: The upserted knowledge row, or None if the operation fails.
 - async upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]] â€” No docstring provided.
 - async upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]] â€” No docstring provided.
- **class BaseDb** (bases: ABC)
 - Base abstract class for all our Database implementations.
 - **Methods:**
 - calculate_metrics(self) -> Optional[Any] â€” No docstring provided.
 - clear_cultural_knowledge(self) -> None â€” No docstring provided.
 - clear_memories(self) -> None â€” No docstring provided.
 - create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord] â€” No docstring provided.
 - delete_cultural_knowledge(self, id: str) -> None â€” No docstring provided.
 - delete_eval_runs(self, eval_run_ids: List[str]) -> None â€” No docstring provided.
 - delete_knowledge_content(self, id: str) â€” Delete a knowledge row from the database. Args: id (str): The ID of the knowledge row to delete.
 - delete_session(self, session_id: str) -> bool â€” No docstring provided.
 - delete_sessions(self, session_ids: List[str]) -> None â€” No docstring provided.
 - delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None â€” No docstring provided.
 - delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) -> None â€” No docstring provided.
 - get_all_cultural_knowledge(self, name: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None) -> Optional[List[CulturalKnowledge]] â€” No docstring provided.
 - get_all_memory_topics(self, user_id: Optional[str]=None) -> List[str] â€” No docstring provided.
 - get_cultural_knowledge(self, id: str) -> Optional[CulturalKnowledge] â€” No docstring provided.
 - get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]] â€” No docstring provided.
 - get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]] â€” No docstring provided.
 - get_knowledge_content(self, id: str) -> Optional[KnowledgeRow] â€” Get a knowledge row from the database. Args: id (str): The ID of the knowledge row to get. Returns: Optional[KnowledgeRow]: The knowledge row, or None if it doesnâ€™t exist.
 - get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int] â€” Get all knowledge contents from the database. Args: limit (Optional[int]): The maximum number of knowledge contents to return. page (Optional[int]): The page number. sort_by (Optional[str]): The column to sort by. sort_order (Optional[str]): The order to sort by. Returns: Tuple[List[KnowledgeRow], int]: The knowledge contents and total count. Raises: Exception: If an error occurs during retrieval.
 - get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[Dict[str, Any]], Optional[int]] â€” No docstring provided.
 - get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]] â€” No docstring provided.
 - get_sessions(self, session_type: SessionType, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]] â€” No docstring provided.
 - get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]] â€” No docstring provided.
 - get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[Union[UserMemory, Dict[str, Any]]] â€” No docstring provided.
 - get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None, user_id: Optional[str]=None) -> Tuple[List[Dict[str, Any]], int] â€” No docstring provided.
 - rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]] â€” No docstring provided.
 - rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]] â€” No docstring provided.
 - table_exists(self, table_name: str) -> bool â€” No docstring provided.
 - upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge) -> Optional[CulturalKnowledge] â€” No docstring provided.
 - upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€” Upsert knowledge content in the database. Args: knowledge_row (KnowledgeRow): The knowledge row to upsert. Returns: Optional[KnowledgeRow]: The upserted knowledge row, or None if the operation fails.
 - upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]] â€” Bulk upsert multiple memories for improved performance on large datasets.
 - upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]] â€” No docstring provided.
 - upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]] â€” Bulk upsert multiple sessions for improved performance on large datasets.
 - upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]] â€” No docstring provided.
 - **class SessionType** (bases: str, Enum)

Module agno.db.dynamo.dynamo

- **Source:** libs/agno/agno/db/dynamo/dynamo.py

Classes

- **class DynamoDb** (bases: BaseDb)

◦ Methods:

- `calculate_metrics(self) -> Optional[Any]` â€” Calculate metrics for all dates without complete metrics. Returns: `Optional[Any]`: The calculated metrics or None if no metrics table. Raises: Exception: If an error occurs during metrics calculation.
- `clear_cultural_knowledge(self) -> None` â€” Delete all cultural knowledge from the database.
- `clear_memories(self) -> None` â€” Delete all memories from the database. Raises: Exception: If an error occurs during deletion.
- `create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord]` â€” Create an eval run in the database. Args: `eval_run (EvalRunRecord)`: The eval run to create. Returns: `Optional[EvalRunRecord]`: The created eval run, or None if the operation fails. Raises: Exception: If an error occurs during creation.
- `delete_cultural_knowledge(self, id: str) -> None` â€” Delete a cultural knowledge entry from the database.
- `delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” No docstring provided.
- `delete_knowledge_content(self, id: str) â€” Delete a knowledge row from the database. Args: id (str): The ID of the knowledge row to delete. Raises: Exception: If an error occurs during deletion.`
- `delete_session(self, session_id: Optional[str]=None) -> bool` â€” Delete a session from the database. Args: `session_id`: The ID of the session to delete. Raises: Exception: If any error occurs while deleting the session.
- `delete_sessions(self, session_ids: List[str]) -> None` â€” Delete sessions from the database in batches. Args: `session_ids`: List of session IDs to delete Raises: Exception: If any error occurs while deleting the sessions.
- `delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None` â€” Delete user memories from the database in batches. Args: `memory_ids`: List of memory IDs to delete `user_id`: The ID of the user (optional, for filtering). Raises: Exception: If any error occurs while deleting the user memories.
- `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) -> None` â€” Delete a user memory from the database. Args: `memory_id`: The ID of the memory to delete. `user_id`: The ID of the user (optional, for filtering). Raises: Exception: If any error occurs while deleting the user memory.
- `get_all_cultural_knowledge(self, name: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]` â€” Get all cultural knowledge from the database.
- `get_all_memory_topics(self) -> List[str]` â€” Get all memory topics from the database. Args: `user_id`: The ID of the user (optional, for filtering). Returns: `List[str]`: List of unique memory topics.
- `get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Get a cultural knowledge entry from the database.
- `get_eval_run(self, eval_run_id: str, table: Optional[Any]=None) -> Optional[EvalRunRecord]` â€” No docstring provided.
- `get_eval_run_raw(self, eval_run_id: str, table: Optional[Any]=None) -> Optional[Dict[str, Any]]` â€” No docstring provided.
- `get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` â€” No docstring provided.
- `get_knowledge_content(self, id: str) -> Optional[KnowledgeRow]` â€” Get a knowledge row from the database. Args: `id (str)`: The ID of the knowledge row to get. Returns: `Optional[KnowledgeRow]`: The knowledge row, or None if it doesnâ€™t exist.
- `get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int]` â€” Get all knowledge contents from the database. Args: `limit (Optional[int])`: The maximum number of knowledge contents to return. `page (Optional[int])`: The page number. `sort_by (Optional[str])`: The column to sort by. `sort_order (Optional[str])`: The order to sort by. `create_table_if_not_found (Optional[bool])`: Whether to create the table if it doesnâ€™t exist. Returns: `Tuple[List[KnowledgeRow], int]`: The knowledge contents and total count. Raises: Exception: If an error occurs during retrieval.
- `get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[Any], Optional[int]]` â€” Get metrics from the database. Args: `starting_date`: The starting date to filter metrics by. `ending_date`: The ending date to filter metrics by. Returns: `Tuple[List[Any], Optional[int]]`: A tuple containing the metrics data and the total count. Raises: Exception: If any error occurs while getting the metrics.
- `get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Get a session from the database as a Session object. Args: `session_id (str)`: The ID of the session to get. `session_type (SessionType)`: The type of session to get. `user_id (Optional[str])`: The ID of the user to get the session for. `deserialize (Optional[bool])`: Whether to deserialize the session. Returns: `Optional[Session]`: The session data as a Session object. Raises: Exception: If any error occurs while getting the session.
- `get_sessions(self, session_type: SessionType, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]]` â€” No docstring provided.
- `get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]` â€” Get user memories from the database as a list of UserMemory objects. Args: `user_id`: The ID of the user to get the memories for. `agent_id`: The ID of the agent to get the memories for. `team_id`: The ID of the team to get the memories for. `workflow_id`: The ID of the workflow to get the memories for. `topics`: The topics to filter the memories by. `search_content`: The content to search for in the memories. `limit`: The maximum number of memories to return. `page`: The page number to return. `sort_by`: The field to sort the memories by. `sort_order`: The order to sort the memories by. `deserialize`: Whether to deserialize the memories. Returns: `Union[List[UserMemory], List[Dict[str, Any]], Tuple[List[Dict[str, Any]], int]]`: The user memories data. Raises: Exception: If any error occurs while getting the user memories.
- `get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Get a user memory from the database as a UserMemory object. Args: `memory_id`: The ID of the memory to get. `deserialize`: Whether to deserialize the memory. `user_id`: The ID of the user (optional, for filtering). Returns: `Optional[UserMemory]`: The user memory data if found, None otherwise. Raises: Exception: If any error occurs while getting the user memory.
- `get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int]` â€” Get user memories stats. Args: `limit (Optional[int])`: The maximum number of user stats to return. `page (Optional[int])`: The page number. `user_id (Optional[str])`: The ID of the user (optional, for filtering). Returns: `Tuple[List[Dict[str, Any]], int]`: A list of dictionaries containing user stats and total count. Example: ([{ â€œuser_idâ€: â€œe123â€€, â€œtotal_memoriesâ€: 10, â€œlast_memory_updated_atâ€: 1714560000, },], total_count: 1,)
- `rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” No docstring provided.
- `rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Rename a session in the database. Args: `session_id`: The ID of the session to rename. `session_type`: The type of session to rename. `session_name`: The new name for the session. Returns: `Optional[Session]`: The renamed session if successful, None otherwise. Raises: Exception: If any error occurs while renaming the session.
- `table_exists(self, table_name: str) -> bool` â€” Check if a DynamoDB table exists. Args: `table_name`: The name of the table to check Returns: `bool`: True if the table exists, False otherwise
- `upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Upsert a cultural knowledge entry into the database.
- `upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€” Upsert knowledge content in the database. Args: knowledge_row (KnowledgeRow): The knowledge row to upsert. Returns: Optional[KnowledgeRow]: The upserted knowledge row, or None if the operation fails.`
- `upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]]` â€” Bulk upsert multiple user memories for improved performance on large datasets. Args: `memories (List[UserMemory])`: List of memories to upsert. `deserialize (Optional[bool])`: Whether to deserialize the memories. Defaults to True. Returns: `List[Union[UserMemory, Dict[str, Any]]]`: List of upserted memories. Raises: Exception: If an error occurs during bulk upsert.
- `upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Upsert a session into the database. This method provides true upsert behavior: creates a new session if it doesnâ€™t exist, or updates an existing session while preserving important fields. Args: `session (Session)`: The session to upsert. `deserialize (Optional[bool])`: Whether to deserialize the session. Returns: `Optional[Session]`: The upserted session if successful, None otherwise.
- `upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]]` â€” Bulk upsert multiple sessions for improved performance on large datasets. Args: `sessions (List[Session])`: List of sessions to upsert. `deserialize (Optional[bool])`: Whether to deserialize the sessions. Defaults to True. Returns: `List[Union[Session, Dict[str, Any]]]`: List of upserted sessions. Raises: Exception: If an error occurs during bulk upsert.
- `upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Upsert a user memory into the database. Args: `memory`: The memory to upsert. Returns: `Optional[Dict[str, Any]]`: The upserted memory data if successful, None otherwise.

Module `agno.db.dynamo.schemas`

- **Source:** `libs/agno/db/dynamo/schemas.py`

Table schemas and related utils used by the `DynamoDb` class

Functions

- `get_table_schema_definition(table_type: str) -> Dict[str, Any]` â€” Get the expected schema definition for the given table. Args: `table_type (str)`: The type of table to get the schema for.

Returns: Dict[str, Any]: Dictionary containing DynamoDB table schema definition

Module agno.db.dynamo.utils

- **Source:** `libs/agno/agno/db/dynamo/utils.py`

Functions

- `apply_pagination(items: List[Dict[str, Any]], limit: Optional[int]=None, page: Optional[int]=None) -> List[Dict[str, Any]]` â€” Apply pagination to a list of items.
- `apply_sorting(items: List[Dict[str, Any]], sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> List[Dict[str, Any]]` â€” Apply sorting to a list of items.
- `build_query_filter_expression(filters: Dict[str, Any]) -> tuple[Optional[str], Dict[str, str], Dict[str, Any]]` â€” Build DynamoDB query filter expression from filters dictionary. Args: filters: Dictionary of filter key-value pairs Returns: Tuple of (filter_expression, expression_attribute_names, expression_attribute_values)
- `build_topic_filter_expression(topics: List[str]) -> tuple[str, Dict[str, Any]]` â€” Build DynamoDB filter expression for topics. Args: topics: List of topics to filter by Returns: Tuple of (filter_expression, expression_attribute_values)
- `bulk_upsert_metrics(dynamodb_client, table_name: str, metrics_data: List[Dict[str, Any]]) -> None` â€” Bulk upsert metrics data to DynamoDB.
- `calculate_date_metrics(date_to_process: date, sessions_data: dict) -> dict` â€” Calculate metrics for the given single date. Args: date_to_process (date): The date to calculate metrics for. sessions_data (dict): The sessions data to calculate metrics for. Returns: dict: The calculated metrics.
- `create_table_if_not_exists(dynamodb_client, table_name: str, schema: Dict[str, Any]) -> bool` â€” Create DynamoDB table if it doesnâ€™t exist.
- `deserialize_cultural_knowledge_from_db(db_row: Dict[str, Any]) -> CulturalKnowledge` â€” Deserialize a database row to a CulturalKnowledge object. The database stores content as a dict containing content, categories, and notes. This method extracts those fields and converts them back to the model format. Args: db_row (Dict[str, Any]): The database row as a dictionary. Returns: CulturalKnowledge: The cultural knowledge object.
- `deserialize_eval_record(item: Dict[str, Any]) -> EvalRunRecord` â€” Convert DynamoDB item to EvalRunRecord.
- `deserialize_from_dynamodb_item(item: Dict[str, Any]) -> Dict[str, Any]` â€” No docstring provided.
- `deserialize_knowledge_row(item: Dict[str, Any]) -> KnowledgeRow` â€” Convert DynamoDB item to KnowledgeRow.
- `deserialize_session(session: Dict[str, Any]) -> Optional[Session]` â€” Deserialize session data from DynamoDB format to Session object.
- `deserialize_session_result(serialized_session: Dict[str, Any], original_session: 'Session', deserialize: Optional[bool]) -> Optional[Union['Session', Dict[str, Any]]]` â€” Deserialize the session result based on the deserialize flag and session type.
- `execute_query_with_pagination(dynamodb_client, table_name: str, index_name: str, key_condition_expression: str, expression_attribute_names: Dict[str, str], expression_attribute_values: Dict[str, Any], filter_expression: Optional[str]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None) -> List[Dict[str, Any]]` â€” Execute DynamoDB query with pagination support. Args: dynamodb_client: DynamoDB client table_name: Table name index_name: Index name for query key_condition_expression: Key condition expression expression_attribute_names: Expression attribute names expression_attribute_values: Expression attribute values filter_expression: Optional filter expression sort_by: Field to sort by sort_order: Sort order (asc/desc) limit: Limit for pagination page: Page number Returns: List of DynamoDB items
- `fetch_all_sessions_data(sessions: List[Dict[str, Any]], dates_to_process: list[date], start_timestamp: int) -> Optional[dict]` â€” Return all session data for the given dates, for all session types. Args: sessions: List of session data dictionaries dates_to_process (list[date]): The dates to fetch session data for. start_timestamp: The start timestamp for the range Returns: dict: A dictionary with dates as keys and session data as values, for all session types. Example: { âœ2000-01-01âœ: { âœagentâœ: [, âœ], âœteamâœ: [âœ], âœworkflowâœ: [âœ], } }
- `fetch_all_sessions_data_by_type(dynamodb_client, table_name: str, session_type: str, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None) -> List[Dict[str, Any]]` â€” Fetch all sessions data from DynamoDB table using GSI for session_type.
- `get_dates_to_calculate_metrics_for(starting_date: date) -> list[date]` â€” Return the list of dates to calculate metrics for. Args: starting_date (date): The starting date to calculate metrics for. Returns: list[date]: The list of dates to calculate metrics for.
- `merge_session_data(existing_data: Any, new_data: Any) -> Dict[str, Any]` â€” Merge session_data fields, handling JSON string conversion.
- `merge_with_existing_session(new_session: Dict[str, Any], existing_item: Dict[str, Any]) -> Dict[str, Any]` â€” Merge new session data with existing session, preserving important fields.
- `prepare_session_data(session: 'Session') -> Dict[str, Any]` â€” Prepare session data for storage by serializing JSON fields and setting session type.
- `process_query_results(items: List[Dict[str, Any]], sort_by: Optional[str]=None, sort_order: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, deserialize_func: Optional[Callable]=None, deserialize: bool=True) -> Union[List[Any], tuple[List[Any], int]]` â€” Process query results with sorting, pagination, and deserialization. Args: items: List of DynamoDB items sort_by: Field to sort by sort_order: Sort order (asc/desc) limit: Limit for pagination page: Page number deserialize_func: Function to deserialize items deserialize: Whether to deserialize items Returns: List of processed items or tuple of (items, total_count)
- `serialize_cultural_knowledge_for_db(cultural_knowledge: CulturalKnowledge) -> Dict[str, Any]` â€” Serialize a CulturalKnowledge object for database storage. Converts the modelâ€™s separate content, categories, and notes fields into a single JSON dict for the database content column. DynamoDB supports nested maps/dicts natively. Args: cultural_knowledge (CulturalKnowledge): The cultural knowledge object to serialize. Returns: Dict[str, Any]: A dictionary with the content field as a dict containing content, categories, and notes.
- `serialize_eval_record(eval_record: EvalRunRecord) -> Dict[str, Any]` â€” Convert EvalRunRecord to DynamoDB item format.
- `serialize_knowledge_row(knowledge: KnowledgeRow) -> Dict[str, Any]` â€” Convert KnowledgeRow to DynamoDB item format.
- `serialize_to_dynamo_item(data: Dict[str, Any]) -> Dict[str, Any]` â€” Serialize the given dict to a valid DynamoDB item Args: data: The dict to serialize Returns: A DynamoDB-ready dict with the serialized data

Module agno.db.firestore.firestore

- **Source:** `libs/agno/agno/db/firestore/firestore.py`

Classes

- **class FirestoreDb** (bases: BaseDb)
 - **Methods:**
 - `calculate_metrics(self) -> Optional[list[dict]]` â€” Calculate metrics for all dates without complete metrics.
 - `clear_cultural_knowledge(self) -> None` â€” Delete all cultural knowledge from the database. Raises: Exception: If an error occurs during deletion.
 - `clear_memories(self) -> None` â€” Delete all memories from the database. Raises: Exception: If an error occurs during deletion.
 - `create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord]` â€” Create an EvalRunRecord in the database.
 - `delete_cultural_knowledge(self, id: str) -> None` â€” Delete cultural knowledge by ID. Args: id (str): The ID of the cultural knowledge to delete. Raises: Exception: If an error occurs during deletion.
 - `delete_eval_run(self, eval_run_id: str) -> None` â€” Delete an eval run from the database.
 - `delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” Delete multiple eval runs from the database. Args: eval_run_ids (List[str]): The IDs of the eval runs to delete. Raises: Exception: If there is an error deleting the eval runs.
 - `delete_knowledge_content(self, id: str) â€” Delete a knowledge row from the database. Args: id (str): The ID of the knowledge row to delete. Raises: Exception: If an error occurs during deletion.`
 - `delete_session(self, session_id: str) -> bool` â€” Delete a session from the database. Args: session_id (str): The ID of the session to delete. session_type (SessionType): The type of session to delete. Defaults to SessionType.AGENT. Returns: bool: True if the session was deleted, False otherwise. Raises: Exception: If there is an error deleting the session.
 - `delete_sessions(self, session_ids: List[str]) -> None` â€” Delete multiple sessions from the database. Args: session_ids (List[str]): The IDs of the sessions to delete.
 - `delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None` â€” Delete user memories from the database. Args: memory_ids (List[str]): The IDs of the memories to delete. user_id (Optional[str]): The ID of the user (optional, for filtering). Raises: Exception: If there is an error deleting the memories.
 - `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) â€” Delete a user memory from the database. Args: memory_id (str): The ID of the memory to delete. user_id (Optional[str]): The ID of the user (optional, for filtering). Returns: bool: True if the memory was deleted, False otherwise. Raises: Exception: If there is an error deleting the memory.`
 - `get_all_cultural_knowledge(self, agent_id: Optional[str]=None, team_id: Optional[str]=None, name: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]` â€” Get all cultural knowledge with filtering and pagination. Args: agent_id (Optional[str]): Filter by agent ID. team_id (Optional[str]): Filter by team ID. name (Optional[str]): Filter by name (case-insensitive partial match). limit (Optional[int]): Maximum number of results to return. page (Optional[int]): Page number for pagination. sort_by (Optional[str]): Field to sort by. sort_order (Optional[str]): Sort order (âœ”ascâœ” or âœ”descâœ”). deserialize (Optional[bool]): Whether to deserialize to CulturalKnowledge objects. Defaults to True. Returns: Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]): - When deserialize=True: List of CulturalKnowledge objects - When deserialize=False: Tuple with list of

dictionaries and total count Raises: Exception: If an error occurs during retrieval.

- `get_all_memory_topics(self, create_collection_if_not_found: Optional[bool]=True) -> List[str]` â€” Get all memory topics from the database. Returns: `List[str]`: The topics. Raises: Exception: If there is an error getting the topics.
- `get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Get cultural knowledge by ID. Args: `id (str)`: The ID of the cultural knowledge to retrieve. `deserialize (Optional[bool])`: Whether to deserialize to `CulturalKnowledge` object. Defaults to `True`. Returns: `Optional[Union[CulturalKnowledge, Dict[str, Any]]]`: The cultural knowledge if found, `None` otherwise. Raises: Exception: If an error occurs during retrieval.
- `get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Get an eval run from the database. Args: `eval_run_id (str)`: The ID of the eval run to get. `deserialize (Optional[bool])`: Whether to serialize the eval run. Defaults to `True`. Returns: `Optional[Union[EvalRunRecord, Dict[str, Any]]]`: - When `deserialize=True`: `EvalRunRecord` object - When `deserialize=False`: `EvalRun` dictionary Raises: Exception: If there is an error getting the eval run.
- `get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` â€” Get all eval runs from the database. Args: `limit (Optional[int])`: The maximum number of eval runs to return. `page (Optional[int])`: The page number to return. `sort_by (Optional[str])`: The field to sort by. `sort_order (Optional[str])`: The order to sort by. `agent_id (Optional[str])`: The ID of the agent to filter by. `team_id (Optional[str])`: The ID of the team to filter by. `workflow_id (Optional[str])`: The ID of the workflow to filter by. `model_id (Optional[str])`: The ID of the model to filter by. `eval_type (Optional[List[EvalType]])`: The type of eval to filter by. `filter_type (Optional[EvalFilterType])`: The type of filter to apply. `deserialize (Optional[bool])`: Whether to serialize the eval runs. Defaults to `True`. `create_table_if_not_found (Optional[bool])`: Whether to create the table if it doesnâ€™t exist. Returns: `Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` - When `deserialize=True`: List of `EvalRunRecord` objects - When `deserialize=False`: List of eval run dictionaries and the total count Raises: Exception: If there is an error getting the eval runs.
- `get_knowledge_content(self, id: str) -> Optional[KnowledgeRow]` â€” Get a knowledge row from the database. Args: `id (str)`: The ID of the knowledge row to get. Returns: `Optional[KnowledgeRow]`: The knowledge row, or `None` if it doesnâ€™t exist. Raises: Exception: If an error occurs during retrieval.
- `get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int]` â€” Get all knowledge contents from the database. Args: `limit (Optional[int])`: The maximum number of knowledge contents to return. `page (Optional[int])`: The page number. `sort_by (Optional[str])`: The column to sort by. `sort_order (Optional[str])`: The order to sort by. `create_table_if_not_found (Optional[bool])`: Whether to create the table if it doesnâ€™t exist. Returns: `Tuple[List[KnowledgeRow], int]`: The knowledge contents and total count. Raises: Exception: If an error occurs during retrieval.
- `get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]]` â€” Get all metrics matching the given date range.
- `get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Read a session from the database. Args: `session_id (str)`: The ID of the session to get. `session_type (SessionType)`: The type of session to get. `user_id (Optional[str])`: The ID of the user to get the session for. `deserialize (Optional[bool])`: Whether to serialize the session. Defaults to `True`. Returns: `Union[Session, Dict[str, Any], None]`: - When `deserialize=True`: `Session` object - When `deserialize=False`: `Session` dictionary Raises: Exception: If there is an error reading the session.
- `get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]]` â€” Get all sessions. Args: `session_type (Optional[SessionType])`: The type of session to get. `user_id (Optional[str])`: The ID of the user to get the session for. `component_id (Optional[str])`: The ID of the component to get the session for. `session_name (Optional[str])`: The name of the session to filter by. `start_timestamp (Optional[int])`: The start timestamp to filter sessions by. `end_timestamp (Optional[int])`: The end timestamp to filter sessions by. `limit (Optional[int])`: The limit of the sessions to get. `page (Optional[int])`: The page number to get. `sort_by (Optional[str])`: The field to sort the sessions by. `sort_order (Optional[str])`: The order to sort the sessions by. `deserialize (Optional[bool])`: Whether to serialize the sessions. Defaults to `True`. Returns: `Union[List[AgentSession], List[TeamSession], List[WorkflowSession], Tuple[List[Dict[str, Any]], int]]` - When `deserialize=True`: List of `Session` objects - When `deserialize=False`: List of session dictionaries and the total count Raises: Exception: If there is an error reading the sessions.
- `get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]` â€” Get all memories from the database as `UserMemory` objects. Args: `user_id (Optional[str])`: The ID of the user to get the memories for. `agent_id (Optional[str])`: The ID of the agent to get the memories for. `team_id (Optional[str])`: The ID of the team to get the memories for. `topics (Optional[List[str])`: The topics to filter the memories by. `search_content (Optional[str])`: The content to filter the memories by. `limit (Optional[int])`: The limit of the memories to get. `page (Optional[int])`: The page number to get. `sort_by (Optional[str])`: The field to sort the memories by. `sort_order (Optional[str])`: The order to sort the memories by. `deserialize (Optional[bool])`: Whether to serialize the memories. Defaults to `True`. `create_table_if_not_found (Optional[bool])`: Whether to create the index if it doesnâ€™t exist. Returns: `Tuple[List[Dict[str, Any]], int]`: A tuple containing the memories and the total count. Raises: Exception: If there is an error getting the memories.
- `get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[UserMemory]` â€” Get a memory from the database. Args: `memory_id (str)`: The ID of the memory to get. `deserialize (Optional[bool])`: Whether to serialize the memory. Defaults to `True`. `user_id (Optional[str])`: The ID of the user (optional, for filtering). Returns: `Optional[UserMemory]`: - When `deserialize=True`: `UserMemory` object - When `deserialize=False`: `Memory` dictionary Raises: Exception: If there is an error getting the memory.
- `get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int]` â€” Get user memories stats. Args: `limit (Optional[int])`: The limit of the memories to get. `page (Optional[int])`: The page number to get. Returns: `Tuple[List[Dict[str, Any]], int]`: A tuple containing the memories stats and the total count. Raises: Exception: If there is an error getting the memories stats.
- `rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Update the name of an eval run in the database. Args: `eval_run_id (str)`: The ID of the eval run to update. `name (str)`: The new name of the eval run. `deserialize (Optional[bool])`: Whether to serialize the eval run. Defaults to `True`. Returns: `Optional[Union[EvalRunRecord, Dict[str, Any]]]`: - When `deserialize=True`: `EvalRunRecord` object - When `deserialize=False`: `EvalRun` dictionary Raises: Exception: If there is an error updating the eval run.
- `rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Rename a session in the database. Args: `session_id (str)`: The ID of the session to rename. `session_type (SessionType)`: The type of session to rename. `session_name (str)`: The new name of the session. `deserialize (Optional[bool])`: Whether to serialize the session. Defaults to `True`. Returns: `Optional[Union[Session, Dict[str, Any]]]`: - When `deserialize=True`: `Session` object - When `deserialize=False`: `Session` dictionary Raises: Exception: If there is an error renaming the session.
- `table_exists(self, table_name: str) -> bool` â€” Check if a collection with the given name exists in the Firestore database. Args: `table_name`: Name of the collection to check Returns: `bool`: `True` if the collection exists in the database, `False` otherwise
- `upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Upsert cultural knowledge in Firestore. Args: `cultural_knowledge (CulturalKnowledge)`: The cultural knowledge to upsert. `deserialize (Optional[bool])`: Whether to deserialize the result. Defaults to `True`. Returns: `Optional[Union[CulturalKnowledge, Dict[str, Any]]]`: The upserted cultural knowledge. Raises: Exception: If an error occurs during upsert.
- `upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€” Upsert knowledge content in the database. Args: knowledge_row (KnowledgeRow): The knowledge row to upsert. Returns: Optional[KnowledgeRow]: The upserted knowledge row, or None if the operation fails.`
- `upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]]` â€” Bulk upsert multiple (user memories for improved performance on large datasets. Args: `memories (List[UserMemory])`: List of memories to upsert. `deserialize (Optional[bool])`: Whether to deserialize the memories. Defaults to `True`. Returns: `List[Union[UserMemory, Dict[str, Any]]]`: List of upserted memories. Raises: Exception: If an error occurs during bulk upsert.
- `upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Insert or update a session in the database. Args: `session (Session)`: The session to upsert. Returns: `Optional[Session]`: The upserted session. Raises: Exception: If there is an error upserting the session.
- `upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]]` â€” Bulk upsert multiple sessions for improved performance on large datasets. Args: `sessions (List[Session])`: List of sessions to upsert. `deserialize (Optional[bool])`: Whether to deserialize the sessions. Defaults to `True`. Returns: `List[Union[Session, Dict[str, Any]]]`: List of upserted sessions. Raises: Exception: If an error occurs during bulk upsert.
- `upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Upsert a user memory in the database. Args: `memory (UserMemory)`: The memory to upsert. `deserialize (Optional[bool])`: Whether to serialize the memory. Defaults to `True`. Returns: `Optional[Union[UserMemory, Dict[str, Any]]]`: - When `deserialize=True`: `UserMemory` object - When `deserialize=False`: `Memory` dictionary Raises: Exception: If there is an error upserting the memory.

Module agno.db.firestore.schemas

- **Source:** `libs/agno/agno/db/firestore/schemas.py`

Firestore collection schemas and related utilities

Functions

- `get_collection_indexes(collection_type: str) -> List[Dict[str, Any]]` â€” Get the index definitions for a specific collection type.

Module agno.db.firestore.utils

- **Source:** `libs/agno/agno/db/firestore/utils.py`

Utility functions for the Firestore database class.

Functions

- `apply_pagination(query, limit: Optional[int]=None, page: Optional[int]=None) â€” Apply pagination to Firestore query.`
- `apply_pagination_to_records(records: List[Dict[str, Any]], limit: Optional[int]=None, page: Optional[int]=None) -> List[Dict[str, Any]]` â€” Apply pagination to in-memory records (for cases where Firestore query pagination isnâ€™t possible).

- `apply_sorting(query, sort_by: Optional[str]=None, sort_order: Optional[str]=None) â€”` Apply sorting to Firestore query.
- `apply_sorting_to_records(records: List[Dict[str, Any]], sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> List[Dict[str, Any]] â€”` Apply sorting to in-memory records (for cases where Firestore query sorting isnâ€™t possible).
- `bulk_upsert_metrics(collection_ref, metrics_records: List[Dict[str, Any]]) -> List[Dict[str, Any]] â€”` Bulk upsert metrics into the database. Args: `collection_ref`: The Firestore collection reference to upsert the metrics into. `metrics_records` (`List[Dict[str, Any]]`): The list of metrics records to upsert. Returns: The list of upserted metrics records.
- `calculate_date_metrics(date_to_process: date, sessions_data: dict) -> dict â€”` Calculate metrics for the given single date.
- `create_collection_indexes(client: Client, collection_name: str, collection_type: str) -> None â€”` Create all required indexes for a collection including composite indexes. This function automatically creates both single-field and composite indexes.
- `deserialize_cultural_knowledge_from_db(db_row: Dict[str, Any]) -> CulturalKnowledge â€”` Deserialize a database row to a CulturalKnowledge object. The database stores content as a dict containing content, categories, and notes. This method extracts those fields and converts them back to the model format. Args: `db_row` (`Dict[str, Any]`): The database row as a dictionary. Returns: `CulturalKnowledge`: The cultural knowledge object.
- `fetch_all_sessions_data(sessions: List[Dict[str, Any]], dates_to_process: list[date], start_timestamp: int) -> Optional[dict] â€”` Return all session data for the given dates, for all session types.
- `get_dates_to_calculate_metrics_for(starting_date: date) -> list[date] â€”` Return the list of dates to calculate metrics for.
- `serialize_cultural_knowledge_for_db(cultural_knowledge: CulturalKnowledge) -> Dict[str, Any] â€”` Serialize a CulturalKnowledge object for database storage. Converts the modelâ€™s separate content, categories, and notes fields into a single dict for the database content field. Args: `cultural_knowledge` (`CulturalKnowledge`): The cultural knowledge object to serialize. Returns: `Dict[str, Any]`: A dictionary with content, categories, and notes.

Module `agno.db.gcs_json.gcs_json_db`

- **Source:** `libs/agno/agno/db/gcs_json/gcs_json_db.py`

Classes

- **class** `GcsJsonDb` (bases: `BaseDb`)
 - **Methods:**
 - `calculate_metrics(self) -> Optional[list[dict]] â€”` Calculate metrics for all dates without complete metrics.
 - `clear_cultural_knowledge(self) -> None â€”` Delete all cultural knowledge from the database. Raises: `Exception`: If an error occurs during deletion.
 - `clear_memories(self) -> None â€”` Delete all memories from the database. Raises: `Exception`: If an error occurs during deletion.
 - `create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord] â€”` Create an EvalRunRecord in the GCS JSON file.
 - `delete_cultural_knowledge(self, id: str) -> None â€”` Delete cultural knowledge by ID. Args: `id` (`str`): The ID of the cultural knowledge to delete. Raises: `Exception`: If an error occurs during deletion.
 - `delete_eval_run(self, eval_run_id: str) -> None â€”` Delete an eval run from the GCS JSON file.
 - `delete_eval_runs(self, eval_run_ids: List[str]) -> None â€”` Delete multiple eval runs from the GCS JSON file.
 - `delete_knowledge_content(self, id: str) â€”` Delete knowledge content by ID.
 - `delete_session(self, session_id: str) -> bool â€”` Delete a session from the GCS JSON file. Args: `session_id` (`str`): The ID of the session to delete. Returns: `bool`: True if the session was deleted, False otherwise. Raises: `Exception`: If an error occurs during deletion.
 - `delete_sessions(self, session_ids: List[str]) -> None â€”` Delete multiple sessions from the GCS JSON file. Args: `session_ids` (`List[str]`): The IDs of the sessions to delete. Raises: `Exception`: If an error occurs during deletion.
 - `delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None â€”` Delete multiple user memories from the GCS JSON file. Args: `memory_ids` (`List[str]`): The IDs of the memories to delete. `user_id` (`Optional[str]`): The ID of the user. If provided, verifies ownership before deletion.
 - `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) -> None â€”` Delete a user memory from the GCS JSON file. Args: `memory_id` (`str`): The ID of the memory to delete. `user_id` (`Optional[str]`): The ID of the user. If provided, verifies ownership before deletion.
 - `get_all_cultural_knowledge(self, agent_id: Optional[str]=None, team_id: Optional[str]=None, name: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]] â€”` Get all cultural knowledge with filtering and pagination. Args: `agent_id` (`Optional[str]`): Filter by agent ID. `team_id` (`Optional[str]`): Filter by team ID. `name` (`Optional[str]`): Filter by name (case-insensitive partial match). `limit` (`Optional[int]`): Maximum number of results to return. `page` (`Optional[int]`): Page number for pagination. `sort_by` (`Optional[str]`): Field to sort by. `sort_order` (`Optional[str]`): Sort order (â€™ascâ€™ or â€™descâ€™). `deserialize` (`Optional[bool]`): Whether to deserialize to CulturalKnowledge objects. Defaults to True. Returns: `Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of CulturalKnowledge objects - When `deserialize=False`: Tuple with list of dictionaries and total count Raises: `Exception`: If an error occurs during retrieval.
 - `get_all_memory_topics(self) -> List[str] â€”` Get all memory topics from the GCS JSON file. Returns: `List[str]`: List of unique memory topics.
 - `get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]] â€”` Get cultural knowledge by ID. Args: `id` (`str`): The ID of the cultural knowledge to retrieve. `deserialize` (`Optional[bool]`): Whether to deserialize to CulturalKnowledge object. Defaults to True. Returns: `Optional[Union[CulturalKnowledge, Dict[str, Any]]]`: The cultural knowledge if found, None otherwise. Raises: `Exception`: If an error occurs during retrieval.
 - `get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]] â€”` Get an eval run from the GCS JSON file.
 - `get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]] â€”` Get all eval runs from the GCS JSON file with filtering and pagination.
 - `get_knowledge_content(self, id: str) -> Optional[KnowledgeRow] â€”` Get knowledge content by ID.
 - `get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int] â€”` Get all knowledge contents from the GCS JSON file.
 - `get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]] â€”` Get all metrics matching the given date range.
 - `get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[AgentSession, TeamSession, WorkflowSession, Dict[str, Any]]] â€”` Read a session from the GCS JSON file. Args: `session_id` (`str`): The ID of the session to read. `session_type` (`SessionType`): The type of the session to read. `user_id` (`Optional[str]`): The ID of the user to read the session for. `deserialize` (`Optional[bool]`): Whether to deserialize the session. Returns: `Union[Session, Dict[str, Any], None]`: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: `Exception`: If an error occurs while reading the session.
 - `get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]] â€”` Get all sessions from the GCS JSON file with filtering and pagination. Args: `session_type` (`Optional[SessionType]`): The type of the sessions to read. `user_id` (`Optional[str]`): The ID of the user to read the sessions for. `component_id` (`Optional[str]`): The ID of the component to read the sessions for. `session_name` (`Optional[str]`): The name of the session to read. `start_timestamp` (`Optional[int]`): The start timestamp of the sessions to read. `end_timestamp` (`Optional[int]`): The end timestamp of the sessions to read. `limit` (`Optional[int]`): The limit of the sessions to read. `page` (`Optional[int]`): The page of the sessions to read. `sort_by` (`Optional[str]`): The field to sort the sessions by. `sort_order` (`Optional[str]`): The order to sort the sessions by. `deserialize` (`Optional[bool]`): Whether to deserialize the sessions. `create_table_if_not_found` (`Optional[bool]`): Whether to create a file to track sessions if it doesnâ€™t exist. Returns: `Union[List[AgentSession], List[TeamSession], List[WorkflowSession], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of sessions - When `deserialize=False`: Tuple with list of sessions and total count Raises: `Exception`: If an error occurs while reading the sessions.
 - `get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]] â€”` Get all memories from the GCS JSON file with filtering and pagination.
 - `get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[Union[UserMemory, Dict[str, Any]]] â€”` Get a memory from the GCS JSON file. Args: `memory_id` (`str`): The ID of the memory to retrieve. `deserialize` (`Optional[bool]`): Whether to deserialize to UserMemory object. Defaults to True. `user_id` (`Optional[str]`): The ID of the user. If provided, verifies ownership before returning. Returns: `Optional[Union[UserMemory, Dict[str, Any]]]`: The memory if found and ownership matches, None otherwise.
 - `get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int] â€”` Get user memory statistics. Args: `limit` (`Optional[int]`): Maximum number of results to return. `page` (`Optional[int]`): Page number for pagination. Returns: `Tuple[List[Dict[str, Any]], int]`: List of user memory statistics and total count.
 - `rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]] â€”` Rename an eval run in the GCS JSON file.
 - `rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]] â€”` Rename a session in the GCS JSON file.
 - `table_exists(self, table_name: str) -> bool â€”` JSON implementation, always returns True.

- `upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Upsert cultural knowledge in the GCS JSON file. Args: `cultural_knowledge` (CulturalKnowledge): The cultural knowledge to upsert. `deserialize` (Optional[bool]): Whether to deserialize the result. Defaults to True. Returns: `Optional[Union[CulturalKnowledge, Dict[str, Any]]]`: The upserted cultural knowledge. Raises: Exception: If an error occurs during upsert.
- `upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€”` Upsert knowledge content in the GCS JSON file.
- `upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]]` â€” Bulk upsert multiple user memories for improved performance on large datasets. Args: `memories` (List[UserMemory]): List of memories to upsert. `deserialize` (Optional[bool]): Whether to deserialize the memories. Defaults to True. Returns: `List[Union[UserMemory, Dict[str, Any]]]`: List of upserted memories. Raises: Exception: If an error occurs during bulk upsert.
- `upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Insert or update a session in the GCS JSON file.
- `upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]]` â€” Bulk upsert multiple sessions for improved performance on large datasets. Args: `sessions` (List[Session]): List of sessions to upsert. `deserialize` (Optional[bool]): Whether to deserialize the sessions. Defaults to True. Returns: `List[Union[Session, Dict[str, Any]]]`: List of upserted sessions. Raises: Exception: If an error occurs during bulk upsert.
- `upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Upsert a user memory in the GCS JSON file.

Module `agno.db.gcs_json.utils`

- **Source:** `libs/agno/agno/db/gcs_json/utils.py`

Utility functions for the GCS JSON database class.

Functions

- `apply_sorting(data: List[Dict[str, Any]], sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> List[Dict[str, Any]]` â€” Apply sorting to the given data list. Args: `data`: The list of dictionaries to sort `sort_by`: The field to sort by `sort_order`: The sort order (â€œascâ€” or â€œdescâ€”) Returns: The sorted list
- `calculate_date_metrics(date_to_process: date, sessions_data: dict) -> dict` â€” Calculate metrics for the given single date. Args: `date_to_process` (date): The date to calculate metrics for. `sessions_data` (dict): The sessions data to calculate metrics for. Returns: `dict`: The calculated metrics.
- `deserialize_cultural_knowledge_from_db(db_row: Dict[str, Any]) -> CulturalKnowledge` â€” Deserialize a database row to a CulturalKnowledge object. The database stores content as a dict containing `content`, `categories`, and `notes`. This method extracts those fields and converts them back to the model format. Args: `db_row` (Dict[str, Any]): The database row as a dictionary. Returns: `CulturalKnowledge`: The cultural knowledge object.
- `fetch_all_sessions_data(sessions: List[Dict[str, Any]], dates_to_process: list[date], start_timestamp: int) -> Optional[dict]` â€” Return all session data for the given dates, for all session types. Args: `sessions`: List of session dictionaries `dates_to_process` (list[date]): The dates to fetch session data for. `start_timestamp` (int): The starting timestamp for filtering Returns: `dict`: A dictionary with dates as keys and session data as values, for all session types. Example: { â€œ2000-01-01â€: { â€œagentâ€: [, â€€], â€œteamâ€: [â€€], â€œworkflowâ€: [â€€], } }
- `get_dates_to_calculate_metrics_for(starting_date: date) -> list[date]` â€” Return the list of dates to calculate metrics for. Args: `starting_date` (date): The starting date to calculate metrics for. Returns: `list[date]`: The list of dates to calculate metrics for.
- `serialize_cultural_knowledge_for_db(cultural_knowledge: CulturalKnowledge) -> Dict[str, Any]` â€” Serialize a CulturalKnowledge object for database storage. Converts the modelâ€™s separate `content`, `categories`, and `notes` fields into a single dict for the database content column. Args: `cultural_knowledge` (CulturalKnowledge): The cultural knowledge object to serialize. Returns: `Dict[str, Any]`: A dictionary with the `content` field as a dict containing `content`, `categories`, and `notes`.

Module `agno.db.in_memory.in_memory_db`

- **Source:** `libs/agno/agno/db/in_memory/in_memory_db.py`

Classes

- **class `InMemoryDb`** (bases: `BaseDb`)
 - **Methods:**
 - `calculate_metrics(self) -> Optional[list[dict]]` â€” Calculate metrics for all dates without complete metrics.
 - `clear_cultural_knowledge(self) -> None` â€” Delete all cultural knowledge from in-memory storage.
 - `clear_memories(self) -> None` â€” Delete all memories. Raises: Exception: If an error occurs during deletion.
 - `create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord]` â€” Create an EvalRunRecord
 - `delete_cultural_knowledge(self, id: str) -> None` â€” Delete a cultural knowledge entry from in-memory storage.
 - `delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” Delete multiple eval runs from in-memory storage.
 - `delete_knowledge_content(self, id: str) â€”` Delete a knowledge row from in-memory storage. Args: `id` (str): The ID of the knowledge row to delete. Raises: Exception: If an error occurs during deletion.
 - `delete_session(self, session_id: str) -> bool` â€” Delete a session from in-memory storage. Args: `session_id` (str): The ID of the session to delete. Returns: `bool`: True if the session was deleted, False otherwise. Raises: Exception: If an error occurs during deletion.
 - `delete_sessions(self, session_ids: List[str]) -> None` â€” Delete multiple sessions from in-memory storage. Args: `session_ids` (List[str]): The IDs of the sessions to delete. Raises: Exception: If an error occurs during deletion.
 - `delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None` â€” Delete multiple user memories from in-memory storage. Args: `memory_ids` (List[str]): The IDs of the memories to delete. `user_id` (Optional[str]): The ID of the user. If provided, only deletes memories belonging to this user. Raises: Exception: If an error occurs during deletion.
 - `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) â€”` Delete a user memory from in-memory storage. Args: `memory_id` (str): The ID of the memory to delete. `user_id` (Optional[str]): The ID of the user. If provided, verifies the memory belongs to this user before deletion. Raises: Exception: If an error occurs during deletion.
 - `get_all_cultural_knowledge(self, name: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]` â€” Get all cultural knowledge from in-memory storage.
 - `get_all_memory_topics(self) -> List[str]` â€” Get all memory topics from in-memory storage. Returns: `List[str]`: List of unique topics. Raises: Exception: If an error occurs while reading topics.
 - `get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Get a cultural knowledge entry from in-memory storage.
 - `get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Get an eval run from in-memory storage.
 - `get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` â€” Get all eval runs from in-memory storage with filtering and pagination.
 - `get_knowledge_content(self, id: str) -> Optional[KnowledgeRow]` â€” Get a knowledge row from in-memory storage. Args: `id` (str): The ID of the knowledge row to get. Returns: `Optional[KnowledgeRow]`: The knowledge row, or None if it doesnâ€™t exist. Raises: Exception: If an error occurs during retrieval.
 - `get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int]` â€” Get all knowledge contents from in-memory storage. Args: `limit` (Optional[int]): The maximum number of knowledge contents to return. `page` (Optional[int]): The page number. `sort_by` (Optional[str]): The column to sort by. `sort_order` (Optional[str]): The order to sort by. Returns: `Tuple[List[KnowledgeRow], int]`: The knowledge contents and total count. Raises: Exception: If an error occurs during retrieval.
 - `get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]]` â€” Get all metrics matching the given date range.
 - `get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[AgentSession, TeamSession, WorkflowSession, Dict[str, Any]]]` â€” Read a session from in-memory storage. Args: `session_id` (str): The ID of the session to read. `session_type` (SessionType): The type of the session to read. `user_id` (Optional[str]): The ID of the user to read the session for. `deserialize` (Optional[bool]): Whether to deserialize the session. Returns: `Union[Session, Dict[str, Any], None]`: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: Exception: If an error occurs while reading the session.
 - `get_sessions(self, session_type: SessionType, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]]` â€” Get all sessions from in-memory storage with filtering and pagination. Args: `session_type` (SessionType): The type of the sessions to read. `user_id` (Optional[str]): The ID of the user to read the sessions for. `component_id` (Optional[str]): The ID of the component to read the sessions for. `session_name` (Optional[str]): The name of the session to read. `start_timestamp` (Optional[int]): The start timestamp of the sessions to read. `end_timestamp` (Optional[int]): The end timestamp of the sessions to read. `limit` (Optional[int]): The limit of the sessions to read. `page` (Optional[int]): The page of the sessions to read. `sort_by` (Optional[str]): The field to sort the sessions by. `sort_order` (Optional[str]): The order to sort the sessions by. `deserialize` (Optional[bool]): Whether to deserialize the sessions. Returns: `Union[List[AgentSession, TeamSession], List[WorkflowSession], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of sessions - When `deserialize=False`: Tuple with list of sessions and total

count Raises: Exception: If an error occurs while reading the sessions.

- `get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]` â€” No docstring provided.
- `get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Get a user memory from in-memory storage. Args: memory_id (str): The ID of the memory to retrieve. deserialize (Optional[bool]): Whether to deserialize the memory. Defaults to True. user_id (Optional[str]): The ID of the user. If provided, only returns the memory if it belongs to this user. Returns: Optional[Union[UserMemory, Dict[str, Any]]]: The memory object or dictionary, or None if not found. Raises: Exception: If an error occurs while reading the memory.
- `get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int]` â€” Get user memory statistics. Args: limit (Optional[int]): Maximum number of stats to return. page (Optional[int]): Page number for pagination. Returns: Tuple[List[Dict[str, Any]], int]: List of user memory statistics and total count. Raises: Exception: If an error occurs while getting stats.
- `rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Rename an eval run.
- `rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” No docstring provided.
- `table_exists(self, table_name: str) -> bool` â€” In-memory implementation, always returns True.
- `upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Upsert a cultural knowledge entry into in-memory storage.
- `upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€” Upsert knowledge content. Args: knowledge_row (KnowledgeRow): The knowledge row to upsert. Returns: Optional[KnowledgeRow]: The upserted knowledge row, or None if the operation fails. Raises: Exception: If an error occurs during upsert.`
- `upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]]` â€” Bulk upsert multiple user memories for improved performance on large datasets. Args: memories (List[UserMemory]): List of memories to upsert. deserialize (Optional[bool]): Whether to deserialize the memories. Defaults to True. Returns: List[Union[UserMemory, Dict[str, Any]]]: List of upserted memories. Raises: Exception: If an error occurs during bulk upsert.
- `upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” No docstring provided.
- `upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]]` â€” Bulk upsert multiple sessions for improved performance on large datasets. Args: sessions (List[Session]): List of sessions to upsert. deserialize (Optional[bool]): Whether to deserialize the sessions. Defaults to True. Returns: List[Union[Session, Dict[str, Any]]]: List of upserted sessions. Raises: Exception: If an error occurs during bulk upsert.
- `upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” No docstring provided.

Module `agno.db.in_memory.utils`

- **Source:** `libs/agno/agno/db/in_memory/utils.py`

Utility functions for the in-memory database class.

Functions

- `apply_sorting(data: List[Dict[str, Any]], sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> List[Dict[str, Any]]` â€” Apply sorting to the given data list. Args: data: The list of dictionaries to sort `sort_by`: The field to sort by `sort_order`: The sort order (â€”ascâ€” or â€”descâ€”) Returns: The sorted list
- `calculate_date_metrics(date_to_process: date, sessions_data: dict) -> dict` â€” Calculate metrics for the given single date. Args: date_to_process (date): The date to calculate metrics for. sessions_data (dict): The sessions data to calculate metrics for. Returns: dict: The calculated metrics.
- `deserialize_cultural_knowledge_from_db(db_row: Dict[str, Any]) -> CulturalKnowledge` â€” Deserialize a database row to a CulturalKnowledge object. The database stores content as a dict containing content, categories, and notes. This method extracts those fields and converts them back to the model format. Args: db_row (Dict[str, Any]): The database row as a dictionary. Returns: CulturalKnowledge: The cultural knowledge object.
- `fetch_all_sessions_data(sessions: List[Dict[str, Any]], dates_to_process: List[date], start_timestamp: int) -> Optional[dict]` â€” Return all session data for the given dates, for all session types. Args: sessions: List of session dictionaries `dates_to_process` (List[date]): The dates to fetch session data for. `start_timestamp` (int): The starting timestamp for filtering Returns: dict: A dictionary with dates as keys and session data as values, for all session types. Example: { â€œ2000-01-01â€: { â€œagentâ€: [, â€œ], â€œteamâ€: [â€œ], â€œworkflowâ€: [â€œ], } }
- `get_dates_to_calculate_metrics_for(starting_date: date) -> List[date]` â€” Return the list of dates to calculate metrics for. Args: starting_date (date): The starting date to calculate metrics for. Returns: List[date]: The list of dates to calculate metrics for.
- `serialize_cultural_knowledge_for_db(cultural_knowledge: CulturalKnowledge) -> Dict[str, Any]` â€” Serialize a CulturalKnowledge object for database storage. Converts the modelâ€”s separate content, categories, and notes fields into a single dict for the database content column. Args: cultural_knowledge (CulturalKnowledge): The cultural knowledge object to serialize. Returns: Dict[str, Any]: A dictionary with the content field as a dict containing content, categories, and notes.

Module `agno.db.json.json_db`

- **Source:** `libs/agno/agno/db/json/json_db.py`

Classes

- **class** `JsonDb` (bases: `BaseDb`)

• **Methods:**

- `calculate_metrics(self) -> Optional[List[dict]]` â€” Calculate metrics for all dates without complete metrics.
- `clear_cultural_knowledge(self) -> None` â€” Delete all cultural knowledge from JSON file.
- `clear_memories(self) -> None` â€” Delete all memories from the database. Raises: Exception: If an error occurs during deletion.
- `create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord]` â€” Create an EvalRunRecord in the JSON file.
- `delete_cultural_knowledge(self, id: str) -> None` â€” Delete a cultural knowledge entry from JSON file.
- `delete_eval_run(self, eval_run_id: str) -> None` â€” Delete an eval run from the JSON file.
- `delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” Delete multiple eval runs from the JSON file.
- `delete_knowledge_content(self, id: str) â€” Delete a knowledge row from the database. Args: id (str): The ID of the knowledge row to delete. Raises: Exception: If an error occurs during deletion.`
- `delete_session(self, session_id: str) -> bool` â€” Delete a session from the JSON file. Args: session_id (str): The ID of the session to delete. Returns: bool: True if the session was deleted, False otherwise. Raises: Exception: If an error occurs during deletion.
- `delete_sessions(self, session_ids: List[str]) -> None` â€” Delete multiple sessions from the JSON file. Args: session_ids (List[str]): The IDs of the sessions to delete. Raises: Exception: If an error occurs during deletion.
- `delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None` â€” Delete multiple user memories from the JSON file. Args: memory_ids (List[str]): List of memory IDs to delete. user_id (Optional[str]): The ID of the user (optional, for filtering).
- `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) â€” Delete a user memory from the JSON file. Args: memory_id (str): The ID of the memory to delete. user_id (Optional[str]): The ID of the user (optional, for filtering).`
- `get_all_cultural_knowledge(self, name: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]` â€” Get all cultural knowledge from JSON file.
- `get_all_memory_topics(self) -> List[str]` â€” Get all memory topics from the JSON file. Returns: List[str]: List of unique memory topics.
- `get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Get a cultural knowledge entry from JSON file.
- `get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Get an eval run from the JSON file.
- `get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` â€” Get all eval runs from the JSON file with filtering and pagination.
- `get_knowledge_content(self, id: str) -> Optional[KnowledgeRow]` â€” Get a knowledge row from the database. Args: id (str): The ID of the knowledge row to get. Returns: Optional[KnowledgeRow]: The knowledge row, or None if it doesnâ€”t exist. Raises: Exception: If an error occurs during retrieval.

- `get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int]` â€” Get all knowledge contents from the database. Args: `limit` (Optional[int]): The maximum number of knowledge contents to return. `page` (Optional[int]): The page number. `sort_by` (Optional[str]): The column to sort by. `sort_order` (Optional[str]): The order to sort by. Returns: `Tuple[List[KnowledgeRow], int]`: The knowledge contents and total count. Raises: `Exception`: If an error occurs during retrieval.
- `get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]]` â€” Get all metrics matching the given date range.
- `get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[AgentSession, TeamSession, WorkflowSession, Dict[str, Any]]]` â€” Read a session from the JSON file. Args: `session_id` (str): The ID of the session to read. `session_type` (SessionType): The type of the session to read. `user_id` (Optional[str]): The ID of the user to read the session for. `deserialize` (Optional[bool]): Whether to deserialize the session. Returns: `Union[Session, Dict[str, Any], None]`: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: `Exception`: If an error occurs while reading the session.
- `get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]]` â€” Get all sessions from the JSON file with filtering and pagination. Args: `session_type` (Optional[SessionType]): The type of the sessions to read. `user_id` (Optional[str]): The ID of the user to read the sessions for. `component_id` (Optional[str]): The ID of the component to read the sessions for. `session_name` (Optional[str]): The name of the session to read. `start_timestamp` (Optional[int]): The start timestamp of the sessions to read. `end_timestamp` (Optional[int]): The end timestamp of the sessions to read. `limit` (Optional[int]): The limit of the sessions to read. `page` (Optional[int]): The page of the sessions to read. `sort_by` (Optional[str]): The field to sort the sessions by. `sort_order` (Optional[str]): The order to sort the sessions by. `deserialize` (Optional[bool]): Whether to deserialize the sessions. `create_table` (Optional[bool]): Whether to create a json file to track sessions if it doesnâ€™t exist. Returns: `Union[List[AgentSession], List[TeamSession], List[WorkflowSession], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of sessions - When `deserialize=False`: Tuple with list of sessions and total count Raises: `Exception`: If an error occurs while reading the sessions.
- `get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]` â€” Get all memories from the JSON file with filtering and pagination.
- `get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Get a memory from the JSON file. Args: `memory_id` (str): The ID of the memory to get. `deserialize` (Optional[bool]): Whether to deserialize the memory. `user_id` (Optional[str]): The ID of the user (optional, for filtering). Returns: `Optional[Union[UserMemory, Dict[str, Any]]]`: The user memory data if found, `None` otherwise.
- `get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int]` â€” Get user memory statistics. Args: `limit` (Optional[int]): The maximum number of user stats to return. `page` (Optional[int]): The page number. Returns: `Tuple[List[Dict[str, Any]], int]`: A list of dictionaries containing user stats and total count.
- `rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Rename an eval run in the JSON file.
- `rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Rename a session in the JSON file.
- `table_exists(self, table_name: str) -> bool` â€” JSON implementation, always returns True.
- `upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Upsert a cultural knowledge entry into JSON file.
- `upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€” Upsert knowledge content in the database. Args: knowledge_row (KnowledgeRow): The knowledge row to upsert. Returns: Optional[KnowledgeRow]: The upserted knowledge row, or None if the operation fails. Raises: Exception: If an error occurs during upsert.`
- `upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]]` â€” Bulk upsert multiple user memories for improved performance on large datasets. Args: `memories` (List[UserMemory]): List of memories to upsert. `deserialize` (Optional[bool]): Whether to deserialize the memories. Defaults to True. Returns: `List[Union[UserMemory, Dict[str, Any]]]`: List of upserted memories. Raises: `Exception`: If an error occurs during bulk upsert.
- `upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Insert or update a session in the JSON file.
- `upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]]` â€” Bulk upsert multiple sessions for improved performance on large datasets. Args: `sessions` (List[Session]): List of sessions to upsert. `deserialize` (Optional[bool]): Whether to deserialize the sessions. Defaults to True. Returns: `List[Union[Session, Dict[str, Any]]]`: List of upserted sessions. Raises: `Exception`: If an error occurs during bulk upsert.
- `upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Upsert a user memory in the JSON file.

Module `agno.db.json.utils`

- **Source:** `libs/agno/agno/db/json/utils.py`

Utility functions for the JSON database class.

Functions

- `apply_sorting(data: List[Dict[str, Any]], sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> List[Dict[str, Any]]` â€” Apply sorting to the given data list. Args: `data`: The list of dictionaries to sort `sort_by`: The field to sort by `sort_order`: The sort order (â€™ascâ€™ or â€™descâ€™) Returns: The sorted list
- `calculate_date_metrics(date_to_process: date, sessions_data: dict) -> dict` â€” Calculate metrics for the given single date. Args: `date_to_process` (date): The date to calculate metrics for. `sessions_data` (dict): The sessions data to calculate metrics for. Returns: `dict`: The calculated metrics.
- `deserialize_cultural_knowledge_from_db(db_row: Dict[str, Any]) -> CulturalKnowledge` â€” Deserialize a database row to a CulturalKnowledge object. The database stores content as a dict containing content, categories, and notes. This method extracts those fields and converts them back to the model format. Args: `db_row` (Dict[str, Any]): The database row as a dictionary. Returns: `CulturalKnowledge`: The cultural knowledge object.
- `fetch_all_sessions_data(sessions: List[Dict[str, Any]], dates_to_process: list[date], start_timestamp: int) -> Optional[dict]` â€” Return all session data for the given dates, for all session types. Args: `sessions`: List of session dictionaries `dates_to_process` (list[date]): The dates to fetch session data for. `start_timestamp` (int): The starting timestamp for filtering Returns: `dict`: A dictionary with dates as keys and session data as values, for all session types. Example: { â€™2000-01-01â€™: { â€™agentâ€™: [, â€™], â€™teamâ€™: [â€™], â€™workflowâ€™: [â€™], } }
- `get_dates_to_calculate_metrics_for(starting_date: date) -> list[date]` â€” Return the list of dates to calculate metrics for. Args: `starting_date` (date): The starting date to calculate metrics for. Returns: `list[date]`: The list of dates to calculate metrics for.
- `serialize_cultural_knowledge_for_db(cultural_knowledge: CulturalKnowledge) -> Dict[str, Any]` â€” Serialize a CulturalKnowledge object for database storage. Converts the modelâ€™s separate content, categories, and notes fields into a single dict for the database content column. Args: `cultural_knowledge` (CulturalKnowledge): The cultural knowledge object to serialize. Returns: `Dict[str, Any]`: A dictionary with the content field as a dict containing content, categories, and notes.

Module `agno.db.migrations.v1_to_v2`

- **Source:** `libs/agno/agno/db/migrations/v1_to_v2.py`

Migration utility to migrate your Agno tables from v1 to v2

Functions

- `convert_any_metrics_in_data(data: Any) -> Any` â€” Recursively find and convert any metrics dictionaries and handle v1 to v2 field conversion.
- `convert_session_data_comprehensively(session_data: Optional[Dict[str, Any]]) -> Optional[Dict[str, Any]]` â€” Comprehensively convert session data from v1 to v2 format, including metrics conversion and field mapping.
- `convert_v1_fields_to_v2(data: Dict[str, Any]) -> Dict[str, Any]` â€” Convert v1 fields to v2 format with proper field mapping and extraction.
- `convert_v1_media_to_v2(media_data: Dict[str, Any]) -> Dict[str, Any]` â€” Convert v1 media objects to v2 format.
- `convert_v1_metrics_to_v2(metrics_dict: Dict[str, Any]) -> Dict[str, Any]` â€” Convert v1 metrics dictionary to v2 format by mapping old field names to new ones.
- `get_all_table_content(db, db_schema: str, table_name: str) -> list[dict[str, Any]]` â€” Get all content from the given table/collection (legacy method kept for backward compatibility) WARNING: This method loads all data into memory and should not be used for large tables. Use `get_table_content_in_batches()` for large datasets.
- `get_table_content_in_batches(db: BaseDb, db_schema: str, table_name: str, batch_size: int=5000) â€” Get table content in batches to avoid memory issues with large tables`
- `migrate(db: BaseDb, v1_db_schema: str, agent_sessions_table_name: Optional[str]=None, team_sessions_table_name: Optional[str]=None, workflow_sessions_table_name: Optional[str]=None, memories_table_name: Optional[str]=None, batch_size: int=5000) â€” Given a database connection and table/collection names, parse and migrate the content to corresponding v2 tables/collections. Args: db: The database to migrate (PostgresDb, MySQLDb, SqliteDb, or MongoDb) v1_db_schema: The schema of the v1 tables (leave empty for SQLite and MongoDB) agent_sessions_table_name: The name of the agent sessions table/collection. If not provided, agent sessions will not be migrated. team_sessions_table_name: The name of the team sessions table/collection. If not provided, team sessions will not be migrated. workflow_sessions_table_name: The name of the workflow sessions table/collection. If not provided, workflow sessions will not be migrated. memories_table_name: The name of the memories table/collection. If not provided, memories will not be migrated. batch_size: Number of records to process in each batch (default: 5000)`
- `migrate_table_in_batches(db: BaseDb, v1_db_schema: str, v1_table_name: str, v1_table_type: str, batch_size: int=5000) â€” No docstring provided.`
- `parse_agent_sessions(v1_content: List[Dict[str, Any]]) -> List[AgentSession]` â€” Parse v1 Agent sessions into v2 Agent sessions and Memories

- `parse_memories(v1_content: List[Dict[str, Any]]) -> List[UserMemory]` â€” Parse v1 Memories into v2 Memories
- `parse_team_sessions(v1_content: List[Dict[str, Any]]) -> List[TeamSession]` â€” Parse v1 Team sessions into v2 Team sessions and Memories
- `parse_workflow_sessions(v1_content: List[Dict[str, Any]]) -> List[WorkflowSession]` â€” Parse v1 Workflow sessions into v2 Workflow sessions
- `safe_get_runs_from_memory(memory_data: Any) -> Any` â€” Safely extract runs data from memory field, handling various data types.

Module `agno.db.mongo.async_mongo`

- **Source:** `libs/agno/agno/db/mongo/async_mongo.py`

Classes

- class `AsyncMongoDB` (bases: `AsyncBaseDb`)

◦ Methods:

- `async calculate_metrics(self) -> Optional[list[dict]]` â€” Calculate metrics for all dates without complete metrics.
- `async clear_cultural_knowledge(self) -> None` â€” Delete all cultural knowledge from the database. Raises: Exception: If an error occurs during deletion.
- `async clear_memories(self) -> None` â€” Delete all memories from the database. Raises: Exception: If an error occurs during deletion.
- `async create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord]` â€” Create an EvalRunRecord in the database.
- `database(self) -> AsyncIOMotorDatabase` â€” Get the MongoDB database, ensuring itâ€™s valid for the current event loop.
- `db_client(self) -> AsyncIOMotorClient` â€” Get the MongoDB client, ensuring itâ€™s valid for the current event loop.
- `async delete_cultural_knowledge(self, id: str) -> None` â€” Delete cultural knowledge by ID. Args: `id (str)`: The ID of the cultural knowledge to delete. Raises: Exception: If an error occurs during deletion.
- `async delete_eval_run(self, eval_run_id: str) -> None` â€” Delete an eval run from the database.
- `async delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” Delete multiple eval runs from the database.
- `async delete_knowledge_content(self, id: str) â€” Delete a knowledge row from the database. Args: id (str): The ID of the knowledge row to delete. Raises: Exception: If an error occurs during deletion.`
- `async delete_session(self, session_id: str) -> bool` â€” Delete a session from the database. Args: `session_id (str)`: The ID of the session to delete. Returns: `bool`: True if the session was deleted, False otherwise. Raises: Exception: If there is an error deleting the session.
- `async delete_sessions(self, session_ids: List[str]) -> None` â€” Delete multiple sessions from the database. Args: `session_ids (List[str])`: The IDs of the sessions to delete.
- `async delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None` â€” Delete user memories from the database. Args: `memory_ids (List[str])`: The IDs of the memories to delete. `user_id (Optional[str])`: The ID of the user to verify ownership. If provided, only delete memories that belong to this user. Raises: Exception: If there is an error deleting the memories.
- `async delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) â€” Delete a user memory from the database. Args: memory_id (str): The ID of the memory to delete. user_id (Optional[str]): The ID of the user to verify ownership. If provided, only delete if the memory belongs to this user. Returns: bool: True if the memory was deleted, False otherwise. Raises: Exception: If there is an error deleting the memory.`
- `async get_all_cultural_knowledge(self, agent_id: Optional[str]=None, team_id: Optional[str]=None, name: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]` â€” Get all cultural knowledge with filtering and pagination. Args: `agent_id (Optional[str])`: Filter by agent ID. `team_id (Optional[str])`: Filter by team ID. `name (Optional[str])`: Filter by name (case-insensitive partial match). `limit (Optional[int])`: Maximum number of results to return. `page (Optional[int])`: Page number for pagination. `sort_by (Optional[str])`: Field to sort by. `sort_order (Optional[str])`: Sort order (â€”ascâ€™ or â€”descâ€™). `deserialize (Optional[bool])`: Whether to deserialize to CulturalKnowledge objects. Defaults to True. Returns: `Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of CulturalKnowledge objects - When `deserialize=False`: Tuple with list of dictionaries and total count Raises: Exception: If an error occurs during retrieval.
- `async get_all_memory_topics(self, user_id: Optional[str]=None) -> List[str]` â€” Get all memory topics from the database. Args: `user_id (Optional[str])`: The ID of the user to filter by. Defaults to None. Returns: `List[str]`: The topics. Raises: Exception: If there is an error getting the topics.
- `async get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Get cultural knowledge by ID. Args: `id (str)`: The ID of the cultural knowledge to retrieve. `deserialize (Optional[bool])`: Whether to deserialize to CulturalKnowledge object. Defaults to True. Returns: `Optional[Union[CulturalKnowledge, Dict[str, Any]]]`: The cultural knowledge if found, None otherwise. Raises: Exception: If an error occurs during retrieval.
- `async get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Get an eval run from the database. Args: `eval_run_id (str)`: The ID of the eval run to get. `deserialize (Optional[bool])`: Whether to serialize the eval run. Defaults to True. Returns: `Optional[Union[EvalRunRecord, Dict[str, Any]]]`: - When `deserialize=True`: EvalRunRecord object - When `deserialize=False`: EvalRun dictionary Raises: Exception: If there is an error getting the eval run.
- `async get_eval_run_raw(self, eval_run_id: str) -> Optional[Dict[str, Any]]` â€” Get an eval run from the database as a raw dictionary.
- `async get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` â€” Get all eval runs from the database. Args: `limit (Optional[int])`: The maximum number of eval runs to return. `page (Optional[int])`: The page number to return. `sort_by (Optional[str])`: The field to sort by. `sort_order (Optional[str])`: The order to sort by. `agent_id (Optional[str])`: The ID of the agent to filter by. `team_id (Optional[str])`: The ID of the team to filter by. `workflow_id (Optional[str])`: The ID of the workflow to filter by. `model_id (Optional[str])`: The ID of the model to filter by. `eval_type (Optional[List[EvalType]])`: The type of eval to filter by. `filter_type (Optional[EvalFilterType])`: The type of filter to apply. `deserialize (Optional[bool])`: Whether to serialize the eval runs. Defaults to True. Returns: `Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of EvalRunRecord objects - When `deserialize=False`: List of eval run dictionaries and the total count Raises: Exception: If there is an error getting the eval runs.
- `async get_knowledge_content(self, id: str) -> Optional[KnowledgeRow]` â€” Get a knowledge row from the database. Args: `id (str)`: The ID of the knowledge row to get. Returns: `Optional[KnowledgeRow]`: The knowledge row, or None if it doesnâ€™t exist. Raises: Exception: If an error occurs during retrieval.
- `async get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int]` â€” Get all knowledge contents from the database. Args: `limit (Optional[int])`: The maximum number of knowledge contents to return. `page (Optional[int])`: The page number. `sort_by (Optional[str])`: The column to sort by. `sort_order (Optional[str])`: The order to sort by. Returns: `Tuple[List[KnowledgeRow], int]`: The knowledge contents and total count. Raises: Exception: If an error occurs during retrieval.
- `async get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]]` â€” Get all metrics matching the given date range.
- `async get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Read a session from the database. Args: `session_id (str)`: The ID of the session to get. `session_type (SessionType)`: The type of session to get. `user_id (Optional[str])`: The ID of the user to get the session for. `deserialize (Optional[bool])`: Whether to serialize the session. Defaults to True. Returns: `Union[Session, Dict[str, Any], None]`: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: Exception: If there is an error reading the session.
- `async get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]]` â€” Get all sessions. Args: `session_type (Optional[SessionType])`: The type of session to get. `user_id (Optional[str])`: The ID of the user to get the session for. `component_id (Optional[str])`: The ID of the component to get the session for. `session_name (Optional[str])`: The name of the session to filter by. `start_timestamp (Optional[int])`: The start timestamp to filter sessions by. `end_timestamp (Optional[int])`: The end timestamp to filter sessions by. `limit (Optional[int])`: The limit of the sessions to get. `page (Optional[int])`: The page number to get. `sort_by (Optional[str])`: The field to sort the sessions by. `sort_order (Optional[str])`: The order to sort the sessions by. `deserialize (Optional[bool])`: Whether to serialize the sessions. Defaults to True. Returns: `Union[List[AgentSession], List[TeamSession], List[WorkflowSession], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of Session objects - When `deserialize=False`: List of session dictionaries and the total count Raises: Exception: If there is an error reading the sessions.
- `async get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]` â€” Get all memories from the database as UserMemory objects. Args: `user_id (Optional[str])`: The ID of the user to get the memories for. `agent_id (Optional[str])`: The ID of the agent to get the memories for. `team_id (Optional[str])`: The ID of the team to get the memories for. `topics (Optional[List[str]])`: The topics to filter the memories by. `search_content (Optional[str])`: The content to filter the memories by. `limit (Optional[int])`: The limit of the memories to get. `page (Optional[int])`: The page number to get. `sort_by (Optional[str])`: The field to sort the memories by. `sort_order (Optional[str])`: The order to sort the memories by. `deserialize (Optional[bool])`: Whether to serialize the memories. Defaults to True. Returns: `Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of UserMemory objects - When `deserialize=False`: Tuple of (memory dictionaries, total count) Raises: Exception: If there is an error getting the memories.
- `async get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[UserMemory]` â€” Get a memory from the database. Args: `memory_id (str)`: The ID of the memory to get. `deserialize (Optional[bool])`: Whether to serialize the memory. Defaults to True. `user_id (Optional[str])`: The ID of the user to verify ownership. If provided, only return the memory if it belongs to this user. Returns: `Optional[UserMemory]`: - When `deserialize=True`: UserMemory object - When `deserialize=False`: Memory dictionary Raises: Exception: If there is an error getting the memory.
- `async get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None, user_id: Optional[str]=None) -> Tuple[List[Dict[str, Any]], int]` â€” Get user memories stats. Args: `limit (Optional[int])`: The limit of the memories to get. `page (Optional[int])`: The page number to get. `user_id (Optional[str])`: The ID of the user to filter by. Defaults to None.

Returns: Tuple[List[Dict[str, Any]], int]: A tuple containing the memories stats and the total count. Raises: Exception: If there is an error getting the memories stats.

- `async rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Update the name of an eval run in the database. Args: `eval_run_id` (str): The ID of the eval run to update. `name` (str): The new name of the eval run. `deserialize` (Optional[bool]): Whether to serialize the eval run. Defaults to True. Returns: Optional[Union[EvalRunRecord, Dict[str, Any]]]: - When `deserialize=True`: EvalRunRecord object - When `deserialize=False`: EvalRun dictionary Raises: Exception: If there is an error updating the eval run.
- `async rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Rename a session in the database. Args: `session_id` (str): The ID of the session to rename. `session_type` (SessionType): The type of session to rename. `session_name` (str): The new name of the session. `deserialize` (Optional[bool]): Whether to serialize the session. Defaults to True. Returns: Optional[Union[Session, Dict[str, Any]]]: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: Exception: If there is an error renaming the session.
- `async table_exists(self, table_name: str) -> bool` â€” Check if a collection with the given name exists in the MongoDB database. Args: `table_name`: Name of the collection to check Returns: bool: True if the collection exists in the database, False otherwise
- `async upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Upsert cultural knowledge in MongoDB. Args: `cultural_knowledge` (CulturalKnowledge): The cultural knowledge to upsert. `deserialize` (Optional[bool]): Whether to deserialize the result. Defaults to True. Returns: Optional[Union[CulturalKnowledge, Dict[str, Any]]]: The upserted cultural knowledge. Raises: Exception: If an error occurs during upsert.
- `async upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€” Upsert knowledge content in the database. Args: knowledge_row (KnowledgeRow): The knowledge row to upsert. Returns: Optional[KnowledgeRow]: The upserted knowledge row, or None if the operation fails. Raises: Exception: If an error occurs during upsert.`
- `async upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]]` â€” Bulk upsert multiple user memories for improved performance on large datasets. Args: `memories` (List[UserMemory]): List of memories to upsert. `deserialize` (Optional[bool]): Whether to deserialize the memories. Defaults to True. `preserve_updated_at` (bool): If True, preserve the updated_at from the memory object. Returns: List[Union[UserMemory, Dict[str, Any]]]: List of upserted memories. Raises: Exception: If an error occurs during bulk upsert.
- `async upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Insert or update a session in the database. Args: `session` (Session): The session to upsert. `deserialize` (Optional[bool]): Whether to deserialize the session. Defaults to True. Returns: Optional[Union[Session, Dict[str, Any]]]: The upserted session. Raises: Exception: If there is an error upserting the session.
- `async upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]]` â€” Bulk upsert multiple sessions for improved performance on large datasets. Args: `sessions` (List[Session]): List of sessions to upsert. `deserialize` (Optional[bool]): Whether to deserialize the sessions. Defaults to True. `preserve_updated_at` (bool): If True, preserve the updated_at from the session object. Returns: List[Union[Session, Dict[str, Any]]]: List of upserted sessions. Raises: Exception: If an error occurs during bulk upsert.
- `async upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Upsert a user memory in the database. Args: `memory` (UserMemory): The memory to upsert. `deserialize` (Optional[bool]): Whether to serialize the memory. Defaults to True. Returns: Optional[Union[UserMemory, Dict[str, Any]]]: - When `deserialize=True`: UserMemory object - When `deserialize=False`: Memory dictionary Raises: Exception: If there is an error upserting the memory.

Module `agno.db.mongo.mongo`

- **Source:** `libs/agno/agno/db/mongo/mongo.py`

Classes

- **class** `MongoDb` (bases: `BaseDb`)

• **Methods:**

- `calculate_metrics(self) -> Optional[list[dict]]` â€” Calculate metrics for all dates without complete metrics.
- `clear_cultural_knowledge(self) -> None` â€” Delete all cultural knowledge from the database. Raises: Exception: If an error occurs during deletion.
- `clear_memories(self) -> None` â€” Delete all memories from the database. Raises: Exception: If an error occurs during deletion.
- `create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord]` â€” Create an EvalRunRecord in the database.
- `database(self) -> Database` â€” No docstring provided.
- `delete_cultural_knowledge(self, id: str) -> None` â€” Delete cultural knowledge by ID. Args: `id` (str): The ID of the cultural knowledge to delete. Raises: Exception: If an error occurs during deletion.
- `delete_eval_run(self, eval_run_id: str) -> None` â€” Delete an eval run from the database.
- `delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” Delete multiple eval runs from the database.
- `delete_knowledge_content(self, id: str) â€” Delete a knowledge row from the database. Args: id (str): The ID of the knowledge row to delete. Raises: Exception: If an error occurs during deletion.`
- `delete_session(self, session_id: str) -> bool` â€” Delete a session from the database. Args: `session_id` (str): The ID of the session to delete. Returns: bool: True if the session was deleted, False otherwise. Raises: Exception: If there is an error deleting the session.
- `delete_sessions(self, session_ids: List[str]) -> None` â€” Delete multiple sessions from the database. Args: `session_ids` (List[str]): The IDs of the sessions to delete.
- `delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None` â€” Delete user memories from the database. Args: `memory_ids` (List[str]): The IDs of the memories to delete. `user_id` (Optional[str]): The ID of the user to verify ownership. If provided, only delete memories that belong to this user. Raises: Exception: If there is an error deleting the memories.
- `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) â€” Delete a user memory from the database. Args: memory_id (str): The ID of the memory to delete. user_id (Optional[str]): The ID of the user to verify ownership. If provided, only delete if the memory belongs to this user. Returns: bool: True if the memory was deleted, False otherwise. Raises: Exception: If there is an error deleting the memory.`
- `get_all_cultural_knowledge(self, agent_id: Optional[str]=None, team_id: Optional[str]=None, name: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]` â€” Get all cultural knowledge with filtering and pagination. Args: `agent_id` (Optional[str]): Filter by agent ID. `team_id` (Optional[str]): Filter by team ID. `name` (Optional[str]): Filter by name (case-insensitive partial match). `limit` (Optional[int]): Maximum number of results to return. `page` (Optional[int]): Page number for pagination. `sort_by` (Optional[str]): Field to sort by. `sort_order` (Optional[str]): Sort order (â€”ascâ€” or â€”descâ€”). `deserialize` (Optional[bool]): Whether to deserialize to CulturalKnowledge objects. Defaults to True. Returns: Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]: - When `deserialize=True`: List of CulturalKnowledge objects - When `deserialize=False`: Tuple with list of dictionaries and total count Raises: Exception: If an error occurs during retrieval.
- `get_all_memory_topics(self) -> List[str]` â€” Get all memory topics from the database. Returns: List[str]: The topics. Raises: Exception: If there is an error getting the topics.
- `get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Get cultural knowledge by ID. Args: `id` (str): The ID of the cultural knowledge to retrieve. `deserialize` (Optional[bool]): Whether to deserialize to CulturalKnowledge object. Defaults to True. Returns: Optional[Union[CulturalKnowledge, Dict[str, Any]]]: The cultural knowledge if found, None otherwise. Raises: Exception: If an error occurs during retrieval.
- `get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[EvalRunRecord]` â€” Get an eval run from the database. Args: `eval_run_id` (str): The ID of the eval run to get. `deserialize` (Optional[bool]): Whether to serialize the eval run. Defaults to True. Returns: Optional[EvalRunRecord]: - When `deserialize=True`: EvalRunRecord object - When `deserialize=False`: EvalRun dictionary Raises: Exception: If there is an error getting the eval run.
- `get_eval_run_raw(self, eval_run_id: str) -> Optional[Dict[str, Any]]` â€” Get an eval run from the database as a raw dictionary.
- `get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` â€” Get all eval runs from the database. Args: `limit` (Optional[int]): The maximum number of eval runs to return. `page` (Optional[int]): The page number to return. `sort_by` (Optional[str]): The field to sort by. `sort_order` (Optional[str]): The order to sort by. `agent_id` (Optional[str]): The ID of the agent to filter by. `team_id` (Optional[str]): The ID of the team to filter by. `workflow_id` (Optional[str]): The ID of the workflow to filter by. `model_id` (Optional[str]): The ID of the model to filter by. `eval_type` (Optional[List[EvalType]]): The type of eval to filter by. `filter_type` (Optional[EvalFilterType]): The type of filter to apply. `deserialize` (Optional[bool]): Whether to serialize the eval runs. Defaults to True. `create_table` (Optional[bool]): Whether to create the collection if it doesnâ€”t exist. Returns: Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]: - When `deserialize=True`: List of EvalRunRecord objects - When `deserialize=False`: List of eval run dictionaries and the total count Raises: Exception: If there is an error getting the eval runs.
- `get_knowledge_content(self, id: str) -> Optional[KnowledgeRow]` â€” Get a knowledge row from the database. Args: `id` (str): The ID of the knowledge row to get. Returns: Optional[KnowledgeRow]: The knowledge row, or None if it doesnâ€”t exist. Raises: Exception: If an error occurs during retrieval.
- `get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int]` â€” Get all knowledge contents from the database. Args: `limit` (Optional[int]): The maximum number of knowledge contents to return. `page` (Optional[int]): The page number. `sort_by` (Optional[str]): The column to sort by. `sort_order` (Optional[str]): The order to sort by. `create_table` (Optional[bool]): Whether to create the collection if it doesnâ€”t exist. Returns: Tuple[List[KnowledgeRow], int]: The knowledge contents and total count. Raises: Exception: If an error occurs during retrieval.
- `get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]]` â€” Get all metrics matching the given date range.
- `get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Read a

session from the database. Args: session_id (str): The ID of the session to get. session_type (SessionType): The type of session to get. user_id (Optional[str]): The ID of the user to get the session for. deserialize (Optional[bool]): Whether to serialize the session. Defaults to True. Returns: Union[Session, Dict[str, Any], None]: - When deserialize=True: Session object - When deserialize=False: Session dictionary Raises: Exception: If there is an error reading the session.

- `get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]]` â€” Get all sessions. Args: session_type (Optional[SessionType]): The type of session to get. user_id (Optional[str]): The ID of the user to get the session for. component_id (Optional[str]): The ID of the component to get the session for. session_name (Optional[str]): The name of the session to filter by. start_timestamp (Optional[int]): The start timestamp to filter sessions by. end_timestamp (Optional[int]): The end timestamp to filter sessions by. limit (Optional[int]): The limit of the sessions to get. page (Optional[int]): The page number to get. sort_by (Optional[str]): The field to sort the sessions by. sort_order (Optional[str]): The order to sort the sessions by. deserialize (Optional[bool]): Whether to serialize the sessions. Defaults to True. create_table (Optional[bool]): Whether to create the collection if it doesnâ€™t exist. Returns: Union[List[AgentSession], List[TeamSession], List[WorkflowSession], Tuple[List[Dict[str, Any]], int]]: - When deserialize=True: List of Session objects - When deserialize=False: List of session dictionaries and the total count Raises: Exception: If there is an error reading the sessions.
- `get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]` â€” Get all memories from the database as UserMemory objects. Args: user_id (Optional[str]): The ID of the user to get the memories for. agent_id (Optional[str]): The ID of the agent to get the memories for. team_id (Optional[str]): The ID of the team to get the memories for. topics (Optional[List[str]]): The topics to filter the memories by. search_content (Optional[str]): The content to filter the memories by. limit (Optional[int]): The limit of the memories to get. page (Optional[int]): The page number to get. sort_by (Optional[str]): The field to sort the memories by. sort_order (Optional[str]): The order to sort the memories by. deserialize (Optional[bool]): Whether to serialize the memories. Defaults to True. create_table (Optional[bool]): Whether to create the collection if it doesnâ€™t exist. Returns: Tuple[List[Dict[str, Any]], int]: A tuple containing the memories and the total count. Raises: Exception: If there is an error getting the memories.
- `get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[UserMemory]` â€” Get a memory from the database. Args: memory_id (str): The ID of the memory to get. deserialize (Optional[bool]): Whether to serialize the memory. Defaults to True. user_id (Optional[str]): The ID of the user to verify ownership. If provided, only return the memory if it belongs to this user. Returns: Optional[UserMemory]: - When deserialize=True: UserMemory object - When deserialize=False: Memory dictionary Raises: Exception: If there is an error getting the memory.
- `get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int]` â€” Get user memories stats. Args: limit (Optional[int]): The limit of the memories to get. page (Optional[int]): The page number to get. Returns: Tuple[List[Dict[str, Any]], int]: A tuple containing the memories stats and the total count. Raises: Exception: If there is an error getting the memories stats.
- `migrate_table_from_v1_to_v2(self, v1_db_schema: str, v1_table_name: str, v1_table_type: str)` â€” Migrate all content in the given collection to the right v2 collection
- `rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Update the name of an eval run in the database. Args: eval_run_id (str): The ID of the eval run to update. name (str): The new name of the eval run. deserialize (Optional[bool]): Whether to serialize the eval run. Defaults to True. Returns: Optional[Union[EvalRunRecord, Dict[str, Any]]]: - When deserialize=True: EvalRunRecord object - When deserialize=False: EvalRun dictionary Raises: Exception: If there is an error updating the eval run.
- `rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Rename a session in the database. Args: session_id (str): The ID of the session to rename. session_type (SessionType): The type of session to rename. session_name (str): The new name of the session. deserialize (Optional[bool]): Whether to serialize the session. Defaults to True. Returns: Optional[Union[Session, Dict[str, Any]]]: - When deserialize=True: Session object - When deserialize=False: Session dictionary Raises: Exception: If there is an error renaming the session.
- `table_exists(self, table_name: str) -> bool` â€” Check if a collection with the given name exists in the MongoDB database. Args: table_name: Name of the collection to check Returns: bool: True if the collection exists in the database, False otherwise
- `upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Upsert cultural knowledge in MongoDB. Args: cultural_knowledge (CulturalKnowledge): The cultural knowledge to upsert. deserialize (Optional[bool]): Whether to deserialize the result. Defaults to True. Returns: Optional[Union[CulturalKnowledge, Dict[str, Any]]]: The upserted cultural knowledge. Raises: Exception: If an error occurs during upsert.
- `upsert_knowledge_content(self, knowledge_row: KnowledgeRow) -> Optional[KnowledgeRow]` â€” Upsert knowledge content in the database. Args: knowledge_row (KnowledgeRow): The knowledge row to upsert. Returns: Optional[KnowledgeRow]: The upserted knowledge row, or None if the operation fails. Raises: Exception: If an error occurs during upsert.
- `upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]]` â€” Bulk upsert multiple user memories for improved performance on large datasets. Args: memories (List[UserMemory]): List of memories to upsert. deserialize (Optional[bool]): Whether to deserialize the memories. Defaults to True. Returns: List[Union[UserMemory, Dict[str, Any]]]: List of upserted memories. Raises: Exception: If an error occurs during bulk upsert.
- `upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Insert or update a session in the database. Args: session (Session): The session to upsert. Returns: Optional[Session]: The upserted session. Raises: Exception: If there is an error upserting the session.
- `upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]]` â€” Bulk upsert multiple sessions for improved performance on large datasets. Args: sessions (List[Session]): List of sessions to upsert. deserialize (Optional[bool]): Whether to deserialize the sessions. Defaults to True. preserve_updated_at (bool): If True, preserve the updated_at from the session object. Returns: List[Union[Session, Dict[str, Any]]]: List of upserted sessions. Raises: Exception: If an error occurs during bulk upsert.
- `upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Upsert a user memory in the database. Args: memory (UserMemory): The memory to upsert. deserialize (Optional[bool]): Whether to serialize the memory. Defaults to True. Returns: Optional[Union[UserMemory, Dict[str, Any]]]: - When deserialize=True: UserMemory object - When deserialize=False: Memory dictionary Raises: Exception: If there is an error upserting the memory.

Module agno.db.mongo.schemas

- **Source:** `libs/agno/agno/db/mongo/schemas.py`

MongoDB collection schemas and related utilities

Functions

- `get_collection_indexes(collection_type: str) -> List[Dict[str, Any]]` â€” Get the index definitions for a specific collection type.

Module agno.db.mongo.utils

- **Source:** `libs/agno/agno/db/mongo/utils.py`

Utility functions for the MongoDB database class.

Functions

- `apply_pagination(query_args: Dict[str, Any], limit: Optional[int]=None, page: Optional[int]=None) -> Dict[str, Any]` â€” Apply pagination to MongoDB query.
- `apply_sorting(query_args: Dict[str, Any], sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> List[tuple]` â€” Apply sorting to MongoDB query.
- `bulk_upsert_metrics(collection: Collection, metrics_records: List[Dict[str, Any]]) -> List[Dict[str, Any]]` â€” Bulk upsert metrics into the database. Args: collection (Collection): The collection to upsert the metrics into. metrics_records (List[Dict[str, Any]]): The list of metrics records to upsert. Returns: The list of upserted metrics records.
- `calculate_date_metrics(date_to_process: date, sessions_data: dict) -> dict` â€” Calculate metrics for the given single date.
- `create_collection_indexes(collection: Collection, collection_type: str) -> None` â€” Create all required indexes for a collection
- `deserialize_cultural_knowledge_from_db(db_row: Dict[str, Any]) -> CulturalKnowledge` â€” Deserialize a database row to a CulturalKnowledge object. The database stores content as a dict containing content, categories, and notes. This method extracts those fields and converts them back to the model format. Args: db_row (Dict[str, Any]): The database row as a dictionary. Returns: CulturalKnowledge: The cultural knowledge object.
- `fetch_all_sessions_data(sessions: List[Dict[str, Any]], dates_to_process: list[date], start_timestamp: int) -> Optional[dict]` â€” Return all session data for the given dates, for all session types.
- `get_dates_to_calculate_metrics_for(starting_date: date) -> list[date]` â€” Return the list of dates to calculate metrics for.
- `serialize_cultural_knowledge_for_db(cultural_knowledge: CulturalKnowledge) -> Dict[str, Any]` â€” Serialize a CulturalKnowledge object for database storage. Converts the modelâ€™s separate content, categories, and notes fields into a single dict for the database content column. MongoDB stores as BSON which natively supports nested documents. Args: cultural_knowledge (CulturalKnowledge): The cultural knowledge object to serialize. Returns: Dict[str, Any]: A dictionary with the content field as a dict containing content, categories, and notes.

Module agno.db.mysql.mysql

- **Source:** `libs/agno/agno/db/mysql/mysql.py`

Classes

- class MySQLdb (bases: BaseDb)
 - **Methods:**
 - `calculate_metrics(self) -> Optional[list[dict]]` â€” Calculate metrics for all dates without complete metrics. Returns: Optional[list[dict]]: The calculated metrics. Raises: Exception:

If an error occurs during metrics calculation.

- `clear_cultural_knowledge(self)` -> None â€” Delete all cultural knowledge from the database. Raises: Exception: If an error occurs during deletion.
- `clear_memories(self)` -> None â€” Clear all user memories from the database.
- `create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord] â€” Create an EvalRunRecord in the database. Args: eval_run (EvalRunRecord): The eval run to create. Returns: Optional[EvalRunRecord]: The created eval run, or None if the operation fails. Raises: Exception: If an error occurs during creation.`
- `delete_cultural_knowledge(self, id: str) -> None â€” Delete a cultural knowledge entry from the database. Args: id (str): The ID of the cultural knowledge to delete. Raises: Exception: If an error occurs during deletion.`
- `delete_eval_run(self, eval_run_id: str) -> None â€” Delete an eval run from the database. Args: eval_run_id (str): The ID of the eval run to delete.`
- `delete_eval_runs(self, eval_run_ids: List[str]) -> None â€” Delete multiple eval runs from the database. Args: eval_run_ids (List[str]): List of eval run IDs to delete.`
- `delete_knowledge_content(self, id: str) â€” Delete a knowledge row from the database. Args: id (str): The ID of the knowledge row to delete. Raises: Exception: If an error occurs during deletion.`
- `delete_session(self, session_id: str) -> bool â€” Delete a session from the database. Args: session_id (str): ID of the session to delete Returns: bool: True if the session was deleted, False otherwise. Raises: Exception: If an error occurs during deletion.`
- `delete_sessions(self, session_ids: List[str]) -> None â€” Delete all given sessions from the database. Can handle multiple session types in the same run. Args: session_ids (List[str]): The IDs of the sessions to delete. Raises: Exception: If an error occurs during deletion.`
- `delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None â€” Delete user memories from the database. Args: memory_ids (List[str]): The IDs of the memories to delete. user_id (Optional[str]): The user ID to filter by. Defaults to None. Raises: Exception: If an error occurs during deletion.`
- `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) â€” Delete a user memory from the database. Args: memory_id (str): The ID of the memory to delete. user_id (Optional[str]): The user ID to filter by. Defaults to None. Returns: bool: True if deletion was successful, False otherwise. Raises: Exception: If an error occurs during deletion.`
- `get_all_cultural_knowledge(self, name: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]] â€” Get all cultural knowledge from the database as CulturalKnowledge objects. Args: name (Optional[str]): The name of the cultural knowledge to filter by. agent_id (Optional[str]): The ID of the agent to filter by. team_id (Optional[str]): The ID of the team to filter by. limit (Optional[int]): The maximum number of cultural knowledge entries to return. page (Optional[int]): The page number. sort_by (Optional[str]): The column to sort by. sort_order (Optional[str]): The order to sort by. deserialize (Optional[bool]): Whether to deserialize the cultural knowledge. Defaults to True. Returns: Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]: - When deserialize=True: List of CulturalKnowledge objects - When deserialize=False: List of CulturalKnowledge dictionaries and total count Raises: Exception: If an error occurs during retrieval.`
- `get_all_memory_topics(self) -> List[str] â€” Get all memory topics from the database. Returns: List[str]: List of memory topics.`
- `get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]] â€” Get a cultural knowledge entry from the database. Args: id (str): The ID of the cultural knowledge to get. deserialize (Optional[bool]): Whether to deserialize the cultural knowledge. Defaults to True. Returns: Optional[Union[CulturalKnowledge, Dict[str, Any]]]: The cultural knowledge entry, or None if it doesnâ€™t exist. Raises: Exception: If an error occurs during retrieval.`
- `get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]] â€” Get an eval run from the database. Args: eval_run_id (str): The ID of the eval run to get. deserialize (Optional[bool]): Whether to serialize the eval run. Defaults to True. Returns: Optional[Union[EvalRunRecord, Dict[str, Any]]]: - When deserialize=True: EvalRunRecord object - When deserialize=False: EvalRun dictionary Raises: Exception: If an error occurs during retrieval.`
- `get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]] â€” Get all eval runs from the database. Args: limit (Optional[int]): The maximum number of eval runs to return. page (Optional[int]): The page number. sort_by (Optional[str]): The column to sort by. sort_order (Optional[str]): The order to sort by. agent_id (Optional[str]): The ID of the agent to filter by. team_id (Optional[str]): The ID of the team to filter by. workflow_id (Optional[str]): The ID of the workflow to filter by. model_id (Optional[str]): The ID of the model to filter by. eval_type (Optional[List[EvalType]]): The type(s) of eval to filter by. filter_type (Optional[EvalFilterType]): Filter by component type (agent, team, workflow). deserialize (Optional[bool]): Whether to serialize the eval runs. Defaults to True. create_table (Optional[bool]): Whether to create the table if it doesnâ€™t exist. Returns: Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]: - When deserialize=True: List of EvalRunRecord objects - When deserialize=False: List of dictionaries Raises: Exception: If an error occurs during retrieval.`
- `get_knowledge_content(self, id: str) -> Optional[KnowledgeRow] â€” Get a knowledge row from the database. Args: id (str): The ID of the knowledge row to get. Returns: Optional[KnowledgeRow]: The knowledge row, or None if it doesnâ€™t exist. Raises: Exception: If an error occurs during retrieval.`
- `get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int] â€” Get all knowledge contents from the database. Args: limit (Optional[int]): The maximum number of knowledge contents to return. page (Optional[int]): The page number. sort_by (Optional[str]): The column to sort by. sort_order (Optional[str]): The order to sort by. create_table (Optional[bool]): Whether to create the table if it doesnâ€™t exist. Returns: Tuple[List[KnowledgeRow], int]: The knowledge contents and total count. Raises: Exception: If an error occurs during retrieval.`
- `get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]] â€” Get all metrics matching the given date range. Args: starting_date (Optional[date]): The starting date to filter metrics by. ending_date (Optional[date]): The ending date to filter metrics by. Returns: Tuple[List[dict], Optional[int]]: A tuple containing the metrics and the timestamp of the latest update. Raises: Exception: If an error occurs during retrieval.`
- `get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]] â€” Read a session from the database. Args: session_id (str): ID of the session to read. session_type (SessionType): Type of session to get. user_id (Optional[str]): User ID to filter by. Defaults to None. deserialize (Optional[bool]): Whether to serialize the session. Defaults to True. Returns: Union[Session, Dict[str, Any], None]: - When deserialize=True: Session object - When deserialize=False: Session dictionary Raises: Exception: If an error occurs during retrieval.`
- `get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]] â€” Get all sessions in the given table. Can filter by user_id and entity_id. Args: session_type (Optional[SessionType]): The type of sessions to get. user_id (Optional[str]): The ID of the user to filter by. entity_id (Optional[str]): The ID of the agent / workflow to filter by. start_timestamp (Optional[int]): The start timestamp to filter by. end_timestamp (Optional[int]): The end timestamp to filter by. session_name (Optional[str]): The name of the session to filter by. limit (Optional[int]): The maximum number of sessions to return. Defaults to None. page (Optional[int]): The page number to return. Defaults to None. sort_by (Optional[str]): The field to sort by. Defaults to None. sort_order (Optional[str]): The sort order. Defaults to None. deserialize (Optional[bool]): Whether to serialize the sessions. Defaults to True. create_table (Optional[bool]): Whether to create the table if it doesnâ€™t exist. Returns: Union[List[Session], Tuple[List[Dict], int]]: - When deserialize=True: List of Session objects - When deserialize=False: Tuple of (session dictionaries, total count) Raises: Exception: If an error occurs during retrieval.`
- `get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]] â€” Get all memories from the database as MemoryRow objects. Args: user_id (Optional[str]): The ID of the user to filter by. agent_id (Optional[str]): The ID of the agent to filter by. team_id (Optional[str]): The ID of the team to filter by. topics (Optional[List[str]]): The topics to filter by. search_content (Optional[str]): The content to search for. limit (Optional[int]): The maximum number of memories to return. page (Optional[int]): The page number. sort_by (Optional[str]): The column to sort by. sort_order (Optional[str]): The order to sort by. deserialize (Optional[bool]): Whether to serialize the memories. Defaults to True. Returns: Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]: - When deserialize=True: List of UserMemory objects - When deserialize=False: Tuple of (memory dictionaries, total count) Raises: Exception: If an error occurs during retrieval.`
- `get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[UserMemory] â€” Get a memory from the database. Args: memory_id (str): The ID of the memory to get. deserialize (Optional[bool]): Whether to serialize the memory. Defaults to True. user_id (Optional[str]): The user ID to filter by. Defaults to None. Returns: Union[UserMemory, Dict[str, Any], None]: - When deserialize=True: UserMemory object - When deserialize=False: UserMemory dictionary Raises: Exception: If an error occurs during retrieval.`
- `get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int] â€” Get user memories stats. Args: limit (Optional[int]): The maximum number of user stats to return. page (Optional[int]): The page number. Returns: Tuple[List[Dict[str, Any]], int]: A list of dictionaries containing user stats and total count. Example: ([{ â€œuser_idâ€: â€œ0123â€€, â€œtotal_memoriesâ€: 10, â€œlast_memory_updated_atâ€: 1714560000, },], total_count: 1,)`
- `migrate_table_from_v1_to_v2(self, v1_db_schema: str, v1_table_name: str, v1_table_type: str) â€” Migrate all content in the given table to the right v2 table`
- `rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]] â€” Upsert the name of an eval run in the database, returning raw dictionary. Args: eval_run_id (str): The ID of the eval run to update. name (str): The new name of the eval run. Returns: Optional[Dict[str, Any]]: The updated eval run, or None if the operation fails. Raises: Exception: If an error occurs during update.`
- `rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]] â€” Rename a session in the database. Args: session_id (str): The ID of the session to rename. session_type (SessionType): The type of session to rename. session_name (str): The new name for the session. deserialize (Optional[bool]): Whether to serialize the session. Defaults to True. Returns: Optional[Union[Session, Dict[str, Any]]]: - When deserialize=True: Session object - When deserialize=False: Session dictionary Raises: Exception: If an error occurs during renaming.`
- `table_exists(self, table_name: str) -> bool â€” Check if a table with the given name exists in the MySQL database. Args: table_name: Name of the table to check Returns: bool: True if the table exists in the database, False otherwise`
- `upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]] â€” Upsert a cultural knowledge entry into the database. Args: cultural_knowledge (CulturalKnowledge): The cultural knowledge to upsert. deserialize (Optional[bool]): Whether to deserialize the cultural knowledge. Defaults to True. Returns: Optional[CulturalKnowledge]: The upserted cultural knowledge entry. Raises: Exception: If an error occurs during upsert.`
- `upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€” Upsert knowledge content in the database. Args: knowledge_row (KnowledgeRow): The knowledge row to upsert. Returns: Optional[KnowledgeRow]: The upserted knowledge row, or None if the operation fails. Raises: Exception: If an error occurs during upsert.`

- `upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]]` â€” Bulk upsert multiple user memories for improved performance on large datasets. Args: `memories (List[UserMemory])`: List of memories to upsert. `deserialize (Optional[bool])`: Whether to deserialize the memories. Defaults to True. Returns: `List[Union[UserMemory, Dict[str, Any]]]`: List of upserted memories. Raises: Exception: If an error occurs during bulk upsert.
- `upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Insert or update a session in the database. Args: `session (Session)`: The session data to upsert. `deserialize (Optional[bool])`: Whether to deserialize the session. Defaults to True. Returns: `Optional[Union[Session, Dict[str, Any]]]`: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: Exception: If an error occurs during upsert.
- `upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]]` â€” Bulk upsert multiple sessions for improved performance on large datasets. Args: `sessions (List[Session])`: List of sessions to upsert. `deserialize (Optional[bool])`: Whether to deserialize the sessions. Defaults to True. `preserve_updated_at (bool)`: If True, preserve the updated_at from the session object. Returns: `List[Union[Session, Dict[str, Any]]]`: List of upserted sessions. Raises: Exception: If an error occurs during bulk upsert.
- `upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Upsert a user memory in the database. Args: `memory (UserMemory)`: The user memory to upsert. `deserialize (Optional[bool])`: Whether to serialize the memory. Defaults to True. Returns: `Optional[Union[UserMemory, Dict[str, Any]]]`: - When `deserialize=True`: UserMemory object - When `deserialize=False`: UserMemory dictionary Raises: Exception: If an error occurs during upsert.

Module `agno.db.mysql.schemas`

- **Source:** `libs/agno/agno/db/mysql/schemas.py`

Table schemas and related utils used by the MySQLDb class

Functions

- `get_table_schema_definition(table_type: str) -> dict[str, Any]` â€” Get the expected schema definition for the given table. Args: `table_type (str)`: The type of table to get the schema for. Returns: `Dict[str, Any]`: Dictionary containing column definitions for the table

Module `agno.db.mysql.utils`

- **Source:** `libs/agno/agno/db/mysql/utils.py`

Utility functions for the MySQL database class.

Functions

- `apply_sorting(stmtt, table: Table, sort_by: Optional[str]=None, sort_order: Optional[str]=None) â€”` Apply sorting to the given SQLAlchemy statement. Args: `stmtt`: The SQLAlchemy statement to modify table: The table being queried `sort_by`: The field to sort by `sort_order`: The sort order (â€”ascâ€” or â€”descâ€”) Returns: The modified statement with sorting applied
- `bulk_upsert_metrics(session: Session, table: Table, metrics_records: list[dict]) -> list[dict]` â€” Bulk upsert metrics into the database. Args: `table (Table)`: The table to upsert into. `metrics_records (list[dict])`: The metrics records to upsert. Returns: `list[dict]`: The upserted metrics records.
- `calculate_data_metrics(date_to_process: date, sessions_data: dict) -> dict â€”` Calculate metrics for the given single date. Args: `date_to_process (date)`: The date to calculate metrics for. `sessions_data (dict)`: The sessions data to calculate metrics for. Returns: `dict`: The calculated metrics.
- `create_schema(session: Session, db_schema: str) -> None` â€” Create the database schema if it doesnâ€”t exist. Args: `session`: The SQLAlchemy session to use `db_schema (str)`: The definition of the database schema to create
- `deserialize_cultural_knowledge_from_db(db_row: Dict[str, Any]) -> CulturalKnowledge` â€” Deserialize a database row to a CulturalKnowledge object. The database stores content as a JSON dict containing content, categories, and notes. This method extracts those fields and converts them back to the model format. Args: `db_row (Dict[str, Any])`: The database row as a dictionary. Returns: `CulturalKnowledge`: The cultural knowledge object.
- `fetch_all_sessions_data(sessions: List[Dict[str, Any]], dates_to_process: list[date], start_timestamp: int) -> Optional[dict]` â€” Return all session data for the given dates, for all session types. Args: `dates (list[date])`: The dates to fetch session data for. Returns: `dict`: A dictionary with dates as keys and session data as values, for all session types. Example: { â€œ2000-01-01â€: { â€œagentâ€: [, â€], â€œteamâ€: [â€], â€œworkflowâ€: [â€], } }
- `get_dates_to_calculate_metrics_for(starting_date: date) -> list[date]` â€” Return the list of dates to calculate metrics for. Args: `starting_date (date)`: The starting date to calculate metrics for. Returns: `list[date]`: The list of dates to calculate metrics for.
- `is_table_available(session: Session, table_name: str, db_schema: str) -> bool` â€” Check if a table with the given name exists in the given schema. Returns: `bool`: True if the table exists, False otherwise.
- `is_valid_table(db engine: Engine, table_name: str, table type: str, db schema: str) -> bool` â€” Check if the existing table has the expected column names. Args: `table_name (str)`: Name of the table to validate schema (str): Database schema name Returns: `bool`: True if table has all expected columns, False otherwise
- `serialize_cultural_knowledge_for_db(cultural_knowledge: CulturalKnowledge) -> Dict[str, Any]` â€” Serialize a CulturalKnowledge object for database storage. Converts the modelâ€”s separate content, categories, and notes fields into a single JSON dict for the database content column. Args: `cultural_knowledge (CulturalKnowledge)`: The cultural knowledge object to serialize. Returns: `Dict[str, Any]`: A dictionary with the content field as JSON containing content, categories, and notes.

Module `agno.db.postgres.async_postgres`

- **Source:** `libs/agno/agno/db/postgres/async_postgres.py`

Classes

- **class `AsyncPostgresDb` (bases: `AsyncBaseDb`)**
 - **Methods:**
 - `async calculate_metrics(self) -> Optional[list[dict]]` â€” Calculate metrics for all dates without complete metrics. Returns: `Optional[list[dict]]`: The calculated metrics. Raises: Exception: If an error occurs during metrics calculation.
 - `async clear_cultural_knowledge(self) -> None` â€” Delete all cultural knowledge from the database. Raises: Exception: If an error occurs during deletion.
 - `async clear_memories(self) -> None` â€” Delete all memories from the database. Raises: Exception: If an error occurs during deletion.
 - `async create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord]` â€” Create an EvalRunRecord in the database. Args: `eval_run (EvalRunRecord)`: The eval run to create. Returns: `Optional[EvalRunRecord]`: The created eval run, or None if the operation fails. Raises: Exception: If an error occurs during creation.
 - `async delete_cultural_knowledge(self, id: str) -> None` â€” Delete cultural knowledge by ID. Args: `id (str)`: The ID of the cultural knowledge to delete. Raises: Exception: If an error occurs during deletion.
 - `async delete_eval_run(self, eval_run_id: str) -> None` â€” Delete an eval run from the database. Args: `eval_run_id (str)`: The ID of the eval run to delete.
 - `async delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” Delete multiple eval runs from the database. Args: `eval_run_ids (List[str])`: List of eval run IDs to delete.
 - `async delete_knowledge_content(self, id: str) â€”` Delete a knowledge row from the database. Args: `id (str)`: The ID of the knowledge row to delete.
 - `async delete_session(self, session_id: str) -> bool` â€” Delete a session from the database. Args: `session_id (str)`: ID of the session to delete Returns: `bool`: True if the session was deleted, False otherwise. Raises: Exception: If an error occurs during deletion.
 - `async delete_sessions(self, session_ids: List[str]) -> None` â€” Delete all given sessions from the database. Can handle multiple session types in the same run. Args: `session_ids (List[str])`: The IDs of the sessions to delete. Raises: Exception: If an error occurs during deletion.
 - `async delete_user_memories(self, memory_ids: List[str]) -> None` â€” Delete user memories from the database. Args: `memory_ids (List[str])`: The IDs of the memories to delete. Raises: Exception: If an error occurs during deletion.
 - `async delete_user_memory(self, memory_id: str) â€”` Delete a user memory from the database. Returns: `bool`: True if deletion was successful, False otherwise. Raises: Exception: If an error occurs during deletion.
 - `async get_all_cultural_knowledge(self, agent_id: Optional[str]=None, team_id: Optional[str]=None, name: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]` â€” Get all cultural knowledge with filtering and pagination. Args: `agent_id (Optional[str])`: Filter by agent ID. `team_id (Optional[str])`: Filter by team ID. `name (Optional[str])`: Filter by name (case-insensitive partial match). `limit (Optional[int])`: Maximum number of results to return. `page (Optional[int])`: Page number for pagination. `sort_by (Optional[str])`: Field to sort by. `sort_order (Optional[str])`: Sort order (â€”ascâ€” or â€”descâ€”). `deserialize (Optional[bool])`: Whether to deserialize to CulturalKnowledge objects. Defaults to True. Returns: `Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of CulturalKnowledge objects - When `deserialize=False`: Tuple with list of dictionaries and total count Raises: Exception: If an error occurs during retrieval.
 - `async get_all_memory_topics(self) -> List[str]` â€” Get all memory topics from the database. Returns: `List[str]`: List of memory topics.
 - `async get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Get cultural knowledge by ID. Args: `id (str)`: The ID of the cultural knowledge to retrieve. `deserialize (Optional[bool])`: Whether to deserialize to CulturalKnowledge object. Defaults to True. Returns: `Optional[Union[CulturalKnowledge, Dict[str, Any]]]`: The cultural knowledge if found, None otherwise. Raises: Exception: If an error occurs during retrieval.

- `async get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Get an eval run from the database. Args: `eval_run_id` (str): The ID of the eval run to get. `deserialize` (Optional[bool]): Whether to serialize the eval run. Defaults to True. Returns: `Optional[Union[EvalRunRecord, Dict[str, Any]]]`: - When `deserialize=True`: `EvalRunRecord` object - When `deserialize=False`: `EvalRun` dictionary Raises: `Exception`: If an error occurs during retrieval.
- `async get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` â€” Get all eval runs from the database. Args: `limit` (Optional[int]): The maximum number of eval runs to return. `page` (Optional[int]): The page number. `sort_by` (Optional[str]): The column to sort by. `sort_order` (Optional[str]): The order to sort by. `agent_id` (Optional[str]): The ID of the agent to filter by. `team_id` (Optional[str]): The ID of the team to filter by. `workflow_id` (Optional[str]): The ID of the workflow to filter by. `model_id` (Optional[str]): The ID of the model to filter by. `eval_type` (Optional[List[EvalType]]): The type(s) of eval to filter by. `filter_type` (Optional[EvalFilterType]): Filter by component type (agent, team, workflow). `deserialize` (Optional[bool]): Whether to serialize the eval runs. Defaults to True. Returns: `Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of `EvalRunRecord` objects - When `deserialize=False`: List of dictionaries Raises: `Exception`: If an error occurs during retrieval.
- `async get_knowledge_content(self, id: str) -> Optional[KnowledgeRow]` â€” Get a knowledge row from the database. Args: `id` (str): The ID of the knowledge row to get. Returns: `Optional[KnowledgeRow]`: The knowledge row, or None if it doesnâ€™t exist.
- `async get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int]` â€” Get all knowledge contents from the database. Args: `limit` (Optional[int]): The maximum number of knowledge contents to return. `page` (Optional[int]): The page number. `sort_by` (Optional[str]): The column to sort by. `sort_order` (Optional[str]): The order to sort by. Returns: `List[KnowledgeRow]`: The knowledge contents. Raises: `Exception`: If an error occurs during retrieval.
- `async get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]]` â€” Get all metrics matching the given date range. Args: `starting_date` (Optional[date]): The starting date to filter metrics by. `ending_date` (Optional[date]): The ending date to filter metrics by. Returns: `Tuple[List[dict], Optional[int]]`: A tuple containing the metrics and the timestamp of the latest update. Raises: `Exception`: If an error occurs during retrieval.
- `async get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Read a session from the database. Args: `session_id` (str): ID of the session to read. `user_id` (Optional[str]): User ID to filter by. Defaults to None. `session_type` (Optional[SessionType]): Type of session to read. Defaults to None. `deserialize` (Optional[bool]): Whether to serialize the session. Defaults to True. Returns: `Union[Session, Dict[str, Any], None]`: - When `deserialize=True`: `Session` object - When `deserialize=False`: `Session` dictionary Raises: `Exception`: If an error occurs during retrieval.
- `async get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]]` â€” Get all sessions in the given table. Can filter by `user_id` and `entity_id`. Args: `user_id` (Optional[str]): The ID of the user to filter by. `component_id` (Optional[str]): The ID of the agent / workflow to filter by. `start_timestamp` (Optional[int]): The start timestamp to filter by. `end_timestamp` (Optional[int]): The end timestamp to filter by. `session_name` (Optional[str]): The name of the session to filter by. `limit` (Optional[int]): The maximum number of sessions to return. Defaults to None. `page` (Optional[int]): The page number to return. Defaults to None. `sort_by` (Optional[str]): The field to sort by. Defaults to None. `sort_order` (Optional[str]): The sort order. Defaults to None. `deserialize` (Optional[bool]): Whether to serialize the sessions. Defaults to True. Returns: `Union[List[Session], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of `Session` objects - When `deserialize=False`: Tuple of (session dictionaries, total count) Raises: `Exception`: If an error occurs during retrieval.
- `async get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]` â€” Get all memories from the database as `UserMemory` objects. Args: `user_id` (Optional[str]): The ID of the user to filter by. `agent_id` (Optional[str]): The ID of the agent to filter by. `team_id` (Optional[str]): The ID of the team to filter by. `topics` (Optional[List[str]]): The topics to filter by. `search_content` (Optional[str]): The content to search for. `limit` (Optional[int]): The maximum number of memories to return. `page` (Optional[int]): The page number. `sort_by` (Optional[str]): The column to sort by. `sort_order` (Optional[str]): The order to sort by. `deserialize` (Optional[bool]): Whether to serialize the memories. Defaults to True. Returns: `Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of `UserMemory` objects - When `deserialize=False`: Tuple of (memory dictionaries, total count) Raises: `Exception`: If an error occurs during retrieval.
- `async get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Get a memory from the database. Args: `memory_id` (str): The ID of the memory to get. `deserialize` (Optional[bool]): Whether to serialize the memory. Defaults to True. Returns: `Union[UserMemory, Dict[str, Any], None]`: - When `deserialize=True`: `UserMemory` object - When `deserialize=False`: `UserMemory` dictionary Raises: `Exception`: If an error occurs during retrieval.
- `async get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int]` â€” Get user memories stats. Args: `limit` (Optional[int]): The maximum number of user stats to return. `page` (Optional[int]): The page number. Returns: `Tuple[List[Dict[str, Any]], int]`: A list of dictionaries containing user stats and total count. Example: `{ [ { â€œuser_idâ€: â€œ123â€€, â€œtotal_memoriesâ€: 10, â€œlast_memory_updated_atâ€: 1714560000, }, ], total_count: 1 }`
- `async migrate_table_from_v1_to_v2(self, v1_db_schema: str, v1_table_name: str, v1_table_type: str) â€”` Migrate all content in the given table to the right v2 table
- `async rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Upsert the name of an eval run in the database, returning raw dictionary. Args: `eval_run_id` (str): The ID of the eval run to update. `name` (str): The new name of the eval run. Returns: `Optional[Dict[str, Any]]`: The updated eval run, or None if the operation fails. Raises: `Exception`: If an error occurs during update.
- `async rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Rename a session in the database. Args: `session_id` (str): The ID of the session to rename. `session_type` (SessionType): The type of session to rename. `session_name` (str): The new name for the session. `deserialize` (Optional[bool]): Whether to serialize the session. Defaults to True. Returns: `Optional[Union[Session, Dict[str, Any]]]`: - When `deserialize=True`: `Session` object - When `deserialize=False`: `Session` dictionary Raises: `Exception`: If an error occurs during renaming.
- `async table_exists(self, table_name: str) -> bool` â€” Check if a table with the given name exists in the Postgres database. Args: `table_name`: Name of the table to check Returns: `bool`: True if the table exists in the database, False otherwise
- `async upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Upsert cultural knowledge in the database. Args: `cultural_knowledge` (CulturalKnowledge): The cultural knowledge to upsert. `deserialize` (Optional[bool]): Whether to deserialize the result. Defaults to True. Returns: `Optional[Union[CulturalKnowledge, Dict[str, Any]]]`: The upserted cultural knowledge. Raises: `Exception`: If an error occurs during upsert.
- `async upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€”` Upsert knowledge content in the database. Args: `knowledge_row` (KnowledgeRow): The knowledge row to upsert. Returns: `Optional[KnowledgeRow]`: The upserted knowledge row, or None if the operation fails.
- `async upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Insert or update a session in the database. Args: `session` (Session): The session data to upsert. `deserialize` (Optional[bool]): Whether to deserialize the session. Defaults to True. Returns: `Optional[Union[Session, Dict[str, Any]]]`: - When `deserialize=True`: `Session` object - When `deserialize=False`: `Session` dictionary Raises: `Exception`: If an error occurs during upsert.
- `async upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Upsert a user memory in the database. Args: `memory` (UserMemory): The user memory to upsert. `deserialize` (Optional[bool]): Whether to serialize the memory. Defaults to True. Returns: `Optional[Union[UserMemory, Dict[str, Any]]]`: - When `deserialize=True`: `UserMemory` object - When `deserialize=False`: `UserMemory` dictionary Raises: `Exception`: If an error occurs during upsert.

Module agno.db.postgres.postgres

- **Source:** `libs/agno/db/postgres/postgres.py`

Classes

- **class PostgresDb** (bases: `BaseDb`)
 - **Methods:**
 - `calculate_metrics(self) -> Optional[list[dict]]` â€” Calculate metrics for all dates without complete metrics. Returns: `Optional[list[dict]]`: The calculated metrics. Raises: `Exception`: If an error occurs during metrics calculation.
 - `clear_cultural_knowledge(self) -> None` â€” Delete all cultural knowledge from the database. Raises: `Exception`: If an error occurs during deletion.
 - `clear_memories(self) -> None` â€” Delete all memories from the database. Raises: `Exception`: If an error occurs during deletion.
 - `create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord]` â€” Create an `EvalRunRecord` in the database. Args: `eval_run` (EvalRunRecord): The eval run to create. Returns: `Optional[EvalRunRecord]`: The created eval run, or None if the operation fails. Raises: `Exception`: If an error occurs during creation.
 - `delete_cultural_knowledge(self, id: str) -> None` â€” Delete a cultural knowledge entry from the database. Args: `id` (str): The ID of the cultural knowledge to delete. Raises: `Exception`: If an error occurs during deletion.
 - `delete_eval_run(self, eval_run_id: str) -> None` â€” Delete an eval run from the database. Args: `eval_run_id` (str): The ID of the eval run to delete.
 - `delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” Delete multiple eval runs from the database. Args: `eval_run_ids` (List[str]): List of eval run IDs to delete.
 - `delete_knowledge_content(self, id: str) â€”` Delete a knowledge row from the database. Args: `id` (str): The ID of the knowledge row to delete.
 - `delete_session(self, session_id: str) -> bool` â€” Delete a session from the database. Args: `session_id` (str): ID of the session to delete Returns: `bool`: True if the session was deleted, False otherwise. Raises: `Exception`: If an error occurs during deletion.
 - `delete_sessions(self, session_ids: List[str]) -> None` â€” Delete all given sessions from the database. Can handle multiple session types in the same run. Args: `session_ids` (List[str]): The IDs of the sessions to delete. Raises: `Exception`: If an error occurs during deletion.
 - `delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None` â€” Delete user memories from the database. Args: `memory_ids` (List[str]): The IDs of the memories to delete. `user_id` (Optional[str]): The ID of the user to filter by. Defaults to None. Raises: `Exception`: If an error occurs during deletion.
 - `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) â€”` Delete a user memory from the database. Args: `memory_id` (str): The ID of the memory to delete. `user_id`

(Optional[str]): The ID of the user to filter by. Defaults to None. Returns: bool: True if deletion was successful, False otherwise. Raises: Exception: If an error occurs during deletion.

- `get_all_cultural_knowledge(self, name: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]` â€” Get all cultural knowledge from the database as CulturalKnowledge objects. Args: name (Optional[str]): The name of the cultural knowledge to filter by. agent_id (Optional[str]): The ID of the agent to filter by. team_id (Optional[str]): The ID of the team to filter by. limit (Optional[int]): The maximum number of cultural knowledge entries to return. page (Optional[int]): The page number. sort_by (Optional[str]): The column to sort by. sort_order (Optional[str]): The order to sort by. deserialize (Optional[bool]): Whether to deserialize the cultural knowledge. Defaults to True. Returns: Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]: - When deserialize=True: List of CulturalKnowledge objects - When deserialize=False: List of CulturalKnowledge dictionaries and total count Raises: Exception: If an error occurs during retrieval.
- `get_all_memory_topics(self) -> List[str]` â€” Get all memory topics from the database. Returns: List[str]: List of memory topics.
- `get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Get a cultural knowledge entry from the database. Args: id (str): The ID of the cultural knowledge to get. deserialize (Optional[bool]): Whether to deserialize the cultural knowledge. Defaults to True. Returns: Optional[Union[CulturalKnowledge, Dict[str, Any]]]: The cultural knowledge entry, or None if it doesnâ€™t exist. Raises: Exception: If an error occurs during retrieval.
- `get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Get an eval run from the database. Args: eval_run_id (str): The ID of the eval run to get. deserialize (Optional[bool]): Whether to serialize the eval run. Defaults to True. Returns: Optional[Union[EvalRunRecord, Dict[str, Any]]]: - When deserialize=True: EvalRunRecord object - When deserialize=False: EvalRun dictionary Raises: Exception: If an error occurs during retrieval.
- `get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` â€” Get all eval runs from the database. Args: limit (Optional[int]): The maximum number of eval runs to return. page (Optional[int]): The page number. sort_by (Optional[str]): The column to sort by. sort_order (Optional[str]): The order to sort by. agent_id (Optional[str]): The ID of the agent to filter by. team_id (Optional[str]): The ID of the team to filter by. workflow_id (Optional[str]): The ID of the workflow to filter by. model_id (Optional[str]): The ID of the model to filter by. eval_type (Optional[List[EvalType]]): The type(s) of eval to filter by. filter_type (Optional[EvalFilterType]): Filter by component type (agent, team, workflow). deserialize (Optional[bool]): Whether to serialize the eval runs. Defaults to True. create_table_if_not_found (Optional[bool]): Whether to create the table if it doesnâ€™t exist. Returns: Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]: - When deserialize=True: List of EvalRunRecord objects - When deserialize=False: List of dictionaries Raises: Exception: If an error occurs during retrieval.
- `get_knowledge_content(self, id: str) -> Optional[KnowledgeRow]` â€” Get a knowledge row from the database. Args: id (str): The ID of the knowledge row to get. Returns: Optional[KnowledgeRow]: The knowledge row, or None if it doesnâ€™t exist.
- `get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int]` â€” Get all knowledge contents from the database. Args: limit (Optional[int]): The maximum number of knowledge contents to return. page (Optional[int]): The page number. sort_by (Optional[str]): The column to sort by. sort_order (Optional[str]): The order to sort by. create_table_if_not_found (Optional[bool]): Whether to create the table if it doesnâ€™t exist. Returns: List[KnowledgeRow]: The knowledge contents. Raises: Exception: If an error occurs during retrieval.
- `get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]]` â€” Get all metrics matching the given date range. Args: starting_date (Optional[date]): The starting date to filter metrics by. ending_date (Optional[date]): The ending date to filter metrics by. Returns: Tuple[List[dict], Optional[int]): A tuple containing the metrics and the timestamp of the latest update. Raises: Exception: If an error occurs during retrieval.
- `get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Read a session from the database. Args: session_id (str): ID of the session to read. session_type (SessionType): Type of session to get. user_id (Optional[str]): User ID to filter by. Defaults to None. deserialize (Optional[bool]): Whether to serialize the session. Defaults to True. Returns: Union[Session, Dict[str, Any], None]: - When deserialize=True: Session object - When deserialize=False: Session dictionary Raises: Exception: If an error occurs during retrieval.
- `get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]]` â€” Get all sessions in the given table. Can filter by user_id and entity_id. Args: session_type (Optional[SessionType]): The type of session to get. user_id (Optional[str]): The ID of the user to filter by. entity_id (Optional[str]): The ID of the agent / workflow to filter by. start_timestamp (Optional[int]): The start timestamp to filter by. end_timestamp (Optional[int]): The end timestamp to filter by. session_name (Optional[str]): The name of the session to filter by. limit (Optional[int]): The maximum number of sessions to return. Defaults to None. page (Optional[int]): The page number to return. Defaults to None. sort_by (Optional[str]): The field to sort by. Defaults to None. sort_order (Optional[str]): The sort order. Defaults to None. deserialize (Optional[bool]): Whether to serialize the sessions. Defaults to True. Returns: Union[List[Session], Tuple[List[Dict[str, Any]], int]]: - When deserialize=True: List of Session objects - When deserialize=False: Tuple of (session dictionaries, total count) Raises: Exception: If an error occurs during retrieval.
- `get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]` â€” Get all memories from the database as UserMemory objects. Args: user_id (Optional[str]): The ID of the user to filter by. agent_id (Optional[str]): The ID of the agent to filter by. team_id (Optional[str]): The ID of the team to filter by. topics (Optional[List[str]]): The topics to filter by. search_content (Optional[str]): The content to search for. limit (Optional[int]): The maximum number of memories to return. page (Optional[int]): The page number. sort_by (Optional[str]): The column to sort by. sort_order (Optional[str]): The order to sort by. deserialize (Optional[bool]): Whether to serialize the memories. Defaults to True. Returns: Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]: - When deserialize=True: List of UserMemory objects - When deserialize=False: Tuple of (memory dictionaries, total count) Raises: Exception: If an error occurs during retrieval.
- `get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Get a memory from the database. Args: memory_id (str): The ID of the memory to get. deserialize (Optional[bool]): Whether to serialize the memory. Defaults to True. user_id (Optional[str]): The ID of the user to filter by. Defaults to None. Returns: Union[UserMemory, Dict[str, Any], None]: - When deserialize=True: UserMemory object - When deserialize=False: UserMemory dictionary Raises: Exception: If an error occurs during retrieval.
- `get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int]` â€” Get user memories stats. Args: limit (Optional[int]): The maximum number of user stats to return. page (Optional[int]): The page number. Returns: Tuple[List[Dict[str, Any]], int]: A list of dictionaries containing user stats and total count. Example: ([{ â€œuser_idâ€: â€œ123â€€, â€œtotal_memoriesâ€: 10, â€œlast_memory_updated_atâ€: 1714560000, },], total_count: 1,)
- `migrate_table_from_v1_to_v2(self, v1_db_schema: str, v1_table_name: str, v1_table_type: str)` â€” Migrate all content in the given table to the right v2 table
- `rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Upsert the name of an eval run in the database, returning raw dictionary. Args: eval_run_id (str): The ID of the eval run to update. name (str): The new name of the eval run. Returns: Optional[Dict[str, Any]]: The updated eval run, or None if the operation fails. Raises: Exception: If an error occurs during update.
- `rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Rename a session in the database. Args: session_id (str): The ID of the session to rename. session_type (SessionType): The type of session to rename. session_name (str): The new name for the session. deserialize (Optional[bool]): Whether to serialize the session. Defaults to True. Returns: Optional[Union[Session, Dict[str, Any]]]: - When deserialize=True: Session object - When deserialize=False: Session dictionary Raises: Exception: If an error occurs during renaming.
- `table_exists(self, table_name: str) -> bool` â€” Check if a table with the given name exists in the Postgres database. Args: table_name: Name of the table to check Returns: bool: True if the table exists in the database, False otherwise
- `upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Upsert a cultural knowledge entry into the database. Args: cultural_knowledge (CulturalKnowledge): The cultural knowledge to upsert. deserialize (Optional[bool]): Whether to deserialize the cultural knowledge. Defaults to True. Returns: Optional[CulturalKnowledge]: The upserted cultural knowledge entry. Raises: Exception: If an error occurs during upsert.
- `upsert_knowledge_content(self, knowledge_row: KnowledgeRow)` â€” Upsert knowledge content in the database. Args: knowledge_row (KnowledgeRow): The knowledge row to upsert. Returns: Optional[KnowledgeRow]: The upserted knowledge row, or None if the operation fails.
- `upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]]` â€” Bulk insert or update multiple memories in the database for improved performance. Args: memories (List[UserMemory]): The list of memories to upsert. deserialize (Optional[bool]): Whether to deserialize the memories. Defaults to True. preserve_updated_at (bool): If True, preserve the updated_at from the memory object. If False (default), set updated_at to current time. Returns: List[Union[UserMemory, Dict[str, Any]]]: List of upserted memories Raises: Exception: If an error occurs during bulk upsert.
- `upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Insert or update a session in the database. Args: session (Session): The session data to upsert. deserialize (Optional[bool]): Whether to deserialize the session. Defaults to True. Returns: Optional[Union[Session, Dict[str, Any]]]: - When deserialize=True: Session object - When deserialize=False: Session dictionary Raises: Exception: If an error occurs during upsert.
- `upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]]` â€” Bulk insert or update multiple sessions. Args: sessions (List[Session]): The list of session data to upsert. deserialize (Optional[bool]): Whether to deserialize the sessions. Defaults to True. preserve_updated_at (bool): If True, preserve the updated_at from the session object. Returns: List[Union[Session, Dict[str, Any]]]: List of upserted sessions Raises: Exception: If an error occurs during bulk upsert.
- `upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Upsert a user memory in the database. Args: memory (UserMemory): The user memory to upsert. deserialize (Optional[bool]): Whether to serialize the memory. Defaults to True. Returns: Optional[Union[UserMemory, Dict[str, Any]]]: - When deserialize=True: UserMemory object - When deserialize=False: UserMemory dictionary Raises: Exception: If an error occurs during upsert.

Module agno.db.postgres.schemas

- **Source:** `libs/agno/agno/db/postgres/schemas.py`

Table schemas and related utils used by the PostgresDb class

Functions

- `get_table_schema_definition(table_type: str) -> dict[str, Any]` â€” Get the expected schema definition for the given table. Args: `table_type (str)`: The type of table to get the schema for. Returns: `Dict[str, Any]`: Dictionary containing column definitions for the table

Module `agno.db.postgres.utils`

- **Source:** `libs/agno/db/postgres/utils.py`

Utility functions for the Postgres database class.

Functions

- `async abulk_upsert_metrics(session: AsyncSession, table: Table, metrics_records: list[dict]) -> list[dict]` â€” Bulk upsert metrics into the database. Args: `table (Table)`: The table to upsert into. `metrics_records (list[dict])`: The metrics records to upsert. Returns: `list[dict]`: The upserted metrics records.
- `async acreate_schema(session: AsyncSession, db_schema: str) -> None` â€” Create the database schema if it doesnâ€™t exist. Args: `session`: The SQLAlchemy session to use `db_schema (str)`: The definition of the database schema to create
- `async ais_table_available(session: AsyncSession, table_name: str, db_schema: str) -> bool` â€” Check if a table with the given name exists in the given schema. Returns: `bool`: True if the table exists, False otherwise.
- `async ais_valid_table(db_engine: AsyncEngine, table_name: str, table_type: str, db_schema: str) -> bool` â€” Check if the existing table has the expected column names. Args: `table_name (str)`: Name of the table to validate schema (str): Database schema name Returns: `bool`: True if table has all expected columns, False otherwise
- `apply_sorting(stmt, table: Table, sort_by: Optional[str]=None, sort_order: Optional[str]=None)` â€” Apply sorting to the given SQLAlchemy statement. Args: `stmt`: The SQLAlchemy statement to modify table: The table being queried sort_by: The field to sort by sort_order: The sort order (â€™ascâ€™ or â€™descâ€™) Returns: The modified statement with sorting applied
- `bulk_upsert_metrics(session: Session, table: Table, metrics_records: list[dict]) -> list[dict]` â€” Bulk upsert metrics into the database. Args: `table (Table)`: The table to upsert into. `metrics_records (list[dict])`: The metrics records to upsert. Returns: `list[dict]`: The upserted metrics records.
- `calculate_date_metrics(date_to_process: date, sessions_data: dict) -> dict` â€” Calculate metrics for the given single date. Args: `date_to_process (date)`: The date to calculate metrics for. `sessions_data (dict)`: The sessions data to calculate metrics for. Returns: `dict`: The calculated metrics.
- `create_schema(session: Session, db_schema: str) -> None` â€” Create the database schema if it doesnâ€™t exist. Args: `session`: The SQLAlchemy session to use `db_schema (str)`: The definition of the database schema to create
- `deserialize_cultural_knowledge(db_row: Dict[str, Any]) -> CulturalKnowledge` â€” Deserialize a database row to a CulturalKnowledge object. The database stores content as a JSON dict containing content, categories, and notes. This method extracts those fields and converts them back to the model format. Args: `db_row (Dict[str, Any])`: The database row as a dictionary. Returns: `CulturalKnowledge`: The cultural knowledge object.
- `fetch_all_sessions_data(sessions: List[Dict[str, Any]], dates_to_process: list[date], start_timestamp: int) -> Optional[dict]` â€” Return all session data for the given dates, for all session types. Args: `dates to process (list[date])`: The dates to fetch session data for. Returns: `dict`: A dictionary with dates as keys and session data as values, for all session types. Example: { â€™2000-01-01â€™: { â€™agentâ€™: [, â€™], â€™teamâ€™: [â€™], â€™workflowâ€™: [â€™], } }
- `get_dates_to_calculate_metrics_for(starting_date: date) -> list[date]` â€” Return the list of dates to calculate metrics for. Args: `starting_date (date)`: The starting date to calculate metrics for. Returns: `list[date]`: The list of dates to calculate metrics for.
- `is_table_available(session: Session, table_name: str, db_schema: str) -> bool` â€” Check if a table with the given name exists in the given schema. Returns: `bool`: True if the table exists, False otherwise.
- `is_valid_table(db_engine: Engine, table_name: str, table_type: str, db_schema: str) -> bool` â€” Check if the existing table has the expected column names. Args: `table_name (str)`: Name of the table to validate schema (str): Database schema name Returns: `bool`: True if table has all expected columns, False otherwise
- `serialize_cultural_knowledge(cultural_knowledge: CulturalKnowledge) -> Dict[str, Any]` â€” Serialize a CulturalKnowledge object for database storage. Converts the modelâ€™s separate content, categories, and notes fields into a single JSON dict for the database content column. Args: `cultural_knowledge (CulturalKnowledge)`: The cultural knowledge object to serialize. Returns: `Dict[str, Any]`: A dictionary with the content field as JSON containing content, categories, and notes.

Module `agno.db.redis.redis`

- **Source:** `libs/agno/db/redis/redis.py`

Classes

- **class `RedisDb` (bases: `BaseDb`)**
 - **Methods:**
 - `calculate_metrics(self) -> Optional[list[dict]]` â€” Calculate metrics for all dates without complete metrics. Returns: `Optional[list[dict]]`: The list of metrics. Raises: Exception: If any error occurs while calculating the metrics.
 - `clear_cultural_knowledge(self) -> None` â€” Delete all cultural knowledge from the database. Raises: Exception: If an error occurs during deletion.
 - `clear_memories(self) -> None` â€” Delete all memories from the database. Raises: Exception: If an error occurs during deletion.
 - `create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord]` â€” Create an EvalRunRecord in Redis. Args: `eval_run (EvalRunRecord)`: The eval run to create. Returns: `Optional[EvalRunRecord]`: The created eval run if successful, None otherwise. Raises: Exception: If any error occurs while creating the eval run.
 - `delete_cultural_knowledge(self, id: str) -> None` â€” Delete cultural knowledge by ID. Args: `id (str)`: The ID of the cultural knowledge to delete. Raises: Exception: If an error occurs during deletion.
 - `delete_eval_run(self, eval_run_id: str) -> None` â€” Delete an eval run from Redis. Args: `eval_run_id (str)`: The ID of the eval run to delete. Raises: Exception: If any error occurs while deleting the eval run.
 - `delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” Delete multiple eval runs from Redis. Args: `eval_run_ids (List[str])`: The IDs of the eval runs to delete. Raises: Exception: If any error occurs while deleting the eval runs.
 - `delete_knowledge_content(self, id: str)` â€” Delete a knowledge row from the database. Args: `id (str)`: The ID of the knowledge row to delete. Raises: Exception: If any error occurs while deleting the knowledge content.
 - `delete_session(self, session_id: str) -> bool` â€” Delete a session from Redis. Args: `session_id (str)`: The ID of the session to delete. Raises: Exception: If any error occurs while deleting the session.
 - `delete_sessions(self, session_ids: List[str]) -> None` â€” Delete multiple sessions from Redis. Args: `session_ids (List[str])`: The IDs of the sessions to delete. Raises: Exception: If any error occurs while deleting the sessions.
 - `delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None` â€” Delete user memories from Redis. Args: `memory_ids (List[str])`: The IDs of the memories to delete. `user_id (Optional[str])`: The ID of the user. If provided, only deletes memories belonging to this user.
 - `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None)` â€” Delete a user memory from Redis. Args: `memory_id (str)`: The ID of the memory to delete. `user_id (Optional[str])`: The ID of the user. If provided, verifies the memory belongs to this user before deleting. Returns: `bool`: True if the memory was deleted, False otherwise. Raises: Exception: If any error occurs while deleting the memory.
 - `get_all_cultural_knowledge(self, agent_id: Optional[str]=None, team_id: Optional[str]=None, name: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]` â€” Get all cultural knowledge with filtering and pagination. Args: `agent_id (Optional[str])`: Filter by agent ID. `team_id (Optional[str])`: Filter by team ID. `name (Optional[str])`: Filter by name (case-insensitive partial match). `limit (Optional[int])`: Maximum number of results to return. `page (Optional[int])`: Page number for pagination. `sort_by (Optional[str])`: Field to sort by. `sort_order (Optional[str])`: Sort order (â€™ascâ€™ or â€™descâ€™). `deserialize (Optional[bool])`: Whether to deserialize to CulturalKnowledge objects. Defaults to True. Returns: `Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of CulturalKnowledge objects - When `deserialize=False`: Tuple with list of dictionaries and total count Raises: Exception: If an error occurs during retrieval.
 - `get_all_memory_topics(self) -> List[str]` â€” Get all memory topics from Redis. Returns: `List[str]`: The list of memory topics.
 - `get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Get cultural knowledge by ID. Args: `id (str)`: The ID of the cultural knowledge to retrieve. `deserialize (Optional[bool])`: Whether to deserialize to CulturalKnowledge object. Defaults to True. Returns: `Optional[Union[CulturalKnowledge, Dict[str, Any]]]`: The cultural knowledge if found, None otherwise. Raises: Exception: If an error occurs during retrieval.
 - `get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Get an eval run from Redis. Args: `eval_run_id (str)`: The ID of the eval run to get. Returns: `Optional[EvalRunRecord]`: The eval run if found, None otherwise. Raises: Exception: If any error occurs while getting the eval run.
 - `get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` â€” Get all eval runs from Redis. Args: `limit (Optional[int])`: The maximum number of eval runs to return. `page (Optional[int])`: The page number to return. `sort_by (Optional[str])`: The field to sort by. `sort_order (Optional[str])`: The order to sort by. Returns: `List[EvalRunRecord]`: The list of eval runs. Raises: Exception: If any error occurs while getting the eval runs.

- `get_knowledge_content(self, id: str) -> Optional[KnowledgeRow]` â€” Get a knowledge row from the database. Args: `id (str)`: The ID of the knowledge row to get. Returns: `Optional[KnowledgeRow]`: The knowledge row, or None if it doesnâ€™t exist. Raises: `Exception`: If any error occurs while getting the knowledge content.
- `get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int]` â€” Get all knowledge contents from the database. Args: `limit (Optional[int])`: The maximum number of knowledge contents to return. `page (Optional[int])`: The page number. `sort_by (Optional[str])`: The column to sort by. `sort_order (Optional[str])`: The order to sort by. Returns: `Tuple[List[KnowledgeRow], int]`: The knowledge contents and total count. Raises: `Exception`: If an error occurs during retrieval. Raises: `Exception`: If any error occurs while getting the knowledge contents.
- `get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]]` â€” Get all metrics matching the given date range. Args: `starting_date (Optional[date])`: The starting date to filter by. `ending_date (Optional[date])`: The ending date to filter by. Returns: `Tuple[List[dict], Optional[int]]`: A tuple containing the list of metrics and the latest updated_at. Raises: `Exception`: If any error occurs while getting the metrics.
- `get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Read a session from Redis. Args: `session_id (str)`: The ID of the session to get. `session_type (SessionType)`: The type of session to get. `user_id (Optional[str])`: The ID of the user to filter by. Returns: `Optional[Union[AgentSession, TeamSession, WorkflowSession]]`: The session if found, None otherwise. Raises: `Exception`: If any error occurs while getting the session.
- `get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True, create_index_if_not_found: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]]` â€” Get all sessions matching the given filters. Args: `session_type (Optional[SessionType])`: The type of session to filter by. `user_id (Optional[str])`: The ID of the user to filter by. `component_id (Optional[str])`: The ID of the component to filter by. `session_name (Optional[str])`: The name of the session to filter by. `limit (Optional[int])`: The maximum number of sessions to return. `page (Optional[int])`: The page number to return. `sort_by (Optional[str])`: The field to sort by. `sort_order (Optional[str])`: The order to sort by. Returns: `List[Union[AgentSession, TeamSession, WorkflowSession]]`: The list of sessions.
- `get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]` â€” Get all memories from Redis as UserMemory objects. Args: `user_id (Optional[str])`: The ID of the user to filter by. `agent_id (Optional[str])`: The ID of the agent to filter by. `team_id (Optional[str])`: The ID of the team to filter by. `topics (Optional[List[str]])`: The topics to filter by. `search_content (Optional[str])`: The content to search for. `limit (Optional[int])`: The maximum number of memories to return. `page (Optional[int])`: The page number to return. `sort_by (Optional[str])`: The field to sort by. `sort_order (Optional[str])`: The order to sort by. `deserialize (Optional[bool])`: Whether to deserialize the memories. Returns: `Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of UserMemory objects - When `deserialize=False`: Tuple of (memory dictionaries, total count) Raises: `Exception`: If any error occurs while reading the memories.
- `get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Get a memory from Redis. Args: `memory_id (str)`: The ID of the memory to get. `deserialize (Optional[bool])`: Whether to deserialize the memory. Defaults to True. `user_id (Optional[str])`: The ID of the user. If provided, only returns the memory if it belongs to this user. Returns: `Optional[UserMemory]`: The memory data if found, None otherwise.
- `get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int]` â€” Get user memory stats from Redis. Args: `limit (Optional[int])`: The maximum number of stats to return. `page (Optional[int])`: The page number to return. Returns: `Tuple[List[Dict[str, Any]], int]`: A tuple containing the list of stats and the total number of stats. Raises: `Exception`: If any error occurs while getting the user memory stats.
- `rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Update the name of an eval run in Redis. Args: `eval_run_id (str)`: The ID of the eval run to rename. `name (str)`: The new name of the eval run. Returns: `Optional[Dict[str, Any]]`: The updated eval run data if successful, None otherwise. Raises: `Exception`: If any error occurs while updating the eval run name.
- `rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Rename a session in Redis. Args: `session_id (str)`: The ID of the session to rename. `session_type (SessionType)`: The type of session to rename. `session_name (str)`: The new name of the session. Returns: `Optional[Session]`: The renamed session if successful, None otherwise. Raises: `Exception`: If any error occurs while renaming the session.
- `table_exists(self, table_name: str) -> bool` â€” Redis implementation, always returns True.
- `upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Upsert cultural knowledge in Redis. Args: `cultural_knowledge (CulturalKnowledge)`: The cultural knowledge to upsert. `deserialize (Optional[bool])`: Whether to deserialize the result. Defaults to True. Returns: `Optional[Union[CulturalKnowledge, Dict[str, Any]]]`: The upserted cultural knowledge. Raises: `Exception`: If an error occurs during upsert.
- `upsert_knowledge_content(self, knowledge_row: KnowledgeRow) -> Optional[KnowledgeRow]` â€” Upsert knowledge content in the database. Args: `knowledge_row (KnowledgeRow)`: The knowledge row to upsert. Returns: `Optional[KnowledgeRow]`: The upserted knowledge row, or None if the operation fails. Raises: `Exception`: If any error occurs while upserting the knowledge content.
- `upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]]` â€” Bulk upsert multiple user memories for improved performance on large datasets. Args: `memories (List[UserMemory])`: List of memories to upsert. `deserialize (Optional[bool])`: Whether to deserialize the memories. Defaults to True. Returns: `List[Union[UserMemory, Dict[str, Any]]]`: List of upserted memories. Raises: `Exception`: If an error occurs during bulk upsert.
- `upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Insert or update a session in Redis. Args: `session (Session)`: The session to upsert. Returns: `Optional[Session]`: The upserted session if successful, None otherwise. Raises: `Exception`: If any error occurs while upserting the session.
- `upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]]` â€” Bulk upsert multiple sessions for improved performance on large datasets. Args: `sessions (List[Session])`: List of sessions to upsert. `deserialize (Optional[bool])`: Whether to deserialize the sessions. Defaults to True. Returns: `List[Union[Session, Dict[str, Any]]]`: List of upserted sessions. Raises: `Exception`: If an error occurs during bulk upsert.
- `upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Upsert a user memory in Redis. Args: `memory (UserMemory)`: The memory to upsert. Returns: `Optional[UserMemory]`: The upserted memory data if successful, None otherwise.

Module agno.db.redis.schemas

- **Source:** `libs/agno/agno/db/redis/schemas.py`

Table schemas and related utils used by the RedisDb class

Functions

- `get_table_schema_definition(table_type: str) -> dict[str, Any]` â€” Get the expected schema definition for the given table. For Redis, we donâ€™t need actual schemas since itâ€™s a key-value store, but we maintain this for compatibility with the base interface. Args: `table_type (str)`: The type of table to get the schema for. Returns: `Dict[str, Any]`: Dictionary containing schema information for the table

Module agno.db.redis.utils

- **Source:** `libs/agno/agno/db/redis/utils.py`

Utility functions for the Redis database class.

Classes

- **class CustomEncoder** (bases: `json.JSONEncoder`)
 - Custom encoder to handle non JSON serializable types.
 - **Methods:**
 - `default(self, obj) -> No docstring provided.`

Functions

- `apply_filters(records: List[Dict[str, Any]], conditions: Dict[str, Any]) -> List[Dict[str, Any]]` â€” No docstring provided.
- `apply_pagination(records: List[Dict[str, Any]], limit: Optional[int]=None, page: Optional[int]=None) -> List[Dict[str, Any]]` â€” No docstring provided.
- `apply_sorting(records: List[Dict[str, Any]], sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> List[Dict[str, Any]]` â€” No docstring provided.
- `calculate_date_metrics(date_to_process: date, sessions_data: dict) -> dict` â€” Calculate metrics for the given date. Args: `date_to_process (date)`: The date to calculate metrics for. `sessions_data (dict)`: The sessions data. Returns: `dict`: A dictionary with the calculated metrics.
- `create_index_entries(redis_client: Redis, prefix: str, table_type: str, record_id: str, record_data: Dict[str, Any], index_fields: List[str]) -> None` â€” No docstring provided.
- `deserialize_cultural_knowledge_from_db(db_row: Dict[str, Any]) -> CulturalKnowledge` â€” Deserialize a database row to a CulturalKnowledge object. The database stores content as a dict containing content, categories, and notes. This method extracts those fields and converts them back to the model format. Args: `db_row (Dict[str, Any])`: The database row as a dictionary. Returns: `CulturalKnowledge`: The cultural knowledge object.
- `deserialize_data(data: str) -> dict` â€” No docstring provided.
- `fetch_all_sessions_data(sessions: List[Dict[str, Any]], dates_to_process: list[date], start_timestamp: int) -> Optional[dict]` â€” Return all session data for the given dates, for all session types. Args: `sessions (List[Dict[str, Any]])`: The sessions data. `dates_to_process (list[date])`: The dates to process. `start_timestamp (int)`: The start timestamp. Returns: `Optional[dict]`: A dictionary with the session data for the given dates, for all session types.

- generate_index_key(prefix: str, table_type: str, index_field: str, index_value: str) -> str â€œ Generate Redis key for index entries.
- generate_redis_key(prefix: str, table_type: str, key_id: str) -> str â€œ Generate Redis key with proper namespacing.
- get_all_keys_for_table(redis_client: Redis, prefix: str, table_type: str) -> List[str] â€œ Get all relevant keys for the given table type. Args: redis_client (Redis): The Redis client. prefix (str): The prefix for the keys. table_type (str): The table type. Returns: List[str]: A list of all relevant keys for the given table type.
- get_dates_to_calculate_metrics_for(starting_date: date) -> list[date] â€œ Return the list of dates to calculate metrics for. Args: starting_date (date): The starting date. Returns: list[date]: The list of dates to calculate metrics for.
- remove_index_entries(redis_client: Redis, prefix: str, table_type: str, record_id: str, record_data: Dict[str, Any], index_fields: List[str]) -> None â€œ No docstring provided.
- serialize_cultural_knowledge_for_db(cultural_knowledge: CulturalKnowledge) -> Dict[str, Any] â€œ Serialize a CulturalKnowledge object for database storage. Converts the modelâ€™s separate content, categories, and notes fields into a single dict for the database content column. Args: cultural_knowledge (CulturalKnowledge): The cultural knowledge object to serialize. Returns: Dict[str, Any]: A dictionary with the content field as a dict containing content, categories, and notes.
- serialize_data(data: dict) -> str â€œ No docstring provided.

Module agno.db.schemas.culture

- **Source:** libs/agno/agno/db/schemas/culture.py

Classes

- class CulturalKnowledge
 - Model for Cultural Knowledge

Notice: Culture is an experimental feature and is subject to change.

- **Methods:**
 - bump_updated_at(self) -> None â€œ Bump updated_at to now (UTC).
 - from_dict(cls, data: Dict[str, Any]) -> 'CulturalKnowledge' â€œ No docstring provided.
 - preview(self) -> Dict[str, Any] â€œ Return a preview of the cultural knowledge
 - to_dict(self) -> Dict[str, Any] â€œ No docstring provided.

Module agno.db.schemas.evals

- **Source:** libs/agno/agno/db/schemas/evals.py

Classes

- class EvalFilterType (bases: str, Enum)
- class EvalRunRecord (bases: BaseModel)
 - Evaluation run results stored in the database
- class EvalType (bases: str, Enum)

Module agno.db.schemas.knowledge

- **Source:** libs/agno/agno/db/schemas/knowledge.py

Classes

- class KnowledgeRow (bases: BaseModel)
 - Knowledge Row that is stored in the database
 - **Methods:**
 - generate_id(self) -> 'KnowledgeRow' â€œ No docstring provided.
 - to_dict(self) -> Dict[str, Any] â€œ No docstring provided.

Module agno.db.schemas.memory

- **Source:** libs/agno/agno/db/schemas/memory.py

Classes

- class UserMemory
 - Model for User Memories
 - **Methods:**
 - from_dict(cls, data: Dict[str, Any]) -> 'UserMemory' â€œ No docstring provided.
 - to_dict(self) -> Dict[str, Any] â€œ No docstring provided.

Module agno.db.singlestore.schemas

- **Source:** libs/agno/agno/db/singlestore/schemas.py

Table schemas and related utils used by the SingleStoreDb class

Functions

- get_table_schema_definition(table_type: str) -> dict[str, Any] â€œ Get the expected schema definition for the given table. Args: table_type (str): The type of table to get the schema for. Returns: Dict[str, Any]: Dictionary containing column definitions for the table

Module agno.db.singlestore.singlestore

- **Source:** libs/agno/agno/db/singlestore/singlestore.py

Classes

- class SingleStoreDb (bases: BaseDb)
 - **Methods:**
 - calculate_metrics(self) -> Optional[list[dict]] â€œ Calculate metrics for all dates without complete metrics. Returns: Optional[list[dict]]: The calculated metrics. Raises: Exception: If an error occurs during metrics calculation.
 - clear_cultural_knowledge(self) -> None â€œ Delete all cultural knowledge from the database. Raises: Exception: If an error occurs during deletion.
 - clear_memories(self) -> None â€œ Delete all memories from the database. Raises: Exception: If an error occurs during deletion.
 - create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord] â€œ Create an EvalRunRecord in the database. Args: eval_run (EvalRunRecord): The eval run to create. Returns: Optional[EvalRunRecord]: The created eval run, or None if the operation fails. Raises: Exception: If an error occurs during creation.
 - delete_cultural_knowledge(self, id: str) -> None â€œ Delete a cultural knowledge entry from the database. Args: id (str): The ID of the cultural knowledge to delete. Raises: Exception: If an error occurs during deletion.
 - delete_eval_run(self, eval_run_id: str) -> None â€œ Delete an eval run from the database. Args: eval_run_id (str): The ID of the eval run to delete.

- `delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” Delete multiple eval runs from the database. Args: `eval_run_ids (List[str]):` List of eval run IDs to delete.
- `delete_knowledge_content(self, id: str) â€”` Delete a knowledge row from the database. Args: `id (str):` The ID of the knowledge row to delete.
- `delete_session(self, session_id: str) -> bool` â€” Delete a session from the database. Args: `session_id (str):` ID of the session to delete Returns: `bool: True` if the session was deleted, `False` otherwise. Raises: `Exception: If an error occurs during deletion.`
- `delete_sessions(self, session_ids: List[str]) -> None` â€” Delete all given sessions from the database. Can handle multiple session types in the same run. Args: `session_ids (List[str]):` The IDs of the sessions to delete. Raises: `Exception: If an error occurs during deletion.`
- `delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None` â€” Delete user memories from the database. Args: `memory_ids (List[str]):` The IDs of the memories to delete. `user_id (Optional[str]):` The ID of the user to filter by. Defaults to `None`. Raises: `Exception: If an error occurs during deletion.`
- `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) â€”` Delete a user memory from the database. Args: `memory_id (str):` The ID of the memory to delete. `user_id (Optional[str]):` The ID of the user to filter by. Defaults to `None`. Returns: `bool: True` if deletion was successful, `False` otherwise. Raises: `Exception: If an error occurs during deletion.`
- `get_all_cultural_knowledge(self, name: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]` â€” Get all cultural knowledge from the database as CulturalKnowledge objects. Args: `name (Optional[str]):` The name of the cultural knowledge to filter by. `agent_id (Optional[str]):` The ID of the agent to filter by. `team_id (Optional[str]):` The ID of the team to filter by. `limit (Optional[int]):` The maximum number of cultural knowledge entries to return. `page (Optional[int]):` The page number. `sort_by (Optional[str]):` The column to sort by. `sort_order (Optional[str]):` The order to sort by. `deserialize (Optional[bool]):` Whether to deserialize the cultural knowledge. Defaults to `True`. Returns: `Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]:` - When `deserialize=True`: List of CulturalKnowledge objects - When `deserialize=False`: List of CulturalKnowledge dictionaries and total count Raises: `Exception: If an error occurs during retrieval.`
- `get_all_memory_topics(self) -> List[str]` â€” Get all memory topics from the database. Returns: `List[str]:` List of memory topics.
- `get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Get a cultural knowledge entry from the database. Args: `id (str):` The ID of the cultural knowledge to get. `deserialize (Optional[bool]):` Whether to deserialize the cultural knowledge. Defaults to `True`. Returns: `Optional[Union[CulturalKnowledge, Dict[str, Any]]]:` The cultural knowledge entry, or `None` if it doesnâ€™t exist. Raises: `Exception: If an error occurs during retrieval.`
- `get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Get an eval run from the database. Args: `eval_run_id (str):` The ID of the eval run to get. `deserialize (Optional[bool]):` Whether to serialize the eval run. Defaults to `True`. Returns: `Optional[Union[EvalRunRecord, Dict[str, Any]]]:` - When `deserialize=True`: EvalRunRecord object - When `deserialize=False`: EvalRun dictionary Raises: `Exception: If an error occurs during retrieval.`
- `get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` â€” Get all eval runs from the database. Args: `limit (Optional[int]):` The maximum number of eval runs to return. `page (Optional[int]):` The page number. `sort_by (Optional[str]):` The column to sort by. `sort_order (Optional[str]):` The order to sort by. `agent_id (Optional[str]):` The ID of the agent to filter by. `team_id (Optional[str]):` The ID of the team to filter by. `workflow_id (Optional[str]):` The ID of the workflow to filter by. `model_id (Optional[str]):` The ID of the model to filter by. `eval_type (Optional[List[EvalType]]):` The type(s) of eval to filter by. `filter_type (Optional[EvalFilterType]):` Filter by component type (agent, team, workflow). `deserialize (Optional[bool]):` Whether to serialize the eval runs. Defaults to `True`. `create table if not found (Optional[bool]):` Whether to create the table if it doesnâ€™t exist. Returns: `Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]:` - When `deserialize=True`: List of EvalRunRecord objects - When `deserialize=False`: List of dictionaries Raises: `Exception: If an error occurs during retrieval.`
- `get_knowledge_content(self, id: str) -> Optional[KnowledgeRow]` â€” Get a knowledge row from the database. Args: `id (str):` The ID of the knowledge row to get. Returns: `Optional[KnowledgeRow]:` The knowledge row, or `None` if it doesnâ€™t exist.
- `get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int]` â€” Get all knowledge contents from the database. Args: `limit (Optional[int]):` The maximum number of knowledge contents to return. `page (Optional[int]):` The page number. `sort_by (Optional[str]):` The column to sort by. `sort_order (Optional[str]):` The order to sort by. Returns: `Tuple[List[KnowledgeRow], int]:` The knowledge contents and total count. Raises: `Exception: If an error occurs during retrieval.`
- `get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]]` â€” Get all metrics matching the given date range. Args: `starting_date (Optional[date]):` The starting date to filter metrics by. `ending_date (Optional[date]):` The ending date to filter metrics by. Returns: `Tuple[List[dict], int]:` A tuple containing the metrics and the timestamp of the latest update. Raises: `Exception: If an error occurs during retrieval.`
- `get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Read a session from the database. Args: `session_id (str):` ID of the session to read. `session_type (SessionType):` Type of session to get. `user_id (Optional[str]):` User ID to filter by. Defaults to `None`. `deserialize (Optional[bool]):` Whether to serialize the session. Defaults to `True`. Returns: `Union[Session, Dict[str, Any], None]:` - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: `Exception: If an error occurs during retrieval.`
- `get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]]` â€” Get all sessions in the given table. Can filter by user\_id and entity\_id. Args: `session_type (Optional[SessionType]):` The type of session to filter by. `user_id (Optional[str]):` The ID of the user to filter by. `component_id (Optional[str]):` The ID of the agent / workflow to filter by. `session_name (Optional[str]):` The name of the session to filter by. `start_timestamp (Optional[int]):` The start timestamp to filter by. `end_timestamp (Optional[int]):` The end timestamp to filter by. `limit (Optional[int]):` The maximum number of sessions to return. Defaults to `None`. `page (Optional[int]):` The page number to return. Defaults to `None`. `sort_by (Optional[str]):` The field to sort by. Defaults to `None`. `sort_order (Optional[str]):` The sort order. Defaults to `None`. `deserialize (Optional[bool]):` Whether to serialize the sessions. Defaults to `True`. `create table if not found (Optional[bool]):` Whether to create the table if it doesnâ€™t exist. Returns: `Union[List[Session], Tuple[List[Dict], int]]:` - When `deserialize=True`: List of Session objects - When `deserialize=False`: Tuple of (session dictionaries, total count) Raises: `Exception: If an error occurs during retrieval.`
- `get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]` â€” Get all memories from the database as UserMemory objects. Args: `user_id (Optional[str]):` The ID of the user to filter by. `agent_id (Optional[str]):` The ID of the agent to filter by. `team_id (Optional[str]):` The ID of the team to filter by. `topics (Optional[List[str]):` The topics to filter by. `search_content (Optional[str]):` The content to search for. `limit (Optional[int]):` The maximum number of memories to return. `page (Optional[int]):` The page number. `sort_by (Optional[str]):` The column to sort by. `sort_order (Optional[str]):` The order to sort by. `deserialize (Optional[bool]):` Whether to serialize the memories. Defaults to `True`. Returns: `Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]:` - When `deserialize=True`: List of UserMemory objects - When `deserialize=False`: Tuple of (memory dictionaries, total count) Raises: `Exception: If an error occurs during retrieval.`
- `get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[UserMemory]` â€” Get a memory from the database. Args: `memory_id (str):` The ID of the memory to get. `deserialize (Optional[bool]):` Whether to serialize the memory. Defaults to `True`. `user_id (Optional[str]):` The ID of the user to filter by. Defaults to `None`. Returns: `Union[UserMemory, Dict[str, Any], None]:` - When `deserialize=True`: UserMemory object - When `deserialize=False`: UserMemory dictionary Raises: `Exception: If an error occurs during retrieval.`
- `get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int]` â€” Get user memories stats. Args: `limit (Optional[int]):` The maximum number of user stats to return. `page (Optional[int]):` The page number. Returns: `Tuple[List[Dict[str, Any]], int]:` A list of dictionaries containing user stats and total count. Example: `{ [ { â€œuser_idâ€œ: â€œe123â€œ, â€œtotal_memoriesâ€œ: 10, â€œlast_memory_updated_atâ€œ: 1714560000, }, ], total_count: 1 }`
- `rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Upsert the name of an eval run in the database, returning raw dictionary. Args: `eval_run_id (str):` The ID of the eval run to update. `name (str):` The new name of the eval run. Returns: `Optional[Dict[str, Any]]:` The updated eval run, or `None` if the operation fails. Raises: `Exception: If an error occurs during update.`
- `rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Rename a session in the database. Args: `session_id (str):` The ID of the session to rename. `session_type (SessionType):` The type of session to rename. `session_name (str):` The new name for the session. `deserialize (Optional[bool]):` Whether to serialize the session. Defaults to `True`. Returns: `Optional[Union[Session, Dict[str, Any]]]:` - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: `Exception: If an error occurs during renaming.`
- `table_exists(self, table_name: str) -> bool` â€” Check if a table with the given name exists in the SingleStore database. Args: `table_name: Name of the table to check` Returns: `bool: True` if the table exists in the database, `False` otherwise
- `upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Upsert a cultural knowledge entry into the database. Args: `cultural_knowledge (CulturalKnowledge):` The cultural knowledge to upsert. `deserialize (Optional[bool]):` Whether to deserialize the cultural knowledge. Defaults to `True`. Returns: `Optional[CulturalKnowledge]:` The upserted cultural knowledge entry. Raises: `Exception: If an error occurs during upsert.`
- `upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€”` Upsert knowledge content in the database. Args: `knowledge_row (KnowledgeRow):` The knowledge row to upsert. Returns: `Optional[KnowledgeRow]:` The upserted knowledge row, or `None` if the operation fails.
- `upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]]` â€” Bulk upsert multiple user memories for improved performance on large datasets. Args: `memories (List[UserMemory]):` List of memories to upsert. `deserialize (Optional[bool]):` Whether to deserialize the memories. Defaults to `True`. Returns: `List[Union[UserMemory, Dict[str, Any]]]:` List of upserted memories. Raises: `Exception: If an error occurs during bulk upsert.`
- `upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Session]` â€” Insert or update a session in the database. Args: `session (Session):` The session data to upsert. `deserialize (Optional[bool]):` Whether to deserialize the session. Defaults to `True`. Returns: `Optional[Union[Session, Dict[str, Any]]]:` - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: `Exception: If an error occurs during upsert.`
- `upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]]` â€” Bulk upsert multiple sessions for improved performance on large datasets. Args: `sessions (List[Session]):` List of sessions to upsert. `deserialize (Optional[bool]):` Whether to deserialize the sessions. Defaults to `True`. Returns: `List[Union[Session, Dict[str, Any]]]:` List of upserted sessions. Raises: `Exception: If an error occurs during bulk upsert.`
- `upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Upsert a user memory in the database. Args: `memory (UserMemory):` The user memory to upsert. `deserialize (Optional[bool]):` Whether to serialize the memory. Defaults to `True`. Returns: `Optional[Union[UserMemory, Dict[str, Any]]]:` - When `deserialize=True`: UserMemory object - When `deserialize=False`: UserMemory dictionary Raises: `Exception: If an error occurs during upsert.`

Module agno.db.singlestore.utils

- **Source:** `libs/agno/agno/db/singlestore/utils.py`

Utility functions for the SingleStore database class.

Functions

- `apply_sorting(stmt, table: Table, sort_by: Optional[str]=None, sort_order: Optional[str]=None) â€”` Apply sorting to the given SQLAlchemy statement. Args: `stmt`: The SQLAlchemy statement to modify table: The table being queried `sort_by`: The field to sort by `sort_order`: The sort order (â€˜ascâ€™ or â€˜descâ€™) Returns: The modified statement with sorting applied
- `bulk_upsert_metrics(session: Session, table: Table, metrics_records: list[dict]) -> list[dict] â€”` Bulk upsert metrics into the database with proper duplicate handling. Args: `table` (Table): The table to upsert into. `metrics_records` (list[dict]): The metrics records to upsert. Returns: `list[dict]`: The upserted metrics records.
- `calculate_date_metrics(date_to_process: date, sessions_data: dict) -> dict â€”` Calculate metrics for the given single date. Args: `date_to_process` (date): The date to calculate metrics for. `sessions_data` (dict): The sessions data to calculate metrics for. Returns: `dict`: The calculated metrics.
- `create_schema(session: Session, db_schema: str) -> None â€”` Create the database schema if it doesnâ€™t exist. Args: `session`: The SQLAlchemy session to use `db_schema` (str): The definition of the database schema to create Raises: `Exception`: If the schema creation fails.
- `deserialize_cultural_knowledge_from_db(db_row: Dict[str, Any]) -> CulturalKnowledge â€”` Deserialize a database row to a CulturalKnowledge object. The database stores content as a JSON dict containing content, categories, and notes. This method extracts those fields and converts them back to the model format. Args: `db_row` (Dict[str, Any]): The database row as a dictionary. Returns: `CulturalKnowledge`: The cultural knowledge object.
- `fetch_all_sessions_data(sessions: List[Dict[str, Any]], dates_to_process: list[date], start_timestamp: int) -> Optional[dict] â€”` Return all session data for the given dates, for all session types. Args: `dates_to_process` (list[date]): The dates to fetch session data for. Returns: `dict`: A dictionary with dates as keys and session data as values, for all session types. Example: { â€œ2000-01-01â€: { â€œagentâ€: [, â€¦], â€œteamâ€: [â€¦], â€œworkflowâ€: [â€¦], } }
- `get_dates_to_calculate_metrics_for(starting_date: date) -> list[date] â€”` Return the list of dates to calculate metrics for. Args: `starting_date` (date): The starting date to calculate metrics for. Returns: `list[date]`: The list of dates to calculate metrics for.
- `is_table_available(session: Session, table_name: str, db_schema: Optional[str]) -> bool â€”` Check if a table with the given name exists in the given schema. Returns: `bool`: True if the table exists, False otherwise.
- `is_valid_table(db_engine: Engine, table_name: str, table_type: str, db_schema: Optional[str]) -> bool â€”` Check if the existing table has the expected column names. Args: `table_name` (str): Name of the table to validate schema (str): Database schema name Returns: `bool`: True if table has all expected columns, False otherwise
- `serialize_cultural_knowledge_for_db(cultural_knowledge: CulturalKnowledge) -> Dict[str, Any] â€”` Serialize a CulturalKnowledge object for database storage. Converts the modelâ€™s separate content, categories, and notes fields into a single JSON dict for the database content column. Args: `cultural_knowledge` (CulturalKnowledge): The cultural knowledge object to serialize. Returns: `Dict[str, Any]`: A dictionary with the content field as JSON containing content, categories, and notes.

Module agno.db.sqlite.async_sqlite

- **Source:** `libs/agno/agno/db/sqlite/async_sqlite.py`

Classes

- **class AsyncSQLiteDb** (bases: AsyncBaseDb)
 - **Methods:**
 - `async calculate_metrics(self) -> Optional[list[dict]] â€”` Calculate metrics for all dates without complete metrics. Returns: `Optional[list[dict]]`: The calculated metrics. Raises: `Exception`: If an error occurs during metrics calculation.
 - `async clear_cultural_knowledge(self) -> None â€”` Delete all cultural artifacts from the database. Raises: `Exception`: If an error occurs during deletion.
 - `async clear_memories(self) -> None â€”` Delete all memories from the database. Raises: `Exception`: If an error occurs during deletion.
 - `async create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord] â€”` Create an EvalRunRecord in the database. Args: `eval_run` (EvalRunRecord): The eval run to create. Returns: `Optional[EvalRunRecord]`: The created eval run, or None if the operation fails. Raises: `Exception`: If an error occurs during creation.
 - `async delete_cultural_knowledge(self, id: str) -> None â€”` Delete a cultural artifact from the database. Args: `id` (str): The ID of the cultural artifact to delete. Raises: `Exception`: If an error occurs during deletion.
 - `async delete_eval_run(self, eval_run_id: str) -> None â€”` Delete an eval run from the database. Args: `eval_run_id` (str): The ID of the eval run to delete.
 - `async delete_eval_runs(self, eval_run_ids: List[str]) -> None â€”` Delete multiple eval runs from the database. Args: `eval_run_ids` (List[str]): List of eval run IDs to delete.
 - `async delete_knowledge_content(self, id: str) â€”` Delete a knowledge row from the database. Args: `id` (str): The ID of the knowledge row to delete. Raises: `Exception`: If an error occurs during deletion.
 - `async delete_session(self, session_id: str) -> bool â€”` Delete a session from the database. Args: `session_id` (str): ID of the session to delete Returns: `bool`: True if the session was deleted, False otherwise. Raises: `Exception`: If an error occurs during deletion.
 - `async delete_sessions(self, session_ids: List[str]) -> None â€”` Delete all given sessions from the database. Can handle multiple session types in the same run. Args: `session_ids` (List[str]): The IDs of the sessions to delete. Raises: `Exception`: If an error occurs during deletion.
 - `async delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None â€”` Delete user memories from the database. Args: `memory_ids` (List[str]): The IDs of the memories to delete. `user_id` (Optional[str]): The user ID to filter by. Defaults to None. Raises: `Exception`: If an error occurs during deletion.
 - `async delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) â€”` Delete a user memory from the database. Args: `memory_id` (str): The ID of the memory to delete. `user_id` (Optional[str]): The user ID to filter by. Defaults to None. Returns: `bool`: True if deletion was successful, False otherwise. Raises: `Exception`: If an error occurs during deletion.
 - `async get_all_cultural_knowledge(self, name: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]] â€”` Get all cultural artifacts from the database as CulturalNotion objects. Args: `name` (Optional[str]): The name of the cultural artifact to filter by. `agent_id` (Optional[str]): The ID of the agent to filter by. `team_id` (Optional[str]): The ID of the team to filter by. `limit` (Optional[int]): The maximum number of cultural artifacts to return. `page` (Optional[int]): The page number. `sort_by` (Optional[str]): The column to sort by. `sort_order` (Optional[str]): The order to sort by. `deserialize` (Optional[bool]): Whether to serialize the cultural artifacts. Defaults to True. Returns: `Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of CulturalNotion objects - When `deserialize=False`: List of CulturalNotion dictionaries and total count Raises: `Exception`: If an error occurs during retrieval.
 - `async get_all_memory_topics(self) -> List[str] â€”` Get all memory topics from the database. Returns: `List[str]`: List of memory topics.
 - `async get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]] â€”` Get a cultural artifact from the database. Args: `id` (str): The ID of the cultural artifact to get. `deserialize` (Optional[bool]): Whether to serialize the cultural artifact. Defaults to True. Returns: `Optional[CulturalKnowledge]`: The cultural artifact, or None if it doesnâ€™t exist. Raises: `Exception`: If an error occurs during retrieval.
 - `async get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]] â€”` Get an eval run from the database. Args: `eval_run_id` (str): The ID of the eval run to get. `deserialize` (Optional[bool]): Whether to serialize the eval run. Defaults to True. Returns: `Optional[Union[EvalRunRecord, Dict[str, Any]]]`: - When `deserialize=True`: EvalRunRecord object - When `deserialize=False`: EvalRun dictionary Raises: `Exception`: If an error occurs during retrieval.
 - `async get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]] â€”` Get all eval runs from the database. Args: `limit` (Optional[int]): The maximum number of eval runs to return. `page` (Optional[int]): The page number. `sort_by` (Optional[str]): The column to sort by. `sort_order` (Optional[str]): The order to sort by. `agent_id` (Optional[str]): The ID of the agent to filter by. `team_id` (Optional[str]): The ID of the team to filter by. `workflow_id` (Optional[str]): The ID of the workflow to filter by. `model_id` (Optional[str]): The ID of the model to filter by. `eval_type` (Optional[List[EvalType]]): The type(s) of eval to filter by. `filter_type` (Optional[EvalFilterType]): Filter by component type (agent, team, workflow). `deserialize` (Optional[bool]): Whether to serialize the eval runs. Defaults to True. `create_table` (if not found (Optional[bool]): Whether to create the table if it doesnâ€™t exist. Returns: `Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of EvalRunRecord objects - When `deserialize=False`: List of EvalRun dictionaries and total count Raises: `Exception`: If an error occurs during retrieval.
 - `async get_knowledge_content(self, id: str) -> Optional[KnowledgeRow] â€”` Get a knowledge row from the database. Args: `id` (str): The ID of the knowledge row to get. Returns: `Optional[KnowledgeRow]`: The knowledge row, or None if it doesnâ€™t exist. Raises: `Exception`: If an error occurs during retrieval.
 - `async get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int] â€”` Get all knowledge contents from the database. Args: `limit` (Optional[int]): The maximum number of knowledge contents to return. `page` (Optional[int]): The page number. `sort_by` (Optional[str]): The column to sort by. `sort_order` (Optional[str]): The order to sort by. Returns: `Tuple[List[KnowledgeRow], int]`: The knowledge contents and total count. Raises: `Exception`: If an error occurs during retrieval.
 - `async get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]] â€”` Get all metrics matching the given date range. Args: `starting_date` (Optional[date]): The starting date to filter metrics by. `ending_date` (Optional[date]): The ending date to filter metrics by. Returns: `Tuple[List[dict], Optional[int]]`: A tuple containing the metrics and the timestamp of the latest update. Raises: `Exception`: If an error occurs during retrieval.

- `async get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Read a session from the database. Args: `session_id (str)`: ID of the session to read. `session_type (SessionType)`: Type of session to get. `user_id (Optional[str])`: User ID to filter by. Defaults to `None`. `deserialize (Optional[bool])`: Whether to serialize the session. Defaults to `True`. Returns: `Optional[Union[Session, Dict[str, Any]]]`: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: Exception: If an error occurs during retrieval.
- `async get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]]` â€” Get all sessions in the given table. Can filter by `user_id` and `entity_id`. Args: `session_type (Optional[SessionType])`: The type of session to get. `user_id (Optional[str])`: The ID of the user to filter by. `component_id (Optional[str])`: The ID of the agent / workflow to filter by. `session_name (Optional[str])`: The name of the session to filter by. `start_timestamp (Optional[int])`: The start timestamp to filter by. `end_timestamp (Optional[int])`: The end timestamp to filter by. `limit (Optional[int])`: The maximum number of sessions to return. Defaults to `None`. `page (Optional[int])`: The page number to return. Defaults to `None`. `sort_by (Optional[str])`: The field to sort by. Defaults to `None`. `sort_order (Optional[str])`: The sort order. Defaults to `None`. `deserialize (Optional[bool])`: Whether to serialize the sessions. Defaults to `True`. Returns: `List[Session]`: - When `deserialize=True`: List of Session objects matching the criteria. - When `deserialize=False`: List of Session dictionaries matching the criteria. Raises: Exception: If an error occurs during retrieval.
- `async get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]` â€” Get all memories from the database as `UserMemory` objects. Args: `user_id (Optional[str])`: The ID of the user to filter by. `agent_id (Optional[str])`: The ID of the agent to filter by. `team_id (Optional[str])`: The ID of the team to filter by. `topics (Optional[List[str]])`: The topics to filter by. `search_content (Optional[str])`: The content to search for. `limit (Optional[int])`: The maximum number of memories to return. `page (Optional[int])`: The page number. `sort_by (Optional[str])`: The column to sort by. `sort_order (Optional[str])`: The order to sort by. `deserialize (Optional[bool])`: Whether to serialize the memories. Defaults to `True`. Returns: `Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of `UserMemory` objects - When `deserialize=False`: List of `UserMemory` dictionaries and total count Raises: Exception: If an error occurs during retrieval.
- `async get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Get a memory from the database. Args: `memory_id (str)`: The ID of the memory to get. `deserialize (Optional[bool])`: Whether to serialize the memory. Defaults to `True`. `user_id (Optional[str])`: The user ID to filter by. Defaults to `None`. Returns: `Optional[Union[UserMemory, Dict[str, Any]]]`: - When `deserialize=True`: `UserMemory` object - When `deserialize=False`: Memory dictionary Raises: Exception: If an error occurs during retrieval.
- `async get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int]` â€” Get user memories stats. Args: `limit (Optional[int])`: The maximum number of user stats to return. `page (Optional[int])`: The page number. Returns: `Tuple[List[Dict[str, Any]], int]`: A list of dictionaries containing user stats and total count. Example: ([{ â€œuser_idâ€: â€œe123â€}, â€œtotal_memoriesâ€: 10, â€œlast_memory_updated_atâ€: 1714560000. },], total_count: 1,)
- `async migrate_table_from_v1_to_v2(self, v1_db_schema: str, v1_table_name: str, v1_table_type: str) â€”` Migrate all content in the given table to the right v2 table
- `async rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Upsert the name of an eval run in the database, returning raw dictionary. Args: `eval_run_id (str)`: The ID of the eval run to update. `name (str)`: The new name of the eval run. `deserialize (Optional[bool])`: Whether to serialize the eval run. Defaults to `True`. Returns: `Optional[Union[EvalRunRecord, Dict[str, Any]]]`: - When `deserialize=True`: `EvalRunRecord` object - When `deserialize=False`: `EvalRun` dictionary Raises: Exception: If an error occurs during update.
- `async rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Rename a session in the database. Args: `session_id (str)`: The ID of the session to rename. `session_type (SessionType)`: The type of session to rename. `session_name (str)`: The new name for the session. `deserialize (Optional[bool])`: Whether to serialize the session. Defaults to `True`. Returns: `Optional[Union[Session, Dict[str, Any]]]`: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: Exception: If an error occurs during renaming.
- `async table_exists(self, table_name: str) -> bool` â€” Check if a table with the given name exists in the SQLite database. Args: `table_name`: Name of the table to check Returns: `bool`: `True` if the table exists in the database, `False` otherwise
- `async upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Upsert a cultural artifact into the database. Args: `cultural_knowledge (CulturalKnowledge)`: The cultural artifact to upsert. `deserialize (Optional[bool])`: Whether to serialize the cultural artifact. Defaults to `True`. Returns: `Optional[Union[CulturalNotion, Dict[str, Any]]]`: - When `deserialize=True`: `CulturalNotion` object - When `deserialize=False`: `CulturalNotion` dictionary Raises: Exception: If an error occurs during upsert.
- `async upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€”` Upsert knowledge content in the database. Args: `knowledge_row (KnowledgeRow)`: The knowledge row to upsert. Returns: `Optional[KnowledgeRow]`: The upserted knowledge row, or `None` if the operation fails.
- `async upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]]` â€” Bulk upsert multiple user memories for improved performance on large datasets. Args: `memories (List[UserMemory])`: List of memories to upsert. `deserialize (Optional[bool])`: Whether to deserialize the memories. Defaults to `True`. Returns: `List[Union[UserMemory, Dict[str, Any]]]`: List of upserted memories. Raises: Exception: If an error occurs during bulk upsert.
- `async upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Insert or update a session in the database. Args: `session (Session)`: The session data to upsert. `deserialize (Optional[bool])`: Whether to serialize the session. Defaults to `True`. Returns: `Optional[Session]`: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: Exception: If an error occurs during upserting.
- `async upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]]` â€” Bulk upsert multiple sessions for improved performance on large datasets. Args: `sessions (List[Session])`: List of sessions to upsert. `deserialize (Optional[bool])`: Whether to deserialize the sessions. Defaults to `True`. `preserve_updated_at (bool)`: If `True`, preserve the `updated_at` from the session object. Returns: `List[Union[Session, Dict[str, Any]]]`: List of upserted sessions. Raises: Exception: If an error occurs during bulk upsert.
- `async upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Upsert a user memory in the database. Args: `memory (UserMemory)`: The user memory to upsert. `deserialize (Optional[bool])`: Whether to serialize the memory. Defaults to `True`. Returns: `Optional[Union[UserMemory, Dict[str, Any]]]`: - When `deserialize=True`: `UserMemory` object - When `deserialize=False`: `UserMemory` dictionary Raises: Exception: If an error occurs during upsert.

Module agno.db.sqlite.schemas

- **Source:** `libs/agno/db/sqlite/schemas.py`

Table schemas and related utils used by the `SqliteDb` class

Functions

- `get_table_schema_definition(table_type: str) -> dict[str, Any]` â€” Get the expected schema definition for the given table. Args: `table_type (str)`: The type of table to get the schema for. Returns: `Dict[str, Any]`: Dictionary containing column definitions for the table

Module agno.db.sqlite.sqlite

- **Source:** `libs/agno/db/sqlite/sqlite.py`

Classes

- **class `SqliteDb`** (bases: `BaseDb`)

• Methods:

- `calculate_metrics(self) -> Optional[list[dict]]` â€” Calculate metrics for all dates without complete metrics. Returns: `Optional[list[dict]]`: The calculated metrics. Raises: Exception: If an error occurs during metrics calculation.
- `clear_cultural_knowledge(self) -> None` â€” Delete all cultural artifacts from the database. Raises: Exception: If an error occurs during deletion.
- `clear_memories(self) -> None` â€” Delete all memories from the database. Raises: Exception: If an error occurs during deletion.
- `create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord]` â€” Create an `EvalRunRecord` in the database. Args: `eval_run (EvalRunRecord)`: The eval run to create. Returns: `Optional[EvalRunRecord]`: The created eval run, or `None` if the operation fails. Raises: Exception: If an error occurs during creation.
- `delete_cultural_knowledge(self, id: str) -> None` â€” Delete a cultural artifact from the database. Args: `id (str)`: The ID of the cultural artifact to delete. Raises: Exception: If an error occurs during deletion.
- `delete_eval_run(self, eval_run_id: str) -> None` â€” Delete an eval run from the database. Args: `eval_run_id (str)`: The ID of the eval run to delete.
- `delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” Delete multiple eval runs from the database. Args: `eval_run_ids (List[str])`: List of eval run IDs to delete.
- `delete_knowledge_content(self, id: str) â€”` Delete a knowledge row from the database. Args: `id (str)`: The ID of the knowledge row to delete. Raises: Exception: If an error occurs during deletion.
- `delete_session(self, session_id: str) -> bool` â€” Delete a session from the database. Args: `session_id (str)`: ID of the session to delete Raises: Exception: If an error occurs during deletion.
- `delete_sessions(self, session_ids: List[str]) -> None` â€” Delete all given sessions from the database. Can handle multiple session types in the same run. Args: `session_ids (List[str])`: The IDs of the sessions to delete. Raises: Exception: If an error occurs during deletion.
- `delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None` â€” Delete user memories from the database. Args: `memory_ids (List[str])`: The IDs of the memories to delete. `user_id (Optional[str])`: The user ID to filter by. Defaults to `None`. Raises: Exception: If an error occurs during deletion.

- `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) â€”` Delete a user memory from the database. Args: `memory_id (str)`: The ID of the memory to delete. `user_id (Optional[str])`: The user ID to filter by. Defaults to None. Returns: `bool`: True if deletion was successful, False otherwise. Raises: `Exception`: If an error occurs during deletion.
- `get_all_cultural_knowledge(self, name: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]] â€”` Get all cultural artifacts from the database as CulturalNotion objects. Args: `name (Optional[str])`: The name of the cultural artifact to filter by. `agent_id (Optional[str])`: The ID of the agent to filter by. `team_id (Optional[str])`: The ID of the team to filter by. `limit (Optional[int])`: The maximum number of cultural artifacts to return. `page (Optional[int])`: The page number. `sort_by (Optional[str])`: The column to sort by. `sort_order (Optional[str])`: The order to sort by. `deserialize (Optional[bool])`: Whether to serialize the cultural artifacts. Defaults to True. Returns: `Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of CulturalNotion objects - When `deserialize=False`: List of CulturalNotion dictionaries and total count Raises: `Exception`: If an error occurs during retrieval.
- `get_all_memory_topics(self) -> List[str] â€”` Get all memory topics from the database. Returns: `List[str]`: List of memory topics.
- `get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]] â€”` Get a cultural artifact from the database. Args: `id (str)`: The ID of the cultural artifact to get. `deserialize (Optional[bool])`: Whether to serialize the cultural artifact. Defaults to True. Returns: `Optional[CulturalKnowledge]`: The cultural artifact, or None if it doesnâ€™t exist. Raises: `Exception`: If an error occurs during retrieval.
- `get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]] â€”` Get an eval run from the database. Args: `eval_run_id (str)`: The ID of the eval run to get. `deserialize (Optional[bool])`: Whether to serialize the eval run. Defaults to True. Returns: `Optional[Union[EvalRunRecord, Dict[str, Any]]]`: - When `deserialize=True`: EvalRunRecord object - When `deserialize=False`: EvalRun dictionary Raises: `Exception`: If an error occurs during retrieval.
- `get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]] â€”` Get all eval runs from the database. Args: `limit (Optional[int])`: The maximum number of eval runs to return. `page (Optional[int])`: The page number. `sort_by (Optional[str])`: The column to sort by. `sort_order (Optional[str])`: The order to sort by. `agent_id (Optional[str])`: The ID of the agent to filter by. `team_id (Optional[str])`: The ID of the team to filter by. `workflow_id (Optional[str])`: The ID of the workflow to filter by. `model_id (Optional[str])`: The ID of the model to filter by. `eval_type (Optional[List[EvalType]])`: The type(s) of eval to filter by. `filter_type (Optional[EvalFilterType])`: Filter by component type (agent, team, workflow). `deserialize (Optional[bool])`: Whether to serialize the eval runs. Defaults to True. `create_table (Optional[bool])`: Whether to create the table if it doesnâ€™t exist. Returns: `Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of EvalRunRecord objects - When `deserialize=False`: List of EvalRun dictionaries and total count Raises: `Exception`: If an error occurs during retrieval.
- `get_knowledge_content(self, id: str) -> Optional[KnowledgeRow] â€”` Get a knowledge row from the database. Args: `id (str)`: The ID of the knowledge row to get. Returns: `Optional[KnowledgeRow]`: The knowledge row, or None if it doesnâ€™t exist. Raises: `Exception`: If an error occurs during retrieval.
- `get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int] â€”` Get all knowledge contents from the database. Args: `limit (Optional[int])`: The maximum number of knowledge contents to return. `page (Optional[int])`: The page number. `sort_by (Optional[str])`: The column to sort by. `sort_order (Optional[str])`: The order to sort by. Returns: `Tuple[List[KnowledgeRow], int]`: The knowledge contents and total count. Raises: `Exception`: If an error occurs during retrieval.
- `get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[dict], Optional[int]] â€”` Get all metrics matching the given date range. Args: `starting_date (Optional[date])`: The starting date to filter metrics by. `ending_date (Optional[date])`: The ending date to filter metrics by. Returns: `Tuple[List[dict], Optional[int]]`: A tuple containing the metrics and the timestamp of the latest update. Raises: `Exception`: If an error occurs during retrieval.
- `get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]] â€”` Read a session from the database. Args: `session_id (str)`: ID of the session to read. `session_type (SessionType)`: Type of session to get. `user_id (Optional[str])`: User ID to filter by. Defaults to None. `deserialize (Optional[bool])`: Whether to serialize the session. Defaults to True. Returns: `Optional[Union[Session, Dict[str, Any]]]`: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: `Exception`: If an error occurs during retrieval.
- `get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]] â€”` Get all sessions in the given table. Can filter by `user_id` and `entity_id`. Args: `session_type (Optional[SessionType])`: The type of session to get. `user_id (Optional[str])`: The ID of the user to filter by. `component_id (Optional[str])`: The ID of the agent / workflow to filter by. `session_name (Optional[str])`: The name of the session to filter by. `start_timestamp (Optional[int])`: The start timestamp to filter by. `end_timestamp (Optional[int])`: The end timestamp to filter by. `limit (Optional[int])`: The maximum number of sessions to return. Defaults to None. `page (Optional[int])`: The page number to return. Defaults to None. `sort_by (Optional[str])`: The field to sort by. Defaults to None. `sort_order (Optional[str])`: The sort order. Defaults to None. `deserialize (Optional[bool])`: Whether to serialize the sessions. Defaults to True. `create_table (Optional[bool])`: Whether to create the table if it doesnâ€™t exist. Returns: `List[Session]`: - When `deserialize=True`: List of Session objects matching the criteria. - When `deserialize=False`: List of Session dictionaries matching the criteria. Raises: `Exception`: If an error occurs during retrieval.
- `get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]] â€”` Get all memories from the database as UserMemory objects. Args: `user_id (Optional[str])`: The ID of the user to filter by. `agent_id (Optional[str])`: The ID of the agent to filter by. `team_id (Optional[str])`: The ID of the team to filter by. `topics (Optional[List[str]])`: The topics to filter by. `search_content (Optional[str])`: The content to search for. `limit (Optional[int])`: The maximum number of memories to return. `page (Optional[int])`: The page number. `sort_by (Optional[str])`: The column to sort by. `sort_order (Optional[str])`: The order to sort by. `deserialize (Optional[bool])`: Whether to serialize the memories. Defaults to True. Returns: `Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of UserMemory objects - When `deserialize=False`: List of UserMemory dictionaries and total count Raises: `Exception`: If an error occurs during retrieval.
- `get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[Union[UserMemory, Dict[str, Any]]] â€”` Get a memory from the database. Args: `memory_id (str)`: The ID of the memory to get. `deserialize (Optional[bool])`: Whether to serialize the memory. Defaults to True. `user_id (Optional[str])`: The user ID to filter by. Defaults to None. Returns: `Optional[Union[UserMemory, Dict[str, Any]]]`: - When `deserialize=True`: UserMemory object - When `deserialize=False`: Memory dictionary Raises: `Exception`: If an error occurs during retrieval.
- `get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None) -> Tuple[List[Dict[str, Any]], int] â€”` Get user memories stats. Args: `limit (Optional[int])`: The maximum number of user stats to return. `page (Optional[int])`: The page number. Returns: `Tuple[List[Dict[str, Any]], int]`: A list of dictionaries containing user stats and total count. Example: `{ [ { â€œuser_idâ€: â€œe123â€€, â€œtotal_memoriesâ€: 10, â€œlast_memory_updated_atâ€: 1714560000, }, ], total_count: 1 }`
- `migrate_table_from_v1_to_v2(self, v1_db_schema: str, v1_table_name: str, v1_table_type: str) â€”` Migrate all content in the given table to the right v2 table
- `rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]] â€”` Upsert the name of an eval run in the database, returning raw dictionary. Args: `eval_run_id (str)`: The ID of the eval run to update. `name (str)`: The new name of the eval run. `deserialize (Optional[bool])`: Whether to serialize the eval run. Defaults to True. Returns: `Optional[Union[EvalRunRecord, Dict[str, Any]]]`: - When `deserialize=True`: EvalRunRecord object - When `deserialize=False`: EvalRun dictionary Raises: `Exception`: If an error occurs during update.
- `rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]] â€”` Rename a session in the database. Args: `session_id (str)`: The ID of the session to rename. `session_type (SessionType)`: The type of session to rename. `session_name (str)`: The new name for the session. `deserialize (Optional[bool])`: Whether to serialize the session. Defaults to True. Returns: `Optional[Union[Session, Dict[str, Any]]]`: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: `Exception`: If an error occurs during renaming.
- `table_exists(self, table_name: str) -> bool â€”` Check if a table with the given name exists in the SQLite database. Args: `table_name`: Name of the table to check Returns: `bool`: True if the table exists in the database, False otherwise
- `upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]] â€”` Upsert a cultural artifact into the database. Args: `cultural_knowledge (CulturalKnowledge)`: The cultural artifact to upsert. `deserialize (Optional[bool])`: Whether to serialize the cultural artifact. Defaults to True. Returns: `Optional[Union[CulturalNotion, Dict[str, Any]]]`: - When `deserialize=True`: CulturalNotion object - When `deserialize=False`: CulturalNotion dictionary Raises: `Exception`: If an error occurs during upsert.
- `upsert_knowledge_content(self, knowledge_row: KnowledgeRow) â€”` Upsert knowledge content in the database. Args: `knowledge_row (KnowledgeRow)`: The knowledge row to upsert. Returns: `Optional[KnowledgeRow]`: The upserted knowledge row, or None if the operation fails.
- `upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[UserMemory, Dict[str, Any]]] â€”` Bulk upsert multiple user memories for improved performance on large datasets. Args: `memories (List[UserMemory])`: List of memories to upsert. `deserialize (Optional[bool])`: Whether to deserialize the memories. Defaults to True. Returns: `List[Union[UserMemory, Dict[str, Any]]]`: List of upserted memories. Raises: `Exception`: If an error occurs during bulk upsert.
- `upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]] â€”` Insert or update a session in the database. Args: `session (Session)`: The session data to upsert. `deserialize (Optional[bool])`: Whether to serialize the session. Defaults to True. Returns: `Optional[Session]`: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: `Exception`: If an error occurs during upserting.
- `upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True, preserve_updated_at: bool=False) -> List[Union[Session, Dict[str, Any]]] â€”` Bulk upsert multiple sessions for improved performance on large datasets. Args: `sessions (List[Session])`: List of sessions to upsert. `deserialize (Optional[bool])`: Whether to deserialize the sessions. Defaults to True. `preserve_updated_at (bool)`: If True, preserve the `updated_at` from the session object. Returns: `List[Union[Session, Dict[str, Any]]]`: List of upserted sessions. Raises: `Exception`: If an error occurs during bulk upsert.
- `upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]] â€”` Upsert a user memory in the database. Args: `memory (UserMemory)`: The user memory to upsert. `deserialize (Optional[bool])`: Whether to serialize the memory. Defaults to True. Returns: `Optional[Union[UserMemory, Dict[str, Any]]]`: - When `deserialize=True`: UserMemory object - When `deserialize=False`: UserMemory dictionary Raises: `Exception`: If an error occurs during upsert.

Module agno.db.sqlite.utils

- **Source:** `libs/agno/db/sqlite/utils.py`

Functions

- `async abulk_upsert_metrics(session: AsyncSession, table: Table, metrics_records: list[dict]) -> list[dict] â€”` Bulk upsert metrics into the database. Args: `table (Table)`: The table to upsert

- into. metrics_records (list[dict]): The metrics records to upsert. Returns: list[dict]: The upserted metrics records.
- `async ais_table_available(session: AsyncSession, table_name: str, db_schema: Optional[str]=None) -> bool` â€” Check if a table with the given name exists. Note: db_schema parameter is ignored in SQLite but kept for API compatibility. Returns: bool: True if the table exists, False otherwise.
 - `async ais_valid_table(db_engine: AsyncEngine, table_name: str, table_type: str, db_schema: Optional[str]=None) -> bool` â€” Check if the existing table has the expected column names. Note: db_schema parameter is ignored in SQLite but kept for API compatibility. Args: db_engine (Engine): Database engine table_name (str): Name of the table to validate table_type (str): Type of table to get expected schema db_schema (Optional[str]): Database schema name (ignored in SQLite) Returns: bool: True if table has all expected columns, False otherwise
 - `apply_sorting(stmt, table: Table, sort_by: Optional[str]=None, sort_order: Optional[str]=None) â€”` Apply sorting to the given SQLAlchemy statement. Args: stmt: The SQLAlchemy statement to modify table: The table being queried sort_by: The field to sort by sort_order: The sort order (â€˜ascâ€™ or â€˜descâ€™) Returns: The modified statement with sorting applied
 - `bulk_upsert_metrics(session: Session, table: Table, metrics_records: list[dict]) -> list[dict]` â€” Bulk upsert metrics into the database. Args: table (Table): The table to upsert into. metrics_records (list[dict]): The metrics records to upsert. Returns: list[dict]: The upserted metrics records.
 - `calculate_date_metrics(date_to_process: date, sessions_data: dict) -> dict` â€” Calculate metrics for the given single date. Args: date_to_process (date): The date to calculate metrics for. sessions_data (dict): The sessions data to calculate metrics for. Returns: dict: The calculated metrics.
 - `deserialize_cultural_knowledge_from_db(db_row: Dict[str, Any]) -> CulturalKnowledge` â€” Deserialize a database row to a CulturalKnowledge object. The database stores content as a JSON dict containing content, categories, and notes. This method extracts those fields and converts them back to the model format. Args: db_row (Dict[str, Any]): The database row as a dictionary. Returns: CulturalKnowledge: The cultural knowledge object.
 - `fetch_all_sessions_data(sessions: List[Dict[str, Any]], dates_to_process: list[date], start_timestamp: int) -> Optional[dict]` â€” Return all session data for the given dates, for all session types. Args: dates_to_process (list[date]): The dates to fetch session data for. Returns: dict: A dictionary with dates as keys and session data as values, for all session types. Example: { â€œ2000-01-01â€: { â€œagentâ€: [, â€¦], â€œteamâ€: [â€¦], â€œworkflowâ€: [â€¦], } }
 - `get_dates_to_calculate_metrics_for(starting_date: date) -> list[date]` â€” Return the list of dates to calculate metrics for. Args: starting_date (date): The starting date to calculate metrics for. Returns: list[date]: The list of dates to calculate metrics for.
 - `is_table_available(session: Session, table_name: str, db_schema: Optional[str]=None) -> bool` â€” Check if a table with the given name exists. Note: db_schema parameter is ignored in SQLite but kept for API compatibility. Returns: bool: True if the table exists, False otherwise.
 - `is_valid_table(db_engine: Engine, table_name: str, table_type: str, db_schema: Optional[str]=None) -> bool` â€” Check if the existing table has the expected column names. Note: db_schema parameter is ignored in SQLite but kept for API compatibility. Args: db_engine (Engine): Database engine table_name (str): Name of the table to validate table_type (str): Type of table to get expected schema db_schema (Optional[str]): Database schema name (ignored in SQLite) Returns: bool: True if table has all expected columns, False otherwise
 - `serialize_cultural_knowledge_for_db(cultural_knowledge: CulturalKnowledge) -> str` â€” Serialize a CulturalKnowledge object for database storage. Converts the modelâ€™s separate content, categories, and notes fields into a single JSON string for the database content column. SQLite requires JSON to be stored as strings. Args: cultural_knowledge (CulturalKnowledge): The cultural knowledge object to serialize. Returns: str: A JSON string containing content, categories, and notes.

Module agno.db.surrealdb.metrics

- **Source:** `libs/agno/agno/db/surrealdb/metrics.py`

Functions

- `bulk_upsert_metrics(client: Union[BlockingWsSurrealConnection, BlockingHttpSurrealConnection], table: str, metrics_records: List[Dict[str, Any]]) -> List[Dict[str, Any]]` â€” Bulk upsert metrics into the database. Args: table (Table): The table to upsert into. metrics_records (List[Dict[str, Any]]): The list of metrics records to upsert. Returns: list[dict]: The upserted metrics records.
- `calculate_date_metrics(date_to_process: date, sessions_data: dict) -> dict` â€” Calculate metrics for the given single date. Args: date_to_process (date): The date to calculate metrics for. sessions_data (dict): The sessions data to calculate metrics for. Returns: dict: The calculated metrics.
- `fetch_all_sessions_data(sessions: List[Dict[str, Any]], dates_to_process: list[date], start_timestamp: int) -> Optional[dict]` â€” Return all session data for the given dates, for all session types. Args: sessions (List[Dict[str, Any]]): The sessions to process. dates_to_process (list[date]): The dates to fetch session data for. start_timestamp (int): The start timestamp (fallback if created_at is missing). Returns: dict: A dictionary with dates as keys and session data as values, for all session types. Example: { â€œ2000-01-01â€: { â€œagentâ€: [, â€¦], â€œteamâ€: [â€¦], â€œworkflowâ€: [â€¦], } }
- `get_all_sessions_for_metrics_calculation(client: Union[BlockingWsSurrealConnection, BlockingHttpSurrealConnection], table: str, start_timestamp: Optional[datetime]=None, end_timestamp: Optional[datetime]=None) -> List[Dict[str, Any]]` â€” Get all sessions of all types (agent, team, workflow) as raw dictionaries. Args: start_timestamp (Optional[int]): The start timestamp to filter by. Defaults to None. end_timestamp (Optional[int]): The end timestamp to filter by. Defaults to None. Returns: List[Dict[str, Any]]: List of session dictionaries with session_type field. Raises: Exception: If an error occurs during retrieval.
- `get_metrics_calculation_starting_date(client: Union[BlockingWsSurrealConnection, BlockingHttpSurrealConnection], table: str, get_sessions: Callable) -> Optional[date]` â€” Get the first date for which metrics calculation is needed: 1. If there are metrics records, return the date of the first day without a complete metrics record. 2. If there are no metrics records, return the date of the first recorded session. 3. If there are no metrics records and no sessions records, return None. Args: table (Table): The table to get the starting date for. Returns: Optional[date]: The starting date for which metrics calculation is needed.

Module agno.db.surrealdb.models

- **Source:** `libs/agno/agno/db/surrealdb/models.py`

Functions

- `deserialize_cultural_knowledge(cultural_knowledge_raw: dict) -> CulturalKnowledge` â€” No docstring provided.
- `deserialize_eval_run_record(eval_run_record_raw: dict) -> EvalRunRecord` â€” No docstring provided.
- `deserialize_knowledge_row(knowledge_row_raw: dict) -> KnowledgeRow` â€” No docstring provided.
- `deserialize_record_id(record: dict, agno_field: str, surreal_field: Optional[str]=None) -> dict` â€” No docstring provided.
- `deserialize_session(session_type: SessionType, session_raw: dict) -> Optional[Session]` â€” No docstring provided.
- `deserialize_sessions(session_type: SessionType, sessions_raw: List[dict]) -> List[Session]` â€” No docstring provided.
- `deserialize_user_memories(memories_raw: Sequence[dict]) -> List[UserMemory]` â€” No docstring provided.
- `deserialize_user_memory(memory_raw: dict) -> UserMemory` â€” No docstring provided.
- `desurrealize_dates(record: dict) -> dict` â€” No docstring provided.
- `desurrealize_eval_run_record(eval_run_record_raw: dict) -> dict` â€” No docstring provided.
- `desurrealize_session(session_raw: dict, session_type: Optional[SessionType]=None) -> dict` â€” No docstring provided.
- `desurrealize_user_memory(memory_raw: dict) -> dict` â€” No docstring provided.
- `get_schema(table_type: TableType, table_name: str) -> str` â€” No docstring provided.
- `get_session_type(session: Session) -> SessionType` â€” No docstring provided.
- `serialize_cultural_knowledge(cultural_knowledge: CulturalKnowledge, culture_table_name: str) -> dict` â€” No docstring provided.
- `serialize_eval_run_record(eval_run_record: EvalRunRecord, table_names: dict[TableType, str]) -> dict` â€” No docstring provided.
- `serialize_knowledge_row(knowledge_row: KnowledgeRow, knowledge_table_name: str) -> dict` â€” No docstring provided.
- `serialize_session(session: Session, table_names: dict[TableType, str]) -> dict` â€” No docstring provided.
- `serialize_user_memory(memory: UserMemory, memory_table_name: str, user_table_name: str) -> dict` â€” No docstring provided.
- `surrealize_dates(record: dict) -> dict` â€” No docstring provided.

Module agno.db.surrealdb.queries

- **Source:** `libs/agno/agno/db/surrealdb/queries.py`

Classes

- **class WhereClause**
 - **Methods:**
 - `and_(self, field: str, value: Any, operator: OPERATOR=')` â€” No docstring provided.

- `build(self) -> tuple[str, dict[str, Any]]` â€” No docstring provided.

Functions

- `order_limit_start(sort_by: Optional[str]=None, sort_order: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None) -> str` â€” No docstring provided.

Module `agno.db.surrealdb.surrealdb`

- **Source:** `libs/agno/agno/db/surrealdb/surrealdb.py`

Classes

- **class `SurrealDb`** (bases: `BaseDb`)
 - **Methods:**
 - `calculate_metrics(self) -> Optional[List[Dict[str, Any]]]` â€” Calculate metrics for all dates without complete metrics. Returns: `Optional[List[Dict[str, Any]]]`: The calculated metrics. Raises: Exception: If an error occurs during metrics calculation.
 - `clear_cultural_knowledge(self) -> None` â€” Delete all cultural knowledge from the database. Raises: Exception: If an error occurs during deletion.
 - `clear_evals(self) -> None` â€” Delete all eval rows from the database. Raises: Exception: If an error occurs during deletion.
 - `clear_knowledge(self) -> None` â€” Delete all knowledge rows from the database. Raises: Exception: If an error occurs during deletion.
 - `clear_memories(self) -> None` â€” Delete all memories from the database. Raises: Exception: If an error occurs during deletion.
 - `clear_sessions(self) -> None` â€” Delete all session rows from the database. Raises: Exception: If an error occurs during deletion.
 - `client(self) -> Union[BlockingWsSurrealConnection, BlockingHttpSurrealConnection]` â€” No docstring provided.
 - `create_eval_run(self, eval_run: EvalRunRecord) -> Optional[EvalRunRecord]` â€” Create an `EvalRunRecord` in the database. Args: `eval_run` (`EvalRunRecord`): The eval run to create. Returns: `Optional[EvalRunRecord]`: The created eval run, or `None` if the operation fails. Raises: Exception: If an error occurs during creation.
 - `delete_cultural_knowledge(self, id: str) -> None` â€” Delete cultural knowledge by ID. Args: `id` (`str`): The ID of the cultural knowledge to delete. Raises: Exception: If an error occurs during deletion.
 - `delete_eval_runs(self, eval_run_ids: List[str]) -> None` â€” Delete multiple eval runs from the database. Args: `eval_run_ids` (`List[str]`): List of eval run IDs to delete.
 - `delete_knowledge_content(self, id: str)` â€” Delete a knowledge row from the database. Args: `id` (`str`): The ID of the knowledge row to delete.
 - `delete_session(self, session_id: str) -> bool` â€” No docstring provided.
 - `delete_sessions(self, session_ids: list[str]) -> None` â€” No docstring provided.
 - `delete_user_memories(self, memory_ids: List[str], user_id: Optional[str]=None) -> None` â€” Delete user memories from the database. Args: `memory_ids` (`List[str]`): The IDs of the memories to delete. `user_id` (`Optional[str]`): The ID of the user to filter by. Defaults to `None`. Raises: Exception: If an error occurs during deletion.
 - `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) -> None` â€” Delete a user memory from the database. Args: `memory_id` (`str`): The ID of the memory to delete. `user_id` (`Optional[str]`): The ID of the user to filter by. Defaults to `None`. Returns: `bool`: `True` if deletion was successful, `False` otherwise. Raises: Exception: If an error occurs during deletion.
 - `get_all_cultural_knowledge(self, agent_id: Optional[str]=None, team_id: Optional[str]=None, name: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]` â€” Get all cultural knowledge with filtering and pagination. Args: `agent_id` (`Optional[str]`): Filter by agent ID. `team_id` (`Optional[str]`): Filter by team ID. `name` (`Optional[str]`): Filter by name (case-insensitive partial match). `limit` (`Optional[int]`): Maximum number of results to return. `page` (`Optional[int]`): Page number for pagination. `sort_by` (`Optional[str]`): Field to sort by. `sort_order` (`Optional[str]`): Sort order (â€œascâ€” or â€œdescâ€”). `deserialize` (`Optional[bool]`): Whether to deserialize to `CulturalKnowledge` objects. Defaults to `True`. Returns: `Union[List[CulturalKnowledge], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of `CulturalKnowledge` objects - When `deserialize=False`: Tuple with list of dictionaries and total count Raises: Exception: If an error occurs during retrieval.
 - `get_all_memory_topics(self, user_id: Optional[str]=None) -> List[str]` â€” Get all memory topics from the database. Args: `user_id` (`Optional[str]`): The ID of the user to filter by. Defaults to `None`. Returns: `List[str]`: List of memory topics.
 - `get_cultural_knowledge(self, id: str, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€” Get cultural knowledge by ID. Args: `id` (`str`): The ID of the cultural knowledge to retrieve. `deserialize` (`Optional[bool]`): Whether to deserialize to `CulturalKnowledge` object. Defaults to `True`. Returns: `Optional[Union[CulturalKnowledge, Dict[str, Any]]]`: The cultural knowledge if found, `None` otherwise. Raises: Exception: If an error occurs during retrieval.
 - `get_eval_run(self, eval_run_id: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€” Get an eval run from the database. Args: `eval_run_id` (`str`): The ID of the eval run to get. `deserialize` (`Optional[bool]`): Whether to serialize the eval run. Defaults to `True`. Returns: `Optional[Union[EvalRunRecord, Dict[str, Any]]]`: - When `deserialize=True`: `EvalRunRecord` object - When `deserialize=False`: `EvalRun` dictionary Raises: Exception: If an error occurs during retrieval.
 - `get_eval_runs(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None, model_id: Optional[str]=None, filter_type: Optional[EvalFilterType]=None, eval_type: Optional[List[EvalType]]=None, deserialize: Optional[bool]=True) -> Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]` â€” Get all eval runs from the database. Args: `limit` (`Optional[int]`): The maximum number of eval runs to return. `page` (`Optional[int]`): The page number to return. `sort_by` (`Optional[str]`): The field to sort by. `sort_order` (`Optional[str]`): The order to sort by. `agent_id` (`Optional[str]`): The ID of the agent to filter by. `team_id` (`Optional[str]`): The ID of the team to filter by. `workflow_id` (`Optional[str]`): The ID of the workflow to filter by. `model_id` (`Optional[str]`): The ID of the model to filter by. `eval_type` (`Optional[List[EvalType]]`): The type of eval to filter by. `filter_type` (`Optional[EvalFilterType]`): The type of filter to apply. `deserialize` (`Optional[bool]`): Whether to serialize the eval runs. Defaults to `True`. Returns: `Union[List[EvalRunRecord], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of `EvalRunRecord` objects - When `deserialize=False`: List of eval run dictionaries and the total count Raises: Exception: If there is an error getting the eval runs.
 - `get_knowledge_content(self, id: str) -> Optional[KnowledgeRow]` â€” Get a knowledge row from the database. Args: `id` (`str`): The ID of the knowledge row to get. Returns: `Optional[KnowledgeRow]`: The knowledge row, or `None` if it doesnâ€”t exist.
 - `get_knowledge_contents(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[KnowledgeRow], int]` â€” Get all knowledge contents from the database. Args: `limit` (`Optional[int]`): The maximum number of knowledge contents to return. `page` (`Optional[int]`): The page number. `sort_by` (`Optional[str]`): The column to sort by. `sort_order` (`Optional[str]`): The order to sort by. Returns: `Tuple[List[KnowledgeRow], int]`: The knowledge contents and total count. Raises: Exception: If an error occurs during retrieval.
 - `get_metrics(self, starting_date: Optional[date]=None, ending_date: Optional[date]=None) -> Tuple[List[Dict[str, Any]], Optional[int]]` â€” Get all metrics matching the given date range. Args: `starting_date` (`Optional[date]`): The starting date to filter metrics by. `ending_date` (`Optional[date]`): The ending date to filter metrics by. Returns: `Tuple[List[dict], Optional[int]]`: A tuple containing the metrics and the timestamp of the latest update. Raises: Exception: If an error occurs during retrieval.
 - `get_session(self, session_id: str, session_type: SessionType, user_id: Optional[str]=None, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€” Read a session from the database. Args: `session_id` (`str`): ID of the session to read. `session_type` (`SessionType`): Type of session to get. `user_id` (`Optional[str]`): User ID to filter by. Defaults to `None`. `deserialize` (`Optional[bool]`): Whether to serialize the session. Defaults to `True`. Returns: `Optional[Union[Session, Dict[str, Any]]]`: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: Exception: If an error occurs during retrieval.
 - `get_sessions(self, session_type: Optional[SessionType]=None, user_id: Optional[str]=None, component_id: Optional[str]=None, session_name: Optional[str]=None, start_timestamp: Optional[int]=None, end_timestamp: Optional[int]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[Session], Tuple[List[Dict[str, Any]], int]]` â€” Get all sessions in the given table. Can filter by `user_id` and `entity_id`. Args: `session_type` (`SessionType`): The type of session to get. `user_id` (`Optional[str]`): The ID of the user to filter by. `component_id` (`Optional[str]`): The ID of the agent / team / workflow to filter by. `session_name` (`Optional[str]`): The name of the session to filter by. `start_timestamp` (`Optional[int]`): The start timestamp to filter by. `end_timestamp` (`Optional[int]`): The end timestamp to filter by. `limit` (`Optional[int]`): The maximum number of sessions to return. Defaults to `None`. `page` (`Optional[int]`): The page number to return. Defaults to `None`. `sort_by` (`Optional[str]`): The field to sort by. Defaults to `None`. `sort_order` (`Optional[str]`): The sort order. Defaults to `None`. `deserialize` (`Optional[bool]`): Whether to serialize the sessions. Defaults to `True`. Returns: `Union[List[Session], Tuple[List[Dict], int]]`: - When `deserialize=True`: List of Session objects - When `deserialize=False`: Tuple of (session dictionaries, total count) Raises: Exception: If an error occurs during retrieval.
 - `get_user_memories(self, user_id: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, topics: Optional[List[str]]=None, search_content: Optional[str]=None, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None, deserialize: Optional[bool]=True) -> Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]` â€” Get all memories from the database as `UserMemory` objects. Args: `user_id` (`Optional[str]`): The ID of the user to filter by. `agent_id` (`Optional[str]`): The ID of the agent to filter by. `team_id` (`Optional[str]`): The ID of the team to filter by. `topics` (`Optional[List[str]]`): The topics to filter by. `search_content` (`Optional[str]`): The content to search for. `limit` (`Optional[int]`): The maximum number of memories to return. `page` (`Optional[int]`): The page number. `sort_by` (`Optional[str]`): The column to sort by. `sort_order` (`Optional[str]`): The order to sort by. `deserialize` (`Optional[bool]`): Whether to serialize the memories. Defaults to `True`. Returns: `Union[List[UserMemory], Tuple[List[Dict[str, Any]], int]]`: - When `deserialize=True`: List of `UserMemory` objects - When `deserialize=False`: Tuple of (memory dictionaries, total count) Raises: Exception: If an error occurs during retrieval.
 - `get_user_memory(self, memory_id: str, deserialize: Optional[bool]=True, user_id: Optional[str]=None) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€” Get a memory from the database. Args: `memory_id` (`str`): The ID of the memory to get. `deserialize` (`Optional[bool]`): Whether to serialize the memory. Defaults to `True`. `user_id` (`Optional[str]`): The ID of the user to filter by. Defaults to `None`. Returns: `Optional[Union[UserMemory, Dict[str, Any]]]`: - When `deserialize=True`: `UserMemory` object - When `deserialize=False`: `UserMemory` dictionary Raises: Exception: If an error occurs during retrieval.
 - `get_user_memory_stats(self, limit: Optional[int]=None, page: Optional[int]=None, user_id: Optional[str]=None) -> Tuple[List[Dict[str, Any]], int]` â€” Get user memories stats. Args: `limit` (`Optional[int]`): The maximum number of user stats to return. `page` (`Optional[int]`): The page number. `user_id` (`Optional[str]`): The ID of the user to filter by. Defaults to `None`. Returns: `Tuple[List[Dict[str, Any]], int]`: A list of dictionaries containing user stats and total count. Example: ([{ â€œuser_idâ€”: â€œ123â€”, â€œtotal_memoriesâ€”: 10,

â€œelast_memory_updated_atâ€: 1714560000, },], total_count: 1,)

- `rename_eval_run(self, eval_run_id: str, name: str, deserialize: Optional[bool]=True) -> Optional[Union[EvalRunRecord, Dict[str, Any]]]` â€œ Update the name of an eval run in the database. Args: `eval_run_id` (str): The ID of the eval run to update. `name` (str): The new name of the eval run. `deserialize` (Optional[bool]): Whether to serialize the eval run. Defaults to True. Returns: Optional[Union[EvalRunRecord, Dict[str, Any]]]: - When `deserialize=True`: EvalRunRecord object - When `deserialize=False`: EvalRun dictionary Raises: Exception: If there is an error updating the eval run.
- `rename_session(self, session_id: str, session_type: SessionType, session_name: str, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€œ Rename a session in the database. Args: `session_id` (str): The ID of the session to rename. `session_type` (SessionType): The type of session to rename. `session_name` (str): The new name for the session. `deserialize` (Optional[bool]): Whether to serialize the session. Defaults to True. Returns: Optional[Union[Session, Dict[str, Any]]]: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: Exception: If an error occurs during renaming.
- `table_exists(self, table_name: str) -> bool` â€œ Check if a table with the given name exists in the SurrealDB database. Args: `table_name`: Name of the table to check Returns: bool: True if the table exists in the database, False otherwise
- `table_names(self) -> dict[TableType, str]` â€œ No docstring provided.
- `upsert_cultural_knowledge(self, cultural_knowledge: CulturalKnowledge, deserialize: Optional[bool]=True) -> Optional[Union[CulturalKnowledge, Dict[str, Any]]]` â€œ Upsert cultural knowledge in SurrealDB. Args: `cultural_knowledge` (CulturalKnowledge): The cultural knowledge to upsert. `deserialize` (Optional[bool]): Whether to deserialize the result. Defaults to True. Returns: Optional[Union[CulturalKnowledge, Dict[str, Any]]]: The upserted cultural knowledge. Raises: Exception: If an error occurs during upsert.
- `upsert_knowledge_content(self, knowledge_row: KnowledgeRow) -> Optional[KnowledgeRow]` â€œ Upsert knowledge content in the database. Args: `knowledge_row` (KnowledgeRow): The knowledge row to upsert. Returns: Optional[KnowledgeRow]: The upserted knowledge row, or None if the operation fails.
- `upsert_memories(self, memories: List[UserMemory], deserialize: Optional[bool]=True) -> List[Union[UserMemory, Dict[str, Any]]]` â€œ Bulk insert or update multiple memories in the database for improved performance. Args: `memories` (List[UserMemory]): The list of memories to upsert. `deserialize` (Optional[bool]): Whether to deserialize the memories. Defaults to True. Returns: List[Union[UserMemory, Dict[str, Any]]]: List of upserted memories Raises: Exception: If an error occurs during bulk upsert.
- `upsert_session(self, session: Session, deserialize: Optional[bool]=True) -> Optional[Union[Session, Dict[str, Any]]]` â€œ Insert or update a session in the database. Args: `session` (Session): The session data to upsert. `deserialize` (Optional[bool]): Whether to deserialize the session. Defaults to True. Returns: Optional[Union[Session, Dict[str, Any]]]: - When `deserialize=True`: Session object - When `deserialize=False`: Session dictionary Raises: Exception: If an error occurs during upsert.
- `upsert_sessions(self, sessions: List[Session], deserialize: Optional[bool]=True) -> List[Union[Session, Dict[str, Any]]]` â€œ Bulk insert or update multiple sessions. Args: `sessions` (List[Session]): The list of session data to upsert. `deserialize` (Optional[bool]): Whether to deserialize the sessions. Defaults to True. Returns: List[Union[Session, Dict[str, Any]]]: List of upserted sessions Raises: Exception: If an error occurs during bulk upsert.
- `upsert_user_memory(self, memory: UserMemory, deserialize: Optional[bool]=True) -> Optional[Union[UserMemory, Dict[str, Any]]]` â€œ Upsert a user memory in the database. Args: `memory` (UserMemory): The user memory to upsert. `deserialize` (Optional[bool]): Whether to serialize the memory. Defaults to True. Returns: Optional[Union[UserMemory, Dict[str, Any]]]: - When `deserialize=True`: UserMemory object - When `deserialize=False`: UserMemory dictionary Raises: Exception: If an error occurs during upsert.

Module `agno.db.surrealdb.utils`

- **Source:** `libs/agno/agno/db/surrealdb/utils.py`

Functions

- `build_client(url: str, creds: dict[str, str], ns: str, db: str) -> Union[BlockingWsSurrealConnection, BlockingHttpSurrealConnection]` â€œ No docstring provided.
- `deserialize_cultural_knowledge_from_db(db_row: Dict[str, Any]) -> CulturalKnowledge` â€œ Deserialize a database row to a CulturalKnowledge object. The database stores content as a dict containing content, categories, and notes. This method extracts those fields and converts them back to the model format. Args: `db_row` (Dict[str, Any]): The database row as a dictionary. Returns: CulturalKnowledge: The cultural knowledge object.
- `query(client: Union[BlockingWsSurrealConnection, BlockingHttpSurrealConnection], query: str, vars: dict[str, Any], record_type: type[RecordType]) -> Sequence[RecordType]` â€œ No docstring provided.
- `query_one(client: Union[BlockingWsSurrealConnection, BlockingHttpSurrealConnection], query: str, vars: dict[str, Any], record_type: type[RecordType]) -> Optional[RecordType]` â€œ No docstring provided.
- `serialize_cultural_knowledge_for_db(cultural_knowledge: CulturalKnowledge) -> Dict[str, Any]` â€œ Serialize a CulturalKnowledge object for database storage. Converts the modelâ€™s separate content, categories, and notes fields into a single dict for the database content field. Args: `cultural_knowledge` (CulturalKnowledge): The cultural knowledge object to serialize. Returns: Dict[str, Any]: A dictionary with content, categories, and notes.

Module `agno.db.utils`

- **Source:** `libs/agno/agno/db/utils.py`

Logic shared across different database implementations

Classes

- **class CustomJSONEncoder** (bases: `json.JSONEncoder`)
 - Custom encoder to handle non JSON serializable types.
- **Methods:**
 - `default(self, obj)` â€œ No docstring provided.

Functions

- `deserialize_session_json_fields(session: dict) -> dict` â€œ Deserialize JSON fields in the given Session dictionary. Args: `session` (dict): The dictionary to deserialize. Returns: dict: The dictionary with JSON string fields deserialized to objects.
- `serialize_session_json_fields(session: dict) -> dict` â€œ Serialize all JSON fields in the given Session dictionary. Args: `data` (dict): The dictionary to serialize JSON fields in. Returns: dict: The dictionary with JSON fields serialized.

Module `agno.debug`

- **Source:** `libs/agno/agno/debug.py`

Functions

- `disable_debug_mode()` -> None â€œ Disable debug mode for the agno library. This function resets the logging level to INFO
- `enable_debug_mode()` -> None â€œ Enable debug mode for the agno library. This function sets the logging level to DEBUG

Module `agno.eval.accuracy`

- **Source:** `libs/agno/agno/eval/accuracy.py`

Classes

- **class AccuracyAgentResponse** (bases: `BaseModel`)
- **class AccuracyEval**
 - Interface to evaluate the accuracy of an Agent or Team, given a prompt and expected answer
- **Methods:**
 - `async aevaluate_answer(self, input: str, evaluator_agent: Agent, evaluation_input: str, evaluator_expected_output: str, agent_output: str) -> Optional[AccuracyEvaluation]` â€œ Orchestrate the evaluation process asynchronously.
 - `async arun(self, *, print_summary: bool=True, print_results: bool=True) -> Optional[AccuracyResult]` â€œ No docstring provided.
 - `async arun_with_output(self, *, output: str, print_summary: bool=True, print_results: bool=True) -> Optional[AccuracyResult]` â€œ Run the evaluation logic against the given answer, instead of generating an answer with the Agent
 - `evaluate_answer(self, input: str, evaluator_agent: Agent, evaluation_input: str, evaluator_expected_output: str, agent_output: str) -> Optional[AccuracyEvaluation]` â€œ Orchestrate the evaluation process.
 - `get_eval_expected_output(self) -> str` â€œ Return the eval expected answer. If it is a callable, call it and return the resulting string

- `get_eval_input(self) -> str` Return the evaluation input. If it is a callable, call it and return the resulting string
- `get_evaluator_agent(self) -> Agent` Return the evaluator agent. If not provided, build it based on the evaluator fields and default instructions.
- `run(self, *, print_summary: bool=True, print_results: bool=True) -> Optional[AccuracyResult]` No docstring provided.
- `run_with_output(self, *, output: str, print_summary: bool=True, print_results: bool=True) -> Optional[AccuracyResult]` Run the evaluation logic against the given answer, instead of generating an answer with the Agent

- **class AccuracyEvaluation**

- **Methods:**

- `print_eval(self, console: Optional['Console']=None)` No docstring provided.

- **class AccuracyResult**

- **Methods:**

- `compute_stats(self)` No docstring provided.
 - `print_results(self, console: Optional['Console']=None)` No docstring provided.
 - `print_summary(self, console: Optional['Console']=None)` No docstring provided.

Module `agno.eval.performance`

- **Source:** `libs/agno/agno/eval/performance.py`

Classes

- **class PerformanceEval**

- Evaluate the performance of a function by measuring run time and peak memory usage.

- Warm-up runs are included to avoid measuring overhead on the first execution(s).

- Debug mode can show top memory allocations using tracemalloc snapshots.

- Optionally, you can enable cProfile for CPU profiling stats.

- **Methods:**

- `async arun(self, *, print_summary: bool=False, print_results: bool=False, memory_growth_tracking: bool=False) -> PerformanceResult` Async method to run the performance evaluation of async functions. 1. Do optional warm-up runs. 2. Measure runtime 3. Measure memory 4. Collect results 5. Save results if requested 6. Print results as requested 7. Log results to the Agno platform if requested
 - `run(self, *, print_summary: bool=False, print_results: bool=False, memory_growth_tracking: bool=False) -> PerformanceResult` Main method to run the performance evaluation. 1. Do optional warm-up runs. 2. Measure runtime 3. Measure memory 4. Collect results 5. Save results if requested 6. Print results as requested 7. Log results to the Agno platform if requested

- **class PerformanceResult**

- Holds run-time and memory-usage statistics. In addition to average, min, max, std dev, we add median and percentile metrics for a more robust understanding.

- **Methods:**

- `compute_stats(self)` Compute a variety of statistics for both runtime and memory usage.
 - `print_results(self, console: Optional['Console']=None, measure_memory: bool=True, measure_runtime: bool=True)` Prints individual run results in tabular form.
 - `print_summary(self, console: Optional['Console']=None, measure_memory: bool=True, measure_runtime: bool=True)` Prints a summary table of the computed stats.

Module `agno.eval.reliability`

- **Source:** `libs/agno/agno/eval/reliability.py`

Classes

- **class ReliabilityEval**

- Evaluate the reliability of a model by checking the tool calls

- **Methods:**

- `async arun(self, *, print_results: bool=False) -> Optional[ReliabilityResult]` No docstring provided.
 - `run(self, *, print_results: bool=False) -> Optional[ReliabilityResult]` No docstring provided.

- **class ReliabilityResult**

- **Methods:**

- `assert_passed(self)` No docstring provided.
 - `print_eval(self, console: Optional['Console']=None)` No docstring provided.

Module `agno.eval.utils`

- **Source:** `libs/agno/agno/eval/utils.py`

Functions

- `async async_log_eval(db: Union[BaseDb, AsyncBaseDb], run_id: str, run_data: dict, eval_type: EvalType, eval_input: dict, agent_id: Optional[str]=None, model_id: Optional[str]=None, model_provider: Optional[str]=None, name: Optional[str]=None, evaluated_component_name: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None) -> None` Call the API to create an evaluation run.
- `log_eval_run(db: BaseDb, run_id: str, run_data: dict, eval_type: EvalType, eval_input: dict, agent_id: Optional[str]=None, model_id: Optional[str]=None, model_provider: Optional[str]=None, name: Optional[str]=None, evaluated_component_name: Optional[str]=None, team_id: Optional[str]=None, workflow_id: Optional[str]=None) -> None` Call the API to create an evaluation run.
- `store_result_in_file(file_path: str, result: Union['AccuracyResult', 'PerformanceResult', 'ReliabilityResult'], eval_id: Optional[str]=None, name: Optional[str]=None)` Store the given result in the given file path

Module `agno.exceptions`

- **Source:** `libs/agno/agno/exceptions.py`

Classes

- **class AgentRunException** (bases: Exception)

- **class AgnoError** (bases: Exception)

- Exception raised when an internal error occurs.

- **class CheckTrigger** (bases: Enum)

- Enum for guardrail triggers.

- **class EvalError** (bases: Exception)

- Exception raised when an evaluation fails.

- **class InputCheckError** (bases: Exception)

- Exception raised when an input check fails.
- **class** `ModelProviderError` (bases: `AgnoError`)
 - Exception raised when a model provider returns an error.
- **class** `ModelRateLimitError` (bases: `ModelProviderError`)
 - Exception raised when a model provider returns a rate limit error.
- **class** `OutputCheckError` (bases: `Exception`)
 - Exception raised when an output check fails.
- **class** `RetryAgentRun` (bases: `AgentRunException`)
 - Exception raised when a tool call should be retried.
- **class** `RunCancelledException` (bases: `Exception`)
 - Exception raised when a run is cancelled.
- **class** `StopAgentRun` (bases: `AgentRunException`)
 - Exception raised when an agent should stop executing entirely.

Module `agno.guardrails.base`

- **Source:** `libs/agno/agno/guardrails/base.py`

Classes

- **class** `BaseGuardrail` (bases: `ABC`)
 - Abstract base class for all guardrail implementations.
 - **Methods:**
 - `async async_check(self, run_input: Union[RunInput, TeamRunInput]) -> None` â€” Perform asynchronous guardrail check.
 - `check(self, run_input: Union[RunInput, TeamRunInput]) -> None` â€” Perform synchronous guardrail check.

Module `agno.guardrails.openai`

- **Source:** `libs/agno/agno/guardrails/openai.py`

Classes

- **class** `OpenAIModerationGuardrail` (bases: `BaseGuardrail`)
 - Guardrail for detecting content that violates OpenAIâ€™s content policy.

Args: `moderation_model` (str): The model to use for moderation. Defaults to `â€œomni-moderation-latestâ€`. `raise_for_categories` (List[str]): The categories to raise for. Options are: `â€œsexualâ€`, `â€œsexual/minorsâ€`, `â€œharassmentâ€`, `â€œharassment/threateningâ€`, `â€œhateâ€`, `â€œhate/threateningâ€`, `â€œillicitâ€`, `â€œillicit/violentâ€`, `â€œself-harmâ€`, `â€œself-harm/intentâ€`, `â€œself-harm/instructionsâ€`, `â€œviolenceâ€`, `â€œviolence/graphicâ€`. Defaults to include all categories. `api_key` (str): The API key to use for moderation. Defaults to the `OPENAI_API_KEY` environment variable.

- **Methods:**
 - `async async_check(self, run_input: Union[RunInput, TeamRunInput]) -> None` â€” Check for content that violates OpenAIâ€™s content policy.
 - `check(self, run_input: Union[RunInput, TeamRunInput]) -> None` â€” Check for content that violates OpenAIâ€™s content policy.

Module `agno.guardrails.pii`

- **Source:** `libs/agno/agno/guardrails/pii.py`

Classes

- **class** `PIIDetectionGuardrail` (bases: `BaseGuardrail`)
 - Guardrail for detecting Personally Identifiable Information (PII).

Args: `mask_pii`: Whether to mask the PII in the input, rather than raising an error. `enable_ssn_check`: Whether to check for Social Security Numbers. True by default. `enable_credit_card_check`: Whether to check for credit cards. True by default. `enable_email_check`: Whether to check for emails. True by default. `enable_phone_check`: Whether to check for phone numbers. True by default. `custom_patterns`: A dictionary of custom PII patterns to detect. This is added to the default patterns.

- **Methods:**
 - `async async_check(self, run_input: Union[RunInput, TeamRunInput]) -> None` â€” Asynchronously check for PII patterns in the input.
 - `check(self, run_input: Union[RunInput, TeamRunInput]) -> None` â€” Check for PII patterns in the input.

Module `agno.guardrails.prompt_injection`

- **Source:** `libs/agno/agno/guardrails/prompt_injection.py`

Classes

- **class** `PromptInjectionGuardrail` (bases: `BaseGuardrail`)
 - Guardrail for detecting prompt injection attempts.

Args: `injection_patterns` (Optional[List[str]]): A list of patterns to check for. Defaults to a list of common prompt injection patterns.

- **Methods:**
 - `async async_check(self, run_input: Union[RunInput, TeamRunInput]) -> None` â€” Asynchronously check for prompt injection patterns in the input.
 - `check(self, run_input: Union[RunInput, TeamRunInput]) -> None` â€” Check for prompt injection patterns in the input.

Module `agno.integrations.discord.client`

- **Source:** `libs/agno/agno/integrations/discord/client.py`

Classes

- **class** `DiscordClient`
 - **Methods:**
 - `async handle_hitl(self, run_response: RunOutput, thread: Union[discord.Thread, discord.TextChannel]) -> RunOutput` â€” Handles optional Human-In-The-Loop interaction.
 - `serve(self)` â€” No docstring provided.
- **class** `RequiresConfirmationView` (bases: `discord.ui.View`)
 - **Methods:**
 - `async cancel(self, interaction: discord.Interaction, button: discord.ui.Button)` â€” No docstring provided.
 - `async confirm(self, interaction: discord.Interaction, button: discord.ui.Button)` â€” No docstring provided.

- `async on_timeout(self)` â€” No docstring provided.

Module `agno.knowledge.chunking.agentic`

- **Source:** `libs/agno/agno/knowledge/chunking/agentic.py`

Classes

- **class `AgenticChunking`** (bases: `ChunkingStrategy`)
 - Chunking strategy that uses an LLM to determine natural breakpoints in the text
 - **Methods:**
 - `chunk(self, document: Document) -> List[Document]` â€” Split text into chunks using LLM to determine natural breakpoints based on context

Module `agno.knowledge.chunking.document`

- **Source:** `libs/agno/agno/knowledge/chunking/document.py`

Classes

- **class `DocumentChunking`** (bases: `ChunkingStrategy`)
 - A chunking strategy that splits text based on document structure like paragraphs and sections
 - **Methods:**
 - `chunk(self, document: Document) -> List[Document]` â€” Split document into chunks based on document structure

Module `agno.knowledge.chunking.fixed`

- **Source:** `libs/agno/agno/knowledge/chunking/fixed.py`

Classes

- **class `FixedSizeChunking`** (bases: `ChunkingStrategy`)
 - Chunking strategy that splits text into fixed-size chunks with optional overlap
 - **Methods:**
 - `chunk(self, document: Document) -> List[Document]` â€” Split document into fixed-size chunks with optional overlap

Module `agno.knowledge.chunking.markdown`

- **Source:** `libs/agno/agno/knowledge/chunking/markdown.py`

Classes

- **class `MarkdownChunking`** (bases: `ChunkingStrategy`)
 - A chunking strategy that splits markdown based on structure like headers, paragraphs and sections
 - **Methods:**
 - `chunk(self, document: Document) -> List[Document]` â€” Split markdown document into chunks based on markdown structure

Module `agno.knowledge.chunking.recursive`

- **Source:** `libs/agno/agno/knowledge/chunking/recursive.py`

Classes

- **class `RecursiveChunking`** (bases: `ChunkingStrategy`)
 - Chunking strategy that recursively splits text into chunks by finding natural break points
 - **Methods:**
 - `chunk(self, document: Document) -> List[Document]` â€” Recursively chunk text by finding natural break points

Module `agno.knowledge.chunking.row`

- **Source:** `libs/agno/agno/knowledge/chunking/row.py`

Classes

- **class `RowChunking`** (bases: `ChunkingStrategy`)
 - **Methods:**
 - `chunk(self, document: Document) -> List[Document]` â€” No docstring provided.

Module `agno.knowledge.chunking.semantic`

- **Source:** `libs/agno/agno/knowledge/chunking/semantic.py`

Classes

- **class `SemanticChunking`** (bases: `ChunkingStrategy`)
 - Chunking strategy that splits text into semantic chunks using chonkie
 - **Methods:**
 - `chunk(self, document: Document) -> List[Document]` â€” Split document into semantic chunks using chonkie

Module `agno.knowledge.chunking.strategy`

- **Source:** `libs/agno/agno/knowledge/chunking/strategy.py`

Classes

- **class `ChunkingStrategy`** (bases: `ABC`)
 - Base class for chunking strategies
 - **Methods:**
 - `chunk(self, document: Document) -> List[Document]` â€” No docstring provided.
 - `clean_text(self, text: str) -> str` â€” Clean the text by replacing multiple newlines with a single newline
- **class `ChunkingStrategyFactory`**
 - Factory for creating chunking strategy instances.
 - **Methods:**

- `create_strategy(cls, strategy_type: ChunkingStrategyType, chunk_size: Optional[int]=None, overlap: Optional[int]=None, **kwargs) -> ChunkingStrategy` Create an instance of the chunking strategy with the given parameters.

- **class `ChunkingStrategyType`** (bases: `str`, `Enum`)
 - Enumeration of available chunking strategies.
 - **Methods:**
 - `from_string(cls, strategy_name: str) -> 'ChunkingStrategyType'` Convert a string to a `ChunkingStrategyType`.

Module `agno.knowledge.content`

- **Source:** `libs/agno/agno/knowledge/content.py`

Classes

- **class `Content`**
 - **Methods:**
 - `from_dict(cls, data: Dict[str, Any]) -> 'Content'` No docstring provided.
- **class `ContentAuth`**
- **class `ContentStatus`** (bases: `str`, `Enum`)
 - Enumeration of possible content processing statuses.
- **class `FileData`**

Module `agno.knowledge.document.base`

- **Source:** `libs/agno/agno/knowledge/document/base.py`

Classes

- **class `Document`**
 - Dataclass for managing a document
 - **Methods:**
 - `async async_embed(self, embedder: Optional[Embedder]=None) -> None` Embed the document using the provided embedder
 - `embed(self, embedder: Optional[Embedder]=None) -> None` Embed the document using the provided embedder
 - `from_dict(cls, document: Dict[str, Any]) -> 'Document'` Returns a `Document` object from a dictionary representation
 - `from_json(cls, document: str) -> 'Document'` Returns a `Document` object from a json string representation
 - `to_dict(self) -> Dict[str, Any]` Returns a dictionary representation of the document

Module `agno.knowledge.embedder.aws_bedrock`

- **Source:** `libs/agno/agno/knowledge/embedder/aws_bedrock.py`

Classes

- **class `AwsBedrockEmbedder`** (bases: `Embedder`)
 - AWS Bedrock embedder.

To use this embedder, you need to either: 1. Set the following environment variables: - `AWS_ACCESS_KEY_ID` - `AWS_SECRET_ACCESS_KEY` - `AWS_REGION` 2. Or provide a boto3 Session object

Args: `id` (`str`): The model ID to use. Default is `cohere.embed-multilingual-v3`. `dimensions` (`Optional[int]`): The dimensions of the embeddings. Default is 1024. `input_type` (`str`): Prepends special tokens to differentiate types. Options: `search document`, `search query`, `classification`, `clustering`. Default is `search query`. `truncate` (`Optional[str]`): How to handle inputs longer than the maximum token length. Options: `NONE`, `START`, `END`. Default is `NONE`. `embedding_types` (`Optional[List[str]]`): Types of embeddings to return. Options: `float`, `int`, `uint8`, `binary`, `ubinary`. Default is `[float]`. `aws_region` (`Optional[str]`): The AWS region to use. `aws_access_key_id` (`Optional[str]`): The AWS access key ID to use. `aws_secret_access_key` (`Optional[str]`): The AWS secret access key to use. `session` (`Optional[Session]`): A boto3 Session object to use for authentication. `request_params` (`Optional[Dict[str, Any]]`): Additional parameters to pass to the API requests. `client_params` (`Optional[Dict[str, Any]]`): Additional parameters to pass to the boto3 client.

- **Methods:**
 - `async async_get_embedding(self, text: str) -> List[float]` Async version of `get_embedding()` using native aioboto3 async client.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict[str, Any]]]` Async version of `get_embedding_and_usage()` using native aioboto3 async client.
 - `get_async_client(self)` Returns an async AWS Bedrock client using aioboto3. Returns: An aioboto3 bedrock-runtime client context manager.
 - `get_client(self) -> AwsClient` Returns an AWS Bedrock client. Returns: `AwsClient`: An instance of the AWS Bedrock client.
 - `get_embedding(self, text: str) -> List[float]` Get embeddings for the given text. Args: `text` (`str`): The text to embed. Returns: `List[float]`: The embedding vector.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict[str, Any]]]` Get embeddings and usage information for the given text. Args: `text` (`str`): The text to embed. Returns: `Tuple[List[float], Optional[Dict[str, Any]]]`: The embedding vector and usage information.
 - `response(self, text: str) -> Dict[str, Any]` Get embeddings from AWS Bedrock for the given text. Args: `text` (`str`): The text to embed. Returns: `Dict[str, Any]`: The response from the API.

Module `agno.knowledge.embedder.azure_openai`

- **Source:** `libs/agno/agno/knowledge/embedder/azure_openai.py`

Classes

- **class `AzureOpenAIEEmbedder`** (bases: `Embedder`)
 - **Methods:**
 - `aclient(self) -> AsyncAzureOpenAIClient` No docstring provided.
 - `async async_get_embedding(self, text: str) -> List[float]` Async version of `get_embedding` using the native Azure OpenAI async client.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` Async version of `get_embedding_and_usage` using the native Azure OpenAI async client.
 - `async async_get_embeddings_batch_and_usage(self, texts: List[str]) -> Tuple[List[List[float]], List[Optional[Dict]]]` Get embeddings and usage for multiple texts in batches. Args: `texts`: List of text strings to embed Returns: Tuple of (List of embedding vectors, List of usage dictionaries)
 - `client(self) -> AzureOpenAIClient` No docstring provided.
 - `get_embedding(self, text: str) -> List[float]` No docstring provided.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` No docstring provided.

Module `agno.knowledge.embedder.base`

- **Source:** `libs/agno/agno/knowledge/embedder/base.py`

Classes

- **class Embedder**
 - Base class for managing embedders
 - **Methods:**
 - `async async_get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” No docstring provided.
 - `get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” No docstring provided.

Module `agno.knowledge.embedder.cohere`

- **Source:** `libs/agno/agno/knowledge/embedder/cohere.py`

Classes

- **class CohereEmbedder** (bases: Embedder)
 - **Methods:**
 - `aclient(self) -> AsyncCohereClient` â€” Lazy init for Cohere async client.
 - `async async_get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict[str, Any]]]` â€” No docstring provided.
 - `async async_get_embeddings_batch_and_usage(self, texts: List[str]) -> Tuple[List[List[float]], List[Optional[Dict]]]` â€” Get embeddings and usage for multiple texts in batches (async version). Args: texts: List of text strings to embed Returns: s, List of usage dictionaries
 - `client(self) -> CohereClient` â€” No docstring provided.
 - `get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict[str, Any]]]` â€” No docstring provided.
 - `response(self, text: str) -> Union[EmbeddingsFloatsEmbedResponse, EmbeddingsByTypeEmbedResponse]` â€” No docstring provided.

Module `agno.knowledge.embedder.fastembed`

- **Source:** `libs/agno/agno/knowledge/embedder/fastembed.py`

Classes

- **class FastEmbedEmbedder** (bases: Embedder)
 - Using BAAI/bge-small-en-v1.5 model, more models available: https://qdrant.github.io/fastembed/examples/Supported_Models/
 - **Methods:**
 - `async async_get_embedding(self, text: str) -> List[float]` â€” Async version using thread executor for CPU-bound operations.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” Async version using thread executor for CPU-bound operations.
 - `get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” No docstring provided.

Module `agno.knowledge.embedder.fireworks`

- **Source:** `libs/agno/agno/knowledge/embedder/fireworks.py`

Classes

- **class FireworksEmbedder** (bases: OpenAIEmbedder)

Module `agno.knowledge.embedder.google`

- **Source:** `libs/agno/agno/knowledge/embedder/google.py`

Classes

- **class GeminiEmbedder** (bases: Embedder)
 - **Methods:**
 - `aclient(self) -> GeminiClient` â€” Returns the same client instance since Google GenAI Client supports both sync and async operations.
 - `async async_get_embedding(self, text: str) -> List[float]` â€” Async version of `get_embedding` using `client.aio`.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict[str, Any]]]` â€” Async version of `get_embedding_and_usage` using `client.aio`.
 - `async async_get_embeddings_batch_and_usage(self, texts: List[str]) -> Tuple[List[List[float]], List[Optional[Dict[str, Any]]]]` â€” Get embeddings and usage for multiple texts in batches. Args: texts: List of text strings to embed Returns: Tuple of (List of embedding vectors, List of usage dictionaries)
 - `client(self)` â€” No docstring provided.
 - `get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict[str, Any]]]` â€” No docstring provided.

Module `agno.knowledge.embedder.huggingface`

- **Source:** `libs/agno/agno/knowledge/embedder/huggingface.py`

Classes

- **class HuggingfaceCustomEmbedder** (bases: Embedder)
 - Huggingface Custom Embedder
 - **Methods:**
 - `aclient(self) -> AsyncInferenceClient` â€” No docstring provided.
 - `async async_get_embedding(self, text: str) -> List[float]` â€” Async version of `get_embedding` using `AsyncInferenceClient`.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” Async version of `get_embedding_and_usage`.
 - `client(self) -> InferenceClient` â€” No docstring provided.
 - `get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” No docstring provided.

Module `agno.knowledge.embedder.jina`

- **Source:** `libs/agno/agno/knowledge/embedder/jina.py`

Classes

- `class JinaEmbedder` (bases: Embedder)
 - **Methods:**
 - `async async_get_embedding(self, text: str) -> List[float]` â€” Async version of `get_embedding`.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” Async version of `get_embedding_and_usage`.
 - `async async_get_embeddings_batch_and_usage(self, texts: List[str]) -> Tuple[List[List[float]], List[Optional[Dict]]]` â€” Get embeddings and usage for multiple texts in batches. Args: texts: List of text strings to embed Returns: Tuple of (List of embedding vectors, List of usage dictionaries)
 - `get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” No docstring provided.

Module `agno.knowledge.embedder.langdb`

- **Source:** `libs/agno/agno/knowledge/embedder/langdb.py`

Classes

- `class LangDBEmbedder` (bases: OpenAIEmbedder)

Module `agno.knowledge.embedder.mistral`

- **Source:** `libs/agno/agno/knowledge/embedder/mistral.py`

Classes

- `class MistralEmbedder` (bases: Embedder)
 - **Methods:**
 - `async async_get_embedding(self, text: str) -> List[float]` â€” Async version of `get_embedding`.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Dict[str, Any]]` â€” Async version of `get_embedding_and_usage`.
 - `async async_get_embeddings_batch_and_usage(self, texts: List[str]) -> Tuple[List[List[float]], List[Optional[Dict[str, Any]]]]` â€” Get embeddings and usage for multiple texts in batches. Args: texts: List of text strings to embed Returns: Tuple of (List of embedding vectors, List of usage dictionaries)
 - `client(self) -> Mistral` â€” No docstring provided.
 - `get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Dict[str, Any]]` â€” No docstring provided.

Module `agno.knowledge.embedder.nebius`

- **Source:** `libs/agno/agno/knowledge/embedder/nebius.py`

Classes

- `class NebiusEmbedder` (bases: OpenAIEmbedder)

Module `agno.knowledge.embedder.ollama`

- **Source:** `libs/agno/agno/knowledge/embedder/ollama.py`

Classes

- `class OllamaEmbedder` (bases: Embedder)
 - **Methods:**
 - `aclient(self) -> AsyncOllamaClient` â€” No docstring provided.
 - `async async_get_embedding(self, text: str) -> List[float]` â€” Async version of `get_embedding`.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” Async version of `get_embedding_and_usage`.
 - `client(self) -> OllamaClient` â€” No docstring provided.
 - `get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” No docstring provided.

Module `agno.knowledge.embedder.openai`

- **Source:** `libs/agno/agno/knowledge/embedder/openai.py`

Classes

- `class OpenAIEmbedder` (bases: Embedder)
 - **Methods:**
 - `aclient(self) -> AsyncOpenAI` â€” No docstring provided.
 - `async async_get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `async async_get_embedding_and_usage(self, text: str) â€” No docstring provided.`
 - `async async_get_embeddings_batch_and_usage(self, texts: List[str]) -> Tuple[List[List[float]], List[Optional[Dict]]]` â€” Get embeddings and usage for multiple texts in batches (async version). Args: texts: List of text strings to embed Returns: Tuple of (List of embedding vectors, List of usage dictionaries)
 - `client(self) -> OpenAIClient` â€” No docstring provided.
 - `get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” No docstring provided.
 - `response(self, text: str) -> CreateEmbeddingResponse` â€” No docstring provided.

Module `agno.knowledge.embedder.sentence_transformer`

- **Source:** `libs/agno/agno/knowledge/embedder/sentence_transformer.py`

Classes

- `class SentenceTransformerEmbedder` (bases: Embedder)
 - **Methods:**
 - `async async_get_embedding(self, text: Union[str, List[str]]) -> List[float]` â€” Async version using thread executor for CPU-bound operations.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” Async version using thread executor for CPU-bound operations.
 - `get_embedding(self, text: Union[str, List[str]]) -> List[float]` â€” No docstring provided.

- `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” No docstring provided.

Module `agno.knowledge.embedder.together`

- **Source:** `libs/agno/agno/knowledge/embedder/together.py`

Classes

- `class TogetherEmbedder` (bases: `OpenAIEmbedder`)

Module `agno.knowledge.embedder.vllm`

- **Source:** `libs/agno/agno/knowledge/embedder/vllm.py`

Classes

- `class VLLMEmbedder` (bases: `Embedder`)
 - VLLM Embedder supporting both local and remote deployment modes.

Local Mode (default): - Loads model locally and runs inference on your GPU/CPU - No API key required - Example: `VLLMEmbedder(id="â€œintfloat/e5-mistral-7b-instructâ€”`

Remote Mode: - Connects to a remote vLLM server via OpenAI-compatible API - Uses OpenAI SDK to communicate with vLLM’s OpenAI-compatible endpoint - Requires `base_url` and optionally `api_key` - Example: `VLLMEmbedder(base_url="â€œhttp://localhost:8000/v1â€”, api_key="â€œyour-keyâ€”` - Ref: https://docs.vllm.ai/en/latest/serving/openai_compatible_server.html

- **Methods:**
 - `async async_get_embedding(self, text: str) -> List[float]` â€” Async version of `get_embedding` using thread executor for local mode.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” Async version of `get_embedding_and_usage` using thread executor for local mode.
 - `async async_get_embeddings_batch_and_usage(self, texts: List[str]) -> Tuple[List[List[float]], List[Optional[Dict]]]` â€” Get embeddings and usage for multiple texts in batches (async version). Args: `texts`: List of text strings to embed Returns: Tuple of (List of embedding vectors, List of usage dictionaries)
 - `get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” No docstring provided.
 - `is_remote(self) -> bool` â€” Determine if we should use remote mode.

Module `agno.knowledge.embedder.voyageai`

- **Source:** `libs/agno/agno/knowledge/embedder/voyageai.py`

Classes

- `class VoyageAIEmbedder` (bases: `Embedder`)
 - **Methods:**
 - `aclient(self) -> AsyncVoyageClient` â€” No docstring provided.
 - `async async_get_embedding(self, text: str) -> List[float]` â€” Async version of `get_embedding`.
 - `async async_get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” Async version of `get_embedding_and_usage`.
 - `async async_get_embeddings_batch_and_usage(self, texts: List[str]) -> Tuple[List[List[float]], List[Optional[Dict]]]` â€” Get embeddings and usage for multiple texts in batches. Args: `texts`: List of text strings to embed Returns: Tuple of (List of embedding vectors, List of usage dictionaries)
 - `client(self) -> VoyageClient` â€” No docstring provided.
 - `get_embedding(self, text: str) -> List[float]` â€” No docstring provided.
 - `get_embedding_and_usage(self, text: str) -> Tuple[List[float], Optional[Dict]]` â€” No docstring provided.

Module `agno.knowledge.knowledge`

- **Source:** `libs/agno/agno/knowledge/knowledge.py`

Classes

- `class Knowledge`
 - Knowledge class
 - **Methods:**
 - `add_content(self, *, path: Optional[str]=None, url: Optional[str]=None, text_content: Optional[str]=None, metadata: Optional[Dict[str, str]]=None, include: Optional[List[str]]=None, exclude: Optional[List[str]]=None, upsert: bool=True, skip_if_exists: bool=False, reader: Optional[Reader]=None, auth: Optional[ContentAuth]=None) -> None` â€” No docstring provided.
 - `add_content(self, *args, **kwargs) -> None` â€” No docstring provided.
 - `add_content(self, name: Optional[str]=None, description: Optional[str]=None, path: Optional[str]=None, url: Optional[str]=None, text_content: Optional[str]=None, metadata: Optional[Dict[str, Any]]=None, topics: Optional[List[str]]=None, remote_content: Optional[RemoteContent]=None, reader: Optional[Reader]=None, include: Optional[List[str]]=None, exclude: Optional[List[str]]=None, upsert: bool=True, skip_if_exists: bool=False, auth: Optional[ContentAuth]=None) -> None` â€” Synchronously add content to the knowledge base. Args: `name`: Optional name for the content description: Optional description for the content path: Optional file path to load content from url: Optional URL to load content from text_content: Optional text content to add directly metadata: Optional metadata dictionary topics: Optional list of topics remote_content: Optional cloud storage configuration reader: Optional custom reader for processing the content include: Optional list of file patterns to include exclude: Optional list of file patterns to exclude upsert: Whether to update existing content if it already exists skip_if_exists: Whether to skip adding content if it already exists
 - `async add_content_async(self, *, path: Optional[str]=None, url: Optional[str]=None, text_content: Optional[str]=None, metadata: Optional[Dict[str, str]]=None, include: Optional[List[str]]=None, exclude: Optional[List[str]]=None, upsert: bool=True, skip_if_exists: bool=False, reader: Optional[Reader]=None, auth: Optional[ContentAuth]=None) -> None` â€” No docstring provided.
 - `async add_content_async(self, *args, **kwargs) -> None` â€” No docstring provided.
 - `async add_content_async(self, name: Optional[str]=None, description: Optional[str]=None, path: Optional[str]=None, url: Optional[str]=None, text_content: Optional[str]=None, metadata: Optional[Dict[str, Any]]=None, topics: Optional[List[str]]=None, remote_content: Optional[RemoteContent]=None, reader: Optional[Reader]=None, include: Optional[List[str]]=None, exclude: Optional[List[str]]=None, upsert: bool=True, skip_if_exists: bool=False, auth: Optional[ContentAuth]=None) -> None` â€” No docstring provided.
 - `add_contents(self, contents: List[ContentDict]) -> None` â€” No docstring provided.
 - `add_contents(self, *, paths: Optional[List[str]]=None, urls: Optional[List[str]]=None, metadata: Optional[Dict[str, str]]=None, topics: Optional[List[str]]=None, text_contents: Optional[List[str]]=None, reader: Optional[Reader]=None, include: Optional[List[str]]=None, exclude: Optional[List[str]]=None, upsert: bool=True, skip_if_exists: bool=False, remote_content: Optional[RemoteContent]=None) -> None` â€” No docstring provided.
 - `add_contents(self, *args, **kwargs) -> None` â€” Synchronously add multiple content items to the knowledge base. This method wraps the asynchronous `add_contents` method Supports two usage patterns: 1. Pass a list of content dictionaries as first argument 2. Pass keyword arguments with paths, urls, metadata, etc. Args: `contents`: List of content dictionaries (when used as first overload) paths: Optional list of file paths to load content from urls: Optional list of URLs to load content from metadata: Optional metadata dictionary to apply to all content topics: Optional list of topics to add text_contents: Optional list of text content strings to add reader: Optional reader to use for processing content include: Optional list of file patterns to include exclude: Optional list of file patterns to exclude upsert: Whether to update existing content if it already exists skip_if_exists: Whether to skip adding content if it already exists remote_content: Optional remote content (S3, GCS, etc.) to add
 - `async add_contents_async(self, contents: List[ContentDict]) -> None` â€” No docstring provided.
 - `async add_contents_async(self, *, paths: Optional[List[str]]=None, urls: Optional[List[str]]=None, metadata: Optional[Dict[str, str]]=None, topics: Optional[List[str]]=None, text_contents: Optional[List[str]]=None, reader: Optional[Reader]=None, include: Optional[List[str]]=None, exclude: Optional[List[str]]=None, upsert: bool=True, skip_if_exists: bool=False, remote_content: Optional[RemoteContent]=None) -> None` â€” No docstring provided.
 - `async add_contents_async(self, *args, **kwargs) -> None` â€” No docstring provided.
 - `add_filters(self, metadata: Dict[str, Any]) -> None` â€” No docstring provided.

- `add_reader(self, reader: Reader)` â€” Add a custom reader to the knowledge base.
- `async aget_content(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[Content], int]` â€” No docstring provided.
- `async aget_content_by_id(self, content_id: str) -> Optional[Content]` â€” No docstring provided.
- `async aget_content_status(self, content_id: str) -> Tuple[Optional[ContentStatus], Optional[str]]` â€” No docstring provided.
- `async aget_valid_filters(self) -> Set[str]` â€” No docstring provided.
- `async apatch_content(self, content: Content) -> Optional[Dict[str, Any]]` â€” No docstring provided.
- `async aremove_all_content(self)` â€” No docstring provided.
- `async aremove_content_by_id(self, content_id: str)` â€” No docstring provided.
- `async async_search(self, query: str, max_results: Optional[int]=None, filters: Optional[Dict[str, Any]]=None, search_type: Optional[str]=None) -> List[Document]` â€” Returns relevant documents matching a query
- `async async_validate_filters(self, filters: Optional[Dict[str, Any]]) -> Tuple[Dict[str, Any], List[str]]` â€” No docstring provided.
- `construct_readers(self)` â€” Initialize readers dictionary for lazy loading.
- `csv_reader(self) -> Optional[Reader]` â€” CSV reader - lazy loaded via factory.
- `docx_reader(self) -> Optional[Reader]` â€” Docx reader - lazy loaded via factory.
- `firecrawl_reader(self) -> Optional[Reader]` â€” Firecrawl reader - lazy loaded via factory.
- `get_content(self, limit: Optional[int]=None, page: Optional[int]=None, sort_by: Optional[str]=None, sort_order: Optional[str]=None) -> Tuple[List[Content], int]` â€” No docstring provided.
- `get_content_by_id(self, content_id: str) -> Optional[Content]` â€” No docstring provided.
- `get_content_status(self, content_id: str) -> Tuple[Optional[ContentStatus], Optional[str]]` â€” No docstring provided.
- `get_filters(self) -> List[str]` â€” No docstring provided.
- `get_readers(self) -> Dict[str, Reader]` â€” Get all currently loaded readers (only returns readers that have been used).
- `get_valid_filters(self) -> Set[str]` â€” No docstring provided.
- `json_reader(self) -> Optional[Reader]` â€” JSON reader - lazy loaded via factory.
- `markdown_reader(self) -> Optional[Reader]` â€” Markdown reader - lazy loaded via factory.
- `patch_content(self, content: Content) -> Optional[Dict[str, Any]]` â€” No docstring provided.
- `pdf_reader(self) -> Optional[Reader]` â€” PDF reader - lazy loaded via factory.
- `pptx_reader(self) -> Optional[Reader]` â€” PPTX reader - lazy loaded via factory.
- `remove_all_content(self)` â€” No docstring provided.
- `remove_content_by_id(self, content_id: str)` â€” No docstring provided.
- `remove_vector_by_id(self, id: str) -> bool` â€” No docstring provided.
- `remove_vectors_by_metadata(self, metadata: Dict[str, Any]) -> bool` â€” No docstring provided.
- `remove_vectors_by_name(self, name: str) -> bool` â€” No docstring provided.
- `search(self, query: str, max_results: Optional[int]=None, filters: Optional[Dict[str, Any]]=None, search_type: Optional[str]=None) -> List[Document]` â€” Returns relevant documents matching a query
- `text_reader(self) -> Optional[Reader]` â€” Text reader - lazy loaded via factory.
- `validate_filters(self, filters: Optional[Dict[str, Any]]) -> Tuple[Dict[str, Any], List[str]]` â€” No docstring provided.
- `website_reader(self) -> Optional[Reader]` â€” Website reader - lazy loaded via factory.
- `youtube_reader(self) -> Optional[Reader]` â€” YouTube reader - lazy loaded via factory.

- `class KnowledgeContentOrigin` (bases: Enum)

Module `agno.knowledge.reader.arxiv_reader`

- **Source:** `libs/agno/agno/knowledge/reader/arxiv_reader.py`

Classes

- `class ArxivReader` (bases: Reader)
 - **Methods:**
 - `async async_read(self, query: str) -> List[Document]` â€” Search a query from arXiv database asynchronously This function gets the top_k articles based on a userâ€™s query, sorted by relevance from arxiv @param query: Search query string @return: List of documents
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for Arxiv readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, query: str) -> List[Document]` â€” Search a query from arXiv database This function gets the top_k articles based on a userâ€™s query, sorted by relevance from arxiv @param query: @return: List of documents

Module `agno.knowledge.reader.base`

- **Source:** `libs/agno/agno/knowledge/reader/base.py`

Classes

- `class Reader`
 - Base class for reading documents
 - **Methods:**
 - `async async_read(self, obj: Any, name: Optional[str]=None, password: Optional[str]=None) -> List[Document]` â€” No docstring provided.
 - `chunk_document(self, document: Document) -> List[Document]` â€” No docstring provided.
 - `async chunk_documents_async(self, documents: List[Document]) -> List[Document]` â€” Asynchronously chunk a list of documents using the instanceâ€™s `chunk_document` method. Args: documents: List of documents to be chunked. Returns: A flattened list of chunked documents.
 - `get_supported_chunking_strategies(cls) -> List[ChunkingStrategyType]` â€” No docstring provided.
 - `get_supported_content_types(cls) -> List[ContentType]` â€” No docstring provided.
 - `read(self, obj: Any, name: Optional[str]=None, password: Optional[str]=None) -> List[Document]` â€” No docstring provided.
 - `set_chunking_strategy_from_string(self, strategy_name: str, chunk_size: Optional[int]=None, overlap: Optional[int]=None, **kwargs) -> None` â€” Set the chunking strategy from a string name.

Module `agno.knowledge.reader.csv_reader`

- **Source:** `libs/agno/agno/knowledge/reader/csv_reader.py`

Classes

- **class CSVReader** (bases: Reader)
 - Reader for CSV files
 - **Methods:**
 - `async async_read(self, file: Union[Path, IO[Any]], delimiter: str=',', quotechar: str='"', page_size: int=1000, name: Optional[str]=None) -> List[Document]` â€” Read a CSV file asynchronously, processing batches of rows concurrently. Args: file: Path or file-like object delimiter: CSV delimiter quotechar: CSV quote character page_size: Number of rows per page Returns: List of Document objects
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for CSV readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, file: Union[Path, IO[Any]], delimiter: str=',', quotechar: str='"', name: Optional[str]=None) -> List[Document]` â€” No docstring provided.

Module agno.knowledge.reader.docx_reader

- **Source:** `libs/agno/agno/knowledge/reader/docx_reader.py`

Classes

- **class DocxReader** (bases: Reader)
 - Reader for Doc/Docx files
 - **Methods:**
 - `async async_read(self, file: Union[Path, IO[Any]], name: Optional[str]=None) -> List[Document]` â€” Asynchronously read a docx file and return a list of documents
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for DOCX readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, file: Union[Path, IO[Any]], name: Optional[str]=None) -> List[Document]` â€” Read a docx file and return a list of documents

Module agno.knowledge.reader.field_labeled_csv_reader

- **Source:** `libs/agno/agno/knowledge/reader/field_labeled_csv_reader.py`

Classes

- **class FieldLabeledCSVReader** (bases: Reader)
 - Reader for CSV files that converts each row to a field-labeled document.
 - **Methods:**
 - `async async_read(self, file: Union[Path, IO[Any]], delimiter: str=',', quotechar: str='"', page_size: int=1000, name: Optional[str]=None) -> List[Document]` â€” No docstring provided.
 - `get_supported_chunking_strategies(cls) -> List[ChunkingStrategyType]` â€” Chunking is not supported - each row is already a logical document unit.
 - `get_supported_content_types(cls) -> List[ContentType]` â€” Get the list of supported content types.
 - `read(self, file: Union[Path, IO[Any]], delimiter: str=',', quotechar: str='"', name: Optional[str]=None) -> List[Document]` â€” No docstring provided.

Module agno.knowledge.reader.firecrawl_reader

- **Source:** `libs/agno/agno/knowledge/reader/firecrawl_reader.py`

Classes

- **class FirecrawlReader** (bases: Reader)
 - **Methods:**
 - `async async_crawl(self, url: str, name: Optional[str]=None) -> List[Document]` â€” Asynchronously crawls a website and returns a list of documents. Args: url: The URL of the website to crawl Returns: A list of documents
 - `async async_read(self, url: str, name: Optional[str]=None) -> List[Document]` â€” Asynchronously reads from a URL based on the mode setting. Args: url: The URL of the website to process Returns: A list of documents
 - `async async_scrape(self, url: str, name: Optional[str]=None) -> List[Document]` â€” Asynchronously scrapes a website and returns a list of documents. Args: url: The URL of the website to scrape Returns: A list of documents
 - `crawl(self, url: str, name: Optional[str]=None) -> List[Document]` â€” Crawls a website and returns a list of documents. Args: url: The URL of the website to crawl Returns: A list of documents
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for Firecrawl readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, url: str, name: Optional[str]=None) -> List[Document]` â€” Reads from a URL based on the mode setting. Args: url: The URL of the website to process Returns: A list of documents
 - `scrape(self, url: str, name: Optional[str]=None) -> List[Document]` â€” Scrapes a website and returns a list of documents. Args: url: The URL of the website to scrape Returns: A list of documents

Module agno.knowledge.reader.json_reader

- **Source:** `libs/agno/agno/knowledge/reader/json_reader.py`

Classes

- **class JSONReader** (bases: Reader)
 - Reader for JSON files
 - **Methods:**
 - `async async_read(self, path: Union[Path, IO[Any]], name: Optional[str]=None) -> List[Document]` â€” Asynchronously read JSON files. Args: path (Union[Path, IO[Any]]): Path to a JSON file or a file-like object Returns: List[Document]: List of documents from the JSON file
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for JSON readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, path: Union[Path, IO[Any]], name: Optional[str]=None) -> List[Document]` â€” No docstring provided.

Module agno.knowledge.reader.markdown_reader

- **Source:** `libs/agno/agno/knowledge/reader/markdown_reader.py`

Classes

- **class MarkdownReader** (bases: Reader)
 - Reader for Markdown files

- **Methods:**
 - `async async_read(self, file: Union[Path, IO[Any]], name: Optional[str]=None) -> List[Document]` â€” No docstring provided.
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for Markdown readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, file: Union[Path, IO[Any]], name: Optional[str]=None) -> List[Document]` â€” No docstring provided.

Module `agno.knowledge.reader.pdf_reader`

- **Source:** `libs/agno/agno/knowledge/reader/pdf_reader.py`

Classes

- **class** `BasePDFReader` (bases: `Reader`)
 - **Methods:**
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for PDF readers.
- **class** `PDFImageReader` (bases: `BasePDFReader`)
 - Reader for PDF files with text and images extraction
 - **Methods:**
 - `async async_read(self, pdf: Union[str, Path, IO[Any]], name: Optional[str]=None, password: Optional[str]=None) -> List[Document]` â€” No docstring provided.
 - `read(self, pdf: Union[str, Path, IO[Any]], name: Optional[str]=None, password: Optional[str]=None) -> List[Document]` â€” No docstring provided.
- **class** `PDFReader` (bases: `BasePDFReader`)
 - Reader for PDF files
 - **Methods:**
 - `async async_read(self, pdf: Optional[Union[str, Path, IO[Any]]]=None, name: Optional[str]=None, password: Optional[str]=None) -> List[Document]` â€” No docstring provided.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, pdf: Union[str, Path, IO[Any]], name: Optional[str]=None, password: Optional[str]=None) -> List[Document]` â€” No docstring provided.

Module `agno.knowledge.reader.pptx_reader`

- **Source:** `libs/agno/agno/knowledge/reader/pptx_reader.py`

Classes

- **class** `PPTXReader` (bases: `Reader`)
 - Reader for PPTX files
 - **Methods:**
 - `async async_read(self, file: Union[Path, IO[Any]], name: Optional[str]=None) -> List[Document]` â€” Asynchronously read a pptx file and return a list of documents
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for PPTX readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, file: Union[Path, IO[Any]], name: Optional[str]=None) -> List[Document]` â€” Read a pptx file and return a list of documents

Module `agno.knowledge.reader.reader_factory`

- **Source:** `libs/agno/agno/knowledge/reader/reader_factory.py`

Classes

- **class** `ReaderFactory`
 - Factory for creating and managing document readers with lazy loading.
 - **Methods:**
 - `clear_cache(cls)` â€” Clear the reader cache.
 - `create_all_readers(cls) -> Dict[str, Reader]` â€” Create all readers and return them as a dictionary.
 - `create_reader(cls, reader_key: str, **kwargs) -> Reader` â€” Create a reader instance with the given key and optional overrides.
 - `get_all_reader_keys(cls) -> List[str]` â€” Get all available reader keys in priority order.
 - `get_reader_for_extension(cls, extension: str) -> Reader` â€” Get the appropriate reader for a file extension.
 - `get_reader_for_url(cls, url: str) -> Reader` â€” Get the appropriate reader for a URL.
 - `register_reader(cls, key: str, reader_method, name: str, description: str, extensions: Optional[List[str]]=None)` â€” Register a new reader type.

Module `agno.knowledge.reader.s3_reader`

- **Source:** `libs/agno/agno/knowledge/reader/s3_reader.py`

Classes

- **class** `S3Reader` (bases: `Reader`)
 - Reader for S3 files
 - **Methods:**
 - `async async_read(self, name: Optional[str], s3_object: S3Object) -> List[Document]` â€” Asynchronously read S3 files by running the synchronous read operation in a thread.
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for S3 readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, name: Optional[str], s3_object: S3Object) -> List[Document]` â€” No docstring provided.

Module `agno.knowledge.reader.tavily_reader`

- **Source:** `libs/agno/agno/knowledge/reader/tavily_reader.py`

Classes

- **class** `TavilyReader` (bases: `Reader`)
 - **Methods:**
 - `async async_read(self, url: str, name: Optional[str]=None) -> List[Document]` â€” Asynchronously reads content from a URL using Tavily Extract API. This is the public API method that users should call for async operations. Args: url: The URL to extract content from name: Optional name for the document Returns: A list of documents containing the extracted content

- `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for Tavily readers.
- `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
- `read(self, url: str, name: Optional[str]=None) -> List[Document]` â€” Reads content from a URL using Tavily Extract API. This is the public API method that users should call. Args: url: The URL to extract content from name: Optional name for the document Returns: A list of documents containing the extracted content

Module `agno.knowledge.reader.text_reader`

- **Source:** `libs/agno/agno/knowledge/reader/text_reader.py`

Classes

- **class `TextReader`** (bases: `Reader`)
 - Reader for Text files
 - **Methods:**
 - `async async_read(self, file: Union[Path, IO[Any]], name: Optional[str]=None) -> List[Document]` â€” No docstring provided.
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for Text readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, file: Union[Path, IO[Any]], name: Optional[str]=None) -> List[Document]` â€” No docstring provided.

Module `agno.knowledge.reader.web_search_reader`

- **Source:** `libs/agno/agno/knowledge/reader/web_search_reader.py`

Classes

- **class `WebSearchReader`** (bases: `Reader`)
 - Reader that uses web search to find content for a given query
 - **Methods:**
 - `async async_read(self, query: str) -> List[Document]` â€” Asynchronously read content for a given query
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for Web Search readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, query: str) -> List[Document]` â€” Read content for a given query by performing web search and fetching content

Module `agno.knowledge.reader.website_reader`

- **Source:** `libs/agno/agno/knowledge/reader/website_reader.py`

Classes

- **class `WebsiteReader`** (bases: `Reader`)
 - Reader for Websites
 - **Methods:**
 - `async async_crawl(self, url: str, starting_depth: int=1) -> Dict[str, str]` â€” Asynchronously crawls a website and returns a dictionary of URLs and their corresponding content. Parameters: - url (str): The starting URL to begin the crawl. - starting_depth (int, optional): The starting depth level for the crawl. Defaults to 1. Returns: - Dict[str, str]: A dictionary where each key is a URL and the corresponding value is the main content extracted from that URL. Raises: - httpx.HTTPStatusError: If thereâ€™s an HTTP status error. - httpx.RequestError: If thereâ€™s a request-related error (connection, timeout, etc).
 - `async async_delay(self, min_seconds=1, max_seconds=3) â€”` Introduce a random delay asynchronously. :param min_seconds: Minimum number of seconds to delay. Default is 1. :param max_seconds: Maximum number of seconds to delay. Default is 3.
 - `async async_read(self, url: str, name: Optional[str]=None) -> List[Document]` â€” Asynchronously reads a website and returns a list of documents. This function first converts the website into a dictionary of URLs and their corresponding content. Then iterates through the dictionary and returns chunks of content. :param url: The URL of the website to read. :return: A list of documents. :raises httpx.HTTPStatusError: If thereâ€™s an HTTP status error. :raises httpx.RequestError: If thereâ€™s a request-related error.
 - `crawl(self, url: str, starting_depth: int=1) -> Dict[str, str]` â€” Crawls a website and returns a dictionary of URLs and their corresponding content. Parameters: - url (str): The starting URL to begin the crawl. - starting_depth (int, optional): The starting depth level for the crawl. Defaults to 1. Returns: - Dict[str, str]: A dictionary where each key is a URL and the corresponding value is the main content extracted from that URL. Raises: - httpx.HTTPStatusError: If thereâ€™s an HTTP status error. - httpx.RequestError: If thereâ€™s a request-related error (connection, timeout, etc). Note: The function focuses on extracting the main content by prioritizing content inside common HTML tags like <article>, <main>, and <div> with class names such as â€œcontentâ€, â€œmain-contentâ€, etc. The crawler will also respect the max_depth attribute of the WebCrawler class, ensuring it does not crawl deeper than the specified depth.
 - `delay(self, min_seconds=1, max_seconds=3) â€”` Introduce a random delay. :param min_seconds: Minimum number of seconds to delay. Default is 1. :param max_seconds: Maximum number of seconds to delay. Default is 3.
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for Website readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, url: str, name: Optional[str]=None) -> List[Document]` â€” Reads a website and returns a list of documents. This function first converts the website into a dictionary of URLs and their corresponding content. Then iterates through the dictionary and returns chunks of content. :param url: The URL of the website to read. :return: A list of documents. :raises httpx.HTTPStatusError: If thereâ€™s an HTTP status error. :raises httpx.RequestError: If thereâ€™s a request-related error.

Module `agno.knowledge.reader.wikipedia_reader`

- **Source:** `libs/agno/agno/knowledge/reader/wikipedia_reader.py`

Classes

- **class `WikipediaReader`** (bases: `Reader`)
 - **Methods:**
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for Wikipedia readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.
 - `read(self, topic: str) -> List[Document]` â€” No docstring provided.

Module `agno.knowledge.reader.youtube_reader`

- **Source:** `libs/agno/agno/knowledge/reader/youtube_reader.py`

Classes

- **class `YouTubeReader`** (bases: `Reader`)
 - Reader for YouTube video transcripts
 - **Methods:**
 - `async async_read(self, url: str) -> List[Document]` â€” No docstring provided.
 - `get_supported_chunking_strategies(self) -> List[ChunkingStrategyType]` â€” Get the list of supported chunking strategies for YouTube readers.
 - `get_supported_content_types(self) -> List[ContentType]` â€” No docstring provided.

- read(self, url: str, name: Optional[str]=None) -> List[Document] â€” No docstring provided.

Module agno.knowledge.remote_content.remote_content

- **Source:** libs/agno/agno/knowledge/remote_content/remote_content.py

Classes

- class GCSContent
 - **Methods:**
 - get_config(self) â€” No docstring provided.
- class S3Content
 - **Methods:**
 - get_config(self) â€” No docstring provided.

Module agno.knowledge.reranker.base

- **Source:** libs/agno/agno/knowledge/reranker/base.py

Classes

- class Reranker (bases: BaseModel)
 - Base class for rerankers
 - **Methods:**
 - rerank(self, query: str, documents: List[Document]) -> List[Document] â€” No docstring provided.

Module agno.knowledge.reranker.cohere

- **Source:** libs/agno/agno/knowledge/reranker/cohere.py

Classes

- class CohereReranker (bases: Reranker)
 - **Methods:**
 - client(self) -> CohereClient â€” No docstring provided.
 - rerank(self, query: str, documents: List[Document]) -> List[Document] â€” No docstring provided.

Module agno.knowledge.reranker.infinity

- **Source:** libs/agno/agno/knowledge/reranker/infinity.py

Classes

- class InfinityReranker (bases: Reranker)
 - **Methods:**
 - async arerank(self, query: str, documents: List[Document]) -> List[Document] â€” Async version of rerank
 - base_url(self) -> str â€” Construct the base URL for the Infinity server
 - client(self) -> Any â€” Get or create the infinity client
 - rerank(self, query: str, documents: List[Document]) -> List[Document] â€” No docstring provided.

Module agno.knowledge.reranker.sentence_transformer

- **Source:** libs/agno/agno/knowledge/reranker/sentence_transformer.py

Classes

- class SentenceTransformerReranker (bases: Reranker)
 - **Methods:**
 - rerank(self, query: str, documents: List[Document]) -> List[Document] â€” No docstring provided.

Module agno.knowledge.types

- **Source:** libs/agno/agno/knowledge/types.py

Classes

- class ContentType (bases: str, Enum)
 - Enum for content types supported by knowledge readers.
- class KnowledgeFilter (bases: BaseModel)

Functions

- get_content_type_enum(content_type_str: str) -> ContentType â€” Convert a content type string to ContentType enum.

Module agno.knowledge.utils

- **Source:** libs/agno/agno/knowledge/utils.py

Functions

- get_all_chunkers_info() -> List[Dict] â€” Get information about all available chunkers.
- get_all_content_types() -> List[ContentType] â€” Get all available content types as ContentType enums.
- get_all_readers_info() -> List[Dict] â€” Get information about all available readers.
- get_chunker_info(chunker_key: str) -> Dict â€” Get information about a chunker without instantiating it.
- get_content_types_to_readers_mapping() -> Dict[str, List[str]] â€” Get mapping of content types to list of reader IDs that support them. Returns: Dictionary mapping content type strings (ContentType enum values) to list of reader IDs.
- get_reader_info(reader_key: str) -> Dict â€” Get information about a reader without instantiating it.

Module agno.media

- **Source:** libs/agno/agno/media.py

Classes

- **class Audio** (bases: BaseModel)
 - Unified Audio class for all use cases (input, output, artifacts)
 - **Methods:**
 - `from_base64(cls, base64_content: str, id: Optional[str]=None, mime_type: Optional[str]=None, transcript: Optional[str]=None, expires_at: Optional[int]=None, sample_rate: Optional[int]=24000, channels: Optional[int]=1, **kwargs) -> 'Audio'` Create Audio from base64 content (useful for API responses)
 - `get_content_bytes(self) -> Optional[bytes]` Get audio content as raw bytes
 - `to_base64(self) -> Optional[str]` Convert content to base64 string
 - `to_dict(self, include_base64_content: bool=True) -> Dict[str, Any]` Convert to dict, optionally including base64-encoded content
 - `validate_and_normalize_content(cls, data: Any)` Ensure exactly one content source and normalize to bytes
- **class File** (bases: BaseModel)
 - **Methods:**
 - `check_at_least_one_source(cls, data)` Ensure at least one of url, filepath, or content is provided.
 - `file_url_content(self) -> Optional[Tuple[bytes, str]]` No docstring provided.
 - `from_base64(cls, base64_content: str, id: Optional[str]=None, mime_type: Optional[str]=None, filename: Optional[str]=None, name: Optional[str]=None, format: Optional[str]=None) -> 'File'` Create File from base64 encoded content
 - `to_dict(self) -> Dict[str, Any]` No docstring provided.
 - `valid_mime_types(cls) -> List[str]` No docstring provided.
 - `validate_mime_type(cls, v)` Validate that the mime_type is one of the allowed types.
- **class Image** (bases: BaseModel)
 - Unified Image class for all use cases (input, output, artifacts)
 - **Methods:**
 - `from_base64(cls, base64_content: str, id: Optional[str]=None, mime_type: Optional[str]=None, format: Optional[str]=None, **kwargs) -> 'Image'` Create Image from base64 content
 - `get_content_bytes(self) -> Optional[bytes]` Get image content as raw bytes, loading from URL/file if needed
 - `to_base64(self) -> Optional[str]` Convert content to base64 string for transmission/storage
 - `to_dict(self, include_base64_content: bool=True) -> Dict[str, Any]` Convert to dict, optionally including base64-encoded content
 - `validate_and_normalize_content(cls, data: Any)` Ensure exactly one content source and normalize to bytes
- **class Video** (bases: BaseModel)
 - Unified Video class for all use cases (input, output, artifacts)
 - **Methods:**
 - `from_base64(cls, base64_content: str, id: Optional[str]=None, mime_type: Optional[str]=None, format: Optional[str]=None, **kwargs) -> 'Video'` Create Image from base64 content
 - `get_content_bytes(self) -> Optional[bytes]` Get video content as raw bytes
 - `to_base64(self) -> Optional[str]` Convert content to base64 string
 - `to_dict(self, include_base64_content: bool=True) -> Dict[str, Any]` Convert to dict, optionally including base64-encoded content
 - `validate_and_normalize_content(cls, data: Any)` Ensure exactly one content source and normalize to bytes

Module agno.memory.manager

- **Source:** `libs/agno/agno/memory/manager.py`

Classes

- **class MemoryManager**
 - Memory Manager
 - **Methods:**
 - `async acreate_or_update_memories(self, messages: List[Message], existing_memories: List[Dict[str, Any]], user_id: str, db: Union[BaseDb, AsyncBaseDb], agent_id: Optional[str]=None, team_id: Optional[str]=None, update_memories: bool=True, add_memories: bool=True) -> str` No docstring provided.
 - `async acreate_user_memories(self, message: Optional[str]=None, messages: Optional[List[Message]]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, user_id: Optional[str]=None) -> str` Creates memories from multiple messages and adds them to the memory db.
 - `add_user_memory(self, memory: UserMemory, user_id: Optional[str]=None) -> Optional[str]` Add a user memory for a given user id Args: memory (UserMemory): The memory to add user_id (Optional[str]): The user id to add the memory to. If not provided, the memory is added to the default user. Returns: str: The id of the memory
 - `async aget_user_memories(self, user_id: Optional[str]=None) -> Optional[List[UserMemory]]` Get the user memories for a given user id
 - `async aread_from_db(self, user_id: Optional[str]=None)` No docstring provided.
 - `async arun_memory_task(self, task: str, existing_memories: List[Dict[str, Any]], user_id: str, db: Union[BaseDb, AsyncBaseDb], delete_memories: bool=True, clear_memories: bool=True, update_memories: bool=True, add_memories: bool=True) -> str` No docstring provided.
 - `async aupdate_memory_task(self, task: str, user_id: Optional[str]=None) -> str` Updates the memory with a task
 - `clear(self) -> None` Clears the memory.
 - `create_or_update_memories(self, messages: List[Message], existing_memories: List[Dict[str, Any]], user_id: str, db: BaseDb, agent_id: Optional[str]=None, team_id: Optional[str]=None, update_memories: bool=True, add_memories: bool=True) -> str` No docstring provided.
 - `create_user_memories(self, message: Optional[str]=None, messages: Optional[List[Message]]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None, user_id: Optional[str]=None) -> str` Creates memories from multiple messages and adds them to the memory db.
 - `delete_user_memory(self, memory_id: str, user_id: Optional[str]=None) -> None` Delete a user memory for a given user id Args: memory_id (str): The id of the memory to delete user_id (Optional[str]): The user id to delete the memory from. If not provided, the memory is deleted from the default user.
 - `determine_tools_for_model(self, tools: List[Callable]) -> List[Union[Function, dict]]` No docstring provided.
 - `get_model(self) -> Model` No docstring provided.
 - `get_system_message(self, existing_memories: Optional[List[Dict[str, Any]]]=None, enable_delete_memory: bool=True, enable_clear_memory: bool=True, enable_update_memory: bool=True, enable_add_memory: bool=True) -> Message` No docstring provided.
 - `get_user_memories(self, user_id: Optional[str]=None) -> Optional[List[UserMemory]]` Get the user memories for a given user id
 - `get_user_memory(self, memory_id: str, user_id: Optional[str]=None) -> Optional[UserMemory]` Get the user memory for a given user id
 - `initialize(self, user_id: Optional[str]=None)` No docstring provided.
 - `read_from_db(self, user_id: Optional[str]=None)` No docstring provided.
 - `replace_user_memory(self, memory_id: str, memory: UserMemory, user_id: Optional[str]=None) -> Optional[str]` Replace a user memory for a given user id Args: memory_id (str): The id of the memory to replace memory (UserMemory): The memory to add user_id (Optional[str]): The user id to add the memory to. If not provided, the memory is added to the default user. Returns: str: The id of the memory
 - `run_memory_task(self, task: str, existing_memories: List[Dict[str, Any]], user_id: str, db: BaseDb, delete_memories: bool=True, update_memories: bool=True, add_memories: bool=True,`

clear_memories: bool=True) -> str â€œ No docstring provided.

- search_user_memories(self, query: Optional[str]=None, limit: Optional[int]=None, retrieval_method: Optional[Literal['last_n', 'first_n', 'agentic']]=None, user_id: Optional[str]=None) -> List[UserMemory] â€œ Search through user memories using the specified retrieval method. Args: query: The search query for agentic search. Required if retrieval_method is â€œagenticâ€œ. limit: Maximum number of memories to return. Defaults to self.retrieval_limit if not specified. Optional. retrieval_method: The method to use for retrieving memories. Defaults to self.retrieval if not specified. - â€œlast_nâ€œ: Return the most recent memories - â€œfirst_nâ€œ: Return the oldest memories - â€œagenticâ€œ: Return memories most similar to the query, but using an agentic approach user_id: The user to search for. Optional. Returns: A list of UserMemory objects matching the search criteria.
- set_log_level(self) â€œ No docstring provided.
- update_memory_task(self, task: str, user_id: Optional[str]=None) -> str â€œ Updates the memory with a task

- class MemorySearchResponse (bases: BaseModel)
 - Model for Memory Search Response.

Module agno.models.aimlapi.aimlapi

- **Source:** libs/agno/agno/models/aimlapi/aimlapi.py

Classes

- class AIMLAPI (bases: OpenAIIike)
 - A class for using models hosted on AIMLAPI.

Attributes: id (str): The model id. Defaults to â€œopt-4o-miniâ€œ. name (str): The model name. Defaults to â€œAIMLAPIâ€œ. provider (str): The provider name. Defaults to â€œAIMLAPIâ€œ. api_key (Optional[str]): The API key. base_url (str): The base URL. Defaults to â€œhttps://api.aimlapi.com/v1â€œ. max_tokens (int): The maximum number of tokens. Defaults to 4096.

Module agno.models.anthropic.claude

- **Source:** libs/agno/agno/models/anthropic/claude.py

Classes

- class Claude (bases: Model)
 - A class representing Anthropic Claude model.

For more information, see: <https://docs.anthropic.com/en/api/messages>

- **Methods:**
 - async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse â€œ Send an asynchronous request to the Anthropic API to generate a response.
 - async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse] â€œ Stream an asynchronous response from the Anthropic API. Args: messages (List[Message]): A list of messages to send to the model. Returns: AsyncIterator[ModelResponse]: An async iterator of processed model responses. Raises: APIConnectionError: If there are network connectivity issues RateLimitError: If the API rate limit is exceeded APIStatusError: For other API-related errors
 - get_async_client(self) -> AsyncAnthropicClient â€œ Returns an instance of the async Anthropic client.
 - get_client(self) -> AnthropicClient â€œ Returns an instance of the Anthropic client.
 - get_request_params(self) -> Dict[str, Any] â€œ Generate keyword arguments for API requests.
 - get_system_message_for_model(self, tools: Optional[List[Any]]=None) -> Optional[str] â€œ No docstring provided.
 - invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse â€œ Send a request to the Anthropic API to generate a response.
 - invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Any â€œ Stream a response from the Anthropic API. Args: messages (List[Message]): A list of messages to send to the model. Returns: Any: The streamed response from the model. Raises: APIConnectionError: If there are network connectivity issues RateLimitError: If the API rate limit is exceeded APIStatusError: For other API-related errors

Module agno.models.aws.bedrock

- **Source:** libs/agno/agno/models/aws/bedrock.py

Classes

- class AwsBedrock (bases: Model)
 - AWS Bedrock model.

To use this model, you need to either: 1. Set the following environment variables: - AWS_ACCESS_KEY_ID - AWS_SECRET_ACCESS_KEY - AWS_REGION 2. Or provide a boto3 Session object

For async support, you also need aioboto3 installed: pip install aioboto3

Not all Bedrock models support all features. See this documentation for more information: <https://docs.aws.amazon.com/bedrock/latest/userguide/conversation-inference-supported-models-features.html>

Args: aws_region (Optional[str]): The AWS region to use. aws_access_key_id (Optional[str]): The AWS access key ID to use. aws_secret_access_key (Optional[str]): The AWS secret access key to use. aws_sso_auth (Optional[str]): Removes the need for an access and secret access key by leveraging the current profileâ€™s authentication session (Optional[Session]): A boto3 Session object to use for authentication.

- **Methods:**
 - async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse â€œ Async invoke the Bedrock API.
 - async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse] â€œ Async invoke the Bedrock API with streaming.
 - format_function_call_results(self, messages: List[Message], function_call_results: List[Message], **kwargs) -> None â€œ Handle the results of function calls. Args: messages (List[Message]): The list of conversation messages. function_call_results (List[Message]): The results of the function calls. **kwargs: Additional arguments including tool_ids.
 - get_async_client(self) â€œ Get the async Bedrock client context manager. Returns: The async Bedrock client context manager.
 - get_client(self) -> AwsClient â€œ Get the Bedrock client. Returns: AwsClient: The Bedrock client.
 - invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse â€œ Invoke the Bedrock API.
 - invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Iterator[ModelResponse] â€œ Invoke the Bedrock API with streaming.

Module agno.models.aws.claude

- **Source:** libs/agno/agno/models/aws/claude.py

Classes

- class Claude (bases: AnthropicClaude)
 - AWS Bedrock Claude model.

For more information, see: <https://docs.aws.amazon.com/bedrock/latest/userguide/model-parameters-anthropic.html>

- **Methods:**

- `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Send an asynchronous request to the Anthropic API to generate a response.
- `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse]` â€” Stream an asynchronous response from the Anthropic API. Args: `messages (List[Message])`: A list of messages to send to the model. Returns: `Any`: The streamed response from the model. Raises: `APIConnectionError`: If there are network connectivity issues `RateLimitError`: If the API rate limit is exceeded `APIStatusError`: For other API-related errors
- `get_async_client(self)` â€” Get the Bedrock async client. Returns: `AsyncAnthropicBedrock`: The Bedrock async client.
- `get_client(self)` â€” Get the Bedrock client. Returns: `AnthropicBedrock`: The Bedrock client.
- `get_request_params(self) -> Dict[str, Any]` â€” Generate keyword arguments for API requests. Returns: `Dict[str, Any]`: The keyword arguments for API requests.
- `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Send a request to the Anthropic API to generate a response.
- `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Iterator[ModelResponse]` â€” Stream a response from the Anthropic API. Args: `messages (List[Message])`: A list of messages to send to the model. Returns: `Any`: The streamed response from the model. Raises: `APIConnectionError`: If there are network connectivity issues `RateLimitError`: If the API rate limit is exceeded `APIStatusError`: For other API-related errors
- `to_dict(self) -> Dict[str, Any]` â€” Convert the model to a dictionary. Returns: `Dict[str, Any]`: The dictionary representation of the model.

Module `agno.models.azure.ai_foundry`

- **Source:** `libs/agno/agno/models/azure/ai_foundry.py`

Classes

- **class** `AzureAIFoundry` (bases: `Model`)
 - A class for interacting with Azure AI Interface models.
- For Managed Compute, set the `api_key` to your Azure AI Foundry API key and the `azure_endpoint` to the endpoint URL in the format `https://<your-host-name>.<your-azure-region>.models.ai.azure.com/models`
- For Serverless API, set the `api_key` to your Azure AI Foundry API key and the `azure_endpoint` to the endpoint URL in the format `https://<your-host-name>.<your-azure-region>.models.ai.azure.com/models`
- For Github Models, set the `api_key` to the Github Personal Access Token.
- For Azure OpenAI, set the `api_key` to your Azure AI Foundry API key, the `api_version` to 2024-06-01 and the `azure_endpoint` to the endpoint URL in the format `https://<your-resource-name>.openai.azure.com/openai/deployments/<your-deployment-name>`

For more information, see: <https://learn.microsoft.com/en-gb/python/api/overview/azure/ai-inference-readme>

- **Methods:**
 - `async aclose(self) -> None` â€” Close the asynchronous client and clean up resources.
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Sends an asynchronous chat completion request to the Azure AI API.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse]` â€” Sends an asynchronous streaming chat completion request to the Azure AI API.
 - `close(self) -> None` â€” Close the synchronous client and clean up resources.
 - `get_async_client(self) -> AsyncChatCompletionsClient` â€” Returns an asynchronous Azure AI client. Returns: `AsyncChatCompletionsClient`: An instance of the asynchronous Azure AI client.
 - `get_client(self) -> ChatCompletionsClient` â€” Returns an Azure AI client. Returns: `ChatCompletionsClient`: An instance of the Azure AI client.
 - `get_request_params(self, tools: Optional[List[Dict[str, Any]]]=None, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None) -> Dict[str, Any]` â€” Get the parameters for creating an Azure AI request.
 - `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Send a chat completion request to the Azure AI API.
 - `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Iterator[ModelResponse]` â€” Send a streaming chat completion request to the Azure AI API.
 - `parse_tool_calls(tool_calls_data: List[StreamingChatResponseToolCallUpdate]) -> List[Dict[str, Any]]` â€” Build tool calls from streamed tool call data. Args: `tool_calls_data (List[StreamingChatResponseToolCallUpdate])`: The tool call data to build from. Returns: `List[Dict[str, Any]]`: The built tool calls.

Module `agno.models.azure.openai_chat`

- **Source:** `libs/agno/agno/models/azure/openai_chat.py`

Classes

- **class** `AzureOpenAI` (bases: `OpenAILike`)
 - Azure OpenAI Chat model

Args:

`id (str)`: The model name to use.
`name (str)`: The model name to use.
`provider (str)`: The provider to use.
`api_key (Optional[str])`: The API key to use.
`api_version (str)`: The API version to use.
`azure_endpoint (Optional[str])`: The Azure endpoint to use.
`azure_deployment (Optional[str])`: The Azure deployment to use.
`base_url (Optional[str])`: The base URL to use.
`azure_ad_token (Optional[str])`: The Azure AD token to use.
`azure_ad_token_provider (Optional[Any])`: The Azure AD token provider to use.
`organization (Optional[str])`: The organization to use.
`client (Optional[AzureOpenAIClient])`: The OpenAI client to use.
`async_client (Optional[AsyncAzureOpenAIClient])`: The OpenAI client to use.

- **Methods:**
 - `get_async_client(self) -> AsyncAzureOpenAIClient` â€” Returns an asynchronous OpenAI client. Returns: `AsyncAzureOpenAIClient`: An instance of the asynchronous OpenAI client.
 - `get_client(self) -> AzureOpenAIClient` â€” Get the OpenAI client. Returns: `AzureOpenAIClient`: The OpenAI client.

Module `agno.models.base`

- **Source:** `libs/agno/agno/models/base.py`

Classes

- **class** `MessageData`
- **class** `Model` (bases: `ABC`)
 - **Methods:**
 - `async ainvoke(self, *args, **kwargs) -> ModelResponse` â€” No docstring provided.
 - `ainvoke_stream(self, *args, **kwargs) -> AsyncIterator[ModelResponse]` â€” No docstring provided.

- `async aprocess_response_stream(self, messages: List[Message], assistant_message: Message, stream_data: MessageData, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[Union[RunOutput, TeamRunOutput]]=None) -> AsyncIterator[ModelResponse]` â€” Process a streaming response from the model.
- `async aresponse(self, messages: List[Message], response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Union[Function, dict]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, tool_call_limit: Optional[int]=None, stream_model_response: bool=True, run_response: Optional[Union[RunOutput, TeamRunOutput]]=None, send_media_to_model: bool=True) -> ModelResponse` â€” Generate an asynchronous response from the model.
- `async aresponse_stream(self, messages: List[Message], response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Union[Function, dict]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, tool_call_limit: Optional[int]=None, stream_model_response: bool=True, run_response: Optional[Union[RunOutput, TeamRunOutput]]=None, send_media_to_model: bool=True) -> AsyncIterator[Union[ModelResponse, RunOutputEvent, TeamRunOutputEvent]]` â€” Generate an asynchronous streaming response from the model.
- `async arun_function_call(self, function_call: FunctionCall) -> Tuple[Union[bool, AgentRunException], Timer, FunctionCall, FunctionExecutionResult]` â€” Run a single function call and return its success status, timer, and the FunctionCall object.
- `async arun_function_calls(self, function_calls: List[FunctionCall], function_call_results: List[Message], additional_input: Optional[List[Message]]=None, current_function_call_count: int=0, function_call_limit: Optional[int]=None, skip_pause_check: bool=False) -> AsyncIterator[Union[ModelResponse, RunOutputEvent, TeamRunOutputEvent]]` â€” No docstring provided.
- `create_function_call_result(self, function_call: FunctionCall, success: bool, output: Optional[Union[List[Any], str]]=None, timer: Optional[Timer]=None, function_execution_result: Optional[FunctionExecutionResult]=None) -> Message` â€” Create a function call result message.
- `create_tool_call_limit_error_result(self, function_call: FunctionCall) -> Message` â€” No docstring provided.
- `format_function_call_results(self, messages: List[Message], function_call_results: List[Message], **kwargs) -> None` â€” Format function call results.
- `get_function_call_to_run_from_tool_execution(self, tool_execution: ToolExecution, functions: Optional[Dict[str, Function]]=None) -> FunctionCall` â€” No docstring provided.
- `get_function_calls_to_run(self, assistant_message: Message, messages: List[Message], functions: Optional[Dict[str, Function]]=None) -> List[FunctionCall]` â€” Prepare function calls for the assistant message.
- `get_instructions_for_model(self, tools: Optional[List[Any]]=None) -> Optional[List[str]]` â€” No docstring provided.
- `get_provider(self) -> str` â€” No docstring provided.
- `get_system_message_for_model(self, tools: Optional[List[Any]]=None) -> Optional[str]` â€” No docstring provided.
- `invoke(self, *args, **kwargs) -> ModelResponse` â€” No docstring provided.
- `invoke_stream(self, *args, **kwargs) -> Iterator[ModelResponse]` â€” No docstring provided.
- `parse_tool_calls(self, tool_calls_data: List[Dict[str, Any]]) -> List[Dict[str, Any]]` â€” Parse the tool calls from the model provider into a list of tool calls.
- `process_response_stream(self, messages: List[Message], assistant_message: Message, stream_data: MessageData, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[Union[RunOutput, TeamRunOutput]]=None) -> Iterator[ModelResponse]` â€” Process a streaming response from the model.
- `response(self, messages: List[Message], response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Union[Function, dict]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, tool_call_limit: Optional[int]=None, run_response: Optional[Union[RunOutput, TeamRunOutput]]=None, send_media_to_model: bool=True) -> ModelResponse` â€” Generate a response from the model. Args: messages: List of messages to send to the model response_format: Response format to use tools: List of tools to use. This includes the original Function objects and dicts for built-in tools. tool_choice: Tool choice to use tool_call_limit: Tool call limit run_response: Run response to use send_media_to_model: Whether to send media to the model
- `response_stream(self, messages: List[Message], response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Union[Function, dict]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, tool_call_limit: Optional[int]=None, stream_model_response: bool=True, run_response: Optional[Union[RunOutput, TeamRunOutput]]=None, send_media_to_model: bool=True) -> Iterator[Union[ModelResponse, RunOutputEvent, TeamRunOutputEvent]]` â€” Generate a streaming response from the model.
- `run_function_call(self, function_call: FunctionCall, function_call_results: List[Message], additional_input: Optional[List[Message]]=None) -> Iterator[Union[ModelResponse, RunOutputEvent, TeamRunOutputEvent]]` â€” No docstring provided.
- `run_function_calls(self, function_calls: List[FunctionCall], function_call_results: List[Message], additional_input: Optional[List[Message]]=None, current_function_call_count: int=0, function_call_limit: Optional[int]=None) -> Iterator[Union[ModelResponse, RunOutputEvent, TeamRunOutputEvent]]` â€” No docstring provided.
- `to_dict(self) -> Dict[str, Any]` â€” No docstring provided.

Module `agno.models.cerebras.cerebras`

- **Source:** `libs/agno/agno/models/cerebras/cerebras.py`

Classes

- **class** `Cerebras` (bases: `Model`)
 - A class for interacting with models using the Cerebras API.
 - **Methods:**
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Sends an asynchronous chat completion request to the Cerebras API. Args: messages (List[Message]): A list of messages to send to the model. Returns: ChatCompletion: The chat completion response from the API.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse]` â€” Sends an asynchronous streaming chat completion request to the Cerebras API. Args: messages (List[Message]): A list of messages to send to the model. Returns: AsyncIterator[ChatChunkResponse]: An asynchronous iterator of chat completion chunks.
 - `get_async_client(self) -> AsyncCerebrasClient` â€” Returns an asynchronous Cerebras client. Returns: AsyncCerebras: An instance of the asynchronous Cerebras client.
 - `get_client(self) -> CerebrasClient` â€” Returns a Cerebras client. Returns: CerebrasClient: An instance of the Cerebras client.
 - `get_request_params(self, tools: Optional[List[Dict[str, Any]]]=None, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, **kwargs: Any) -> Dict[str, Any]` â€” Returns keyword arguments for API requests. Returns: Dict[str, Any]: A dictionary of keyword arguments for API requests.
 - `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Send a chat completion request to the Cerebras API. Args: messages (List[Message]): A list of messages to send to the model. Returns: CompletionResponse: The chat completion response from the API.
 - `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Iterator[ModelResponse]` â€” Send a streaming chat completion request to the Cerebras API. Args: messages (List[Message]): A list of messages to send to the model. Returns: Iterator[ChatChunkResponse]: An iterator of chat completion chunks.

Module `agno.models.cerebras.cerebras_openai`

- **Source:** `libs/agno/agno/models/cerebras/cerebras_openai.py`

Classes

- **class** `CerebrasOpenAI` (bases: `OpenAILike`)
 - **Methods:**
 - `get_request_params(self, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, **kwargs: Any) -> Dict[str, Any]` â€” Returns keyword arguments for API requests. Returns: Dict[str, Any]: A dictionary of keyword arguments for API requests.

Module `agno.models.cohere.chat`

- **Source:** `libs/agno/agno/models/cohere/chat.py`

Classes

- **class** `Cohere` (bases: `Model`)
 - A class representing the Cohere model.

For more information, see: <https://docs.cohere.com/docs/chat-api>

- **Methods:**
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Asynchronously invoke a non-streamed chat response from the Cohere API.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse]` â€” Asynchronously invoke a streamed chat response from the Cohere API.
 - `get_async_client(self) -> CohereAsyncClient` â€” No docstring provided.
 - `get_client(self) -> CohereClient` â€” No docstring provided.
 - `get_request_params(self, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None) -> Dict[str, Any]` â€” No docstring provided.
 - `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Invoke a non-streamed chat response from the Cohere API.
 - `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Iterator[ModelResponse]` â€” Invoke a streamed chat response from the Cohere API.

Module `agno.models.cometapi.cometapi`

- **Source:** `libs/agno/agno/models/cometapi/cometapi.py`

Classes

- **class** `CometAPI` (bases: `OpenAILike`)
 - The CometAPI class provides access to multiple AI model providers (GPT, Claude, Gemini, DeepSeek, etc.) through OpenAI-compatible endpoints.

Args: `id` (str): The id of the CometAPI model to use. Default is `â€œgpt-5-miniâ€`. `name` (str): The name for this model. Defaults to `â€œCometAPIâ€`. `api_key` (str): The API key for CometAPI. Defaults to `COMETAPI_KEY` environment variable. `base_url` (str): The base URL for CometAPI. Defaults to `â€œhttps://api.cometapi.com/v1â€`.

- **Methods:**
 - `get_available_models(self) -> List[str]` â€” Fetch available chat models from CometAPI, filtering out non-chat models. Returns: List of available chat model IDs

Module `agno.models.dashscope.dashscope`

- **Source:** `libs/agno/agno/models/dashscope/dashscope.py`

Classes

- **class** `DashScope` (bases: `OpenAILike`)
 - A class for interacting with Qwen models via DashScope API.

Attributes: `id` (str): The model id. Defaults to `â€œqwen-plusâ€`. `name` (str): The model name. Defaults to `â€œQwenâ€`. `provider` (str): The provider name. Defaults to `â€œQwenâ€`. `api_key` (Optional[str]): The DashScope API key. `base_url` (str): The base URL. Defaults to `â€œhttps://dashscope-intl.aliyuncs.com/compatible-mode/v1â€`. `enable_thinking` (bool): Enable thinking process (DashScope native parameter). Defaults to `False`. `include_thoughts` (Optional[bool]): Include thinking process in response (alternative parameter). Defaults to `None`.

- **Methods:**
 - `get_request_params(self, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, **kwargs: Any) -> Dict[str, Any]` â€” No docstring provided.

Module `agno.models.deepinfra.deepinfra`

- **Source:** `libs/agno/agno/models/deepinfra/deepinfra.py`

Classes

- **class** `DeepInfra` (bases: `OpenAILike`)
 - A class for interacting with DeepInfra models.

Attributes: `id` (str): The model id. Defaults to `â€œmeta-llama/Llama-2-70b-chat-hfâ€`. `name` (str): The model name. Defaults to `â€œDeepInfraâ€`. `provider` (str): The provider name. Defaults to `â€œDeepInfraâ€`. `api_key` (Optional[str]): The API key. `base_url` (str): The base URL. Defaults to `â€œhttps://api.deepinfra.com/v1/openaiâ€`.

Module `agno.models.deepseek.deepseek`

- **Source:** `libs/agno/agno/models/deepseek/deepseek.py`

Classes

- **class** `DeepSeek` (bases: `OpenAILike`)
 - A class for interacting with DeepSeek models.

Attributes: `id` (str): The model id. Defaults to `â€œdeepseek-chatâ€`. `name` (str): The model name. Defaults to `â€œDeepSeekâ€`. `provider` (str): The provider name. Defaults to `â€œDeepSeekâ€`. `api_key` (Optional[str]): The API key. `base_url` (str): The base URL. Defaults to `â€œhttps://api.deepseek.comâ€`.

Module `agno.models.fireworks.fireworks`

- **Source:** `libs/agno/agno/models/fireworks/fireworks.py`

Classes

- **class** `Fireworks` (bases: `OpenAILike`)
 - A class for interacting with models hosted on Fireworks.

Attributes: `id` (str): The model name to use. Defaults to `â€œaccounts/fireworks/models/llama-v3p1-405b-instructâ€`. `name` (str): The model name to use. Defaults to `â€œFireworksâ€`. `provider` (str): The provider to use. Defaults to `â€œFireworksâ€`. `api_key` (Optional[str]): The API key to use. `base_url` (str): The base URL to use. Defaults to `â€œhttps://api.fireworks.ai/inference/v1â€`.

Module `agno.models.google.gemini`

- **Source:** `libs/agno/agno/models/google/gemini.py`

Classes

- **class** `Gemini` (bases: `Model`)
 - Gemini model class for Googleâ€™s Generative AI models.

Vertex AI: - You will need Google Cloud credentials to use the Vertex AI API. Run `gcloud auth application-default login` to set credentials. - Set `vertexai` to `True` to use the Vertex AI API. - Set your `project_id` (or set `GOOGLE_CLOUD_PROJECT` environment variable) and `location` (optional). - Set `http_options` (optional) to configure the HTTP options.

Based on <https://googleapis.github.io/python-genai/>

- **Methods:**
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Invokes the model with a list of messages and returns the response.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse]` â€” Invokes the model with a list of messages and returns the response as a stream.
 - `format_function_call_results(self, messages: List[Message], function_call_results: List[Message], **kwargs) -> None` â€” Format function call results.

- `get_client(self)` -> `GeminiClient` â€” Returns an instance of the `GeminiClient` client. Returns: `GeminiClient`: The `GeminiClient` client.
- `get_request_params(self, system_message: Optional[str]=None, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None) -> Dict[str, Any]` â€” Returns the request keyword arguments for the `GenerativeModel` client.
- `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Invokes the model with a list of messages and returns the response.
- `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Iterator[ModelResponse]` â€” Invokes the model with a list of messages and returns the response as a stream.

Module `agno.models.groq.groq`

- **Source:** `libs/agno/agno/models/groq/groq.py`

Classes

- **class** `Groq` (bases: `Model`)
 - A class for interacting with Groq models.

For more information, see: <https://console.groq.com/docs/libraries>

- **Methods:**
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Sends an asynchronous chat completion request to the Groq API.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse]` â€” Sends an asynchronous streaming chat completion request to the Groq API.
 - `format_message(self, message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None) -> Dict[str, Any]` â€” Format a message into the format expected by Groq. Args: `message (Message)`: The message to format. Returns: `Dict[str, Any]`: The formatted message.
 - `get_async_client(self)` -> `AsyncGroqClient` â€” Returns an asynchronous Groq client. Returns: `AsyncGroqClient`: An instance of the asynchronous Groq client.
 - `get_client(self)` -> `GroqClient` â€” Returns a Groq client. Returns: `GroqClient`: An instance of the Groq client.
 - `get_request_params(self, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None) -> Dict[str, Any]` â€” Returns keyword arguments for API requests. Returns: `Dict[str, Any]`: A dictionary of keyword arguments for API requests.
 - `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Send a chat completion request to the Groq API.
 - `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Iterator[ModelResponse]` â€” Send a streaming chat completion request to the Groq API.
 - `parse_tool_calls(tool_calls_data: List[ChoiceDeltaToolCall]) -> List[Dict[str, Any]]` â€” Build tool calls from streamed tool call data. Args: `tool_calls_data (List[ChoiceDeltaToolCall])`: The tool call data to build from. Returns: `List[Dict[str, Any]]`: The built tool calls.
 - `to_dict(self)` -> `Dict[str, Any]` â€” Convert the model to a dictionary. Returns: `Dict[str, Any]`: The dictionary representation of the model.

Module `agno.models.huggingface.huggingface`

- **Source:** `libs/agno/agno/models/huggingface/huggingface.py`

Classes

- **class** `HuggingFace` (bases: `Model`)
 - A class for interacting with HuggingFace Hub Inference models.

For more information, see: <https://huggingface.co/docs/api-inference/index>

- **Methods:**
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Sends an asynchronous chat completion request to the HuggingFace Hub Inference.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[Any]` â€” Sends an asynchronous streaming chat completion request to the HuggingFace API.
 - `get_async_client(self)` -> `AsyncInferenceClient` â€” Returns an asynchronous HuggingFace Hub client. Returns: `AsyncInferenceClient`: An instance of the asynchronous HuggingFace Inference client.
 - `get_client(self)` -> `InferenceClient` â€” Returns an HuggingFace Inference client. Returns: `InferenceClient`: An instance of the Inference client.
 - `get_client_params(self)` -> `Dict[str, Any]` â€” No docstring provided.
 - `get_request_params(self, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None) -> Dict[str, Any]` â€” Returns keyword arguments for inference model client requests. Returns: `Dict[str, Any]`: A dictionary of keyword arguments for inference model client requests.
 - `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Send a chat completion request to the HuggingFace Hub.
 - `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Iterator[ModelResponse]` â€” Send a streaming chat completion request to the HuggingFace API.
 - `parse_tool_calls(tool_calls_data: List[ChatCompletionStreamOutputDeltaToolCall]) -> List[Dict[str, Any]]` â€” Build tool calls from streamed tool call data. Args: `tool_calls_data (List[ChatCompletionStreamOutputDeltaToolCall])`: The tool call data to build from. Returns: `List[Dict[str, Any]]`: The built tool calls.
 - `to_dict(self)` -> `Dict[str, Any]` â€” Convert the model to a dictionary. Returns: `Dict[str, Any]`: The dictionary representation of the model.

Module `agno.models.ibm.watsonx`

- **Source:** `libs/agno/agno/models/ibm/watsonx.py`

Classes

- **class** `WatsonX` (bases: `Model`)
 - A class for interacting with IBM WatsonX models.

See supported models at: <https://dataplatform.cloud.ibm.com/docs/content/wsj/analyze-data/fm-models.html?context=wx>

For more information, see: <https://www.ibm.com/watsonx/developer/>

- **Methods:**
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Any` â€” Sends an asynchronous chat completion request to the WatsonX API.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse]` â€” Sends an asynchronous streaming chat completion request to the WatsonX API.
 - `get_client(self)` -> `ModelInference` â€” Returns a WatsonX ModelInference client. Returns: `ModelInference`: An instance of the WatsonX ModelInference client.
 - `get_request_params(self, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None) -> Dict[str, Any]` â€” No docstring provided.

- `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Send a chat completion request to the WatsonX API.
- `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Iterator[ModelResponse]` â€” Send a streaming chat completion request to the WatsonX API.
- `parse_tool_calls(tool_calls_data: List[Dict[str, Any]]) -> List[Dict[str, Any]]` â€” Build tool calls from streamed tool call data. Args: `tool_calls_data` (List[ChoiceDeltaToolCall]): The tool call data to build from. Returns: List[Dict[str, Any]]: The built tool calls.

Module `agno.models.internlm.internlm`

- **Source:** `libs/agno/agno/models/internlm/internlm.py`

Classes

- **class** `InternLM` (bases: `OpenAILike`)
 - Class for interacting with the InternLM API.

Attributes: `id` (str): The ID of the language model. Defaults to `â€œinternlm2.5-latestâ€`. `name` (str): The name of the model. Defaults to `â€œInternLMâ€`. `provider` (str): The provider of the model. Defaults to `â€œInternLMâ€`. `api_key` (Optional[str]): The API key for the InternLM API. `base_url` (Optional[str]): The base URL for the InternLM API.

Module `agno.models.langdb.langdb`

- **Source:** `libs/agno/agno/models/langdb/langdb.py`

Classes

- **class** `LangDB` (bases: `OpenAILike`)
 - A class for using models hosted on LangDB.

Attributes: `id` (str): The model id. Defaults to `â€œgpt-4oâ€`. `name` (str): The model name. Defaults to `â€œLangDBâ€`. `provider` (str): The provider name. Defaults to `â€œLangDBâ€`. `api_key` (Optional[str]): The API key. Defaults to `getenv(â€œLANGDB_API_KEYâ€)`. `project_id` (Optional[str]): The project id. Defaults to `None`.

Module `agno.models.litellm.chat`

- **Source:** `libs/agno/agno/models/litellm/chat.py`

Classes

- **class** `LiteLLM` (bases: `Model`)
 - A class for interacting with LiteLLM Python SDK.

LiteLLM allows you to use a unified interface for various LLM providers. For more information, see: <https://docs.litellm.ai/docs/>

- **Methods:**
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Sends an asynchronous chat completion request to the LiteLLM API.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse]` â€” Sends an asynchronous streaming chat request to the LiteLLM API.
 - `get_client(self) -> Any` â€” Returns a LiteLLM client. Returns: Any: An instance of the LiteLLM client.
 - `get_request_params(self, tools: Optional[List[Dict[str, Any]]]=None) -> Dict[str, Any]` â€” Returns keyword arguments for API requests. Returns: Dict[str, Any]: The API kwargs for the model.
 - `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Sends a chat completion request to the LiteLLM API.
 - `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Iterator[ModelResponse]` â€” Sends a streaming chat completion request to the LiteLLM API.
 - `parse_tool_calls(tool_calls_data: List[Dict[str, Any]]) -> List[Dict[str, Any]]` â€” Build tool calls from streamed tool call data. Args: `tool_calls_data` (List[Dict[str, Any]]): The tool call data to build from. Returns: List[Dict[str, Any]]: The built tool calls.

Module `agno.models.litellm.litellm_openai`

- **Source:** `libs/agno/agno/models/litellm/litellm_openai.py`

Classes

- **class** `LiteLLMOpenAI` (bases: `OpenAILike`)
 - A class for interacting with LiteLLM.

Attributes: `id` (str): The id of the LiteLLM model. Default is `â€œgpt-4oâ€`. `name` (str): The name of this chat model instance. Default is `â€œLiteLLMâ€`. `provider` (str): The provider of the model. Default is `â€œLiteLLMâ€`. `base_url` (str): The base url to which the requests are sent.

Module `agno.models.llama_cpp.llama_cpp`

- **Source:** `libs/agno/agno/models/llama_cpp/llama_cpp.py`

Classes

- **class** `LlamaCpp` (bases: `OpenAILike`)
 - A class for interacting with LLMs using Llama CPP.

Attributes: `id` (str): The id of the Llama CPP model. Default is `â€œggml-org/gpt-oss-20b-GGUFâ€`. `name` (str): The name of this chat model instance. Default is `â€œLlamaCppâ€`. `provider` (str): The provider of the model. Default is `â€œLlamaCppâ€`. `base_url` (str): The base url to which the requests are sent.

Module `agno.models.lmstudio.lmstudio`

- **Source:** `libs/agno/agno/models/lmstudio/lmstudio.py`

Classes

- **class** `LMStudio` (bases: `OpenAILike`)
 - A class for interacting with LM Studio.

Attributes: `id` (str): The id of the LM Studio model. Default is `â€œqwen2.5-7b-instruct-1mâ€`. `name` (str): The name of this chat model instance. Default is `â€œLMStudioâ€`. `provider` (str): The provider of the model. Default is `â€œLMStudioâ€`. `base_url` (str): The base url to which the requests are sent.

Module `agno.models.message`

- **Source:** `libs/agno/agno/models/message.py`

Classes

- **class** `Citations` (bases: `BaseModel`)
 - Citations for the message
- **class** `DocumentCitation` (bases: `BaseModel`)

- Document of the citation
- **class Message** (bases: BaseModel)
 - Message sent to the Model
 - **Methods:**
 - `content_is_valid(self) -> bool` â€” Check if the message content is valid.
 - `from_dict(cls, data: Dict[str, Any]) -> 'Message'` â€” No docstring provided.
 - `get_content_string(self) -> str` â€” Returns the content as a string.
 - `log(self, metrics: bool=True, level: Optional[str]=None)` â€” Log the message to the console Args: metrics (bool): Whether to log the metrics. level (str): The level to log the message at. One of debug, info, warning, or error. Defaults to debug.
 - `to_dict(self) -> Dict[str, Any]` â€” Returns the message as a dictionary.
 - `to_function_call_dict(self) -> Dict[str, Any]` â€” No docstring provided.
- **class MessageReferences** (bases: BaseModel)
 - References added to user message
- **class UrlCitation** (bases: BaseModel)
 - URL of the citation

Module `agno.models.meta.llama`

- **Source:** `libs/agno/agno/models/meta/llama.py`

Classes

- **class Llama** (bases: Model)
 - A class for interacting with Llama models using the Llama API using the Llama SDK.
 - **Methods:**
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Sends an asynchronous chat completion request to the Llama API.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse]` â€” Sends an asynchronous streaming chat completion request to the Llama API.
 - `get_async_client(self) -> AsyncLlamaAPIClient` â€” Returns an asynchronous Llama client. Returns: AsyncLlamaAPIClient: An instance of the asynchronous Llama client.
 - `get_client(self) -> LlamaAPIClient` â€” Returns a Llama client. Returns: LlamaAPIClient: An instance of the Llama client.
 - `get_request_params(self, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None) -> Dict[str, Any]` â€” Returns keyword arguments for API requests.
 - `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Send a chat completion request to the Llama API.
 - `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Iterator[ModelResponse]` â€” Send a streaming chat completion request to the Llama API.
 - `parse_tool_calls(self, tool_calls_data: List[EventDeltaToolCallDeltaFunction]) -> List[Dict[str, Any]]` â€” Parse the tool calls from the Llama API. Args: tool_calls_data (List[Tuple[str, Any]]): The tool calls data. Returns: List[Dict[str, Any]]: The parsed tool calls.
 - `to_dict(self) -> Dict[str, Any]` â€” Convert the model to a dictionary. Returns: Dict[str, Any]: The dictionary representation of the model.

Module `agno.models.meta.llama_openai`

- **Source:** `libs/agno/agno/models/meta/llama_openai.py`

Classes

- **class LlamaOpenAI** (bases: OpenAILike)
 - Class for interacting with the Llama API via OpenAI-like interface.

Attributes: id (str): The ID of the language model. name (str): The name of the API. provider (str): The provider of the API. api_key (Optional[str]): The API key for the xAI API. base_url (Optional[str]): The base URL for the xAI API.

- **Methods:**
 - `get_async_client(self)` â€” Override to provide custom httpx client that properly handles redirects

Module `agno.models.metrics`

- **Source:** `libs/agno/agno/models/metrics.py`

Classes

- **class Metrics**
 - All relevant metrics for a session, run or message.
 - **Methods:**
 - `set_time_to_first_token(self)` â€” No docstring provided.
 - `start_timer(self)` â€” No docstring provided.
 - `stop_timer(self, set_duration: bool=True)` â€” No docstring provided.
 - `to_dict(self) -> Dict[str, Any]` â€” No docstring provided.

Module `agno.models.mistral.mistral`

- **Source:** `libs/agno/agno/models/mistral/mistral.py`

Classes

- **class MistralChat** (bases: Model)
 - MistralChat is a model that uses the Mistral API to generate responses to messages.

For more information, see the Mistral API documentation: <https://docs.mistral.ai/capabilities/completion/>

- **Methods:**
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Send an asynchronous chat completion request to the Mistral API.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse]` â€” Stream an asynchronous response from the Mistral API.

- `get_client(self)` -> `MistralClient` â€” Get the Mistral client. Returns: `MistralClient`: The Mistral client instance.
- `get_request_params(self, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None)` -> `Dict[str, Any]` â€” Get the API kwargs for the Mistral model. Returns: `Dict[str, Any]`: The API kwargs.
- `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None)` -> `ModelResponse` â€” Send a chat completion request to the Mistral model.
- `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None)` -> `Iterator[ModelResponse]` â€” Stream the response from the Mistral model.
- `to_dict(self)` -> `Dict[str, Any]` â€” Convert the model to a dictionary. Returns: `Dict[str, Any]`: The dictionary representation of the model.

Module `agno.models.nebius.nebius`

- **Source:** `libs/agno/agno/models/nebius/nebius.py`

Classes

- **class `Nebius`** (bases: `OpenAIIike`)
 - A class for interacting with Nebius AI Studio models.

Attributes: `id` (str): The model id. Defaults to `â€œQwen/Qwen3-235B-A22Bâ€œ`. `name` (str): The model name. Defaults to `â€œNebiusâ€œ`. `provider` (str): The provider name. Defaults to `â€œNebiusâ€œ`. `api_key` (Optional[str]): The API key. `base_url` (str): The base URL. Defaults to `â€œhttps://api.studio.nebius.com/v1â€œ`.

Module `agno.models.nexus.nexus`

- **Source:** `libs/agno/agno/models/nexus/nexus.py`

Classes

- **class `Nexus`** (bases: `OpenAIIike`)
 - A class for interacting with LLMs using Nexus.

Attributes: `id` (str): The id of the Nexus model to use. Default is `â€œopenai/gpt-4â€œ`. `name` (str): The name of this chat model instance. Default is `â€œNexusâ€œ` `provider` (str): The provider of the model. Default is `â€œNexusâ€œ`. `base_url` (str): The base url to which the requests are sent.

Module `agno.models.nvidia.nvidia`

- **Source:** `libs/agno/agno/models/nvidia/nvidia.py`

Classes

- **class `Nvidia`** (bases: `OpenAIIike`)
 - A class for interacting with Nvidia models.

Attributes: `id` (str): The id of the Nvidia model to use. Default is `â€œnvidia/llama-3.1-nemotron-70b-instructâ€œ`. `name` (str): The name of this chat model instance. Default is `â€œNvidiaâ€œ` `provider` (str): The provider of the model. Default is `â€œNvidiaâ€œ`. `api_key` (str): The api key to authorize request to Nvidia. `base_url` (str): The base url to which the requests are sent.

Module `agno.models.ollama.chat`

- **Source:** `libs/agno/agno/models/ollama/chat.py`

Classes

- **class `Ollama`** (bases: `Model`)
 - A class for interacting with Ollama models.

For more information, see: <https://github.com/ollama/ollama/blob/main/docs/api.md>

- **Methods:**
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None)` -> `ModelResponse` â€” Sends an asynchronous chat request to the Ollama API.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None)` -> `AsyncIterator[ModelResponse]` â€” Sends an asynchronous streaming chat completion request to the Ollama API.
 - `get_async_client(self)` -> `AsyncOllamaClient` â€” Returns an asynchronous Ollama client. Returns: `AsyncOllamaClient`: An instance of the Ollama client.
 - `get_client(self)` -> `OllamaClient` â€” Returns an Ollama client. Returns: `OllamaClient`: An instance of the Ollama client.
 - `get_request_params(self, tools: Optional[List[Dict[str, Any]]]=None)` -> `Dict[str, Any]` â€” Returns keyword arguments for API requests. Returns: `Dict[str, Any]`: The API kwargs for the model.
 - `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None)` -> `ModelResponse` â€” Send a chat request to the Ollama API.
 - `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None)` -> `Iterator[ModelResponse]` â€” Sends a streaming chat request to the Ollama API.
 - `to_dict(self)` -> `Dict[str, Any]` â€” Convert the model to a dictionary. Returns: `Dict[str, Any]`: A dictionary representation of the model.

Module `agno.models.openai.chat`

- **Source:** `libs/agno/agno/models/openai/chat.py`

Classes

- **class `OpenAIChat`** (bases: `Model`)
 - A class for interacting with OpenAI models using the Chat completions API.

For more information, see: <https://platform.openai.com/docs/api-reference/chat/create>

- **Methods:**
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[Union[RunOutput, TeamRunOutput]]=None)` -> `ModelResponse` â€” Sends an asynchronous chat completion request to the OpenAI API. Args: `messages` (List[Message]): A list of messages to send to the model. `assistant_message` (Message): The assistant message to populate. `response_format` (Optional[Union[Dict, Type[BaseModel]]]): The response format to use. `tools` (Optional[List[Dict[str, Any]]]): The tools to use. `tool_choice` (Optional[Union[str, Dict[str, Any]]]): The tool choice to use. Returns: `ModelResponse`: The chat completion response from the API.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[Union[RunOutput, TeamRunOutput]]=None)` -> `AsyncIterator[ModelResponse]` â€” Sends an asynchronous streaming chat completion request to the OpenAI API. Args: `messages` (List[Message]): A list of messages to send to the model. Returns: Any: An asynchronous iterator of model responses.
 - `get_async_client(self)` -> `AsyncOpenAIClient` â€” Returns an asynchronous OpenAI client. Returns: `AsyncOpenAIClient`: An instance of the asynchronous OpenAI client.
 - `get_client(self)` -> `OpenAIClient` â€” Returns an OpenAI client. Returns: `OpenAIClient`: An instance of the OpenAI client.
 - `get_request_params(self, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[Union[RunOutput, TeamRunOutput]]=None)` -> `Dict[str, Any]` â€” Returns keyword arguments for API requests. Returns: `Dict[str, Any]`: A dictionary of keyword arguments for API requests.
 - `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[Union[RunOutput, TeamRunOutput]]=None)` -> `ModelResponse` â€” Send a chat completion request to the OpenAI API and parse

the response. Args: messages (List[Message]): A list of messages to send to the model. assistant_message (Message): The assistant message to populate. response_format (Optional[Union[Dict, Type[BaseModel]]]): The response format to use. tools (Optional[List[Dict[str, Any]]]): The tools to use. tool_choice (Optional[Union[str, Dict[str, Any]]]): The tool choice to use. Returns: ModelResponse: The chat completion response from the API.

- `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[Union[RunOutput, TeamRunOutput]]=None) -> Iterator[ModelResponse]` â€” Send a streaming chat completion request to the OpenAI API. Args: messages (List[Message]): A list of messages to send to the model. Returns: Iterator[ModelResponse]: An iterator of model responses.
- `parse_tool_calls(tool_calls_data: List[ChoiceDeltaToolCall]) -> List[Dict[str, Any]]` â€” Build tool calls from streamed tool call data. Args: tool_calls_data (List[ChoiceDeltaToolCall]): The tool call data to build from. Returns: List[Dict[str, Any]]: The built tool calls.
- `to_dict(self) -> Dict[str, Any]` â€” Convert the model to a dictionary. Returns: Dict[str, Any]: The dictionary representation of the model.

Module `agno.models.openai.like`

- **Source:** `libs/agno/agno/models/openai/like.py`

Classes

- **class `OpenAILike`** (bases: `OpenAIChat`)
 - A class for to interact with any provider using the OpenAI API schema.

Args: id (str): The id of the OpenAI model to use. Defaults to â€œnot-providedâ€œ. name (str): The name of the OpenAI model to use. Defaults to â€œOpenAILikeâ€œ. api_key (Optional[str]): The API key to use. Defaults to â€œnot-providedâ€œ.

Module `agno.models.openai.responses`

- **Source:** `libs/agno/agno/models/openai/responses.py`

Classes

- **class `OpenAIResponses`** (bases: `Model`)
 - A class for interacting with OpenAI models using the Responses API.

For more information, see: <https://platform.openai.com/docs/api-reference/responses>

- **Methods:**
 - `async ainvoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Sends an asynchronous request to the OpenAI Responses API.
 - `async ainvoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> AsyncIterator[ModelResponse]` â€” Sends an asynchronous streaming request to the OpenAI Responses API.
 - `format_function_call_results(self, messages: List[Message], function_call_results: List[Message], tool_call_ids: List[str]) -> None` â€” Handle the results of function calls. Args: messages (List[Message]): The list of conversation messages. function_call_results (List[Message]): The results of the function calls. tool_ids (List[str]): The tool ids.
 - `get_async_client(self) -> AsyncOpenAI` â€” Returns an asynchronous OpenAI client. Returns: AsyncOpenAI: An instance of the asynchronous OpenAI client.
 - `get_client(self) -> OpenAI` â€” Returns an OpenAI client. Returns: OpenAI: An instance of the OpenAI client.
 - `get_request_params(self, messages: Optional[List[Message]]=None, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None) -> Dict[str, Any]` â€” Returns keyword arguments for API requests. Returns: Dict[str, Any]: A dictionary of keyword arguments for API requests.
 - `invoke(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> ModelResponse` â€” Send a request to the OpenAI Responses API.
 - `invoke_stream(self, messages: List[Message], assistant_message: Message, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Iterator[ModelResponse]` â€” Send a streaming request to the OpenAI Responses API.

Module `agno.models.openrouter.openrouter`

- **Source:** `libs/agno/agno/models/openrouter/openrouter.py`

Classes

- **class `OpenRouter`** (bases: `OpenAILike`)
 - A class for using models hosted on OpenRouter.

Attributes: id (str): The model id. Defaults to â€œgpt-4oâ€œ. name (str): The model name. Defaults to â€œOpenRouterâ€œ. provider (str): The provider name. Defaults to â€œOpenRouterâ€œ. api_key (Optional[str]): The API key. base_url (str): The base URL. Defaults to â€œhttps://openrouter.ai/api/v1â€œ. max_tokens (int): The maximum number of tokens. Defaults to 1024. fallback_models (Optional[List[str]]): List of fallback model IDs to use if the primary model fails due to rate limits, timeouts, or unavailability. OpenRouter will automatically try these models in order. Example: [â€œanthropic/claude-sonnet-4â€œ, â€œdeepseek/deepseek-r1â€œ]

- **Methods:**
 - `get_request_params(self, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[RunOutput]=None) -> Dict[str, Any]` â€” Returns keyword arguments for API requests, including fallback models configuration. Returns: Dict[str, Any]: A dictionary of keyword arguments for API requests.

Module `agno.models.perplexity.perplexity`

- **Source:** `libs/agno/agno/models/perplexity/perplexity.py`

Classes

- **class `Perplexity`** (bases: `OpenAILike`)
 - A class for using models hosted on Perplexity.

Attributes: id (str): The model id. Defaults to â€œsonarâ€œ. name (str): The model name. Defaults to â€œPerplexityâ€œ. provider (str): The provider name. Defaults to â€œPerplexityâ€œ. api_key (Optional[str]): The API key. base_url (str): The base URL. Defaults to â€œhttps://api.perplexity.ai/chat/completionsâ€œ. max_tokens (int): The maximum number of tokens. Defaults to 1024.

- **Methods:**
 - `get_request_params(self, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, **kwargs: Any) -> Dict[str, Any]` â€” Returns keyword arguments for API requests.
 - `parse_provider_response(self, response: Union[ChatCompletion, ParsedChatCompletion], **kwargs) -> ModelResponse` â€” Parse the Perplexity response into a ModelResponse. Args: response: Response from invoke() method Returns: ModelResponse: Parsed response data
 - `parse_provider_response_delta(self, response_delta: ChatCompletionChunk) -> ModelResponse` â€” Parse the Perplexity streaming response into a ModelResponse. Args: response_delta: Raw response chunk from Perplexity Returns: ProviderResponse: Iterator of parsed response data

Module `agno.models.portkey.portkey`

- **Source:** `libs/agno/agno/models/portkey/portkey.py`

Classes

- **class `Portkey`** (bases: `OpenAILike`)
 - A class for using models through the Portkey AI Gateway.

Attributes: id (str): The model id. Defaults to â€œgpt-4o-miniâ€œ. name (str): The model name. Defaults to â€œPortkeyâ€œ. provider (str): The provider name. Defaults to â€œPortkeyâ€œ. portkey_api_key (Optional[str]): The Portkey API key. virtual_key (Optional[str]): The virtual key for model routing. config (Optional[Dict[str, Any]]): Portkey configuration for routing, retries, etc. base_url (str): The Portkey gateway URL.

Module agno.models.requesty.requesty

- **Source:** libs/agno/agno/models/requesty/requesty.py

Classes

- **class Requesty** (bases: OpenAILike)
 - A class for using models hosted on Requesty.

Attributes: id (str): The model id. Defaults to â€œopenai/gpt-4.1â€¢. provider (str): The provider name. Defaults to â€œRequestyâ€¢. api_key (Optional[str]): The API key. base_url (str): The base URL. Defaults to â€œhttps://router.requesty.ai/v1â€¢. max_tokens (int): The maximum number of tokens. Defaults to 1024.

- **Methods:**
 - get_request_params(self, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, run_response: Optional[Union[RunOutput, TeamRunOutput]]=None) -> Dict[str, Any] â€¢ No docstring provided.

Module agno.models.response

- **Source:** libs/agno/agno/models/response.py

Classes

- **class FileType** (bases: str, Enum)
- **class ModelResponse**
 - Response from the model provider
 - **Methods:**
 - from_dict(cls, data: Dict[str, Any]) -> 'ModelResponse' â€¢ Reconstruct ModelResponse from cached dictionary.
 - to_dict(self) -> Dict[str, Any] â€¢ Serialize ModelResponse to dictionary for caching.
- **class ModelResponseEvent** (bases: str, Enum)
 - Events that can be sent by the model provider
- **class ToolExecution**
 - Execution of a tool
 - **Methods:**
 - from_dict(cls, data: Dict[str, Any]) -> 'ToolExecution' â€¢ No docstring provided.
 - is_paused(self) -> bool â€¢ No docstring provided.
 - to_dict(self) -> Dict[str, Any] â€¢ No docstring provided.

Module agno.models.sambanova.sambanova

- **Source:** libs/agno/agno/models/sambanova/sambanova.py

Classes

- **class Sambanova** (bases: OpenAILike)
 - A class for interacting with Sambanova API.

Attributes: id (str): The id of the Sambanova model to use. Default is â€œMeta-Llama-3.1-8B-Instructâ€¢. name (str): The name of this chat model instance. Default is â€œSambanovaâ€¢ provider (str): The provider of the model. Default is â€œSambanovaâ€¢. api_key (str): The api key to authorize request to Sambanova. base_url (str): The base url to which the requests are sent. Defaults to â€œhttps://api.sambanova.ai/v1â€¢.

Module agno.models.siliconflow.siliconflow

- **Source:** libs/agno/agno/models/siliconflow/siliconflow.py

Classes

- **class Siliconflow** (bases: OpenAILike)
 - A class for interacting with Siliconflow API.

Attributes: id (str): The id of the Siliconflow model to use. Default is â€œQwen/QwQ-32Bâ€¢. name (str): The name of this chat model instance. Default is â€œSiliconflowâ€¢. provider (str): The provider of the model. Default is â€œSiliconflowâ€¢. api_key (str): The api key to authorize request to Siliconflow. base_url (str): The base url to which the requests are sent. Defaults to â€œhttps://api.siliconflow.cn/v1â€¢.

Module agno.models.together.together

- **Source:** libs/agno/agno/models/together/together.py

Classes

- **class Together** (bases: OpenAILike)
 - A class for interacting with Together API.

Attributes: id (str): The id of the Together model to use. Default is â€œmistralai/Mixtral-8x7B-Instruct-v0.1â€¢. name (str): The name of this chat model instance. Default is â€œTogetherâ€¢ provider (str): The provider of the model. Default is â€œTogetherâ€¢. api_key (str): The api key to authorize request to Together. base_url (str): The base url to which the requests are sent. Defaults to â€œhttps://api.together.xyz/v1â€¢.

Module agno.models.utils

- **Source:** libs/agno/agno/models/utils.py

Functions

- get_model(model: Union[Model, str, None]) -> Optional[Model] â€¢ No docstring provided.

Module agno.models.vercel.v0

- **Source:** libs/agno/agno/models/vercel/v0.py

Classes

- **class V0** (bases: OpenAILike)
 - Class for interacting with the v0 API.

Attributes: id (str): The ID of the language model. Defaults to â€œov0-1.0-mdâ€¢. name (str): The name of the API. Defaults to â€œov0â€¢. provider (str): The provider of the API. Defaults to â€œov0â€¢. api_key (Optional[str]): The API key for the v0 API. base_url (Optional[str]): The base URL for the v0 API. Defaults to â€œhttps://v0.dev/chat/settings/keysâ€¢.

Module agno.models.vertexai.claude

- **Source:** libs/agno/agno/models/vertexai/claude.py

Classes

- **class Claude** (bases: AnthropicClaude)
 - A class representing Anthropic Claude model.

For more information, see: <https://docs.anthropic.com/en/api/messages>

- **Methods:**
 - `get_async_client(self)` â€œ Returns an instance of the async Anthropic client.
 - `get_client(self)` â€œ Returns an instance of the Anthropic client.

Module `agno.models.vllm.vllm`

- **Source:** `libs/agno/agno/models/vllm/vllm.py`

Classes

- **class VLLM** (bases: OpenAILike)
 - Class for interacting with vLLM models via OpenAI-compatible API.

Attributes: `id`: Model identifier name: API name provider: API provider base_url: vLLM server URL temperature: Sampling temperature top_p: Nucleus sampling probability presence_penalty: Repetition penalty top_k: Top-k sampling enable_thinking: Special mode flag

- **Methods:**
 - `get_request_params(self, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, **kwargs: Any) -> Dict[str, Any]` â€œ No docstring provided.

Module `agno.models.xai.xai`

- **Source:** `libs/agno/agno/models/xai/xai.py`

Classes

- **class xAI** (bases: OpenAILike)
 - Class for interacting with the xAI API.

Attributes: `id` (str): The ID of the language model. Defaults to â€œgrok-betaâ€œ. `name` (str): The name of the API. Defaults to â€œxAIâ€œ. `provider` (str): The provider of the API. Defaults to â€œxAIâ€œ. `api_key` (Optional[str]): The API key for the xAI API. `base_url` (Optional[str]): The base URL for the xAI API. Defaults to â€œhttps://api.x.ai/v1â€œ. `search_parameters` (Optional[Dict[str, Any]]): Search parameters for enabling live search.

- **Methods:**
 - `get_request_params(self, response_format: Optional[Union[Dict, Type[BaseModel]]]=None, tools: Optional[List[Dict[str, Any]]]=None, tool_choice: Optional[Union[str, Dict[str, Any]]]=None, **kwargs: Any) -> Dict[str, Any]` â€œ Returns keyword arguments for API requests, including search parameters. Returns: Dict[str, Any]: A dictionary of keyword arguments for API requests.

Module `agno.os.app`

- **Source:** `libs/agno/agno/os/app.py`

Classes

- **class AgentOS**
 - **Methods:**
 - `get_app(self)` -> FastAPI â€œ No docstring provided.
 - `get_routes(self)` -> List[Any] â€œ Retrieve all routes from the FastAPI app. Returns: List[Any]: List of routes included in the FastAPI app.
 - `resync(self, app: FastAPI) -> None` â€œ Resync the AgentOS to discover, initialize and configure: agents, teams, workflows, databases and knowledge bases.
 - `serve(self, app: Union[str, FastAPI], *, host: str='localhost', port: int=7777, reload: bool=False, workers: Optional[int]=None, access_log: bool=False, **kwargs)` â€œ No docstring provided.

Functions

- `async mcp_lifespan(_, mcp_tools)` â€œ Manage MCP connection lifecycle inside a FastAPI app

Module `agno.os.auth`

- **Source:** `libs/agno/agno/os/auth.py`

Functions

- `get_authentication_dependency(settings: AgnoAPISettings)` â€œ Create an authentication dependency function for FastAPI routes. Args: settings: The API settings containing the security key Returns: A dependency function that can be used with FastAPIâ€™s Depends()
- `validate_websocket_token(token: str, settings: AgnoAPISettings) -> bool` â€œ Validate a bearer token for WebSocket authentication. Args: token: The bearer token to validate settings: The API settings containing the security key Returns: True if the token is valid or authentication is disabled, False otherwise

Module `agno.os.config`

- **Source:** `libs/agno/agno/os/config.py`

Schemas related to the AgentOS configuration

Classes

- **class AgentOSConfig** (bases: BaseModel)
 - General configuration for an AgentOS instance
- **class ChatConfig** (bases: BaseModel)
 - Configuration for the Chat page of the AgentOS
 - **Methods:**
 - `limit_lists(cls, v)` â€œ No docstring provided.
- **class DatabaseConfig** (bases: BaseModel, Generic[DomainConfigType])
 - Configuration for a domain when used with the contextual database
- **class EvalsConfig** (bases: EvalsDomainConfig)
 - Configuration for the Evals domain of the AgentOS
- **class EvalsDomainConfig** (bases: BaseModel)
 - Configuration for the Evals domain of the AgentOS
- **class KnowledgeConfig** (bases: KnowledgeDomainConfig)

- Configuration for the Knowledge domain of the AgentOS
- **class KnowledgeDomainConfig** (bases: BaseModel)
 - Configuration for the Knowledge domain of the AgentOS
- **class MemoryConfig** (bases: MemoryDomainConfig)
 - Configuration for the Memory domain of the AgentOS
- **class MemoryDomainConfig** (bases: BaseModel)
 - Configuration for the Memory domain of the AgentOS
- **class MetricsConfig** (bases: MetricsDomainConfig)
 - Configuration for the Metrics domain of the AgentOS
- **class MetricsDomainConfig** (bases: BaseModel)
 - Configuration for the Metrics domain of the AgentOS
- **class SessionConfig** (bases: SessionDomainConfig)
 - Configuration for the Session domain of the AgentOS
- **class SessionDomainConfig** (bases: BaseModel)
 - Configuration for the Session domain of the AgentOS

Module agno.os.interfaces.a2a.a2a

- **Source:** libs/agno/agno/os/interfaces/a2a/a2a.py

Main class for the A2A app, used to expose an Agno Agent, Team, or Workflow in an A2A compatible format.

Classes

- **class A2A** (bases: BaseInterface)
 - **Methods:**
 - `get_router(self, **kwargs)` -> APIRouter â€” No docstring provided.

Module agno.os.interfaces.a2a.router

- **Source:** libs/agno/agno/os/interfaces/a2a/router.py

Async router handling exposing an Agno Agent or Team in an A2A compatible format.

Functions

- `attach_routes(router: APIRouter, agents: Optional[List[Agent]]=None, teams: Optional[List[Team]]=None, workflows: Optional[List[Workflow]]=None)` -> APIRouter â€” No docstring provided.

Module agno.os.interfaces.a2a.utils

- **Source:** libs/agno/agno/os/interfaces/a2a/utils.py

Functions

- `async map_a2a_request_to_run_input(request_body: dict, stream: bool=True)` -> RunInput â€” Map A2A SendMessageRequest to Agno RunInput. 1. Validate the request 2. Process message parts 3. Build and return RunInput Args: request_body: A2A-valid JSON-RPC request body dict: json { "jsonrpc": "2.0", "method": "message/send", "id": "id", "params": { "message": { "messageId": "id", "role": "user", "contextId": "id", "parts": [{ "kind": "text", "text": "Hello"}] } } } Returns: RunInput: The Agno RunInput stream: Whether we are in stream mode
- `map_run_output_to_a2a_task(run_output: Union[RunOutput, WorkflowRunOutput])` -> Task â€” Map the given RunOutput or WorkflowRunOutput into an A2A Task. 1. Handle output content 2. Handle output media 3. Build the A2A message 4. Build and return the A2A task Args: run_output: The Agno RunOutput or WorkflowRunOutput Returns: Task: The A2A Task
- `async stream_a2a_response(event_stream: AsyncIterator[Union[RunOutputEvent, TeamRunOutputEvent, WorkflowRunOutputEvent, RunOutput]], request_id: Union[str, int])` -> AsyncIterator[str] â€” Stream the given event stream as A2A responses. 1. Send initial event 2. Send content and secondary events 3. Send final status event 4. Send final complete task Args: event_stream: The async iterator of Agno events from agent/team/workflow.arun(stream=True) request_id: The JSON-RPC request ID Yields: str: JSON-RPC response objects (A2A-valid)
- `async stream_a2a_response_with_error_handling(event_stream: AsyncIterator[Union[RunOutputEvent, TeamRunOutputEvent, WorkflowRunOutputEvent, RunOutput]], request_id: Union[str, int])` -> AsyncIterator[str] â€” Wrapper around stream_a2a_response to handle critical errors.

Module agno.os.interfaces.agui.agui

- **Source:** libs/agno/agno/os/interfaces/agui/agui.py

Main class for the AG-UI app, used to expose an Agno Agent or Team in an AG-UI compatible format.

Classes

- **class AGUI** (bases: BaseInterface)
 - **Methods:**
 - `get_router(self)` -> APIRouter â€” No docstring provided.

Module agno.os.interfaces.agui.router

- **Source:** libs/agno/agno/os/interfaces/agui/router.py

Async router handling exposing an Agno Agent or Team in an AG-UI compatible format.

Functions

- `attach_routes(router: APIRouter, agent: Optional[Agent]=None, team: Optional[Team]=None)` -> APIRouter â€” No docstring provided.
- `async run_agent(agent: Agent, run_input: RunAgentInput)` -> AsyncIterator[BaseEvent] â€” Run the contextual Agent, mapping AG-UI input messages to Agno format, and streaming the response in AG-UI format.
- `async run_team(team: Team, input: RunAgentInput)` -> AsyncIterator[BaseEvent] â€” Run the contextual Team, mapping AG-UI input messages to Agno format, and streaming the response in AG-UI format.

Module agno.os.interfaces.agui.utils

- **Source:** libs/agno/agno/os/interfaces/agui/utils.py

Logic used by the AG-UI router.

Classes

- **class EventBuffer**
 - Buffer to manage event ordering constraints, relevant when mapping Agno responses to AG-UI events.
 - **Methods:**
 - `clear_pending_tool_calls_parent_id(self)` -> None â€” Clear the pending parent ID when a new text message starts.
 - `end_tool_call(self, tool_call_id: str)` -> None â€” End a tool call.

- `get_parent_message_id_for_tool_call(self) -> str` â€” Get the message ID to use as parent for tool calls.
- `set_pending_tool_calls_parent_id(self, parent_id: str) -> None` â€” Set the parent message ID for upcoming tool calls.
- `start_text_message(self) -> str` â€” Start a new text message and return its ID.
- `start_tool_call(self, tool_call_id: str) -> None` â€” Start a new tool call.

Functions

- `async async_stream_agno_response_as_agui_events(response_stream: AsyncIterator[Union[RunOutputEvent, TeamRunOutputEvent]], thread_id: str, run_id: str) -> AsyncIterator[BaseEvent]` â€” Map the Agno response stream to AG-UI format, handling event ordering constraints.
- `convert_agui_messages_to_agno_messages(messages: List[AGUIMessage]) -> List[Message]` â€” Convert AG-UI messages to Agno messages.
- `extract_response_chunk_content(response: RunContentEvent) -> str` â€” Given a response stream chunk, find and extract the content.
- `extract_team_response_chunk_content(response: TeamRunContentEvent) -> str` â€” Given a response stream chunk, find and extract the content.
- `stream_agno_response_as_agui_events(response_stream: Iterator[Union[RunOutputEvent, TeamRunOutputEvent]], thread_id: str, run_id: str) -> Iterator[BaseEvent]` â€” Map the Agno response stream to AG-UI format, handling event ordering constraints.
- `validate_agui_state(state: Any, thread_id: str) -> Optional[Dict[str, Any]]` â€” Validate the given AGUI state is of the expected type (dict).

Module `agno.os.interfaces.base`

- **Source:** `libs/agno/agno/os/interfaces/base.py`

Classes

- **class `BaseInterface`** (bases: `ABC`)
 - **Methods:**
 - `get_router(self, use_async: bool=True, **kwargs) -> APIRouter` â€” No docstring provided.

Module `agno.os.interfaces.slack.router`

- **Source:** `libs/agno/agno/os/interfaces/slack/router.py`

Classes

- **class `SlackChallengeResponse`** (bases: `BaseModel`)
 - Response model for Slack URL verification challenge
- **class `SlackEventResponse`** (bases: `BaseModel`)
 - Response model for Slack event processing

Functions

- `attach_routes(router: APIRouter, agent: Optional[Agent]=None, team: Optional[Team]=None, workflow: Optional[Workflow]=None) -> APIRouter` â€” No docstring provided.

Module `agno.os.interfaces.slack.security`

- **Source:** `libs/agno/agno/os/interfaces/slack/security.py`

Functions

- `verify_slack_signature(body: bytes, timestamp: str, slack_signature: str) -> bool` â€” No docstring provided.

Module `agno.os.interfaces.slack.slack`

- **Source:** `libs/agno/agno/os/interfaces/slack/slack.py`

Classes

- **class `Slack`** (bases: `BaseInterface`)
 - **Methods:**
 - `get_router(self) -> APIRouter` â€” No docstring provided.

Module `agno.os.interfaces.whatsapp.router`

- **Source:** `libs/agno/agno/os/interfaces/whatsapp/router.py`

Functions

- `attach_routes(router: APIRouter, agent: Optional[Agent]=None, team: Optional[Team]=None) -> APIRouter` â€” No docstring provided.

Module `agno.os.interfaces.whatsapp.security`

- **Source:** `libs/agno/agno/os/interfaces/whatsapp/security.py`

Functions

- `get_app_secret() -> str` â€” Get the WhatsApp app secret from environment variables. In development mode, returns a dummy secret if `WHATSAPP_APP_SECRET` is not set.
- `is_development_mode() -> bool` â€” Check if the application is running in development mode.
- `validate_webhook_signature(payload: bytes, signature_header: Optional[str]) -> bool` â€” Validate the webhook payload using SHA256 signature. In development mode, signature validation can be bypassed. Args: `payload`: The raw request payload bytes `signature_header`: The X-Hub-Signature-256 header value Returns: `bool`: True if signature is valid or in development mode, False otherwise

Module `agno.os.interfaces.whatsapp.whatsapp`

- **Source:** `libs/agno/agno/os/interfaces/whatsapp/whatsapp.py`

Classes

- **class `Whatsapp`** (bases: `BaseInterface`)
 - **Methods:**
 - `get_router(self) -> APIRouter` â€” No docstring provided.

Module `agno.os.mcp`

- **Source:** `libs/agno/agno/os/mcp.py`

Router for MCP interface providing Model Context Protocol endpoints.

Functions

- `get_mcp_server(os: 'AgentOS') -> StarletteWithLifespan` â€” Attach MCP routes to the provided router.

Module agno.os.middleware.jwt

- **Source:** libs/agno/agno/os/middleware/jwt.py

Classes

- **class JWTMiddleware** (bases: BaseHTTPMiddleware)
 - JWT Middleware for validating tokens and storing JWT claims in request state.

This middleware: 1. Extracts JWT token from Authorization header, cookies, or both 2. Decodes and validates the token 3. Stores JWT claims in request.state for easy access in endpoints

Token Sources: - `header`: Extract from Authorization header (default) - `cookie`: Extract from HTTP cookie - `both`: Try header first, then cookie as fallback

Claims are stored as: - `request.state.user_id`: User ID from configured claim - `request.state.session_id`: Session ID from configured claim - `request.state.dependencies`: Dictionary of dependency claims - `request.state.session_state`: Dictionary of session state claims - `request.state.authenticated`: Boolean authentication status

- **Methods:**
 - `async dispatch(self, request: Request, call_next) -> Response` `â€œ` No docstring provided.
- **class TokenSource** (bases: str, Enum)
 - Enum for JWT token source options.

Module agno.os.router

- **Source:** libs/agno/agno/os/router.py

Classes

- **class WebSocketManager**
 - Manages WebSocket connections for workflow runs
 - **Methods:**
 - `async authenticate_websocket(self, websocket: WebSocket) â€œ` Mark a WebSocket connection as authenticated
 - `async connect(self, websocket: WebSocket, requires_auth: bool=True) â€œ` Accept WebSocket connection
 - `async disconnect_by_run_id(self, run_id: str) â€œ` Remove WebSocket connection by run_id
 - `async disconnect_websocket(self, websocket: WebSocket) â€œ` Remove WebSocket connection and clean up all associated state
 - `async get_websocket_for_run(self, run_id: str) -> Optional[WebSocket] â€œ` Get WebSocket connection for a workflow run
 - `is_authenticated(self, websocket: WebSocket) -> bool â€œ` Check if a WebSocket connection is authenticated
 - `async register_workflow_websocket(self, run_id: str, websocket: WebSocket) â€œ` Register a workflow run with its WebSocket connection

Functions

- `async agent_continue_response_streamer(agent: Agent, run_id: Optional[str]=None, updated_tools: Optional[List]=None, session_id: Optional[str]=None, user_id: Optional[str]=None) -> AsyncGenerator` `â€œ` No docstring provided.
- `async agent_response_streamer(agent: Agent, message: str, session_id: Optional[str]=None, user_id: Optional[str]=None, images: Optional[List[Image]]=None, audio: Optional[List[Audio]]=None, videos: Optional[List[Video]]=None, files: Optional[List[FileMedia]]=None, **kwargs: Any) -> AsyncGenerator` `â€œ` No docstring provided.
- `format_sse_event(event: Union[RunOutputEvent, TeamRunOutputEvent, WorkflowRunOutputEvent]) -> str â€œ` Parse JSON data into SSE-compliant format. Args: `event_dict`: Dictionary containing the event data Returns: SSE-formatted response: `event: EventName data: { ... }` `event: AnotherEventName data: { ... }`
- `get_base_router(os: 'AgentOS', settings: AgnoAPISettings=AgnoAPISettings()) -> APIRouter â€œ` Create the base FastAPI router with comprehensive OpenAPI documentation. This router provides endpoints for: - Core system operations (health, config, models) - Agent management and execution - Team collaboration and coordination - Workflow automation and orchestration All endpoints include detailed documentation, examples, and proper error handling.
- `get_websocket_router(os: 'AgentOS', settings: AgnoAPISettings=AgnoAPISettings()) -> APIRouter â€œ` Create WebSocket router without HTTP authentication dependencies. WebSocket endpoints handle authentication internally via message-based auth.
- `async handle_workflow_via_websocket(websocket: WebSocket, message: dict, os: 'AgentOS') â€œ` Handle workflow execution directly via WebSocket
- `async team_response_streamer(team: Team, message: str, session_id: Optional[str]=None, user_id: Optional[str]=None, images: Optional[List[Image]]=None, audio: Optional[List[Audio]]=None, videos: Optional[List[Video]]=None, files: Optional[List[FileMedia]]=None, **kwargs: Any) -> AsyncGenerator` `â€œ` Run the given team asynchronously and yield its response
- `async workflow_response_streamer(workflow: Workflow, input: Optional[Union[str, Dict[str, Any], List[Any], BaseModel]]=None, session_id: Optional[str]=None, user_id: Optional[str]=None, **kwargs: Any) -> AsyncGenerator` `â€œ` No docstring provided.

Module agno.os.routers.evals.evals

- **Source:** libs/agno/agno/os/routers/evals/evals.py

Functions

- `attach_routes(router: APIRouter, dbs: dict[str, List[Union[BaseDb, AsyncBaseDb]]], agents: Optional[List[Agent]]=None, teams: Optional[List[Team]]=None) -> APIRouter` `â€œ` No docstring provided.
- `get_eval_router(dbs: dict[str, List[Union[BaseDb, AsyncBaseDb]]], agents: Optional[List[Agent]]=None, teams: Optional[List[Team]]=None, settings: AgnoAPISettings=AgnoAPISettings()) -> APIRouter` `â€œ` Create eval router with comprehensive OpenAPI documentation for agent/team evaluation endpoints.
- `parse_eval_types_filter(eval_types: Optional[str]=Query(default=None, description='Comma-separated eval types (accuracy,performance,reliability)', examples=['accuracy,performance'])) -> Optional[List[EvalType]] â€œ` Parse comma-separated eval types into EvalType enums for filtering evaluation runs.

Module agno.os.routers.evals.schemas

- **Source:** libs/agno/agno/os/routers/evals/schemas.py

Classes

- **class DeleteEvalRunsRequest** (bases: BaseModel)
- **class EvalRunInput** (bases: BaseModel)
- **class EvalSchema** (bases: BaseModel)
 - **Methods:**
 - `from_accuracy_eval(cls, accuracy_eval: AccuracyEval, result: AccuracyResult) -> 'EvalSchema' â€œ` No docstring provided.
 - `from_dict(cls, eval_run: Dict[str, Any]) -> 'EvalSchema' â€œ` No docstring provided.
 - `from_performance_eval(cls, performance_eval: PerformanceEval, result: PerformanceResult, model_id: Optional[str]=None, model_provider: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None) -> 'EvalSchema' â€œ` No docstring provided.
 - `from_reliability_eval(cls, reliability_eval: ReliabilityEval, result: ReliabilityResult, model_id: Optional[str]=None, model_provider: Optional[str]=None, agent_id: Optional[str]=None, team_id: Optional[str]=None) -> 'EvalSchema' â€œ` No docstring provided.
- **class UpdateEvalRunRequest** (bases: BaseModel)

Module agno.os.routers.evals.utils

- **Source:** libs/agno/agno/os/routers/evals/utils.py

Functions

- `async run_accuracy_eval(eval_run_input: EvalRunInput, db: Union[BaseDb, AsyncBaseDb], agent: Optional[Agent]=None, team: Optional[Team]=None, default_model: Optional[Model]=None) -> EvalSchema` Run an Accuracy evaluation for the given agent or team
- `async run_performance_eval(eval_run_input: EvalRunInput, db: Union[BaseDb, AsyncBaseDb], agent: Optional[Agent]=None, team: Optional[Team]=None, default_model: Optional[Model]=None) -> EvalSchema` Run a performance evaluation for the given agent or team
- `async run_reliability_eval(eval_run_input: EvalRunInput, db: Union[BaseDb, AsyncBaseDb], agent: Optional[Agent]=None, team: Optional[Team]=None, default_model: Optional[Model]=None) -> EvalSchema` Run a reliability evaluation for the given agent or team

Module `agno.os.routers.health`

- **Source:** `libs/agno/agno/os/routers/health.py`

Functions

- `get_health_router(health_endpoint: str='/health')` -> `APIRouter` No docstring provided.

Module `agno.os.routers.home`

- **Source:** `libs/agno/agno/os/routers/home.py`

Functions

- `get_home_router(os: 'AgentOS')` -> `APIRouter` No docstring provided.

Module `agno.os.routers.knowledge.knowledge`

- **Source:** `libs/agno/agno/os/routers/knowledge/knowledge.py`

Functions

- `attach_routes(router: APIRouter, knowledge_instances: List[Knowledge])` -> `APIRouter` No docstring provided.
- `get_knowledge_router(knowledge_instances: List[Knowledge], settings: AgnoAPISettings=AgnoAPISettings())` -> `APIRouter` Create knowledge router with comprehensive OpenAPI documentation for content management endpoints.
- `async process_content(knowledge: Knowledge, content: Content, reader_id: Optional[str]=None, chunker: Optional[str]=None, chunk_size: Optional[int]=None, chunk_overlap: Optional[int]=None)` Background task to process the content

Module `agno.os.routers.knowledge.schemas`

- **Source:** `libs/agno/agno/os/routers/knowledge/schemas.py`

Classes

- `class ChunkerSchema` (bases: `BaseModel`)
- `class ConfigResponseSchema` (bases: `BaseModel`)
- `class ContentResponseSchema` (bases: `BaseModel`)
 - **Methods:**
 - `from_dict(cls, content: Dict[str, Any])` -> `'ContentResponseSchema'` No docstring provided.
- `class ContentStatus` (bases: `str`, `Enum`)
 - Enumeration of possible content processing statuses.
- `class ContentStatusResponse` (bases: `BaseModel`)
 - Response model for content status endpoint.
- `class ContentUpdateSchema` (bases: `BaseModel`)
 - Schema for updating content.
- `class ReaderSchema` (bases: `BaseModel`)
- `class VectorDbSchema` (bases: `BaseModel`)
- `class VectorSearchRequestSchema` (bases: `BaseModel`)
 - Schema for vector search request.
- `class VectorSearchResult` (bases: `BaseModel`)
 - Schema for search result documents.
 - **Methods:**
 - `from_document(cls, document)` -> `'VectorSearchResult'` Convert a Document object to a serializable VectorSearchResult.

Module `agno.os.routers.memory.memory`

- **Source:** `libs/agno/agno/os/routers/memory/memory.py`

Functions

- `attach_routes(router: APIRouter, dbs: dict[str, list[Union[BaseDb, AsyncBaseDb]]])` -> `APIRouter` No docstring provided.
- `get_memory_router(dbs: dict[str, list[Union[BaseDb, AsyncBaseDb]]], settings: AgnoAPISettings=AgnoAPISettings(), **kwargs)` -> `APIRouter` Create memory router with comprehensive OpenAPI documentation for user memory management endpoints.
- `parse_topics(topics: Optional[List[str]]=Query(default=None, description='Comma-separated list of topics to filter by', examples=['preferences,technical,communication_style']))` -> `Optional[List[str]]` Parse comma-separated topics into a list for filtering memories by topic.

Module `agno.os.routers.memory.schemas`

- **Source:** `libs/agno/agno/os/routers/memory/schemas.py`

Classes

- `class DeleteMemoriesRequest` (bases: `BaseModel`)
- `class UserMemoryCreateSchema` (bases: `BaseModel`)
 - Define the payload expected for creating a new user memory
- `class UserMemorySchema` (bases: `BaseModel`)
 - **Methods:**
 - `from_dict(cls, memory_dict: Dict[str, Any])` -> `'UserMemorySchema'` No docstring provided.
- `class UserStatsSchema` (bases: `BaseModel`)
 - Schema for user memory statistics
 - **Methods:**

- `from_dict(cls, user_stats_dict: Dict[str, Any]) -> 'UserStatsSchema' â€”` No docstring provided.

Module `agno.os.routers.metrics.metrics`

- **Source:** `libs/agno/agno/os/routers/metrics/metrics.py`

Functions

- `attach_routes(router: APIRouter, dbs: dict[str, list[Union[BaseDb, AsyncBaseDb]]]) -> APIRouter â€”` No docstring provided.
- `get_metrics_router(dbs: dict[str, list[Union[BaseDb, AsyncBaseDb]]], settings: AgnoAPISettings=AgnoAPISettings(), **kwargs) -> APIRouter â€”` Create metrics router with comprehensive OpenAPI documentation for system metrics and analytics endpoints.

Module `agno.os.routers.metrics.schemas`

- **Source:** `libs/agno/agno/os/routers/metrics/schemas.py`

Classes

- **class `DayAggregatedMetrics`** (bases: `BaseModel`)
 - Aggregated metrics for a given day
 - **Methods:**
 - `from_dict(cls, metrics_dict: Dict[str, Any]) -> 'DayAggregatedMetrics' â€”` No docstring provided.
- **class `MetricsResponse`** (bases: `BaseModel`)

Module `agno.os.routers.session.session`

- **Source:** `libs/agno/agno/os/routers/session/session.py`

Functions

- `attach_routes(router: APIRouter, dbs: dict[str, list[Union[BaseDb, AsyncBaseDb]]]) -> APIRouter â€”` No docstring provided.
- `get_session_router(dbs: dict[str, list[Union[BaseDb, AsyncBaseDb]]], settings: AgnoAPISettings=AgnoAPISettings()) -> APIRouter â€”` Create session router with comprehensive OpenAPI documentation for session management endpoints.

Module `agno.os.schema`

- **Source:** `libs/agno/agno/os/schema.py`

Classes

- **class `AgentResponse`** (bases: `BaseModel`)
 - **Methods:**
 - `async from_agent(cls, agent: Agent) -> 'AgentResponse' â€”` No docstring provided.
- **class `AgentSessionDetailSchema`** (bases: `BaseModel`)
 - **Methods:**
 - `from_session(cls, session: AgentSession) -> 'AgentSessionDetailSchema' â€”` No docstring provided.
- **class `AgentSummaryResponse`** (bases: `BaseModel`)
 - **Methods:**
 - `from_agent(cls, agent: Agent) -> 'AgentSummaryResponse' â€”` No docstring provided.
- **class `BadRequestResponse`** (bases: `BaseModel`)
- **class `ConfigResponse`** (bases: `BaseModel`)
 - Response schema for the general config endpoint
- **class `CreateSessionRequest`** (bases: `BaseModel`)
- **class `DeleteSessionRequest`** (bases: `BaseModel`)
- **class `HealthResponse`** (bases: `BaseModel`)
- **class `InterfaceResponse`** (bases: `BaseModel`)
- **class `InternalServerErrorResponse`** (bases: `BaseModel`)
- **class `ManagerResponse`** (bases: `BaseModel`)
- **class `Model`** (bases: `BaseModel`)
- **class `ModelResponse`** (bases: `BaseModel`)
- **class `NotFoundResponse`** (bases: `BaseModel`)
- **class `PaginatedResponse`** (bases: `BaseModel`, `Generic[T]`)
 - Wrapper to add pagination info to classes used as response models
- **class `PaginationInfo`** (bases: `BaseModel`)
- **class `RunSchema`** (bases: `BaseModel`)
 - **Methods:**
 - `from_dict(cls, run_dict: Dict[str, Any]) -> 'RunSchema' â€”` No docstring provided.
- **class `SessionSchema`** (bases: `BaseModel`)
 - **Methods:**
 - `from_dict(cls, session: Dict[str, Any]) -> 'SessionSchema' â€”` No docstring provided.
- **class `SortOrder`** (bases: `str`, `Enum`)
- **class `TeamResponse`** (bases: `BaseModel`)
 - **Methods:**
 - `async from_team(cls, team: Team) -> 'TeamResponse' â€”` No docstring provided.
- **class `TeamRunSchema`** (bases: `BaseModel`)
 - **Methods:**
 - `from_dict(cls, run_dict: Dict[str, Any]) -> 'TeamRunSchema' â€”` No docstring provided.
- **class `TeamSessionDetailSchema`** (bases: `BaseModel`)
 - **Methods:**

- from_session(cls, session: TeamSession) -> 'TeamSessionDetailSchema' â€” No docstring provided.
- **class TeamSummaryResponse** (bases: BaseModel)
 - **Methods:**
 - from_team(cls, team: Team) -> 'TeamSummaryResponse' â€” No docstring provided.
- **class UnauthenticatedResponse** (bases: BaseModel)
- **class UnauthorizedResponse** (bases: BaseModel)
- **class UpdateSessionRequest** (bases: BaseModel)
- **class ValidationErrorResponse** (bases: BaseModel)
- **class WorkflowResponse** (bases: BaseModel)
 - **Methods:**
 - async from_workflow(cls, workflow: Workflow) -> 'WorkflowResponse' â€” No docstring provided.
- **class WorkflowRunRequest** (bases: BaseModel)
- **class WorkflowRunSchema** (bases: BaseModel)
 - **Methods:**
 - from_dict(cls, run_response: Dict[str, Any]) -> 'WorkflowRunSchema' â€” No docstring provided.
- **class WorkflowSessionDetailSchema** (bases: BaseModel)
 - **Methods:**
 - from_session(cls, session: WorkflowSession) -> 'WorkflowSessionDetailSchema' â€” No docstring provided.
- **class WorkflowSummaryResponse** (bases: BaseModel)
 - **Methods:**
 - from_workflow(cls, workflow: Workflow) -> 'WorkflowSummaryResponse' â€” No docstring provided.

Module agno.os.settings

- **Source:** `libs/agno/agno/os/settings.py`

Classes

- **class AgnoAPISettings** (bases: BaseSettings)
 - App settings for API-based apps that can be set using environment variables.

Reference: <https://pydantic-docs.helpmanual.io/usage/settings/>

- **Methods:**
 - `set_cors_origin_list(cls, cors_origin_list)` â€” No docstring provided.

Module agno.os.utils

- **Source:** `libs/agno/agno/os/utlis.py`

Functions

- `collect_mcp_tools_from_team(team: Team, mcp_tools: List[Any]) -> None` â€” Recursively collect MCP tools from a team and its members.
- `collect_mcp_tools_from_workflow(workflow: Workflow, mcp_tools: List[Any]) -> None` â€” Recursively collect MCP tools from a workflow and its steps.
- `collect_mcp_tools_from_workflow_step(step: Any, mcp_tools: List[Any]) -> None` â€” Collect MCP tools from a single workflow step.
- `extract_format(file: UploadFile) -> Optional[str]` â€” Extract the File format from file name or content_type.
- `extract_input_media(run_dict: Dict[str, Any]) -> Dict[str, Any]` â€” No docstring provided.
- `find_conflicting_routes(fastapi_app: FastAPI, router: APIRouter) -> List[Dict[str, Any]]` â€” Find conflicting routes in the FastAPI app. Args: fastapi_app: The FastAPI app with all existing routes router: The APIRouter to add Returns: List[Dict[str, Any]]: List of conflicting routes
- `format_team_tools(team_tools: List[Union[Function, dict]])` â€” No docstring provided.
- `format_tools(agent_tools: List[Union[Dict[str, Any], Toolkit, Function, Callable]])` â€” No docstring provided.
- `get_agent_by_id(agent_id: str, agents: Optional[List[Agent]]=None) -> Optional[Agent]` â€” No docstring provided.
- `get_agent_input_schema_dict(agent: Agent) -> Optional[Dict[str, Any]]` â€” Get input schema as dictionary for API responses
- `async get_db(dbs: dict[str, List[Union[BaseDb, AsyncBaseDb]]], db_id: Optional[str]=None, table: Optional[str]=None) -> Union[BaseDb, AsyncBaseDb]` â€” Return the database with the given ID and/or table, or the first database if no ID/table is provided.
- `get_existing_route_paths(fastapi_app: FastAPI) -> Dict[str, List[str]]` â€” Get all existing route paths and methods from the FastAPI app. Returns: Dict[str, List[str]]: Dictionary mapping paths to list of HTTP methods
- `get_knowledge_instance_by_db_id(knowledge_instances: List[Knowledge], db_id: Optional[str]=None) -> Knowledge` â€” Return the knowledge instance with the given ID, or the first knowledge instance if no ID is provided.
- `get_run_input(run_dict: Dict[str, Any], is_workflow_run: bool=False) -> str` â€” Get the run input from the given run dictionary Uses the RunInput/TeamRunInput object which stores the original user input.
- `get_session_name(session: Dict[str, Any]) -> str` â€” Get the session name from the given session dictionary
- `get_team_by_id(team_id: str, teams: Optional[List[Team]]=None) -> Optional[Team]` â€” No docstring provided.
- `get_team_input_schema_dict(team: Team) -> Optional[Dict[str, Any]]` â€” Get input schema as dictionary for API responses
- `get_workflow_by_id(workflow_id: str, workflows: Optional[List[Workflow]]=None) -> Optional[Workflow]` â€” No docstring provided.
- `get_workflow_input_schema_dict(workflow: Workflow) -> Optional[Dict[str, Any]]` â€” Get input schema as dictionary for API responses
- `load_yaml_config(config_file_path: str) -> AgentOSConfig` â€” Load a YAML config file and return the configuration as an AgentOSConfig instance.
- `process_audio(file: UploadFile) -> Audio` â€” No docstring provided.
- `process_document(file: UploadFile) -> Optional[FileMedia]` â€” No docstring provided.
- `process_image(file: UploadFile) -> Image` â€” No docstring provided.
- `process_video(file: UploadFile) -> Video` â€” No docstring provided.
- `stringify_input_content(input_content: Union[str, Dict[str, Any], List[Any], BaseModel]) -> str` â€” Convert any given input_content into its string representation. This handles both serialized (dict) and live (object) input_content formats.
- `update_cors_middleware(app: FastAPI, new_origins: list)` â€” No docstring provided.

Module agno.reasoning.anthropic

- **Source:** `libs/agno/agno/reasoning/anthropic.py`

Functions

- `async aget_anthropic_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” Get reasoning from an Anthropic Claude model asynchronously.
- `get_anthropic_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” Get reasoning from an Anthropic Claude model.
- `is_anthropic_reasoning_model(reasoning_model: Model) -> bool` â€” Check if the model is an Anthropic Claude model with thinking support.

Module `agno.reasoning.azure_ai_foundry`

- **Source:** `libs/agno/agno/reasoning/azure_ai_foundry.py`

Functions

- `async aget_ai_foundry_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” No docstring provided.
- `get_ai_foundry_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” No docstring provided.
- `is_ai_foundry_reasoning_model(reasoning_model: Model) -> bool` â€” No docstring provided.

Module `agno.reasoning.deepseek`

- **Source:** `libs/agno/agno/reasoning/deepseek.py`

Functions

- `async aget_deepseek_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” No docstring provided.
- `get_deepseek_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” No docstring provided.
- `is_deepseek_reasoning_model(reasoning_model: Model) -> bool` â€” No docstring provided.

Module `agno.reasoning.default`

- **Source:** `libs/agno/agno/reasoning/default.py`

Functions

- `get_default_reasoning_agent(reasoning_model: Model, min_steps: int, max_steps: int, tools: Optional[List[Union[Toolkit, Callable, Function, Dict]]]=None, tool_call_limit: Optional[int]=None, use_json_mode: bool=False, telemetry: bool=True, debug_mode: bool=False, debug_level: Literal[1, 2]=1, session_state: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None) -> Optional['Agent']` â€” No docstring provided.

Module `agno.reasoning.gemini`

- **Source:** `libs/agno/agno/reasoning/gemini.py`

Functions

- `async aget_gemini_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” Get reasoning from a Gemini model asynchronously.
- `get_gemini_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” Get reasoning from a Gemini model.
- `is_gemini_reasoning_model(reasoning_model: Model) -> bool` â€” Check if the model is a Gemini model with thinking support.

Module `agno.reasoning.groq`

- **Source:** `libs/agno/agno/reasoning/groq.py`

Functions

- `async aget_groq_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” No docstring provided.
- `get_groq_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” No docstring provided.
- `is_groq_reasoning_model(reasoning_model: Model) -> bool` â€” No docstring provided.

Module `agno.reasoning.helpers`

- **Source:** `libs/agno/agno/reasoning/helpers.py`

Functions

- `get_next_action(reasoning_step: ReasoningStep) -> NextAction` â€” No docstring provided.
- `get_reasoning_agent(reasoning_model: Model, telemetry: bool=False, debug_mode: bool=False, debug_level: Literal[1, 2]=1, session_state: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None) -> 'Agent'` â€” No docstring provided.
- `update_messages_with_reasoning(run_messages: RunMessages, reasoning_messages: List[Message]) -> None` â€” No docstring provided.

Module `agno.reasoning.ollama`

- **Source:** `libs/agno/agno/reasoning/ollama.py`

Functions

- `async aget_ollama_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” No docstring provided.
- `get_ollama_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” No docstring provided.
- `is_ollama_reasoning_model(reasoning_model: Model) -> bool` â€” No docstring provided.

Module `agno.reasoning.openai`

- **Source:** `libs/agno/agno/reasoning/openai.py`

Functions

- `async aget_openai_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” No docstring provided.
- `get_openai_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” No docstring provided.
- `is_openai_reasoning_model(reasoning_model: Model) -> bool` â€” No docstring provided.

Module `agno.reasoning.step`

- **Source:** `libs/agno/agno/reasoning/step.py`

Classes

- `class NextAction` (bases: `str`, `Enum`)
- `class ReasoningStep` (bases: `BaseModel`)
- `class ReasoningSteps` (bases: `BaseModel`)

Module `agno.reasoning.vertexai`

- **Source:** `libs/agno/agno/reasoning/vertexai.py`

Functions

- `async aget_vertexai_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” Get reasoning from a VertexAI Claude model asynchronously.
- `get_vertexai_reasoning(reasoning_agent: 'Agent', messages: List[Message]) -> Optional[Message]` â€” Get reasoning from a VertexAI Claude model.
- `is_vertexai_reasoning_model(reasoning_model: Model) -> bool` â€” Check if the model is a VertexAI model with thinking support.

Module `agno.run.agent`

- **Source:** `libs/agno/agno/run/agent.py`

Classes

- **class** `BaseAgentRunEvent` (bases: `BaseRunOutputEvent`)
 - **Methods:**
 - `tools_awaiting_external_execution(self)` â€” No docstring provided.
 - `tools_requiring_confirmation(self)` â€” No docstring provided.
 - `tools_requiring_user_input(self)` â€” No docstring provided.
- **class** `CustomEvent` (bases: `BaseAgentRunEvent`)
- **class** `IntermediateRunContentEvent` (bases: `BaseAgentRunEvent`)
- **class** `MemoryUpdateCompletedEvent` (bases: `BaseAgentRunEvent`)
- **class** `MemoryUpdateStartedEvent` (bases: `BaseAgentRunEvent`)
- **class** `OutputModelResponseCompletedEvent` (bases: `BaseAgentRunEvent`)
- **class** `OutputModelResponseStartedEvent` (bases: `BaseAgentRunEvent`)
- **class** `ParserModelResponseCompletedEvent` (bases: `BaseAgentRunEvent`)
- **class** `ParserModelResponseStartedEvent` (bases: `BaseAgentRunEvent`)
- **class** `PostHookCompletedEvent` (bases: `BaseAgentRunEvent`)
- **class** `PostHookStartedEvent` (bases: `BaseAgentRunEvent`)
- **class** `PreHookCompletedEvent` (bases: `BaseAgentRunEvent`)
- **class** `PreHookStartedEvent` (bases: `BaseAgentRunEvent`)
- **class** `ReasoningCompletedEvent` (bases: `BaseAgentRunEvent`)
- **class** `ReasoningStartedEvent` (bases: `BaseAgentRunEvent`)
- **class** `ReasoningStepEvent` (bases: `BaseAgentRunEvent`)
- **class** `RunCancelledEvent` (bases: `BaseAgentRunEvent`)
 - **Methods:**
 - `is_cancelled(self)` â€” No docstring provided.
- **class** `RunCompletedEvent` (bases: `BaseAgentRunEvent`)
- **class** `RunContentCompletedEvent` (bases: `BaseAgentRunEvent`)
- **class** `RunContentEvent` (bases: `BaseAgentRunEvent`)
 - Main event for each delta of the `RunOutput`
- **class** `RunContinuedEvent` (bases: `BaseAgentRunEvent`)
- **class** `RunErrorEvent` (bases: `BaseAgentRunEvent`)
- **class** `RunEvent` (bases: `str`, `Enum`)
 - Events that can be sent by the `run()` functions
- **class** `RunInput`
 - Container for the raw input data passed to `Agent.run()`.

This captures the original input exactly as provided by the user, separate from the processed messages that go to the model.

Attributes: `input_content`: The literal input message/content passed to `run()` `images`: Images directly passed to `run()` `videos`: Videos directly passed to `run()` `audios`: Audio files directly passed to `run()` `files`: Files directly passed to `run()`

- **Methods:**
 - `from_dict(cls, data: Dict[str, Any]) -> 'RunInput'` â€” Create `RunInput` from dictionary
 - `input_content_string(self) -> str` â€” No docstring provided.
 - `to_dict(self) -> Dict[str, Any]` â€” Convert to dictionary representation
- **class** `RunOutput`
 - Response returned by `Agent.run()` or `Workflow.run()` functions
 - **Methods:**
 - `from_dict(cls, data: Dict[str, Any]) -> 'RunOutput'` â€” No docstring provided.
 - `get_content_as_string(self, **kwargs) -> str` â€” No docstring provided.
 - `is_cancelled(self)` â€” No docstring provided.
 - `is_paused(self)` â€” No docstring provided.
 - `to_dict(self) -> Dict[str, Any]` â€” No docstring provided.
 - `to_json(self, separators=(',', ' '), indent: Optional[int]=2) -> str` â€” No docstring provided.
 - `tools_awaiting_external_execution(self)` â€” No docstring provided.
 - `tools_requiring_confirmation(self)` â€” No docstring provided.
 - `tools_requiring_user_input(self)` â€” No docstring provided.
- **class** `RunPausedEvent` (bases: `BaseAgentRunEvent`)
 - **Methods:**
 - `is_paused(self)` â€” No docstring provided.
- **class** `RunStartedEvent` (bases: `BaseAgentRunEvent`)

- Event sent when the run starts
- **class SessionSummaryCompletedEvent** (bases: BaseAgentRunEvent)
- **class SessionSummaryStartedEvent** (bases: BaseAgentRunEvent)
- **class ToolCallCompletedEvent** (bases: BaseAgentRunEvent)
- **class ToolCallStartedEvent** (bases: BaseAgentRunEvent)

Functions

- `run_output_event_from_dict(data: dict) -> BaseRunOutputEvent` â€” No docstring provided.

Module `agno.run.base`

- **Source:** `libs/agno/agno/run/base.py`

Classes

- **class BaseRunOutputEvent**
 - **Methods:**
 - `from_dict(cls, data: Dict[str, Any])` â€” No docstring provided.
 - `is_cancelled(self)` â€” No docstring provided.
 - `is_paused(self)` â€” No docstring provided.
 - `to_dict(self) -> Dict[str, Any]` â€” No docstring provided.
 - `to_json(self, separators=(',', ' '), indent: Optional[int]=2) -> str` â€” No docstring provided.
- **class RunContext**
- **class RunStatus** (bases: str, Enum)
 - State of the main run response

Module `agno.run.cancel`

- **Source:** `libs/agno/agno/run/cancel.py`

Run cancellation management.

Classes

- **class RunCancellationManager**
 - Manages cancellation state for agent runs.
 - **Methods:**
 - `cancel_run(self, run_id: str) -> bool` â€” Cancel a run by marking it as cancelled. Returns: bool: True if run was found and cancelled, False if run not found.
 - `cleanup_run(self, run_id: str) -> None` â€” Remove a run from tracking (called when run completes).
 - `get_active_runs(self) -> Dict[str, bool]` â€” Get all currently tracked runs and their cancellation status.
 - `is_cancelled(self, run_id: str) -> bool` â€” Check if a run is cancelled.
 - `raise_if_cancelled(self, run_id: str) -> None` â€” Check if a run should be cancelled and raise exception if so.
 - `register_run(self, run_id: str) -> None` â€” Register a new run as not cancelled.

Functions

- `cancel_run(run_id: str) -> bool` â€” Cancel a run.
- `cleanup_run(run_id: str) -> None` â€” Clean up cancellation tracking for a completed run.
- `raise_if_cancelled(run_id: str) -> None` â€” Check if a run should be cancelled and raise exception if so.
- `register_run(run_id: str) -> None` â€” Register a new run for cancellation tracking.

Module `agno.run.messages`

- **Source:** `libs/agno/agno/run/messages.py`

Classes

- **class RunMessages**
 - Container for messages used in an Agent run.

Attributes: `messages`: List of all messages to send to the model `system_message`: The system message for this run `user_message`: The user message for this run `extra_messages`: Extra messages added after the system and user messages

- **Methods:**
 - `get_input_messages(self) -> List[Message]` â€” Get the input messages for the model.

Module `agno.run.team`

- **Source:** `libs/agno/agno/run/team.py`

Classes

- **class BaseTeamRunEvent** (bases: BaseRunOutputEvent)
 - **Methods:**
 - `from_dict(cls, data: Dict[str, Any]) -> 'BaseTeamRunEvent'` â€” No docstring provided.
- **class CustomEvent** (bases: BaseTeamRunEvent)
- **class IntermediateRunContentEvent** (bases: BaseTeamRunEvent)
- **class MemoryUpdateCompletedEvent** (bases: BaseTeamRunEvent)
- **class MemoryUpdateStartedEvent** (bases: BaseTeamRunEvent)
- **class OutputModelResponseCompletedEvent** (bases: BaseTeamRunEvent)
- **class OutputModelResponseStartedEvent** (bases: BaseTeamRunEvent)
- **class ParserModelResponseCompletedEvent** (bases: BaseTeamRunEvent)
- **class ParserModelResponseStartedEvent** (bases: BaseTeamRunEvent)
- **class PostHookCompletedEvent** (bases: BaseTeamRunEvent)

- **class PostHookStartedEvent** (bases: BaseTeamRunEvent)
- **class PreHookCompletedEvent** (bases: BaseTeamRunEvent)
- **class PreHookStartedEvent** (bases: BaseTeamRunEvent)
- **class ReasoningCompletedEvent** (bases: BaseTeamRunEvent)
- **class ReasoningStartedEvent** (bases: BaseTeamRunEvent)
- **class ReasoningStepEvent** (bases: BaseTeamRunEvent)
- **class RunCancelledEvent** (bases: BaseTeamRunEvent)
 - **Methods:**
 - `is_cancelled(self)` â€” No docstring provided.
- **class RunCompletedEvent** (bases: BaseTeamRunEvent)
- **class RunContentCompletedEvent** (bases: BaseTeamRunEvent)
- **class RunContentEvent** (bases: BaseTeamRunEvent)
 - Main event for each delta of the RunOutput
- **class RunErrorEvent** (bases: BaseTeamRunEvent)
- **class RunStartedEvent** (bases: BaseTeamRunEvent)
 - Event sent when the run starts
- **class SessionSummaryCompletedEvent** (bases: BaseTeamRunEvent)
- **class SessionSummaryStartedEvent** (bases: BaseTeamRunEvent)
- **class TeamRunEvent** (bases: str, Enum)
 - Events that can be sent by the run() functions
- **class TeamRunInput**
 - Container for the raw input data passed to Agent.run(). This captures the original input exactly as provided by the user, separate from the processed messages that go to the model. Attributes: input: content: The literal input message/content passed to run() images: Images directly passed to run() videos: Videos directly passed to run() audios: Audio files directly passed to run() files: Files directly passed to run()
 - **Methods:**
 - `from_dict(cls, data: Dict[str, Any]) -> 'TeamRunInput'` â€” Create TeamRunInput from dictionary
 - `input_content_string(self) -> str` â€” No docstring provided.
 - `to_dict(self) -> Dict[str, Any]` â€” Convert to dictionary representation
- **class TeamRunOutput**
 - Response returned by Team.run() functions
 - **Methods:**
 - `add_member_run(self, run_response: Union['TeamRunOutput', RunOutput]) -> None` â€” No docstring provided.
 - `from_dict(cls, data: Dict[str, Any]) -> 'TeamRunOutput'` â€” No docstring provided.
 - `get_content_as_string(self, **kwargs) -> str` â€” No docstring provided.
 - `is_cancelled(self)` â€” No docstring provided.
 - `is_paused(self)` â€” No docstring provided.
 - `to_dict(self) -> Dict[str, Any]` â€” No docstring provided.
 - `to_json(self, separators=(',', ': '), indent: Optional[int]=2) -> str` â€” No docstring provided.
- **class ToolCallCompletedEvent** (bases: BaseTeamRunEvent)
- **class ToolCallStartedEvent** (bases: BaseTeamRunEvent)

Functions

- `team_run_output_event_from_dict(data: dict) -> BaseTeamRunEvent` â€” No docstring provided.

Module agno.run.workflow

- **Source:** `libs/agno/agno/run/workflow.py`

Classes

- **class BaseWorkflowRunOutputEvent** (bases: BaseRunOutputEvent)
 - Base class for all workflow run response events
 - **Methods:**
 - `is_cancelled(self)` â€” No docstring provided.
 - `is_error(self)` â€” No docstring provided.
 - `status(self)` â€” No docstring provided.
 - `to_dict(self) -> Dict[str, Any]` â€” No docstring provided.
- **class ConditionExecutionCompletedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when condition step execution completes
- **class ConditionExecutionStartedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when condition step execution starts
- **class CustomEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when a custom event is produced
- **class LoopExecutionCompletedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when loop execution completes
- **class LoopExecutionStartedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when loop execution starts
- **class LoopIterationCompletedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when loop iteration completes
- **class LoopIterationStartedEvent** (bases: BaseWorkflowRunOutputEvent)

- Event sent when loop iteration starts
- **class ParallelExecutionCompletedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when parallel step execution completes
- **class ParallelExecutionStartedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when parallel step execution starts
- **class RouterExecutionCompletedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when router step execution completes
- **class RouterExecutionStartedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when router step execution starts
- **class StepCompletedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when step execution completes
- **class StepErrorEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when step execution fails
- **class StepOutputEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when a step produces output - replaces direct StepOutput yielding
 - **Methods:**
 - `audio(self) -> Optional[List[Audio]]` â€” No docstring provided.
 - `content(self) -> Optional[Union[str, Dict[str, Any], List[Any], BaseModel, Any]]` â€” No docstring provided.
 - `error(self) -> Optional[str]` â€” No docstring provided.
 - `images(self) -> Optional[List[Image]]` â€” No docstring provided.
 - `stop(self) -> bool` â€” No docstring provided.
 - `success(self) -> bool` â€” No docstring provided.
 - `videos(self) -> Optional[List[Video]]` â€” No docstring provided.
- **class StepStartedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when step execution starts
- **class StepsExecutionCompletedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when steps execution completes
- **class StepsExecutionStartedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when steps execution starts
- **class WorkflowAgentCompletedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when workflow agent completes (after running workflow or answering directly)
- **class WorkflowAgentStartedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when workflow agent starts (before deciding to run workflow or answer directly)
- **class WorkflowCancelledEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when workflow execution is cancelled
 - **Methods:**
 - `is_cancelled(self)` â€” No docstring provided.
- **class WorkflowCompletedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when workflow execution completes
- **class WorkflowErrorEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when workflow execution fails
- **class WorkflowRunEvent** (bases: str, Enum)
 - Events that can be sent by workflow execution
- **class WorkflowRunOutput**
 - Response returned by Workflow.run() functions - kept for backwards compatibility
 - **Methods:**
 - `from_dict(cls, data: Dict[str, Any]) -> 'WorkflowRunOutput'` â€” No docstring provided.
 - `get_content_as_string(self, **kwargs) -> str` â€” No docstring provided.
 - `has_completed(self) -> bool` â€” Check if the workflow run is completed (either successfully or with error)
 - `is_cancelled(self)` â€” No docstring provided.
 - `to_dict(self) -> Dict[str, Any]` â€” No docstring provided.
- **class WorkflowStartedEvent** (bases: BaseWorkflowRunOutputEvent)
 - Event sent when workflow execution starts

Functions

- `workflow_run_output_event_from_dict(data: dict) -> BaseWorkflowRunOutputEvent` â€” No docstring provided.

Module `agno.session.agent`

- **Source:** `libs/agno/agno/session/agent.py`

Classes

- **class AgentSession**
 - Agent Session that is stored in the database
 - **Methods:**
 - `from_dict(cls, data: Mapping[str, Any]) -> Optional[AgentSession]` â€” No docstring provided.
 - `get_chat_history(self) -> List[Message]` â€” Get the chat history for the session
 - `get_messages_for_session(self, user_role: str='user', assistant_role: Optional[List[str]]=None, skip_history_messages: bool=True) -> List[Message]` â€” Returns a list of messages for the session that iterate through user message and assistant response.

- `get_messages_from_last_n_runs(self, agent_id: Optional[str]=None, team_id: Optional[str]=None, last_n: Optional[int]=None, last_n_messages: Optional[int]=None, skip_role: Optional[str]=None, skip_status: Optional[List[RunStatus]]=None, skip_history_messages: bool=True) -> List[Message]` â€” Returns the messages from the last `n` runs, excluding previously tagged history messages. Args: `agent_id`: The id of the agent to get the messages from. `team_id`: The id of the team to get the messages from. `last_n`: The number of runs to return from the end of the conversation. Defaults to all runs. `last_n_messages`: The number of messages to return from the end of the conversation. Defaults to all messages. `skip_role`: Skip messages with this role. `skip_status`: Skip messages with this status. `skip_history_messages`: Skip messages that were tagged as history in previous runs. Returns: A list of Messages from the specified runs, excluding history messages.
- `get_run(self, run_id: str) -> Optional[RunOutput]` â€” No docstring provided.
- `get_session_summary(self) -> Optional[SessionSummary]` â€” Get the session summary for the session
- `get_tool_calls(self, num_calls: Optional[int]=None) -> List[Dict[str, Any]]` â€” Returns a list of tool calls from the messages
- `to_dict(self) -> Dict[str, Any]` â€” No docstring provided.
- `upsert_run(self, run: RunOutput) â€” Adds a RunOutput, together with some calculated data, to the runs list.`

Module `agno.session.summary`

- **Source:** `libs/agno/agno/session/summary.py`

Classes

- **class** `SessionSummary`
 - Model for Session Summary.
 - **Methods:**
 - `from_dict(cls, data: Dict[str, Any]) -> 'SessionSummary'` â€” No docstring provided.
 - `to_dict(self) -> Dict[str, Any]` â€” No docstring provided.
- **class** `SessionSummaryManager`
 - Session Summary Manager
 - **Methods:**
 - `async acreate_session_summary(self, session: Union['AgentSession', 'TeamSession']) -> Optional[SessionSummary]` â€” Creates a summary of the session
 - `create_session_summary(self, session: Union['AgentSession', 'TeamSession']) -> Optional[SessionSummary]` â€” Creates a summary of the session
 - `get_response_format(self, model: 'Model') -> Union[Dict[str, Any], Type[BaseModel]]` â€” No docstring provided.
 - `get_system_message(self, conversation: List[Message], response_format: Union[Dict[str, Any], Type[BaseModel]]) -> Message` â€” No docstring provided.
- **class** `SessionSummaryResponse` (bases: `BaseModel`)
 - Model for Session Summary.
 - **Methods:**
 - `to_dict(self) -> Dict[str, Any]` â€” No docstring provided.
 - `to_json(self) -> str` â€” No docstring provided.

Module `agno.session.team`

- **Source:** `libs/agno/agno/session/team.py`

Classes

- **class** `TeamSession`
 - Team Session that is stored in the database
 - **Methods:**
 - `from_dict(cls, data: Mapping[str, Any]) -> Optional[TeamSession]` â€” No docstring provided.
 - `get_chat_history(self, skip_history_messages: bool=True, skip_roles: Optional[List[str]]=None) -> List[Message]` â€” Get the chat history for the session. This is all messages across all runs for the team leader.
 - `get_messages_for_session(self, user_role: str='user', assistant_role: Optional[List[str]]=None, skip_history_messages: bool=True) -> List[Message]` â€” Returns a list of messages for the session that iterate through user message and assistant response.
 - `get_messages_from_last_n_runs(self, agent_id: Optional[str]=None, team_id: Optional[str]=None, last_n: Optional[int]=None, last_n_messages: Optional[int]=None, skip_role: Optional[str]=None, skip_status: Optional[List[RunStatus]]=None, skip_history_messages: bool=True, member_runs: bool=False) -> List[Message]` â€” Returns the messages from the last `n` runs, excluding previously tagged history messages. Args: `agent_id`: The id of the agent to get the messages from. `team_id`: The id of the team to get the messages from. `last_n`: The number of runs to return from the end of the conversation. Defaults to all runs. `last_n_messages`: The number of messages to return from the end of the conversation. Defaults to all messages. `skip_role`: Skip messages with this role. `skip_status`: Skip messages with this status. `skip_history_messages`: Skip messages that were tagged as history in previous runs. Returns: A list of Messages from the specified runs, excluding history messages.
 - `get_run(self, run_id: str) -> Optional[Union[TeamRunOutput, RunOutput]]` â€” No docstring provided.
 - `get_session_summary(self) -> Optional[SessionSummary]` â€” Get the session summary for the session
 - `get_team_history(self, num_runs: Optional[int]=None) -> List[Tuple[str, str]]` â€” Get team history as structured data (input, response pairs) -> This is the history of the team leader, not the members. Args: `num_runs`: Number of recent runs to include. If None, returns all available history.
 - `get_team_history_context(self, num_runs: Optional[int]=None) -> Optional[str]` â€” Get formatted team history context for steps Args: `num_runs`: Number of recent runs to include. If None, returns all available history.
 - `get_tool_calls(self, num_calls: Optional[int]=None) -> List[Dict[str, Any]]` â€” Returns a list of tool calls from the messages
 - `to_dict(self) -> Dict[str, Any]` â€” No docstring provided.
 - `upsert_run(self, run_response: Union[TeamRunOutput, RunOutput]) â€” Adds a RunOutput, together with some calculated data, to the runs list.`

Module `agno.session.workflow`

- **Source:** `libs/agno/agno/session/workflow.py`

Classes

- **class** `WorkflowSession`
 - Workflow Session V2 for pipeline-based workflows
 - **Methods:**
 - `from_dict(cls, data: Mapping[str, Any]) -> Optional[WorkflowSession]` â€” Create WorkflowSession from dictionary, deserializing runs from dicts
 - `get_run(self, run_id: str) -> Optional[WorkflowRunOutput]` â€” No docstring provided.
 - `get_workflow_history(self, num_runs: Optional[int]=None) -> List[Tuple[str, str]]` â€” Get workflow history as structured data (input, response pairs) Args: `num_runs`: Number of recent runs to include. If None, returns all available history.
 - `get_workflow_history_context(self, num_runs: Optional[int]=None) -> Optional[str]` â€” Get formatted workflow history context for steps Args: `num_runs`: Number of recent runs to include. If None, returns all available history.
 - `to_dict(self) -> Dict[str, Any]` â€” Convert to dictionary for storage, serializing runs to dicts

- `upsert_run(self, run: WorkflowRunOutput) -> None` Add or update a workflow run (upsert behavior)

Module `agno.team.team`

- **Source:** `libs/agno/agno/team/team.py`

Classes

- **class** `Team`
 - A class representing a team of agents.
 - **Methods:**
 - `async acli_app(self, input: Optional[str]=None, session_id: Optional[str]=None, user_id: Optional[str]=None, user: str='User', emoji: str=':sunglasses:', stream: bool=False, markdown: bool=False, exit_on: Optional[List[str]]=None, **kwargs: Any) -> None` Run an interactive command-line interface to interact with the team. Works with team dependencies requiring async logic.
 - `add_to_knowledge(self, query: str, result: str) -> str` Use this function to add information to the knowledge base for future use. Args: query: The query to add. result: The result of the query. Returns: str: A string indicating the status of the addition.
 - `add_tool(self, tool: Union[Toolkit, Callable, Function, Dict])` No docstring provided.
 - `async delete_session(self, session_id: str)` Delete the current session and save to storage
 - `async get_chat_history(self, session_id: Optional[str]=None) -> List[Message]` Read the chat history from the session Args: session_id: The session ID to get the chat history for. If not provided, the current cached session ID is used. Returns: List[Message]: The chat history from the session.
 - `async get_last_run_output(self, session_id: Optional[str]=None) -> Optional[TeamRunOutput]` Get the last run response from the database. Args: session_id (Optional[str]): The session_id to load from storage. Returns: RunOutput: The last run response from the database.
 - `async get_messages_for_session(self, session_id: Optional[str]=None) -> List[Message]` Get messages for a session Args: session_id: The session ID to get the messages for. If not provided, the current cached session ID is used. Returns: List[Message]: The messages for the session.
 - `async get_relevant_docs_from_knowledge(self, query: str, num_documents: Optional[int]=None, filters: Optional[Dict[str, Any]]=None, **kwargs) -> Optional[List[Union[Dict[str, Any], str]])` Get relevant documents from knowledge base asynchronously.
 - `async get_run_output(self, run_id: str, session_id: Optional[str]=None) -> Optional[Union[TeamRunOutput, RunOutput]]` Get a RunOutput or TeamRunOutput from the database. Handles cached sessions. Args: run_id (str): The run_id to load from storage. session_id (Optional[str]): The session_id to load from storage.
 - `async get_session(self, session_id: Optional[str]=None) -> Optional[TeamSession]` Load an TeamSession from database. Args: session_id: The session_id to load from storage. Returns: TeamSession: The TeamSession loaded from the database or created if it does not exist.
 - `async get_session_metrics(self, session_id: Optional[str]=None) -> Optional[Metrics]` Get the session metrics for the given session ID. Args: session_id: The session ID to get the metrics for. If not provided, the current cached session ID is used. Returns: Optional[Metrics]: The session metrics.
 - `async get_session_name(self, session_id: Optional[str]=None) -> str` Get the session name for the given session ID. Args: session_id: The session ID to get the name for. If not provided, the current cached session ID is used. Returns: str: The session name.
 - `async get_session_state(self, session_id: Optional[str]=None) -> Dict[str, Any]` Get the session state for the given session ID. Args: session_id: The session ID to get the state for. If not provided, the current cached session ID is used. Returns: Dict[str, Any]: The session state.
 - `async get_session_summary(self, session_id: Optional[str]=None) -> Optional[SessionSummary]` Get the session summary for the given session ID and user ID. Args: session_id: The session ID to get the summary for. If not provided, the current cached session ID is used. Returns: SessionSummary: The session summary.
 - `async get_system_message(self, session: TeamSession, run_context: Optional[RunContext]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, tools: Optional[List[Union[Function, dict]]]=None, add_session_state_to_context: Optional[bool]=None, session_state: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None) -> Optional[Message]` Get the system message for the team.
 - `async get_user_memories(self, user_id: Optional[str]=None) -> Optional[List[UserMemory]]` Get the user memories for the given user ID. Args: user_id: The user ID to get the memories for. If not provided, the current cached user ID is used. Returns: Optional[List[UserMemory]]: The user memories.
 - `async aprint_response(self, input: Union[List, Dict, str, Message, BaseModel], *, stream: Optional[bool]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, markdown: Optional[bool]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, show_message: bool=True, show_reasoning: bool=True, show_full_reasoning: bool=False, console: Optional[Any]=None, tags_to_include_in_markdown: Optional[Set[str]]=None, **kwargs: Any) -> None` No docstring provided.
 - `async arun(self, input: Union[str, List, Dict, Message, BaseModel], *, stream: Literal[False]=False, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, run_context: Optional[RunContext]=None, user_id: Optional[str]=None, retries: Optional[int]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, **kwargs: Any) -> TeamRunOutput` No docstring provided.
 - `arun(self, input: Union[str, List, Dict, Message, BaseModel], *, stream: Literal[True]=True, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, run_context: Optional[RunContext]=None, user_id: Optional[str]=None, retries: Optional[int]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, yield_run_response: bool=False, yield_run_output: bool=False, **kwargs: Any) -> AsyncIterator[Union[RunOutputEvent, TeamRunOutputEvent]]` No docstring provided.
 - `arun(self, input: Union[str, List, Dict, Message, BaseModel], *, stream: Optional[bool]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, run_context: Optional[RunContext]=None, user_id: Optional[str]=None, retries: Optional[int]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, yield_run_response: bool=False, yield_run_output: bool=False, **kwargs: Any) -> Union[TeamRunOutput, AsyncIterator[Union[RunOutputEvent, TeamRunOutputEvent]]]` Run the Team asynchronously and return the response.
 - `async asave_session(self, session: TeamSession) -> None` Save the TeamSession to storage Args: session: The TeamSession to save.
 - `async aset_session_name(self, session_id: Optional[str]=None, autogenerate: bool=False, session_name: Optional[str]=None) -> TeamSession` Set the session name and save to storage Args: session_id: The session ID to set the name for. If not provided, the current cached session ID is used. autogenerate: Whether to autogenerate the session name. session_name: The session name to set. If not provided, the session name will be autogenerated. Returns: TeamSession: The updated session.
 - `async update_session_state(self, session_state_updates: Dict[str, Any], session_id: Optional[str]=None) -> str` Update the session state for the given session ID and user ID. Args: session_state_updates: The updates to apply to the session state. Should be a dictionary of key-value pairs. session_id: The session ID to update. If not provided, the current cached session ID is used. Returns: dict: The updated session state.
 - `background_executor(self) -> Any` Lazy initialization of shared thread pool executor for background tasks. Handles both memory creation and cultural knowledge updates concurrently. Initialized only on first use (runtime, not instantiation) and reused across runs.
 - `cached_session(self) -> Optional[TeamSession]` No docstring provided.
 - `cancel_run(run_id: str) -> bool` Cancel a running team execution. Args: run_id (str): The run_id to cancel. Returns: bool: True if the run was found and marked for cancellation, False otherwise.
 - `cli_app(self, input: Optional[str]=None, user: str='User', emoji: str=':sunglasses:', stream: bool=False, markdown: bool=False, exit_on: Optional[List[str]]=None, **kwargs: Any) -> None` Run an interactive command-line interface to interact with the team.
 - `delete_session(self, session_id: str)` Delete the current session and save to storage
 - `generate_session_name(self, session: TeamSession) -> str` Generate a name for the team session Args: session: The TeamSession to generate a name for. Returns: str: The generated session name.
 - `get_chat_history(self, session_id: Optional[str]=None) -> List[Message]` Read the chat history from the session Args: session_id: The session ID to get the chat history for. If not provided, the current cached session ID is used. Returns: List[Message]: The chat history from the session.
 - `get_last_run_output(self, session_id: Optional[str]=None) -> Optional[TeamRunOutput]` Get the last run response from the database. Args: session_id (Optional[str]): The session_id to load from storage. Returns: RunOutput: The last run response from the database.
 - `get_member_information(self) -> str` Get information about the members of the team, including their IDs, names, and roles.
 - `get_members_system_message_content(self, indent: int=0) -> str` No docstring provided.
 - `get_messages_for_session(self, session_id: Optional[str]=None) -> List[Message]` Get messages for a session Args: session_id: The session ID to get the messages for. If not

provided, the current cached session ID is used. Returns: List[Message]: The messages for the session.

- `get_relevant_docs_from_knowledge(self, query: str, num_documents: Optional[int]=None, filters: Optional[Dict[str, Any]]=None, **kwargs) -> Optional[List[Union[Dict[str, Any], str]]]` â€” Return a list of references from the knowledge base
- `get_run_output(self, run_id: str, session_id: Optional[str]=None) -> Optional[Union[TeamRunOutput, RunOutput]]` â€” Get a RunOutput or TeamRunOutput from the database. Handles cached sessions. Args: run_id (str): The run_id to load from storage. session_id (Optional[str]): The session_id to load from storage.
- `get_session(self, session_id: Optional[str]=None) -> Optional[TeamSession]` â€” Load an TeamSession from database. Args: session_id: The session_id to load from storage. Returns: TeamSession: The TeamSession loaded from the database or created if it does not exist.
- `get_session_metrics(self, session_id: Optional[str]=None) -> Optional[Metrics]` â€” Get the session metrics for the given session ID. Args: session_id: The session ID to get the metrics for. If not provided, the current cached session ID is used. Returns: Optional[Metrics]: The session metrics.
- `get_session_name(self, session_id: Optional[str]=None) -> str` â€” Get the session name for the given session ID. Args: session_id: The session ID to get the name for. If not provided, the current cached session ID is used. Returns: str: The session name.
- `get_session_state(self, session_id: Optional[str]=None) -> Dict[str, Any]` â€” Get the session state for the given session ID. Args: session_id: The session ID to get the state for. If not provided, the current cached session ID is used. Returns: Dict[str, Any]: The session state.
- `get_session_summary(self, session_id: Optional[str]=None) -> Optional[SessionSummary]` â€” Get the session summary for the given session ID and user ID. Args: session_id: The session ID to get the summary for. If not provided, the current cached session ID is used. Returns: SessionSummary: The session summary.
- `get_system_message(self, session: TeamSession, run_context: Optional[RunContext]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, tools: Optional[List[Union[Function, dict]]]=None, add_session_state_to_context: Optional[bool]=None, session_state: Optional[Dict[str, Any]]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None) -> Optional[Message]` â€” Get the system message for the team. 1. If the system_message is provided, use that. 2. If build_context is False, return None. 3. Build and return the default system message for the Team.
- `get_user_memories(self, user_id: Optional[str]=None) -> Optional[List[UserMemory]]` â€” Get the user memories for the given user ID. Args: user_id: The user ID to get the memories for. If not provided, the current cached user ID is used. Returns: Optional[List[UserMemory]]: The user memories.
- `initialize_team(self, debug_mode: Optional[bool]=None) -> None` â€” No docstring provided.
- `print_response(self, input: Union[List, Dict, str, Message, BaseModel, List[Message]], *, stream: Optional[bool]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, markdown: Optional[bool]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, show_message: bool=True, show_reasoning: bool=True, show_full_reasoning: bool=False, console: Optional[Any]=None, tags_to_include_in_markdown: Optional[Set[str]]=None, **kwargs: Any) -> None` â€” No docstring provided.
- `run(self, input: Union[str, List, Dict, Message, BaseModel, List[Message]], *, stream: Literal[False]=False, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, run_context: Optional[RunContext]=None, user_id: Optional[str]=None, retries: Optional[int]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, yield_run_response: bool=False, yield_run_output: bool=False, **kwargs: Any) -> Iterator[Union[RunOutputEvent, TeamRunOutputEvent]]` â€” No docstring provided.
- `run(self, input: Union[str, List, Dict, Message, BaseModel, List[Message]], *, stream: Optional[bool]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, run_context: Optional[RunContext]=None, user_id: Optional[str]=None, retries: Optional[int]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, yield_run_response: bool=False, yield_run_output: bool=False, **kwargs: Any) -> Union[TeamRunOutput, Iterator[Union[RunOutputEvent, TeamRunOutputEvent]]]` â€” Run the Team and return the response.
- `save_session(self, session: TeamSession) -> None` â€” Save the TeamSession to storage Args: session: The TeamSession to save.
- `set_id(self) -> None` â€” Set the ID of the team if not set yet. If the ID is not provided, generate a deterministic UUID from the name. If the name is not provided, generate a random UUID.
- `set_session_name(self, session_id: Optional[str]=None, autogenerate: bool=False, session_name: Optional[str]=None) -> TeamSession` â€” Set the session name and save to storage Args: session_id: The session ID to set the name for. If not provided, the current cached session ID is used. autogenerate: Whether to autogenerate the session name. session_name: The session name to set. If not provided, the session name will be autogenerated. Returns: TeamSession: The updated session.
- `set_tools(self, tools: List[Union[Toolkit, Callable, Function, Dict]])` â€” No docstring provided.
- `should_parse_structured_output(self) -> bool` â€” No docstring provided.
- `update_session_state(self, session_state_updates: Dict[str, Any], session_id: Optional[str]=None) -> str` â€” Update the session state for the given session ID and user ID. Args: session_state_updates: The updates to apply to the session state. Should be a dictionary of key-value pairs. session_id: The session ID to update. If not provided, the current cached session ID is used. Returns: dict: The updated session state.

Module agno.tools.agentql

- **Source:** libs/agno/agno/tools/agentql.py

Classes

- **class AgentQLTools** (bases: Toolkit)
 - **Methods:**
 - `custom_scrape_website(self, url: str) -> str` â€” Scrape a website using a custom AgentQL query. Args: url (str): The URL of the website to scrape Returns: str: Extracted text content or error message
 - `scrape_website(self, url: str) -> str` â€” Scrape all text content from a website using AgentQL. Args: url (str): The URL of the website to scrape Returns: str: Extracted text content or error message

Module agno.tools.airflow

- **Source:** libs/agno/agno/tools/airflow.py

Classes

- **class AirflowTools** (bases: Toolkit)
 - **Methods:**
 - `read_dag_file(self, dag_file: str) -> str` â€” Reads an Airflow DAG file dag_file and returns the contents if successful. :param dag_file: The name of the file to read :return: The contents of the file if successful, otherwise returns an error message.
 - `save_dag_file(self, contents: str, dag_file: str) -> str` â€” Saves python code for an Airflow DAG to a file called dag_file and returns the file path if successful. :param contents: The contents of the DAG. :param dag_file: The name of the file to save to. :return: The file path if successful, otherwise returns an error message.

Module agno.tools.api

- **Source:** libs/agno/agno/tools/api.py

Classes

- **class CustomApiTools** (bases: Toolkit)
 - **Methods:**
 - `make_request(self, endpoint: str, method: Literal['GET', 'POST', 'PUT', 'DELETE', 'PATCH']='GET', params: Optional[Dict[str, Any]]=None, data: Optional[Dict[str, Any]]=None, headers: Optional[Dict[str, str]]=None, json_data: Optional[Dict[str, Any]]=None) -> str` â€” Make an HTTP request to the API. Args: method (str): HTTP method (GET, POST, PUT, DELETE, PATCH) endpoint (str): API endpoint (will be combined with base url if set) params (Optional[Dict[str, Any]]): Query parameters data (Optional[Dict[str, Any]]): Form data to send headers (Optional[Dict[str, str]]): Additional headers json_data (Optional[Dict[str, Any]]): JSON data to send Returns: str: JSON string containing response data or error message

Module agno.tools.apify

- **Source:** `libs/agno/agno/tools/apify.py`

Classes

- **class** `ApifyTools` (bases: `Toolkit`)
 - **Methods:**
 - `register_actor(self, actor_id: str) -> None` Register an Apify Actor as a function in the toolkit. Args: `actor_id (str)`: ID of the Apify Actor to register (e.g., `apify/web-scraper`)

Functions

- `actor_id_to_tool_name(actor_id: str) -> str` Turn `actor_id` into a valid tool name. Args: `actor_id (str)`: Actor ID from Apify store Returns: `str`: A valid tool name
- `create_apify_client(token: str) -> ApifyClient` Create an Apify client instance with a custom user-agent. Args: `token (str)`: API token Returns: `ApifyClient`: Apify client instance Raises: `ValueError`: If the API token is not provided
- `get_actor_latest_build(apify_client: ApifyClient, actor_id: str) -> Dict[str, Any]` Get the latest build of an Actor from the default build tag. Args: `apify_client (ApifyClient)`: An instance of the `ApifyClient` class `actor_id (str)`: Actor name from Apify store to run Returns: `Dict[str, Any]`: The latest build of the Actor Raises: `ValueError`: If the Actor is not found or the build data is not found `TypeError`: If the build is not a dictionary
- `props_to_json_schema(input_dict, required_fields=None)` No docstring provided.
- `prune_actor_input_schema(input_schema: Dict[str, Any]) -> Tuple[Dict[str, Any], List[str]]` Get the input schema from the Actor build and trim descriptions. Args: `input_schema (Dict[str, Any])`: The input schema from the Actor build Returns: `Tuple[Dict[str, Any], List[str]]`: A tuple containing the pruned properties and required fields

Module agno.tools.arxiv

- **Source:** `libs/agno/agno/tools/arxiv.py`

Classes

- **class** `ArxivTools` (bases: `Toolkit`)
 - **Methods:**
 - `read_arxiv_papers(self, id_list: List[str], pages_to_read: Optional[int]=None) -> str` Use this function to read a list of arxiv papers and return the content. Args: `id_list (list, str)`: The list of id of the papers to add to the knowledge base. Should be of the format: `[2103.03404v1, 2103.03404v2]` `pages_to_read (int, optional)`: The number of pages to read from the paper. None means read all pages. Defaults to None. Returns: `str`: JSON of the papers.
 - `search_arxiv_and_return_articles(self, query: str, num_articles: int=10) -> str` Use this function to search arXiv for a query and return the top articles. Args: `query (str)`: The query to search arXiv for. `num_articles (int, optional)`: The number of articles to return. Defaults to 10. Returns: `str`: A JSON of the articles with title, id, authors, `pdf_url` and summary.

Module agno.tools.aws_lambda

- **Source:** `libs/agno/agno/tools/aws_lambda.py`

Classes

- **class** `AWSLambdaTools` (bases: `Toolkit`)
 - **Methods:**
 - `invoke_function(self, function_name: str, payload: str='{}') -> str` Invoke a specific AWS Lambda function with an optional JSON payload. Args: `function_name (str)`: The name of the Lambda function to invoke. `payload (str)`: The JSON payload to send to the function. Defaults to `{}`.
 - `list_functions(self) -> str` List all AWS Lambda functions in the configured AWS account.

Module agno.tools.aws_ses

- **Source:** `libs/agno/agno/tools/aws_ses.py`

Classes

- **class** `AWSSESTool` (bases: `Toolkit`)
 - **Methods:**
 - `send_email(self, subject: str, body: str, receiver_email: str) -> str` Use this tool to send an email using AWS SES. Args: `subject`: The subject of the email `body`: The body of the email `receiver_email`: The email address of the receiver

Module agno.tools.baidusearch

- **Source:** `libs/agno/agno/tools/baidusearch.py`

Classes

- **class** `BaiduSearchTools` (bases: `Toolkit`)
 - `BaiduSearch` is a toolkit for searching Baidu easily.

Args: `fixed_max_results (Optional[int])`: A fixed number of maximum results. `fixed_language (Optional[str])`: A fixed language for the search results. `headers (Optional[Any])`: Headers to be used in the search request. `proxy (Optional[str])`: Proxy to be used in the search request. `debug (Optional[bool])`: Enable debug output.

- **Methods:**
 - `baidu_search(self, query: str, max_results: int=5, language: str='zh') -> str` Execute Baidu search and return results Args: `query (str)`: Search keyword `max_results (int, optional)`: Maximum number of results to return, default 5 `language (str, optional)`: Search language, default Chinese Returns: `str`: A JSON formatted string containing the search results.

Module agno.tools.bitbucket

- **Source:** `libs/agno/agno/tools/bitbucket.py`

Classes

- **class** `BitbucketTools` (bases: `Toolkit`)
 - **Methods:**
 - `create_repository(self, name: str, project: Optional[str]=None, is_private: bool=False, description: Optional[str]=None, language: Optional[str]=None, has_issues: bool=False, has_wiki: bool=False) -> str` Creates a new repository in Bitbucket for the given workspace. Args: `name (str)`: The name of the new repository. `project (str, optional)`: The key of the project to create the repository in. `is_private (bool, optional)`: Whether the repository is private. `description (str, optional)`: A short description of the repository. `language (str, optional)`: The primary language of the repository has issues (bool, optional): Whether the repository has issues enabled. `has_wiki (bool, optional)`: Whether the repository has a wiki enabled. Returns: `str`: A JSON string containing repository information.
 - `get_pull_request_changes(self, pull_request_id: int) -> str` Retrieves changes for a pull request in a repository. Args: `pull_request_id (int)`: The ID of the pull request to retrieve. Returns: `str`: A markdown string containing the pull request diff.
 - `get_pull_request_details(self, pull_request_id: int) -> str` Retrieves a pull request for a repository. Args: `pull_request_id (int)`: The ID of the pull request to retrieve. Returns: `str`: A JSON string containing the pull request.
 - `get_repository_details(self) -> str` Retrieves repository information. API Docs: <https://developer.atlassian.com/cloud/bitbucket/rest/api-group-repositories/#api-repositories-workspace-repo-slug-get> Returns: `str`: A JSON string containing repository information.
 - `list_all_pull_requests(self, state: str='OPEN') -> str` Retrieves all pull requests for a repository. Args: `state (str, optional)`: The state of the pull requests to retrieve. Returns: `str`: A JSON string containing all pull requests.

- `list_issues(self, count: int=10) -> str` Retrieves all issues for a repository. Args: `count` (int, optional): The number of issues to retrieve. Defaults to 10. Maximum 50. Returns: `str`: A JSON string containing all issues.
- `list_repositories(self, count: int=10) -> str` Get all repositories in the workspace. Args: `count` (int, optional): The number of repositories to retrieve Returns: `str`: A JSON string containing repository list.
- `list_repository_commits(self, count: int=10) -> str` Retrieves all commits in a repository. Args: `count` (int, optional): The number of commits to retrieve. Defaults to 10. Maximum 50. Returns: `str`: A JSON string containing all commits.

Module `agno.tools.brandfetch`

- **Source:** `libs/agno/agno/tools/brandfetch.py`

Going to contribute this to agno toolkits.

Classes

- **class** `BrandfetchTools` (bases: `Toolkit`)
 - Brandfetch API toolkit for retrieving brand data and searching brands.

Supports both Brand API (retrieve comprehensive brand data) and Brand Search API (find and search brands by name).

`Brand API`

`api_key`: `str` - your Brandfetch API key

`Brand Search API`

`client_id`: `str` - your Brandfetch Client ID

`all`: `bool` - if `True`, will use all tools `enable_search_by_identifier`: `bool` - if `True`, will use search by identifier `enable_search_by_brand`: `bool` - if `True`, will use search by brand `enable_asearch_by_identifier`: `bool` - if `True`, will use async search by identifier `enable_asearch_by_brand`: `bool` - if `True`, will use async search by brand

- **Methods:**
 - `async_asearch_by_brand(self, name: str) -> dict[str, Any]` Search for brands by name using the Brand Search API - can give you the right brand id to use for the brand api. Args: `name`: Brand name to search for (e.g., `Google`, `Apple`) Returns: Dict containing search results with brand matches Raises: `ValueError`: If no client ID is provided
 - `async_asearch_by_identifier(self, identifier: str) -> dict[str, Any]` Search for brand data by identifier (domain, brand id, isin, stock ticker). Args: `identifier`: Options are you can use: Domain (`nike.com`), Brand ID (`id_0dwKPKT`), ISIN (`US6541061031`), Stock Ticker (`NKE`) Returns: Dict containing brand data including logos, colors, fonts, and other brand assets Raises: `ValueError`: If no API key is provided
 - `search_by_brand(self, name: str) -> dict[str, Any]` Search for brands by name using the Brand Search API - can give you the right brand id to use for the brand api. Args: `name`: Brand name to search for (e.g., `Google`, `Apple`) Returns: Dict containing search results with brand matches Raises: `ValueError`: If no client ID is provided
 - `search_by_identifier(self, identifier: str) -> dict[str, Any]` Search for brand data by identifier (domain, brand id, isin, stock ticker). Args: `identifier`: Options are you can use: Domain (`nike.com`), Brand ID (`id_0dwKPKT`), ISIN (`US6541061031`), Stock Ticker (`NKE`) Returns: Dict containing brand data including logos, colors, fonts, and other brand assets Raises: `ValueError`: If no API key is provided

Module `agno.tools.bravesearch`

- **Source:** `libs/agno/agno/tools/bravesearch.py`

Classes

- **class** `BraveSearchTools` (bases: `Toolkit`)
 - BraveSearch is a toolkit for searching Brave easily.

Args: `api_key` (str, optional): Brave API key. If not provided, will use `BRAVE_API_KEY` environment variable. `fixed_max_results` (Optional[int]): A fixed number of maximum results. `fixed_language` (Optional[str]): A fixed language for the search results.

- **Methods:**
 - `brave_search(self, query: str, max_results: int=5, country: str='US', search_lang: str='en') -> str` Search Brave for the specified query and return the results. Args: `query` (str): The query to search for. `max_results` (int, optional): The maximum number of results to return. Default is 5. `country` (str, optional): The country code for search results. Default is `US`. `search_lang` (str, optional): The language of the search results. Default is `en`. Returns: `str`: A JSON formatted string containing the search results.

Module `agno.tools.brightdata`

- **Source:** `libs/agno/agno/tools/brightdata.py`

Classes

- **class** `BrightDataTools` (bases: `Toolkit`)
 - BrightData is a toolkit for web scraping, screenshots, search engines, and web data feeds.

Args: `api_key` (Optional[str]): Bright Data API key. Retrieved from `BRIGHT_DATA_API_KEY` env variable if not provided. `enable_scrape_markdown` (bool): Enable webpage scraping as Markdown. Default is `True`. `enable_screenshot` (bool): Enable website screenshot capture. Default is `True`. `enable_search_engine` (bool): Enable search engine functionality. Default is `True`. `enable_web_data_feed` (bool): Enable web data feed retrieval. Default is `True`. `all` (bool): Enable all tools. Overrides individual flags when `True`. Default is `False`. `serp_zone` (str): SERP zone for search operations. Default is `serp_api`. `web_unlocker_zone` (str): Web unlocker zone for scraping operations. Default is `web_unlocker1`. `verbose` (bool): Enable verbose logging. Default is `False`. `timeout` (int): Timeout in seconds for operations. Default is 600.

- **Methods:**
 - `get_screenshot(self, agent: Agent, url: str, output_path: str='screenshot.png') -> ToolResult` Capture a screenshot of a webpage Args: `url` (str): URL to screenshot `output_path` (str): Output path for the screenshot (not used, kept for compatibility) Returns: `ToolResult`: Contains the screenshot image or error message.
 - `scrape_as_markdown(self, url: str) -> str` Scrape a webpage and return content in Markdown format. Args: `url` (str): URL to scrape Returns: `str`: Scraped content as Markdown
 - `search_engine(self, query: str, engine: str='google', num_results: int=10, language: Optional[str]=None, country_code: Optional[str]=None) -> str` Search using Google, Bing, or Yandex and return results in Markdown. Args: `query` (str): Search query engine (str): Search engine - `google`, `bing`, or `yandex` `num_results` (int): Number of results to return `language` (Optional[str]): Two-letter language code `country_code` (Optional[str]): Two-letter country code Returns: `str`: Search results as Markdown
 - `web_data_feed(self, source_type: str, url: str, num_of_reviews: Optional[int]=None) -> str` Retrieve structured web data from various sources like LinkedIn, Amazon, Instagram, etc. Args: `source_type` (str): Type of data source (e.g., `linkedin_person_profile`, `amazon_product`) `url` (str): URL of the web resource to retrieve data from `num_of_reviews` (Optional[int]): Number of reviews to retrieve Returns: `str`: Structured data from the requested source as JSON

Module `agno.tools.browserbase`

- **Source:** `libs/agno/agno/tools/browserbase.py`

Classes

- **class** `BrowserbaseTools` (bases: `Toolkit`)
 - **Methods:**
 - `close_session(self) -> str` Closes a browser session. Args: `session_id` (str, optional): The session ID to close. If not provided, will use the current session. Returns: JSON string with closure status
 - `get_page_content(self, connect_url: Optional[str]=None) -> str` Gets the HTML content of the current page. Args: `connect_url` (str, optional): The connection URL from an existing session Returns: The page HTML content
 - `navigate_to(self, url: str, connect_url: Optional[str]=None) -> str` Navigates to a URL. Args: `url` (str): The URL to navigate to `connect_url` (str, optional): The connection URL from an existing session Returns: JSON string with navigation status
 - `screenshot(self, path: str, full_page: bool=True, connect_url: Optional[str]=None) -> str` Takes a screenshot of the current page. Args: `path` (str): Where to save the screenshot `full_page` (bool): Whether to capture the full page `connect_url` (str, optional): The connection URL from an existing session Returns: JSON string confirming screenshot was saved

Module agno.tools.calcom

- **Source:** `libs/agno/agno/tools/calcom.py`

Classes

- **class** `CalComTools` (bases: `Toolkit`)
 - **Methods:**
 - `cancel_booking(self, booking_uid: str, reason: str) -> str` â€œ Cancel an existing booking. Args: `booking_uid`: Booking UID to cancel `reason`: Reason for cancellation Returns: `str`: Cancellation confirmation or error message
 - `create_booking(self, start_time: str, name: str, email: str) -> str` â€œ Create a new booking. Args: `start_time`: Start time in YYYY-MM-DDTHH:MM:SSZ format `name`: Attendeeâ€™s name `email`: Attendeeâ€™s email Returns: `str`: Booking confirmation or error message
 - `get_available_slots(self, start_date: str, end_date: str) -> str` â€œ Get available time slots for booking. Args: `start_date`: Start date in YYYY-MM-DD format `end_date`: End date in YYYY-MM-DD format `user_timezone`: Userâ€™s timezone `event_type_id`: Optional specific event type ID Returns: `str`: Available slots or error message
 - `get_upcoming_bookings(self, email: Optional[str]=None) -> str` â€œ Get all upcoming bookings for an attendee. Args: `email (str)`: Attendeeâ€™s email [Optional] Returns: `str`: List of upcoming bookings or error message
 - `reschedule_booking(self, booking_uid: str, new_start_time: str, reason: str) -> str` â€œ Reschedule an existing booking. Args: `booking_uid`: Booking UID to reschedule `new_start_time`: New start time in YYYY-MM-DDTHH:MM:SSZ format `reason`: Reason for rescheduling `user_timezone`: Userâ€™s timezone Returns: `str`: Rescheduling confirmation or error message

Module agno.tools.calculator

- **Source:** `libs/agno/agno/tools/calculator.py`

Classes

- **class** `CalculatorTools` (bases: `Toolkit`)
 - **Methods:**
 - `add(self, a: float, b: float) -> str` â€œ Add two numbers and return the result. Args: `a (float)`: First number. `b (float)`: Second number. Returns: `str`: JSON string of the result.
 - `divide(self, a: float, b: float) -> str` â€œ Divide first number by second and return the result. Args: `a (float)`: Numerator. `b (float)`: Denominator. Returns: `str`: JSON string of the result.
 - `exponentiate(self, a: float, b: float) -> str` â€œ Raise first number to the power of the second number and return the result. Args: `a (float)`: Base. `b (float)`: Exponent. Returns: `str`: JSON string of the result.
 - `factorial(self, n: int) -> str` â€œ Calculate the factorial of a number and return the result. Args: `n (int)`: Number to calculate the factorial of. Returns: `str`: JSON string of the result.
 - `is_prime(self, n: int) -> str` â€œ Check if a number is prime and return the result. Args: `n (int)`: Number to check if prime. Returns: `str`: JSON string of the result.
 - `multiply(self, a: float, b: float) -> str` â€œ Multiply two numbers and return the result. Args: `a (float)`: First number. `b (float)`: Second number. Returns: `str`: JSON string of the result.
 - `square_root(self, n: float) -> str` â€œ Calculate the square root of a number and return the result. Args: `n (float)`: Number to calculate the square root of. Returns: `str`: JSON string of the result.
 - `subtract(self, a: float, b: float) -> str` â€œ Subtract second number from first and return the result. Args: `a (float)`: First number. `b (float)`: Second number. Returns: `str`: JSON string of the result.

Module agno.tools.cartesia

- **Source:** `libs/agno/agno/tools/cartesia.py`

Classes

- **class** `CartesiaTools` (bases: `Toolkit`)
 - **Methods:**
 - `list_voices(self) -> str` â€œ List available voices from Cartesia (first page). Returns: `str`: JSON string containing a list of voices, each with id, name, description, and language.
 - `localize_voice(self, name: str, description: str, language: str, original_speaker_gender: str, voice_id: Optional[str]=None) -> str` â€œ Create a new voice localized to a different language. Args: `name (str)`: The desired name for the new localized voice. `description (str)`: The description for the new localized voice. `language (str)`: The target language code (e.g., â€œfrâ€œ, â€œesâ€œ). `original_speaker_gender (str)`: The gender of the original speaker (â€œmaleâ€œ or â€œfemaleâ€œ). `voice_id (optional)`: The ID of an existing voice to use as the base. If None, uses the default voice ID configured in the tool. Defaults to None. Returns: `str`: JSON string containing the information of the newly created localized voice, including its â€œidâ€œ.
 - `text_to_speech(self, agent: Union[Agent, Team], transcript: str, voice_id: Optional[str]=None) -> ToolResult` â€œ Convert text to speech. Args: `transcript`: The text to convert to speech `voice_id (optional)`: The ID of the voice to use for the text-to-speech. If None, uses the default voice ID configured in the tool. Defaults to None. Returns: `ToolResult`: A `ToolResult` containing the generated audio or error message.

Module agno.tools.clickup

- **Source:** `libs/agno/agno/tools/clickup.py`

Classes

- **class** `ClickUpTools` (bases: `Toolkit`)
 - **Methods:**
 - `create_task(self, space_name: str, task_name: str, task_description: str) -> str` â€œ Create a new task in a space. Args: `space_name (str)`: Name of the space to create task in `task_name (str)`: Name of the task `task_description (str)`: Description of the task Returns: `str`: JSON string containing created task details
 - `delete_task(self, task_id: str) -> str` â€œ Delete a specific task. Args: `task_id (str)`: The ID of the task Returns: `str`: JSON string containing deletion status
 - `get_task(self, task_id: str) -> str` â€œ Get details of a specific task. Args: `task_id (str)`: The ID of the task Returns: `str`: JSON string containing task details
 - `list_lists(self, space_name: str) -> str` â€œ List all lists in a space. Args: `space_name (str)`: Name of the space to list lists from Returns: `str`: JSON string containing list of lists
 - `list_spaces(self) -> str` â€œ List all spaces in the workspace. Returns: `str`: JSON string containing list of spaces
 - `list_tasks(self, space_name: str) -> str` â€œ List all tasks in a space. Args: `space_name (str)`: Name of the space to list tasks from Returns: `str`: JSON string containing tasks
 - `update_task(self, task_id: str, **kwargs) -> str` â€œ Update a specific task. Args: `task_id (str)`: The ID of the task `**kwargs`: Task fields to update (name, description, status, priority, etc.) Returns: `str`: JSON string containing updated task details

Module agno.tools.confluence

- **Source:** `libs/agno/agno/tools/confluence.py`

Classes

- **class** `ConfluenceTools` (bases: `Toolkit`)
 - **Methods:**
 - `create_page(self, space_name: str, title: str, body: str, parent_id: Optional[str]=None) -> str` â€œ Create a new page in Confluence. Args: `space_name (str)`: Name of the Confluence space. `title (str)`: Title of the new page. `body (str)`: Content of the new page. `parent_id (str, optional)`: ID of the parent page if creating a child page. Defaults to None. Returns: `str`: JSON-encoded page ID and title or error message.
 - `get_all_page_from_space(self, space_name: str) â€œ` Retrieve all pages from a specific Confluence space. Args: `space_name (str)`: Name of the Confluence space. Returns: `list`: Details

of pages in the specified space.

- `get_all_space_detail(self)` â€” Retrieve details about all Confluence spaces. Returns: str: List of space details as a string.
- `get_page_content(self, space_name: str, page_title: str, expand: Optional[str]='body.storage')` â€” Retrieve the content of a specific page in a Confluence space. Args: space_name (str): Name of the Confluence space. page_title (str): Title of the page to retrieve. expand (str, optional): Fields to expand in the page response. Defaults to â€œbody.storageâ€œ. Returns: str: JSON-encoded page content or error message.
- `get_space_key(self, space_name: str)` â€” Get the space key for a particular Confluence space. Args: space_name (str): Name of the space whose key is required. Returns: str: Space key or â€œNo space foundâ€œ if space doesnâ€™t exist.
- `update_page(self, page_id: str, title: str, body: str) -> str` â€” Update an existing Confluence page. Args: page_id (str): ID of the page to update. title (str): New title for the page. body (str): Updated content for the page. Returns: str: JSON-encoded status and ID of the updated page or error message.

Module agno.tools.crawl4ai

- **Source:** `libs/agno/agno/tools/crawl4ai.py`

Classes

- **class Crawl4aiTools** (bases: Toolkit)
 - **Methods:**
 - `crawl(self, url: Union[str, List[str]], search_query: Optional[str]=None) -> Union[str, Dict[str, str]]` â€” Crawl URLs and extract their text content. Args: url: Single URL string or list of URLs to crawl search_query: Optional query string to filter content using BM25 algorithm Returns: The extracted text content from the URL(s)

Module agno.tools.csv_toolkit

- **Source:** `libs/agno/agno/tools/csv_toolkit.py`

Classes

- **class CsvTools** (bases: Toolkit)
 - **Methods:**
 - `get_columns(self, csv_name: str) -> str` â€” Use this function to get the columns of the csv file `csv_name` without the extension. Args: csv_name (str): The name of the csv file to get the columns from without the extension. Returns: str: The columns of the csv file if successful, otherwise returns an error message.
 - `list_csv_files(self) -> str` â€” Returns a list of available csv files Returns: str: List of available csv files
 - `query_csv_file(self, csv_name: str, sql_query: str) -> str` â€” Use this function to run a SQL query on csv file `csv_name` without the extension. The Table name is the name of the csv file without the extension. The SQL Query should be a valid DuckDB SQL query. Always wrap column names with double quotes if they contain spaces or special characters Remember to escape the quotes in the JSON string (use â€œ) Use single quotes for string values Args: csv_name (str): The name of the csv file to query sql_query (str): The SQL Query to run on the csv file. Returns: str: The query results if successful, otherwise returns an error message.
 - `read_csv_file(self, csv_name: str, row_limit: Optional[int]=None) -> str` â€” Use this function to read the contents of a csv file `name` without the extension. Args: csv_name (str): The name of the csv file to read without the extension. row_limit (Optional[int]): The number of rows to return. None returns all rows. Defaults to None. Returns: str: The contents of the csv file if successful, otherwise returns an error message.

Module agno.tools.dalle

- **Source:** `libs/agno/agno/tools/dalle.py`

Classes

- **class DalleTools** (bases: Toolkit)
 - **Methods:**
 - `create_image(self, prompt: str) -> ToolResult` â€” Use this function to generate an image for a prompt. Args: prompt (str): A text description of the desired image. Returns: ToolResult: Result containing the message and generated images.

Module agno.tools.daytona

- **Source:** `libs/agno/agno/tools/daytona.py`

Classes

- **class DaytonaTools** (bases: Toolkit)
 - **Methods:**
 - `change_directory(self, agent: Union[Agent, Team], directory: str) -> str` â€” Change the current working directory. Args: directory: Directory to change to (relative to current directory or absolute) Returns: Success message or error
 - `create_file(self, agent: Union[Agent, Team], file_path: str, content: str) -> str` â€” Create or update a file in the sandbox. Args: file_path: Path to the file (relative to current directory or absolute) content: Content to write to the file Returns: Success message or error
 - `delete_file(self, agent: Union[Agent, Team], file_path: str) -> str` â€” Delete a file or directory from the sandbox. Args: file_path: Path to the file or directory (relative to current directory or absolute) Returns: Success message or error
 - `list_files(self, agent: Union[Agent, Team], directory: Optional[str]=None) -> str` â€” List files in a directory. Args: directory: Directory to list (defaults to current working directory) Returns: List of files and directories as formatted string
 - `read_file(self, agent: Union[Agent, Team], file_path: str) -> str` â€” Read a file from the sandbox. Args: file_path: Path to the file (relative to current directory or absolute) Returns: File content or error message
 - `run_code(self, agent: Union[Agent, Team], code: str) -> str` â€” Execute Python code in the Daytona sandbox. Args: code: Code to execute Returns: Execution output as a string
 - `run_shell_command(self, agent: Union[Agent, Team], command: str) -> str` â€” Execute a shell command in the sandbox. Args: command: Shell command to execute Returns: Command output as a string

Module agno.tools.decorator

- **Source:** `libs/agno/agno/tools/decorator.py`

Functions

- `tool()` -> Callable[[F], Function] â€” No docstring provided.
- `tool(*, name: Optional[str]=None, description: Optional[str]=None, strict: Optional[bool]=None, instructions: Optional[str]=None, add_instructions: bool=True, show_result: Optional[bool]=None, stop_after_tool_call: Optional[bool]=None, requires_confirmation: Optional[bool]=None, requires_user_input: Optional[bool]=None, user_input_fields: Optional[List[str]]=None, external_execution: Optional[bool]=None, pre_hook: Optional[Callable]=None, post_hook: Optional[Callable]=None, tool_hooks: Optional[List[Callable]]=None, cache_results: bool=False, cache_dir: Optional[str]=None, cache_ttl: int=3600) -> Callable[[F], Function]` â€” No docstring provided.
- `tool(func: F) -> Function` â€” No docstring provided.
- `tool(*args, **kwargs) -> Union[Function, Callable[[F], Function]]` â€” Decorator to convert a function into a Function that can be used by an agent. Args: name: Optional[str] - Override for the function name description: Optional[str] - Override for the function description strict: Optional[bool] - Flag for strict parameter checking instructions: Optional[str] - Instructions for using the tool add_instructions: bool - If True, add instructions to the system message show_result: Optional[bool] - If True, shows the result after function call stop_after_tool_call: Optional[bool] - If True, the agent will stop after the function call. requires_confirmation: Optional[bool] - If True, the function will require user confirmation before execution requires_user_input: Optional[bool] - If True, the function will require user input before execution user_input_fields: Optional[List[str]] - List of fields that will be provided to the function as user input external_execution: Optional[bool] - If True, the function will be executed outside of the agentâ€™s context pre_hook: Optional[Callable] - Hook that runs before the function is executed. post_hook: Optional[Callable] - Hook that runs after the function is executed. tool_hooks: Optional[List[Callable]] - List of hooks that run before and after the function is executed. cache_results: bool - If True, enable caching of function results cache_dir: Optional[str] - Directory to store cache files cache_ttl: int - Time-to-live for cached results in seconds Returns: Union[Function, Callable[[F], Function]]: Decorated function or decorator Examples: @tool def my_function(): pass @tool(name=â€œcustom_nameâ€œ, description=â€œCustom descriptionâ€œ) def another_function(): pass @tool async def my_async_function(): pass

Module agno.tools.desi_vocal

- **Source:** `libs/agno/agno/tools/desi_vocal.py`

Classes

- **class** `DesiVocalTools` (bases: `Toolkit`)
 - **Methods:**
 - `get_voices(self)` -> `str` â€œ Use this function to get all the voices available. Returns: result (list): A list of voices that have an ID, name and description.
 - `text_to_speech(self, agent: Union[Agent, Team], prompt: str, voice_id: Optional[str]=None)` -> `ToolResult` â€œ Use this function to generate audio from text. Args: prompt (str): The text to generate audio from. Returns: `ToolResult`: A `ToolResult` containing the generated audio or error message.

Module `agno.tools.discord`

- **Source:** `libs/agno/agno/tools/discord.py`

Discord integration tools for interacting with Discord channels and servers.

Classes

- **class** `DiscordTools` (bases: `Toolkit`)
 - **Methods:**
 - `delete_message(self, channel_id: str, message_id: str)` -> `str` â€œ Delete a message from a Discord channel. Args: `channel_id` (str): The ID of the channel containing the message. `message_id` (str): The ID of the message to delete. Returns: `str`: A success message or error message.
 - `get_channel_info(self, channel_id: str)` -> `str` â€œ Get information about a Discord channel. Args: `channel_id` (str): The ID of the channel to get information about. Returns: `str`: A JSON string containing the channel information.
 - `get_channel_messages(self, channel_id: str, limit: int=100)` -> `str` â€œ Get the message history of a Discord channel. Args: `channel_id` (str): The ID of the channel to fetch messages from. `limit` (int): The maximum number of messages to fetch. Defaults to 100. Returns: `str`: A JSON string containing the channelâ€™s message history.
 - `get_tool_config()` -> `dict` â€œ Get the required configuration for the tool.
 - `get_tool_description()` -> `str` â€œ Get the description of the tool.
 - `get_tool_name()` -> `str` â€œ Get the name of the tool.
 - `list_channels(self, guild_id: str)` -> `str` â€œ List all channels in a Discord server. Args: `guild_id` (str): The ID of the server to list channels from. Returns: `str`: A JSON string containing the list of channels.
 - `send_message(self, channel_id: str, message: str)` -> `str` â€œ Send a message to a Discord channel. Args: `channel_id` (str): The ID of the channel to send the message to. `message` (str): The text of the message to send. Returns: `str`: A success message or error message.

Module `agno.tools.docker`

- **Source:** `libs/agno/agno/tools/docker.py`

Classes

- **class** `DockerTools` (bases: `Toolkit`)
 - **Methods:**
 - `build_image(self, path: str, tag: str, dockerfile: str='Dockerfile', rm: bool=True)` -> `str` â€œ Build a Docker image from a Dockerfile. Args: `path` (str): Path to the directory containing the Dockerfile. `tag` (str): Tag to apply to the built image. `dockerfile` (str): Name of the Dockerfile. `rm` (bool): Remove intermediate containers. Returns: `str`: A success message or error message.
 - `connect_container_to_network(self, container_id: str, network_name: str)` -> `str` â€œ Connect a container to a network. Args: `container_id` (str): The ID or name of the container. `network_name` (str): The name of the network. Returns: `str`: A success message or error message.
 - `create_network(self, network_name: str, driver: str='bridge', internal: bool=False, labels: Optional[Dict[str, str]]=None)` -> `str` â€œ Create a Docker network. Args: `network_name` (str): The name of the network to create. `driver` (str): The network driver to use. `internal` (bool): If True, create an internal network. `labels` (dict, optional): Labels to apply to the network. Returns: `str`: A success message or error message.
 - `create_volume(self, volume_name: str, driver: str='local', labels: Optional[Dict[str, str]]=None)` -> `str` â€œ Create a Docker volume. Args: `volume_name` (str): The name of the volume to create. `driver` (str): The volume driver to use. `labels` (dict, optional): Labels to apply to the volume. Returns: `str`: A success message or error message.
 - `disconnect_container_from_network(self, container_id: str, network_name: str)` -> `str` â€œ Disconnect a container from a network. Args: `container_id` (str): The ID or name of the container. `network_name` (str): The name of the network. Returns: `str`: A success message or error message.
 - `exec_in_container(self, container_id: str, command: str)` -> `str` â€œ Execute a command in a running container. Args: `container_id` (str): The ID or name of the container. `command` (str): The command to execute. Returns: `str`: Command output or error message.
 - `get_container_logs(self, container_id: str, tail: int=100, stream: bool=False)` -> `str` â€œ Get logs from a Docker container. Args: `container_id` (str): The ID or name of the container. `tail` (int): Number of lines to show from the end of the logs. `stream` (bool): If True, return a generator that yields log lines. Returns: `str`: The container logs or an error message.
 - `inspect_container(self, container_id: str)` -> `str` â€œ Inspect a Docker container. Args: `container_id` (str): The ID or name of the container. Returns: `str`: A JSON string containing detailed information about the container.
 - `inspect_image(self, image_id: str)` -> `str` â€œ Inspect a Docker image. Args: `image_id` (str): The ID or name of the image. Returns: `str`: A JSON string containing detailed information about the image.
 - `inspect_network(self, network_name: str)` -> `str` â€œ Inspect a Docker network. Args: `network_name` (str): The name of the network. Returns: `str`: A JSON string containing detailed information about the network.
 - `inspect_volume(self, volume_name: str)` -> `str` â€œ Inspect a Docker volume. Args: `volume_name` (str): The name of the volume. Returns: `str`: A JSON string containing detailed information about the volume.
 - `list_containers(self, all: bool=False)` -> `str` â€œ List Docker containers. Args: `all` (bool): If True, show all containers (default shows just running). Returns: `str`: A JSON string containing the list of containers.
 - `list_images(self)` -> `str` â€œ List Docker images. Returns: `str`: A JSON string containing the list of images.
 - `list_networks(self)` -> `str` â€œ List Docker networks. Returns: `str`: A JSON string containing the list of networks.
 - `list_volumes(self)` -> `str` â€œ List Docker volumes. Returns: `str`: A JSON string containing the list of volumes.
 - `pull_image(self, image_name: str, tag: str='latest')` -> `str` â€œ Pull a Docker image. Args: `image_name` (str): The name of the image to pull. `tag` (str): The tag to pull. Returns: `str`: A success message or error message.
 - `remove_container(self, container_id: str, force: bool=False, volumes: bool=False)` -> `str` â€œ Remove a Docker container. Args: `container_id` (str): The ID or name of the container to remove. `force` (bool): If True, force the removal of a running container. `volumes` (bool): If True, remove anonymous volumes associated with the container. Returns: `str`: A success message or error message.
 - `remove_image(self, image_id: str, force: bool=False)` -> `str` â€œ Remove a Docker image. Args: `image_id` (str): The ID or name of the image to remove. `force` (bool): If True, force removal of the image. Returns: `str`: A success message or error message.
 - `remove_network(self, network_name: str)` -> `str` â€œ Remove a Docker network. Args: `network_name` (str): The name of the network to remove. Returns: `str`: A success message or error message.
 - `remove_volume(self, volume_name: str, force: bool=False)` -> `str` â€œ Remove a Docker volume. Args: `volume_name` (str): The name of the volume to remove. `force` (bool): Force removal of the volume. Returns: `str`: A success message or error message.
 - `run_container(self, image: str, command: Optional[str]=None, name: Optional[str]=None, detach: bool=True, ports: Optional[Dict[str, Union[str, int]]]=None, volumes: Optional[Dict[str, Dict[str, str]]]=None, environment: Optional[Dict[str, str]]=None, network: Optional[str]=None)` -> `str` â€œ Run a Docker container. Args: `image` (str): The image to run. `command` (str, optional): The command to run in the container. `name` (str, optional): A name for the container. `detach` (bool): Run container in the background. `ports` (dict, optional): Port mappings {â€œ container_port/protocolâ€œ: host_port}. `volumes` (dict, optional): Volume mappings (dict, optional): Environment variables. `network` (str, optional): Network to connect the container to. Returns: `str`: Container ID or error message.
 - `start_container(self, container_id: str)` -> `str` â€œ Start a Docker container. Args: `container_id` (str): The ID or name of the container to start. Returns: `str`: A success message or error message.

- `stop_container(self, container_id: str, timeout: int=10) -> str` Stop a Docker container. Args: `container_id (str)`: The ID or name of the container to stop. `timeout (int)`: Timeout in seconds to wait for container to stop. Returns: `str`: A success message or error message.
- `tag_image(self, image_id: str, repository: str, tag: Optional[str]=None) -> str` Tag a Docker image. Args: `image_id (str)`: The ID or name of the image to tag. `repository (str)`: The repository to tag in. `tag (str, optional)`: The tag name. Returns: `str`: A success message or error message.

Module agno.tools.duckdb

- **Source:** `libs/agno/agno/tools/duckdb.py`

Classes

- **class DuckDbTools** (bases: Toolkit)
 - **Methods:**
 - `connection(self) -> duckdb.DuckDBPyConnection` Returns the duckdb connection :return duckdb.DuckDBPyConnection: duckdb connection
 - `create_fts_index(self, table: str, unique_key: str, input_values: list[str]) -> str` Create a full text search index on a table :param table: Table to create the index on :param unique_key: Unique key to use :param input_values: Values to index :return: None
 - `create_table_from_path(self, path: str, table: Optional[str]=None, replace: bool=False) -> str` Creates a table from a path :param path: Path to load :param table: Optional table name to use :param replace: Whether to replace the table if it already exists :return: Table name created
 - `describe_table(self, table: str) -> str` Function to describe a table :param table: Table to describe :return: Description of the table
 - `export_table_to_path(self, table: str, format: Optional[str]='PARQUET', path: Optional[str]=None) -> str` Save a table in a desired format (default: parquet) If the path is provided, the table will be saved under that path. Eg: If path is /tmp, the table will be saved as /tmp/table.parquet Otherwise it will be saved in the current directory :param table: Table to export :param format: Format to export in (default: parquet) :param path: Path to export to :return: None
 - `full_text_search(self, table: str, unique_key: str, search_text: str) -> str` Full text Search in a table column for a specific text/keyword :param table: Table to search :param unique_key: Unique key to use :param search_text: Text to search :return: None
 - `get_table_name_from_path(self, path: str) -> str` Get the table name from a path :param path: Path to get the table name from :return: Table name
 - `inspect_query(self, query: str) -> str` Function to inspect a query and return the query plan. Always inspect your query before running them. :param query: Query to inspect :return: Query plan
 - `load_local_csv_to_table(self, path: str, table: Optional[str]=None, delimiter: Optional[str]=None) -> Tuple[str, str]` Load a local CSV file into duckdb :param path: Path to load :param table: Optional table name to use :param delimiter: Optional delimiter to use :return: Table name, SQL statement used to load the file
 - `load_local_path_to_table(self, path: str, table: Optional[str]=None) -> Tuple[str, str]` Load a local file into duckdb :param path: Path to load :param table: Optional table name to use :return: Table name, SQL statement used to load the file
 - `load_s3_csv_to_table(self, path: str, table: Optional[str]=None, delimiter: Optional[str]=None) -> Tuple[str, str]` Load a CSV file from S3 into duckdb :param path: S3 path to load :param table: Optional table name to use :return: Table name, SQL statement used to load the file
 - `load_s3_path_to_table(self, path: str, table: Optional[str]=None) -> Tuple[str, str]` Load a file from S3 into duckdb :param path: S3 path to load :param table: Optional table name to use :return: Table name, SQL statement used to load the file
 - `run_query(self, query: str) -> str` Function that runs a query and returns the result. :param query: SQL query to run :return: Result of the query
 - `show_tables(self, show_tables: bool) -> str` Function to show tables in the database :param show_tables: Show tables in the database :return: List of tables in the database
 - `summarize_table(self, table: str) -> str` Function to compute a number of aggregates over a table. The function launches a query that computes a number of aggregates over all columns, including min, max, avg, std and approx_unique. :param table: Table to summarize :return: Summary of the table

Module agno.tools.duckduckgo

- **Source:** `libs/agno/agno/tools/duckduckgo.py`

Classes

- **class DuckDuckGoTools** (bases: Toolkit)
 - DuckDuckGo is a toolkit for searching using DuckDuckGo easily. It uses the meta-search library DDGS, so it also has access to other backends. Args: `enable_search (bool)`: Enable DDGS search function. `enable_news (bool)`: Enable DDGS news function. `modifier (Optional[str])`: A modifier to be used in the search request. `fixed_max_results (Optional[int])`: A fixed number of maximum results. `proxy (Optional[str])`: Proxy to be used in the search request. `timeout (Optional[int])`: The maximum number of seconds to wait for a response. `backend (Optional[str])`: The backend to be used in the search request.
 - **Methods:**
 - `duckduckgo_news(self, query: str, max_results: int=5) -> str` Use this function to get the latest news from DDGS. Args: `query(str)`: The query to search for. `max_results (optional, default=5)`: The maximum number of results to return. Returns: The latest news from DDGS.
 - `duckduckgo_search(self, query: str, max_results: int=5) -> str` Use this function to search DDGS for a query. Args: `query(str)`: The query to search for. `max_results (optional, default=5)`: The maximum number of results to return. Returns: The result from DDGS.

Module agno.tools.e2b

- **Source:** `libs/agno/agno/tools/e2b.py`

Classes

- **class E2BTools** (bases: Toolkit)
 - **Methods:**
 - `download_chart_data(self, agent: Agent, result_index: int=0, output_path: Optional[str]=None, add_as_artifact: bool=True) -> ToolResult` Extract chart data from an interactive chart in the execution results. Optionally add the chart as an image artifact. Args: `agent`: The agent to add the chart artifact to `result_index (int)`: Index of the result to extract data from (default: 0) `output_path (str, optional)`: Path to save the JSON data. Defaults to `~chart-data-{result_index}.json` `add_as_artifact (bool)`: Whether to add the chart as an image artifact (default: True) Returns: `ToolResult`: Contains chart information and optionally the chart image.
 - `download_file_from_sandbox(self, sandbox_path: str, local_path: Optional[str]=None) -> str` Download a file from the E2B sandbox to the local system. Args: `sandbox_path (str)`: Path to the file in the sandbox `local_path (str, optional)`: Destination path on the local system. Defaults to the same filename. Returns: `str`: Path to the downloaded file or error message
 - `download_png_result(self, agent: Union[Agent, Team], result_index: int=0, output_path: Optional[str]=None) -> ToolResult` Add a PNG image result from the last code execution as an Image object. Args: `agent`: The agent to add the image artifact to `result_index (int)`: Index of the result to use (default: 0, the first result) `output_path (str, optional)`: Optional path to also save the PNG file. If not provided, image is only added as artifact. Returns: `ToolResult`: Contains the PNG image or error message.
 - `get_public_url(self, port: int) -> str` Get a public URL for a service running in the sandbox on the specified port. Args: `port (int)`: Port number the service is running on in the sandbox Returns: `str`: Public URL or error message
 - `get_sandbox_status(self) -> str` Get the current status of the sandbox. Returns: `str`: Sandbox status information
 - `kill_background_command(self, command_obj: Any) -> str` Kill a background command. Args: `command_obj`: Command object returned from `run_background_command` Returns: `str`: Result of the kill operation
 - `list_files(self, directory_path: str='/')` -> str List files and directories in the specified path in the sandbox. Args: `directory_path (str)`: Path to the directory to list (default: root directory) Returns: `str`: List of files and directories or error message
 - `list_running_sandboxes(self) -> str` List all running sandboxes. Returns: `str`: JSON string containing information about running sandboxes or error message
 - `read_file_content(self, file_path: str, encoding: str='utf-8') -> str` Read the content of a file from the sandbox. Args: `file_path (str)`: Path to the file in the sandbox `encoding (str)`: Encoding to use for text files (default: utf-8) Returns: `str`: File content or error message
 - `run_background_command(self, command: str) -> Any` Run a shell command in the background. Args: `command (str)`: Shell command to execute in background Returns: `object`: Command object that can be used to interact with the background process
 - `run_command(self, command: str, on_stdout: Optional[Callable]=None, on_stderr: Optional[Callable]=None, background: bool=False) -> str` Run a shell command in the sandbox environment. Args: `command (str)`: Shell command to execute on `stdout` (callable, optional): Callback function for streaming `stdout` on `stderr` (callable, optional): Callback function for streaming `stderr` `background (bool)`: Whether to run the command in background Returns: `str`: Command results or error message, or the command object for

background execution

- run_python_code(self, code: str) -> str â€œ Run Python code in an isolated E2B sandbox environment. Args: code (str): Python code to execute Returns: str: Execution results or error message
- run_server(self, command: str, port: int) -> str â€œ Start a server in the sandbox and return its public URL. Args: command (str): Command to start the server port (int): Port the server will listen on Returns: str: Server information including public URL or error message
- set_sandbox_timeout(self, timeout: int) -> str â€œ Update the timeout for the sandbox. Args: timeout: New timeout in seconds Returns: str: Success message or error message
- shutdown_sandbox(self) -> str â€œ Shutdown the sandbox immediately. Returns: str: Success message or error message
- stream_command(self, command: str) -> str â€œ Run a shell command and stream its output. Args: command (str): Shell command to execute Returns: str: Summary of command execution
- upload_file(self, file_path: str, sandbox_path: Optional[str]=None) -> str â€œ Upload a file to the E2B sandbox. Args: file_path (str): Path to the file on the local system sandbox_path (str, optional): Destination path in the sandbox. Defaults to the same filename. Returns: str: Path to the file in the sandbox or error message
- watch_directory(self, directory_path: str, duration_seconds: int=5) -> str â€œ Watch a directory for changes for a specified duration. Args: directory_path (str): Path to the directory to watch duration_seconds (int): How long to watch for changes in seconds (default: 5 seconds) Returns: str: List of changes detected or error message
- write_file_content(self, file_path: str, content: str) -> str â€œ Write text content to a file in the sandbox. Args: file_path (str): Path to the file in the sandbox content (str): Text content to write Returns: str: Success message or error message

Module agno.tools.eleven_labs

- Source: libs/agno/agno/tools/eleven_labs.py

Classes

- class ElevenLabsTools (bases: Toolkit)
 - Methods:
 - generate_sound_effect(self, prompt: str, duration_seconds: Optional[float]=None) -> ToolResult â€œ Generate a sound effect from a text description. Args: prompt (str): Description of the sound effect duration_seconds (Optional[float]): Duration in seconds to generate audio from. Has to be between 0.5 and 22. Returns: ToolResult: A ToolResult containing the generated audio or error message.
 - get_voices(self) -> str â€œ Get all the voices available. Returns: result (list): A list of voices that have an ID, name and description.
 - text_to_speech(self, agent: Union[Agent, Team], prompt: str) -> ToolResult â€œ Convert text to speech. Args: prompt (str): Text to generate audio from. Returns: ToolResult: A ToolResult containing the generated audio or error message.

Module agno.tools.email

- Source: libs/agno/agno/tools/email.py

Classes

- class EmailTools (bases: Toolkit)
 - Methods:
 - email_user(self, subject: str, body: str, **kwargs) -> str â€œ Emails the user with the given subject and body. :param subject: The subject of the email. :param body: The body of the email. :return: â€œsuccessâ€ if the email was sent successfully, â€œerror: [error message]â€ otherwise.

Module agno.tools.evm

- Source: libs/agno/agno/tools/evm.py

Classes

- class EvmTools (bases: Toolkit)
 - Methods:
 - get_max_fee_per_gas(self, max_priority_fee_per_gas: int) -> int â€œ Get the max fee per gas for the transaction. Args: max_priority_fee_per_gas: The max priority fee per gas Returns: int: The max fee per gas for the transaction
 - get_max_priority_fee_per_gas(self) -> int â€œ Get the max priority fee per gas for the transaction. Returns: int: The max priority fee per gas for the transaction (1 gwei)
 - send_transaction(self, to_address: str, amount_in_wei: int) -> str â€œ Sends a transaction to the address provided. Args: to_address: The address to which you want to send ETH amount_in_wei: The amount of ETH to send in wei Returns: str: The transaction hash of the transaction or error message

Module agno.tools.exa

- Source: libs/agno/agno/tools/exa.py

Classes

- class ExaTools (bases: Toolkit)
 - ExaTools is a toolkit for interfacing with the Exa web search engine, providing functionalities to perform categorized searches and retrieve structured results.

Args: enable_search (bool): Enable search functionality. Default is True. enable_get_contents (bool): Enable get contents functionality. Default is True. enable_find_similar (bool): Enable find similar functionality. Default is True. enable_answer (bool): Enable answer generation. Default is True. enable_research (bool): Enable research tool functionality. Default is False. all (bool): Enable all tools. Overrides individual flags when True. Default is False. text (bool): Retrieve text content from results. Default is True. text_length_limit (int): Max length of text content per result. Default is 1000. highlights (bool): Include highlighted snippets. Deprecated since it was removed in the Exa API. It will be removed from Agno in a future release. api_key (Optional[str]): Exa API key. Retrieved from EXA_API_KEY env variable if not provided. num_results (Optional[int]): Default number of search results. Overrides individual searches if set. start_crawl_date (Optional[str]): Include results crawled on/after this date (YYYY-MM-DD). end_crawl_date (Optional[str]): Include results crawled on/before this date (YYYY-MM-DD). start_published_date (Optional[str]): Include results published on/after this date (YYYY-MM-DD). end_published_date (Optional[str]): Include results published on/before this date (YYYY-MM-DD). use_autoprompt (Optional[bool]): Enable autoprompt features in queries. Deprecated since it was removed in the Exa API. It will be removed from Agno in a future release. type (Optional[str]): Specify content type (e.g., article, blog, video). category (Optional[str]): Filter results by category. Options are â€œcompanyâ€, â€œresearch paperâ€, â€œnewsâ€, â€œpdfâ€, â€œgithubâ€, â€œtweetâ€, â€œpersonal siteâ€, â€œlinkedin profileâ€, â€œfinancial reportâ€. include_domains (Optional[List[str]]): Restrict results to these domains. exclude_domains (Optional[List[str]]): Exclude results from these domains. show_results (bool): Log search results for debugging. Default is False. model (Optional[str]): The search model to use. Options are â€œexaâ€™ or â€œexa-proâ€™. timeout (int): Maximum time in seconds to wait for API responses. Default is 30 seconds.

- Methods:
 - exa_answer(self, query: str, text: bool=False) -> str â€œ Get an LLM answer to a question informed by Exa search results. Args: query (str): The question or query to answer. text (bool): Include full text from citation. Default is False. Returns: str: The answer results in JSON format with both generated answer and sources.
 - find_similar(self, url: str, num_results: int=5) -> str â€œ Find similar links to a given URL using the Exa API. Args: url (str): The URL for which to find similar links. num_results (int, optional): The number of similar links to return. Defaults to 5. Returns: str: The search results in JSON format.
 - get_contents(self, urls: list[str]) -> str â€œ Retrieve detailed content from specific URLs using the Exa API. Args: urls (list(str)): A list of URLs from which to fetch content. Returns: str: The search results in JSON format.
 - research(self, instructions: str, output_schema: Optional[Dict[str, Any]]=None) -> str â€œ Perform deep research on a topic. Args: instructions (str): Research instructions. output_schema (Optional[Dict[str, Any]]): JSON schema for structured output. If not provided, the API will auto-infer an appropriate schema. Returns: str: JSON formatted research results including data and citations.
 - search_exa(self, query: str, num_results: int=5, category: Optional[str]=None) -> str â€œ Use this function to search Exa (a web search engine) for a query. Args: query (str): The query to search for. num_results (int): Number of results to return. Defaults to 5. category (Optional[str]): The category to filter search results. Options are â€œcompanyâ€, â€œresearch paperâ€, â€œnewsâ€, â€œpdfâ€, â€œgithubâ€, â€œtweetâ€, â€œpersonal siteâ€, â€œlinkedin profileâ€, â€œfinancial reportâ€. Returns: str: The search results in JSON format.

Module agno.tools.fal

- Source: libs/agno/agno/tools/fal.py

pip install fal-client

Classes

- **class** FalTools (bases: Toolkit)
 - **Methods:**
 - generate_media(self, agent: Union[Agent, Team], prompt: str) -> ToolResult â€” Use this function to run a model with a given prompt. Args: prompt (str): A text description of the task. Returns: ToolResult: Contains the generated media and success message.
 - image_to_image(self, agent: Union[Agent, Team], prompt: str, image_url: Optional[str]=None) -> ToolResult â€” Use this function to transform an input image based on a text prompt using the Fal AI image-to-image model. The model takes an existing image and generates a new version modified according to your prompt. See <https://fal.ai/models/fal-ai/flux/dev/image-to-image/api> for more details about the image-to-image capabilities. Args: prompt (str): A text description of the task. image_url (str): The URL of the image to use for the generation. Returns: ToolResult: Contains the generated image and success message.
 - on_queue_update(self, update) â€” No docstring provided.

Module agno.tools.file

- **Source:** `libs/agno/agno/tools/file.py`

Classes

- **class** FileTools (bases: Toolkit)
 - **Methods:**
 - check_escape(self, relative_path: str) -> Tuple[bool, Path] â€” No docstring provided.
 - delete_file(self, file_name: str) -> str â€” Deletes a file :param file_name: Name of the file to delete :return: Empty string, if operation succeeded, otherwise returns an error message
 - list_files(self, **kwargs) -> str â€” Returns a list of files in directory :param directory: (Optional) name of directory to list. :return: The contents of the file if successful, otherwise returns an error message.
 - read_file(self, file_name: str, encoding: str='utf-8') -> str â€” Reads the contents of the file file_name and returns the contents if successful. :param file_name: The name of the file to read. :param encoding: Encoding to use, default - utf-8 :return: The contents of the file if successful, otherwise returns an error message.
 - read_file_chunk(self, file_name: str, start_line: int, end_line: int, encoding: str='utf-8') -> str â€” Reads the contents of the file file_name and returns lines from start_line to end_line. :param file_name: The name of the file to read. :param start_line: Number of first line in the returned chunk :param end_line: Number of the last line in the returned chunk :param encoding: Encoding to use, default - utf-8 :return: The contents of the selected chunk
 - replace_file_chunk(self, file_name: str, start_line: int, end_line: int, chunk: str, encoding: str='utf-8') -> str â€” Reads the contents of the file, replaces lines between start_line and end_line with chunk and writes the file :param file_name: The name of the file to process. :param start_line: Number of first line in the replaced chunk :param end_line: Number of the last line in the replaced chunk :param chunk: String to be inserted instead of lines from start_line to end_line. Can have multiple lines. :param encoding: Encoding to use, default - utf-8 :return: file name if successful, error message otherwise
 - save_file(self, contents: str, file_name: str, overwrite: bool=True, encoding: str='utf-8') -> str â€” Saves the contents to a file called file_name and returns the file name if successful. :param contents: The contents to save. :param file_name: The name of the file to save to. :param overwrite: Overwrite the file if it already exists. :return: The file name if successful, otherwise returns an error message.
 - search_files(self, pattern: str) -> str â€” Searches for files in the base directory that match the pattern :param pattern: The pattern to search for, e.g. *â€œtxtâ€*, *â€œfile.csvâ€*, *â€œ*.pyâ€*. :return: JSON formatted list of matching file paths, or error message.

Module agno.tools.file_generation

- **Source:** `libs/agno/agno/tools/file_generation.py`

Classes

- **class** FileGenerationTools (bases: Toolkit)
 - **Methods:**
 - generate_csv_file(self, data: Union[List[List], List[Dict], str], filename: Optional[str]=None, headers: Optional[List[str]]=None) -> ToolResult â€” Generate a CSV file from the provided data. Args: data: The data to write to the CSV file. Can be a list of lists, list of dictionaries, or CSV string. filename: Optional filename for the generated file. If not provided, a UUID will be used. headers: Optional headers for the CSV. Used when data is a list of lists. Returns: ToolResult: Result containing the generated CSV file as a FileArtifact.
 - generate_json_file(self, data: Union[Dict, List, str], filename: Optional[str]=None) -> ToolResult â€” Generate a JSON file from the provided data. Args: data: The data to write to the JSON file. Can be a dictionary, list, or JSON string. filename: Optional filename for the generated file. If not provided, a UUID will be used. Returns: ToolResult: Result containing the generated JSON file as a FileArtifact.
 - generate_pdf_file(self, content: str, filename: Optional[str]=None, title: Optional[str]=None) -> ToolResult â€” Generate a PDF file from the provided content. Args: content: The text content to write to the PDF file. filename: Optional filename for the generated file. If not provided, a UUID will be used. title: Optional title for the PDF document. Returns: ToolResult: Result containing the generated PDF file as a FileArtifact.
 - generate_text_file(self, content: str, filename: Optional[str]=None) -> ToolResult â€” Generate a text file from the provided content. Args: content: The text content to write to the file. filename: Optional filename for the generated file. If not provided, a UUID will be used. Returns: ToolResult: Result containing the generated text file as a FileArtifact.

Module agno.tools.financial_datasets

- **Source:** `libs/agno/agno/tools/financial_datasets.py`

Classes

- **class** FinancialDatasetsTools (bases: Toolkit)
 - **Methods:**
 - get_balance_sheets(self, ticker: str, period: str='annual', limit: int=10) -> str â€” Get balance sheets for a ticker. Args: ticker: Stock ticker symbol period: *â€œannualâ€*, *â€œquarterlyâ€*, or *â€œtmâ€* limit: Number of statements to return Returns: Dictionary containing balance sheets
 - get_cash_flow_statements(self, ticker: str, period: str='annual', limit: int=10) -> str â€” Get cash flow statements for a ticker. Args: ticker: Stock ticker symbol period: *â€œannualâ€*, *â€œquarterlyâ€*, or *â€œtmâ€* limit: Number of statements to return Returns: Dictionary containing cash flow statements
 - get_company_info(self, ticker: str) -> str â€” Get company information for a ticker. Args: ticker: Stock ticker symbol Returns: Dictionary containing company information
 - get_crypto_prices(self, symbol: str, interval: str='1d', limit: int=100) -> str â€” Get cryptocurrency prices. Args: symbol: Cryptocurrency symbol (e.g., *â€œBTCâ€*) interval: Price interval (e.g., *â€œ1dâ€*, *â€œ1hâ€*) limit: Number of price points to return Returns: Dictionary containing crypto prices
 - get_earnings(self, ticker: str, limit: int=10) -> str â€” Get earnings data for a ticker. Args: ticker: Stock ticker symbol limit: Number of earnings reports to return Returns: Dictionary containing earnings data
 - get_financial_metrics(self, ticker: str) -> str â€” Get financial metrics for a ticker. Args: ticker: Stock ticker symbol Returns: Dictionary containing financial metrics
 - get_income_statements(self, ticker: str, period: str='annual', limit: int=10) -> str â€” Get income statements for a ticker. Args: ticker: Stock ticker symbol period: *â€œannualâ€*, *â€œquarterlyâ€*, or *â€œtmâ€* limit: Number of statements to return Returns: Dictionary containing income statements
 - get_insider_trades(self, ticker: str, limit: int=50) -> str â€” Get insider trades for a ticker. Args: ticker: Stock ticker symbol limit: Number of trades to return Returns: Dictionary containing insider trades
 - get_institutional_ownership(self, ticker: str) -> str â€” Get institutional ownership data for a ticker. Args: ticker: Stock ticker symbol Returns: Dictionary containing institutional ownership data
 - get_news(self, ticker: Optional[str]=None, limit: int=50) -> str â€” Get market news, optionally filtered by ticker. Args: ticker: Stock ticker symbol (optional) limit: Number of news items to return Returns: Dictionary containing news items
 - get_sec_filings(self, ticker: str, form_type: Optional[str]=None, limit: int=50) -> str â€” Get SEC filings for a ticker. Args: ticker: Stock ticker symbol form_type: Type of SEC form (e.g., *â€œ10-Kâ€*, *â€œ10-Qâ€*) limit: Number of filings to return Returns: Dictionary containing SEC filings
 - get_segmented_financials(self, ticker: str, period: str='annual', limit: int=10) -> str â€” Get segmented financials for a ticker. Args: ticker: Stock ticker symbol period: *â€œannualâ€* or *â€œquarterlyâ€* limit: Number of reports to return Returns: Dictionary containing segmented financials

- `get_stock_prices(self, ticker: str, interval: str='1d', limit: int=100) -> str` Get stock prices for a ticker. Args: ticker: Stock ticker symbol interval: Price interval (e.g., `1d`, `1h`, `1m`) limit: Number of price points to return Returns: Dictionary containing stock prices
- `search_tickers(self, query: str, limit: int=10) -> str` Search for tickers based on a query. Args: query: Search query limit: Maximum number of results to return Returns: Dictionary containing search results

Module `agno.tools.firecrawl`

- **Source:** `libs/agno/agno/tools/firecrawl.py`

Classes

- **class `CustomJSONEncoder`** (bases: `json.JSONEncoder`)
 - Custom JSON encoder that handles non-serializable types by converting them to strings.
 - **Methods:**
 - `default(self, obj)` No docstring provided.
- **class `FirecrawlTools`** (bases: `Toolkit`)
 - Firecrawl is a tool for scraping and crawling websites.

Args: `api_key` (Optional[str]): The API key to use for the Firecrawl app. `enable_scrape` (bool): Enable website scraping functionality. Default is True. `enable_crawl` (bool): Enable website crawling functionality. Default is False. `enable_mapping` (bool): Enable website mapping functionality. Default is False. `enable_search` (bool): Enable web search functionality. Default is False. `all` (bool): Enable all tools. Overrides individual flags when True. Default is False. `formats` (Optional[List[str]]): The formats to use for the Firecrawl app. `limit` (int): The maximum number of pages to crawl. `poll_interval` (int): Polling interval for crawl operations. `search_params` (Optional[Dict[str, Any]]): Parameters for search operations. `api_url` (Optional[str]): The API URL to use for the Firecrawl app.

- **Methods:**
 - `crawl_website(self, url: str, limit: Optional[int]=None) -> str` Use this function to Crawl a website using Firecrawl. Args: `url` (str): The URL to crawl. `limit` (int): The maximum number of pages to crawl Returns: The results of the crawling.
 - `map_website(self, url: str) -> str` Use this function to Map a website using Firecrawl. Args: `url` (str): The URL to map.
 - `scrape_website(self, url: str) -> str` Use this function to scrape a website using Firecrawl. Args: `url` (str): The URL to scrape.
 - `search_web(self, query: str, limit: Optional[int]=None)` Use this function to search for the web using Firecrawl. Args: `query` (str): The query to search for. `limit` (int): The maximum number of results to return.

Module `agno.tools.function`

- **Source:** `libs/agno/agno/tools/function.py`

Classes

- **class `Function`** (bases: `BaseModel`)
 - Model for storing functions that can be called by an agent.
 - **Methods:**
 - `from_callable(cls, c: Callable, name: Optional[str]=None, strict: bool=False) -> 'Function'` No docstring provided.
 - `model_copy(self, *, deep: bool=False) -> 'Function'` Override `model_copy` to handle callable fields that can't be deep copied (pickled). Callables should always be shallow copied (referenced), not deep copied.
 - `process_entrypoint(self, strict: bool=False)` Process the entrypoint and make it ready for use by an agent.
 - `process_schema_for_strict(self)` Process the schema to make it strict mode compliant.
 - `to_dict(self) -> Dict[str, Any]` No docstring provided.
- **class `FunctionCall`** (bases: `BaseModel`)
 - Model for Function Calls
 - **Methods:**
 - `async aexecute(self) -> FunctionExecutionResult` Runs the function call asynchronously.
 - `execute(self) -> FunctionExecutionResult` Runs the function call.
 - `get_call_str(self) -> str` Returns a string representation of the function call.
- **class `FunctionExecutionResult`** (bases: `BaseModel`)
- **class `ToolResult`** (bases: `BaseModel`)
 - Result from a tool that can include media artifacts.
- **class `UserInputField`**
 - **Methods:**
 - `from_dict(cls, data: Dict[str, Any]) -> 'UserInputField'` No docstring provided.
 - `to_dict(self) -> Dict[str, Any]` No docstring provided.

Functions

- `get_entrypoint_docstring(entrypoint: Callable) -> str` No docstring provided.

Module `agno.tools.giphy`

- **Source:** `libs/agno/agno/tools/giphy.py`

Classes

- **class `GiphyTools`** (bases: `Toolkit`)
 - **Methods:**
 - `search_gifs(self, agent: Union[Agent, Team], query: str) -> ToolResult` Find a GIPHY gif Args: `query` (str): A text description of the required gif. Returns: `ToolResult`: Contains the found GIF images or error message.

Module `agno.tools.github`

- **Source:** `libs/agno/agno/tools/github.py`

Classes

- **class `GithubTools`** (bases: `Toolkit`)
 - **Methods:**
 - `assign_issue(self, repo_name: str, issue_number: int, assignees: List[str]) -> str` Assign users to an issue. Args: `repo_name` (str): The full name of the repository. `issue_number` (int): The number of the issue. `assignees` (List[str]): A list of usernames to assign. Returns: A JSON-formatted string confirming the assignees.
 - `authenticate(self)` Authenticate with GitHub using the provided access token.

- `close_issue(self, repo_name: str, issue_number: int) -> str â€œ` Close an issue. Args: `repo_name (str):` The full name of the repository. `issue_number (int):` The number of the issue. Returns: A JSON-formatted string confirming the issue is closed.
- `comment_on_issue(self, repo_name: str, issue_number: int, comment_body: str) -> str â€œ` Add a comment to an issue. Args: `repo_name (str):` The full name of the repository. `issue_number (int):` The number of the issue. `comment_body (str):` The content of the comment. Returns: A JSON-formatted string containing the comment details.
- `create_branch(self, repo_name: str, branch_name: str, source_branch: Optional[str]=None) -> str â€œ` Create a new branch in a repository. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `branch_name (str):` The name of the new branch. `source_branch (str, optional):` The source branch to create from. Defaults to repositoryâ€™s default branch. Returns: A JSON-formatted string containing information about the created branch.
- `create_file(self, repo_name: str, path: str, content: str, message: str, branch: Optional[str]=None) -> str â€œ` Create a new file in a repository. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `path (str):` The path to the file in the repository. `content (str):` The content of the file. `message (str):` The commit message. `branch (str, optional):` The branch to commit to. Defaults to repositoryâ€™s default branch. Returns: A JSON-formatted string containing the file creation result.
- `create_issue(self, repo_name: str, title: str, body: Optional[str]=None) -> str â€œ` Create an issue in a repository. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `title (str):` The title of the issue. `body (str, optional):` The body content of the issue. Returns: A JSON-formatted string containing the created issue details.
- `create_pull_request(self, repo_name: str, title: str, body: str, head: str, base: str, draft: bool=False, maintainer_can_modify: bool=True) -> str â€œ` Create a new pull request in a repository. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `title (str):` The title of the pull request. `body (str):` The body text of the pull request. `head (str):` The name of the branch where your changes are implemented. `base (str):` The name of the branch you want the changes pulled into. `draft (bool, optional):` Whether the pull request is a draft. Defaults to False. `maintainer_can_modify (bool, optional):` Whether maintainers can modify the PR. Defaults to True. Returns: A JSON-formatted string containing the created pull request details.
- `create_pull_request_comment(self, repo_name: str, pr_number: int, body: str, commit_id: str, path: str, position: int) -> str â€œ` Create a comment on a specific line of a specific file in a pull request. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `pr_number (int):` The number of the pull request. `body (str):` The text of the comment. `commit_id (str):` The SHA of the commit to comment on. `path (str):` The relative path to the file to comment on. `position (int):` The line index in the diff to comment on. Returns: A JSON-formatted string containing the created comment details.
- `create_repository(self, name: str, private: bool=False, description: Optional[str]=None, auto_init: bool=False, organization: Optional[str]=None) -> str â€œ` Create a new repository on GitHub. Args: `name (str):` The name of the repository. `private (bool, optional):` Whether the repository is private. Defaults to False. `description (str, optional):` A short description of the repository. `auto_init (bool, optional):` Whether to initialize the repository with a README. Defaults to False. `organization (str, optional):` Name of organization to create repo in. If None, creates in user account. Returns: A JSON-formatted string containing the created repository details.
- `create_review_request(self, repo_name: str, pr_number: int, reviewers: List[str], team_reviewers: Optional[List[str]]=None) -> str â€œ` Create a review request for a pull request. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `pr_number (int):` The number of the pull request. `reviewers (List[str]):` List of user logins that will be requested to review. `team_reviewers (List[str], optional):` List of team slugs that will be requested to review. Defaults to None. Returns: A JSON-formatted string with the success message or error.
- `delete_file(self, repo_name: str, path: str, message: str, sha: str, branch: Optional[str]=None) -> str â€œ` Delete a file from a repository. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `path (str):` The path to the file in the repository. `message (str):` The commit message. `sha (str):` The blob SHA of the file being deleted. `branch (str, optional):` The branch to commit to. Defaults to repositoryâ€™s default branch. Returns: A JSON-formatted string containing the file deletion result.
- `delete_repository(self, repo_name: str) -> str â€œ` Delete a repository (requires admin permissions). Args: `repo_name (str):` The full name of the repository to delete (e.g., `â€œowner/repoâ€œ`). Returns: A JSON-formatted string with success message or error.
- `edit_issue(self, repo_name: str, issue_number: int, title: Optional[str]=None, body: Optional[str]=None) -> str â€œ` Edit the title or body of an issue. Args: `repo_name (str):` The full name of the repository. `issue_number (int):` The number of the issue. `title (str, optional):` The new title for the issue. `body (str, optional):` The new body content for the issue. Returns: A JSON-formatted string confirming the issue has been updated.
- `edit_pull_request_comment(self, repo_name: str, comment_id: int, body: str) -> str â€œ` Edit an existing pull request comment. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `comment_id (int):` The id of the comment to edit. `body (str):` The new text of the comment. Returns: A JSON-formatted string containing the updated comment details.
- `get_branch_content(self, repo_name: str, branch: str='main') -> str â€œ` Get the root directory content of a specific branch. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `branch (str, optional):` The branch name. Defaults to `â€œmainâ€œ`. Returns: A JSON-formatted string containing a list of branch contents.
- `get_directory_content(self, repo_name: str, path: str, ref: Optional[str]=None) -> str â€œ` Get the contents of a directory in a repository. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `path (str):` The path to the directory in the repository. Use empty string for root. `ref (str, optional):` The name of the commit/branch/tag. Defaults to repositoryâ€™s default branch. Returns: A JSON-formatted string containing a list of directory contents.
- `get_file_content(self, repo_name: str, path: str, ref: Optional[str]=None) -> str â€œ` Get the content of a file in a repository. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `path (str):` The path to the file in the repository. `ref (str, optional):` The name of the commit/branch/tag. Defaults to the repositoryâ€™s default branch. Returns: A JSON-formatted string containing the file content and metadata.
- `get_issue(self, repo_name: str, issue_number: int) -> str â€œ` Get details of a specific issue. Args: `repo_name (str):` The full name of the repository. `issue_number (int):` The number of the issue. Returns: A JSON-formatted string containing issue details.
- `get_pull_request(self, repo_name: str, pr_number: int) -> str â€œ` Get details of a specific pull request. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `pr_number (int):` The number of the pull request. Returns: A JSON-formatted string containing pull request details.
- `get_pull_request_changes(self, repo_name: str, pr_number: int) -> str â€œ` Get the changes (files modified) in a pull request. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `pr_number (int):` The number of the pull request. Returns: A JSON-formatted string containing the list of changed files.
- `get_pull_request_comments(self, repo_name: str, pr_number: int, include_issue_comments: bool=True) -> str â€œ` Get all comments on a pull request. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `pr_number (int):` The number of the pull request. `include_issue_comments (bool, optional):` Whether to include general PR comments. Defaults to True. Returns: A JSON-formatted string containing a list of pull request comments.
- `get_pull_request_count(self, repo_name: str, state: str='all', author: Optional[str]=None, base: Optional[str]=None, head: Optional[str]=None) -> str â€œ` Get the count of pull requests for a repository based on query parameters. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `state (str, optional):` The state of the PRs to count (`â€œopenâ€œ`, `â€œclosedâ€œ`, `â€œallâ€œ`). Defaults to `â€œallâ€œ`. `author (str, optional):` Filter PRs by author username. `base (str, optional):` Filter PRs by base branch name. `head (str, optional):` Filter PRs by head branch name. Returns: A JSON-formatted string containing the count of pull requests.
- `get_pull_request_with_details(self, repo_name: str, pr_number: int) -> str â€œ` Get comprehensive details of a pull request including comments, labels, and metadata. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `pr_number (int):` The number of the pull request. Returns: A JSON-formatted string containing detailed pull request information.
- `get_pull_requests(self, repo_name: str, state: str='open', sort: str='created', direction: str='desc', limit: int=50) -> str â€œ` Get pull requests matching query parameters. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `state (str, optional):` State of the PRs to retrieve. Can be `â€œopenâ€œ`, `â€œclosedâ€œ`, or `â€œallâ€œ`. Defaults to `â€œopenâ€œ`. `sort (str, optional):` What to sort results by. Can be `â€œcreatedâ€œ`, `â€œupdatedâ€œ`, `â€œpopularityâ€œ`, `â€œlong-runningâ€œ`. Defaults to `â€œcreatedâ€œ`. `direction (str, optional):` The direction of the sort. Can be `â€œascâ€œ` or `â€œdescâ€œ`. Defaults to `â€œdescâ€œ`. `limit (int, optional):` The maximum number of pull requests to return. Defaults to 20. Returns: A JSON-formatted string containing a list of pull requests.
- `get_repository(self, repo_name: str) -> str â€œ` Get details of a specific repository. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). Returns: A JSON-formatted string containing repository details.
- `get_repository_languages(self, repo_name: str) -> str â€œ` Get the languages used in a repository. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). Returns: A JSON-formatted string containing the list of languages.
- `get_repository_stars(self, repo_name: str) -> str â€œ` Get the number of stars for a repository. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). Returns: A JSON-formatted string containing the star count.
- `get_repository_with_stats(self, repo_name: str) -> str â€œ` Get comprehensive repository information including statistics. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). Returns: A JSON-formatted string containing detailed repository information and statistics.
- `label_issue(self, repo_name: str, issue_number: int, labels: List[str]) -> str â€œ` Add labels to an issue. Args: `repo_name (str):` The full name of the repository. `issue_number (int):` The number of the issue. `labels (List[str]):` A list of label names to add. Returns: A JSON-formatted string confirming the labels.
- `list_branches(self, repo_name: str) -> str â€œ` List all branches in a repository. Args: `repo_name (str):` Full repository name (e.g., `â€œowner/repoâ€œ`). Returns: JSON list of branch names.
- `list_issue_comments(self, repo_name: str, issue_number: int) -> str â€œ` List comments on an issue. Args: `repo_name (str):` The full name of the repository. `issue_number (int):` The number of the issue. Returns: A JSON-formatted string containing a list of comments.
- `list_issues(self, repo_name: str, state: str='open', page: int=1, per_page: int=20) -> str â€œ` List issues for a repository with pagination. Args: `repo_name (str):` The full name of the repository (e.g., `â€œowner/repoâ€œ`). `state (str, optional):` The state of issues to list (`â€œopenâ€œ`, `â€œclosedâ€œ`, `â€œallâ€œ`). Defaults to `â€œopenâ€œ`. `page (int, optional):` Page number of results to return, counting from 1. Defaults to 1. `per_page (int, optional):` Number of results per page. Defaults to 20. Returns: A JSON-formatted string containing a list of issues with pagination metadata.
- `list_repositories(self) -> str â€œ` List all repositories for the authenticated user. Returns: A JSON-formatted string containing a list of repository names.
- `reopen_issue(self, repo_name: str, issue_number: int) -> str â€œ` Reopen a closed issue. Args: `repo_name (str):` The full name of the repository. `issue_number (int):` The number of the issue. Returns: A JSON-formatted string confirming the issue is reopened.
- `search_code(self, query: str, language: Optional[str]=None, repo: Optional[str]=None, user: Optional[str]=None, path: Optional[str]=None, filename: Optional[str]=None) -> str â€œ` Search for code in GitHub repositories. Args: `query (str):` The search query. `language (str, optional):` Filter by language. Defaults to None. `repo (str, optional):` Filter by repository (e.g.,

â€œowner/repoâ€™). Defaults to None. user (str, optional): Filter by user or organization. Defaults to None. path (str, optional): Filter by file path. Defaults to None. filename (str, optional): Filter by filename. Defaults to None. Returns: A JSON-formatted string containing the search results.

- search_issues_and_prs(self, query: str, state: Optional[str]=None, type: filter: Optional[str]=None, repo: Optional[str]=None, user: Optional[str]=None, label: Optional[str]=None, sort: str='created', order: str='desc', page: int=1, per_page: int=30) -> str â€œ Search for issues and pull requests on GitHub. Args: query (str): The search query. state (str, optional): Filter by state (â€œopenâ€™, â€œclosedâ€™). Defaults to None. type filter (str, optional): Filter by type (â€œissueâ€™, â€œprâ€™). Defaults to None. repo (str, optional): Filter by repository (e.g., â€œowner/repoâ€™). Defaults to None. user (str, optional): Filter by user or organization. Defaults to None. label (str, optional): Filter by label. Defaults to None. sort (str, optional): Sort results by (â€œcreatedâ€™, â€œupdatedâ€™, â€œcommentsâ€™). Defaults to â€œcreatedâ€™. order (str, optional): Sort order (â€œascâ€™, â€œdescâ€™). Defaults to â€œdescâ€™. page (int, optional): Page number for pagination. Defaults to 1. per_page (int, optional): Number of results per page. Defaults to 30. Returns: A JSON-formatted string containing the search results.
- search_repositories(self, query: str, sort: str='stars', order: str='desc', page: int=1, per_page: int=30) -> str â€œ Search for repositories on GitHub. Note: GitHubâ€™s Search API has a maximum limit of 1000 results per query. Args: query (str): The search query keywords. sort (str, optional): The field to sort results by. Can be â€œstarsâ€™, â€œforksâ€™, or â€œupdatedâ€™. Defaults to â€œstarsâ€™. order (str, optional): The order of results. Can be â€œascâ€™ or â€œdescâ€™. Defaults to â€œdescâ€™. page (int, optional): Page number of results to return, counting from 1. per_page (int, optional): Number of results per page. Max 100. Defaults to 30. Returns: A JSON-formatted string containing a list of repositories matching the search query.
- set_default_branch(self, repo_name: str, branch_name: str) -> str â€œ Set the default branch for a repository. Args: repo_name (str): The full name of the repository (e.g., â€œowner/repoâ€™). branch_name (str): The name of the branch to set as default. Returns: A JSON-formatted string with success message or error.
- update_file(self, repo_name: str, path: str, content: str, message: str, sha: str, branch: Optional[str]=None) -> str â€œ Update an existing file in a repository. Args: repo_name (str): The full name of the repository (e.g., â€œowner/repoâ€™). path (str): The path to the file in the repository. content (str): The new content of the file. message (str): The commit message. sha (str): The blob SHA of the file being replaced. branch (str, optional): The branch to commit to. Defaults to repositoryâ€™s default branch. Returns: A JSON-formatted string containing the file update result.

Module agno.tools.gmail

- **Source:** libs/agno/agno/tools/gmail.py

Gmail Toolkit for interacting with Gmail API

Required Environment Variables:

- GOOGLE_CLIENT_ID: Google OAuth client ID
- GOOGLE_CLIENT_SECRET: Google OAuth client secret
- GOOGLE_PROJECT_ID: Google Cloud project ID
- GOOGLE_REDIRECT_URI: Google OAuth redirect URI (default: http://localhost)

How to Get These Credentials:

1. Go to Google Cloud Console (<https://console.cloud.google.com>)
2. Create a new project or select an existing one
3. Enable the Gmail API:
 - Go to â€œAPIs & Servicesâ€ > â€œEnable APIs and Servicesâ€
 - Search for â€œGmail APIâ€
 - Click â€œEnableâ€
4. Create OAuth 2.0 credentials:
 - Go to â€œAPIs & Servicesâ€ > â€œCredentialsâ€
 - Click â€œCreate Credentialsâ€ > â€œOAuth client IDâ€
 - Go through the OAuth consent screen setup
 - Give it a name and click â€œCreateâ€
 - Youâ€™ll receive:
 - Client ID (GOOGLE_CLIENT_ID)
 - Client Secret (GOOGLE_CLIENT_SECRET)
 - The Project ID (GOOGLE_PROJECT_ID) is visible in the project dropdown at the top of the page
5. Add auth redirect URI:
 - Go to <https://console.cloud.google.com/auth/clients> and add the redirect URI as <http://127.0.0.1/>
6. Set up environment variables: Create a .envrc file in your project root with:

```
export GOOGLE_CLIENT_ID=your_client_id_here
export GOOGLE_CLIENT_SECRET=your_client_secret_here
export GOOGLE_PROJECT_ID=your_project_id_here
export GOOGLE_REDIRECT_URI=http://127.0.0.1/ # Default value
```

Note: The first time you run the application, it will open a browser window for OAuth authentication. A token.json file will be created to store the authentication credentials for future use.

Classes

- **class GmailTools** (bases: Toolkit)
 - **Methods:**
 - apply_label(self, context: str, label_name: str, count: int=10) -> str â€œ Find emails matching a context (search query) and apply a label, creating it if necessary. Args: context (str): Gmail search query (e.g., â€œis:unread category:promotionsâ€™) label_name (str): Name of the label to apply count (int): Maximum number of emails to process Returns: str: Summary of labeled emails
 - create_draft_email(self, to: str, subject: str, body: str, cc: Optional[str]=None, attachments: Optional[Union[str, List[str]]]=None) -> str â€œ Create and save a draft email. to and cc are comma separated string of email ids Args: to (str): Comma separated string of recipient email addresses subject (str): Email subject body (str): Email body content cc (Optional[str]): Comma separated string of CC email addresses (optional) attachments (Optional[Union[str, List[str]]]): File path(s) for attachments (optional) Returns: str: Stringified dictionary containing draft email details including id
 - delete_custom_label(self, label_name: str, confirm: bool=False) -> str â€œ Delete a custom label (with safety confirmation). Args: label_name (str): Name of the label to delete confirm (bool): Must be True to actually delete the label Returns: str: Confirmation message or warning
 - get_emails_by_context(self, context: str, count: int) -> str â€œ Get X number of emails matching a specific context or search term. Args: context (str): Search term or context to match in emails count (int): Maximum number of emails to retrieve Returns: str: Formatted string containing email details
 - get_emails_by_date(self, start_date: int, range_in_days: Optional[int]=None, num_emails: Optional[int]=10) -> str â€œ Get emails based on date range. start_date is an integer representing a unix timestamp Args: start_date (datetime): Start date for the query range in days (Optional[int]): Number of days to include in the range (default: None) num_emails (Optional[int]): Maximum number of emails to retrieve (default: 10) Returns: str: Formatted string containing email details
 - get_emails_by_thread(self, thread_id: str) -> str â€œ Retrieve all emails from a specific thread. Args: thread_id (str): The ID of the email thread. Returns: str: Formatted string containing email thread details.
 - get_emails_from_user(self, user: str, count: int) -> str â€œ Get X number of emails from a specific user (name or email). Args: user (str): Name or email address of the sender count (int): Maximum number of emails to retrieve Returns: str: Formatted string containing email details
 - get_latest_emails(self, count: int) -> str â€œ Get the latest X emails from the userâ€™s inbox. Args: count (int): Number of latest emails to retrieve Returns: str: Formatted string containing email details
 - get_starred_emails(self, count: int) -> str â€œ Get X number of starred emails from the userâ€™s inbox. Args: count (int): Maximum number of starred emails to retrieve Returns: str: Formatted string containing email details
 - get_unread_emails(self, count: int) -> str â€œ Get the X number of latest unread emails from the userâ€™s inbox. Args: count (int): Maximum number of unread emails to retrieve Returns: str: Formatted string containing email details
 - list_custom_labels(self) -> str â€œ List only user-created custom labels (filters out system labels) in a numbered format. Returns: str: A numbered list of custom labels only
 - mark_email_as_read(self, message_id: str) -> str â€œ Mark a specific email as read by removing the â€œUNREADâ€™ label. This is crucial for long polling scenarios to prevent processing the same email multiple times. Args: message_id (str): The ID of the message to mark as read Returns: str: Success message or error description
 - mark_email_as_unread(self, message_id: str) -> str â€œ Mark a specific email as unread by adding the â€œUNREADâ€™ label. This is useful for flagging emails that need attention or re-processing. Args: message_id (str): The ID of the message to mark as unread Returns: str: Success message or error description
 - remove_label(self, context: str, label_name: str, count: int=10) -> str â€œ Remove a label from emails matching a context (search query). Args: context (str): Gmail search query

(e.g., `is:unread category:promotions`) `label_name` (str): Name of the label to remove `count` (int): Maximum number of emails to process `Returns`: str: Summary of emails with label removed

- `search_emails(self, query: str, count: int) -> str` `Get X number of emails based on a given natural text query. Searches in to, from, cc, subject and email body contents. Args: query (str): Natural language query to search for count (int): Number of emails to retrieve Returns: str: Formatted string containing email details`
- `send_email(self, to: str, subject: str, body: str, cc: Optional[str]=None, attachments: Optional[Union[str, List[str]]]=None) -> str` `Send an email immediately. to and cc are comma separated string of email ids Args: to (str): Comma separated string of recipient email addresses subject (str): Email subject body (str): Email body content cc (Optional[str]): Comma separated string of CC email addresses (optional) attachments (Optional[Union[str, List[str]]]): File path(s) for attachments (optional) Returns: str: Stringified dictionary containing sent email details including id`
- `send_email_reply(self, thread_id: str, message_id: str, to: str, subject: str, body: str, cc: Optional[str]=None, attachments: Optional[Union[str, List[str]]]=None) -> str` `Respond to an existing email thread. Args: thread_id (str): The ID of the email thread to reply to. message_id (str): The ID of the email being replied to. to (str): Comma-separated recipient email addresses. subject (str): Email subject (prefixed with Re: if not already). body (str): Email body content. cc (Optional[str]): Comma-separated CC email addresses (optional). attachments (Optional[Union[str, List[str]]]): File path(s) for attachments (optional) Returns: str: Stringified dictionary containing sent email details including id.`

Functions

- `authenticate(func)` Decorator to ensure authentication before executing a function.
- `validate_email(email: str) -> bool` Validate email format.

Module `agno.tools.google_bigquery`

- Source:** `libs/agno/agno/tools/google_bigquery.py`

Classes

- class `GoogleBigQueryTools`** (bases: `Toolkit`)
 - Methods:**
 - `describe_table(self, table_id: str) -> str` Use this function to describe a table. Args: `table_name` (str): The name of the table to get the schema for. Returns: str: schema of a table
 - `list_tables(self) -> str` Use this function to get a list of table names in the dataset. Returns: str: list of tables in the dataset.
 - `run_sql_query(self, query: str) -> str` Use this function to run a BigQuery SQL query and return the result. Args: `query` (str): The query to run. Returns: str: Result of the Google BigQuery SQL query. Notes: - The result may be empty if the query does not return any data.

Module `agno.tools.google_drive`

- Source:** `libs/agno/agno/tools/google_drive.py`

Google Drive API integration for file management and sharing.

This module provides functions to interact with Google Drive, including listing, uploading, and downloading files. It uses the Google Drive API and handles authentication via OAuth2.

Required Environment Variables:

- `GOOGLE_CLIENT_ID`: Google OAuth client ID
- `GOOGLE_CLIENT_SECRET`: Google OAuth client secret
- `GOOGLE_PROJECT_ID`: Google Cloud project ID
- `GOOGLE_REDIRECT_URI`: Google OAuth redirect URI (default: `http://localhost`)
- `GOOGLE_CLOUD_QUOTA_PROJECT_ID`: Google Cloud quota project ID

How to Get These Credentials:

- Go to Google Cloud Console (<https://console.cloud.google.com>)
- Create a new project or select an existing one
- Enable the Google Drive API:
 - Go to `APIs & Services` > `Enable APIs and Services`
 - Search for `Google Drive API`
 - Click `Enable`
- Create OAuth 2.0 credentials:
 - Go to `APIs & Services` > `Credentials`
 - Click `Create Credentials` > `OAuth client ID`
 - Enable the OAuth Consent Screen if you haven't already
 - After enabling the Consent Screen, click on `Create Credentials` > `OAuth client ID`
 - You'll receive:
 - Client ID (`GOOGLE_CLIENT_ID`)
 - Client Secret (`GOOGLE_CLIENT_SECRET`)
 - The Project ID (`GOOGLE_PROJECT_ID`) is visible in the project dropdown at the top of the page
- Add auth redirect URI:
 - Go to <https://console.cloud.google.com/auth/clients>
 - Add `http://localhost:5050` as a recognized redirect URI OR with `http://localhost:{PORT_NUMBER}`
- Set up environment variables: Create a `.envrc` file in your project root with: `export GOOGLE_CLIENT_ID=your_client_id_here export GOOGLE_CLIENT_SECRET=your_client_secret_here export GOOGLE_PROJECT_ID=your_project_id_here export GOOGLE_REDIRECT_URI=http://localhost/ # Default value export GOOGLE_AUTHENTICATION_PORT=5050 # Port for OAuth redirect export GOOGLE_CLOUD_QUOTA_PROJECT_ID=your_quota_project_id_here`

Remember to install the dependencies using `pip install google google-auth-oauthlib`

Important Points to Note : 1. The first time you run the application, it will open a browser window for OAuth authentication. 2. A `token.json` file will be created to store the authentication credentials for future use.

You can customize the authentication port by setting the `GOOGLE_AUTHENTICATION_PORT` environment variable. This will be used in the `run_local_server` method for OAuth authentication.

Classes

- class `GoogleDriveTools`** (bases: `Toolkit`)
 - Methods:**
 - `download_file(self, file_id: str, dest_path: Union[str, Path]) -> Optional[Path]` Download a file from your Google Drive. Args: `file_id` (str): The ID of the file you want to download. `dest_path` (`Union[str, Path]`): Where to save the downloaded file. Returns: `Optional[Path]`: The path to the downloaded file, or `None` if download failed.
 - `list_files(self, query: Optional[str]=None, page_size: int=10) -> List[dict]` List files in your Google Drive. Args: `query` (`Optional[str]`): Optional search query to filter files (see Google Drive API docs). `page_size` (int): Maximum number of files to return. Returns: `List[dict]`: List of file metadata dictionaries.
 - `upload_file(self, file_path: Union[str, Path], mime_type: Optional[str]=None) -> Optional[dict]` Upload a file to your Google Drive. Args: `file_path` (`Union[str, Path]`): Path to the file you want to upload. `mime_type` (`Optional[str]`): MIME type of the file. If not provided, it will be guessed. Returns: `Optional[dict]`: Metadata of the uploaded file, or `None` if upload failed.

Functions

- `authenticate(func)` Decorator to ensure authentication before executing a function.

Module `agno.tools.google_maps`

- Source:** `libs/agno/agno/tools/google_maps.py`

This module provides tools for searching business information using the Google Maps API.

Prerequisites: - Set the environment variable `GOOGLE_MAPS_API_KEY` with your Google Maps API key. You can obtain the API key from the Google Cloud Console: <https://console.cloud.google.com/projectselector2/google/maps-apis/credentials>

- You also need to activate the Address Validation API for your project. <https://console.developers.google.com/apis/api/addressvalidation.googleapis.com>

Classes

- class **GoogleMapTools** (bases: Toolkit)
 - Methods:**
 - geocode_address(self, address: str, region: Optional[str]=None) -> str â€œ Convert an address into geographic coordinates using Google Maps Geocoding API. Args: address (str): The address to geocode region (str, optional): The region code to bias results Returns: str: Stringified list of dictionaries containing location information
 - get_directions(self, origin: str, destination: str, mode: str='driving', departure_time: Optional[datetime]=None, avoid: Optional[List[str]]=None) -> str â€œ Get directions between two locations using Google Maps Directions API. Args: origin (str): Starting point address or coordinates destination (str): Destination address or coordinates mode (str, optional): Travel mode. Options: â€œdrivingâ€œ, â€œwalkingâ€œ, â€œbicyclingâ€œ, â€œtransitâ€œ. Defaults to â€œdrivingâ€œ departure_time (datetime, optional): Desired departure time for transit directions avoid (List[str], optional): Features to avoid: â€œtollsâ€œ, â€œhighwaysâ€œ, â€œferriesâ€œ Returns: str: Stringified dictionary containing route information including steps, distance, duration, etc.
 - get_distance_matrix(self, origins: List[str], destinations: List[str], mode: str='driving', departure_time: Optional[datetime]=None, avoid: Optional[List[str]]=None) -> str â€œ Calculate distance and time for a matrix of origins and destinations. Args: origins (List[str]): List of addresses or coordinates destinations (List[str]): List of addresses or coordinates mode (str, optional): Travel mode. Options: â€œdrivingâ€œ, â€œwalkingâ€œ, â€œbicyclingâ€œ, â€œtransitâ€œ departure_time (datetime, optional): Desired departure time avoid (List[str], optional): Features to avoid: â€œtollsâ€œ, â€œhighwaysâ€œ, â€œferriesâ€œ Returns: str: Stringified dictionary containing distance and duration information
 - get_elevation(self, lat: float, lng: float) -> str â€œ Get the elevation for a specific location using Google Maps Elevation API. Args: lat (float): Latitude lng (float): Longitude Returns: str: Stringified dictionary containing elevation data
 - get_timezone(self, lat: float, lng: float, timestamp: Optional[datetime]=None) -> str â€œ Get timezone information for a location using Google Maps Time Zone API. Args: lat (float): Latitude lng (float): Longitude timestamp (datetime, optional): The timestamp to use for timezone calculation Returns: str: Stringified dictionary containing timezone information
 - reverse_geocode(self, lat: float, lng: float, result_type: Optional[List[str]]=None, location_type: Optional[List[str]]=None) -> str â€œ Convert geographic coordinates into an address using Google Maps Reverse Geocoding API. Args: lat (float): Latitude lng (float): Longitude result_type (List[str], optional): Array of address types to filter results location_type (List[str], optional): Array of location types to filter results Returns: str: Stringified list of dictionaries containing address information
 - search_places(self, query: str) -> str â€œ Search for places using Google Maps Places API. This tool takes a search query and returns detailed place information. Args: query (str): The query string to search for using Google Maps Search API. (e.g., â€œdental clinics in Noidaâ€œ) Returns: Stringified list of dictionaries containing business information like name, address, phone, website, rating, and reviews etc.
 - validate_address(self, address: str, region_code: str='US', locality: Optional[str]=None, enable_usps_cass: bool=False) -> str â€œ Validate an address using Google Maps Address Validation API. Args: address (str): The address to validate region_code (str): The region code (e.g., â€œUSâ€œ for United States) locality (str, optional): The locality (city) to help with validation enable_usps_cass (bool): Whether to enable USPS CASS validation for US addresses Returns: str: Stringified dictionary containing address validation results

Module agno.tools.googlecalendar

- Source:** `libs/agno/agno/tools/googlecalendar.py`

Classes

- class **GoogleCalendarTools** (bases: Toolkit)
 - Methods:**
 - create_event(self, start_date: str, end_date: str, title: Optional[str]=None, description: Optional[str]=None, location: Optional[str]=None, timezone: Optional[str]='UTC', attendees: Optional[List[str]]=None, add_google_meet_link: Optional[bool]=False, notify_attendees: Optional[bool]=False) -> str â€œ Create a new event in the Google Calendar. Args: start_date (str): Start date and time of the event in ISO format (YYYY-MM-DDTHH:MM:SS) end_date (str): End date and time of the event in ISO format (YYYY-MM-DDTHH:MM:SS) title (Optional[str]): Title/summary of the event description (Optional[str]): Detailed description of the event location (Optional[str]): Location of the event timezone (Optional[str]): Timezone for the event (default: UTC) attendees (Optional[List[str]]): List of email addresses of the attendees add_google_meet_link (Optional[bool]): Whether to add a Google Meet video link to the event notify_attendees (Optional[bool]): Whether to send email notifications to attendees (default: False) Returns: str: JSON string containing the created Google Calendar event or error message
 - delete_event(self, event_id: str, notify_attendees: Optional[bool]=True) -> str â€œ Delete an event from the Google Calendar. Args: event_id (str): ID of the event to delete notify_attendees (Optional[bool]): Whether to send email notifications to attendees (default: False) Returns: str: JSON string containing success message or error message
 - fetch_all_events(self, max_results: int=10, start_date: Optional[str]=None, end_date: Optional[str]=None) -> str â€œ Fetch all Google Calendar events in a given date range. Args: start_date (Optional[str]): The minimum date to include events from in ISO format (YYYY-MM-DDTHH:MM:SS) end_date (Optional[str]): The maximum date to include events up to in ISO format (YYYY-MM-DDTHH:MM:SS). Returns: str: JSON string containing all Google Calendar events or error message
 - find_available_slots(self, start_date: str, end_date: str, duration_minutes: int=30) -> str â€œ Find available time slots within a date range. This method fetches your actual calendar events to determine busy periods, then finds available slots within standard working hours (9 AM - 5 PM). Args: start_date (str): Start date to search from in ISO format (YYYY-MM-DD) end_date (str): End date to search to in ISO format (YYYY-MM-DD) duration_minutes (int): Length of the desired slot in minutes (default: 30 minutes) Returns: str: JSON string containing available Google Calendar time slots or error message
 - list_calendars(self) -> str â€œ List all available Google Calendars for the authenticated user. Returns: str: JSON string containing available calendars with their IDs and names
 - list_events(self, limit: int=10, start_date: Optional[str]=None) -> str â€œ List upcoming events from the userâ€™s Google Calendar. Args: limit (Optional[int]): Number of events to return, default value is 10 start_date (Optional[str]): The start date to return events from in ISO format (YYYY-MM-DDTHH:MM:SS) Returns: str: JSON string containing the Google Calendar events or error message
 - update_event(self, event_id: str, title: Optional[str]=None, description: Optional[str]=None, location: Optional[str]=None, start_date: Optional[str]=None, end_date: Optional[str]=None, timezone: Optional[str]=None, attendees: Optional[List[str]]=None, notify_attendees: Optional[bool]=False) -> str â€œ Update an existing event in the Google Calendar. Args: event_id (str): ID of the event to update title (Optional[str]): New title/summary of the event description (Optional[str]): New description of the event location (Optional[str]): New location of the event start_date (Optional[str]): New start date and time in ISO format (YYYY-MM-DDTHH:MM:SS) end_date (Optional[str]): New end date and time in ISO format (YYYY-MM-DDTHH:MM:SS) timezone (Optional[str]): New timezone for the event attendees (Optional[List[str]]): Updated list of attendee email addresses notify_attendees (Optional[bool]): Whether to send email notifications to attendees (default: False) Returns: str: JSON string containing the updated Google Calendar event or error message

Functions

- authenticate(func) â€œ Decorator to ensure authentication before executing the method.

Module agno.tools.googlesearch

- Source:** `libs/agno/agno/tools/googlesearch.py`

Classes

- class **GoogleSearchTools** (bases: Toolkit)
 - GoogleSearch is a Python library for searching Google easily. It uses requests and BeautifulSoup4 to scrape Google.

Args: fixed_max_results (Optional[int]): A fixed number of maximum results. fixed_language (Optional[str]): Language of the search results. headers (Optional[Any]): Custom headers for the request. proxy (Optional[str]): Proxy settings for the request. timeout (Optional[int]): Timeout for the request, default is 10 seconds. cache_results (bool): Enable caching of search results. cache_ttl (int): Time-to-live for cached results in seconds. cache_dir (Optional[str]): Directory to store cache files. enable_google_search (bool): Enable Google search. all (bool): Enable all tools.

- Methods:**
 - google_search(self, query: str, max_results: int=5, language: str='en') -> str â€œ Use this function to search Google for a specified query. Args: query (str): The query to search for. max_results (int, optional): The maximum number of results to return. Default is 5. language (str, optional): The language of the search results. Default is â€œenâ€œ. Returns: str: A JSON formatted string containing the search results.

Module agno.tools.goglesheets

- Source:** `libs/agno/agno/tools/goglesheets.py`

Google Sheets Toolset for interacting with Sheets API

Required Environment Variables:

- GOOGLE_CLIENT_ID: Google OAuth client ID
- GOOGLE_CLIENT_SECRET: Google OAuth client secret
- GOOGLE_PROJECT_ID: Google Cloud project ID
- GOOGLE_REDIRECT_URI: Google OAuth redirect URI (default: http://localhost)

How to Get These Credentials:

1. Go to Google Cloud Console (<https://console.cloud.google.com>)
2. Create a new project or select an existing one
3. Enable the Google Sheets API:
 - Go to **APIs & Services** > **Enable APIs and Services**
 - Search for **Google Sheets API**
 - Click **Enable**
4. Create OAuth 2.0 credentials:
 - Go to **APIs & Services** > **Credentials**
 - Click **Create Credentials** > **OAuth client ID**
 - Go through the OAuth consent screen setup
 - Give it a name and click **Create**
 - You[™]ll receive:
 - Client ID (`GOOGLE_CLIENT_ID`)
 - Client Secret (`GOOGLE_CLIENT_SECRET`)
 - The Project ID (`GOOGLE_PROJECT_ID`) is visible in the project dropdown at the top of the page
5. Set up environment variables: Create a `.envrc` file in your project root with:

```
export GOOGLE_CLIENT_ID=your_client_id_here
export GOOGLE_CLIENT_SECRET=your_client_secret_here
export GOOGLE_PROJECT_ID=your_project_id_here
export GOOGLE_REDIRECT_URI=http://localhost # Default value
```

Alternatively, follow the instructions in the Google Sheets API Quickstart guide: 1: Steps: <https://developers.google.com/sheets/api/quickstart/python> 2: Save the `credentials.json` file to the root of the project or update the path in the `GoogleSheetsTools` class

Note: The first time you run the application, it will open a browser window for OAuth authentication. A `token.json` file will be created to store the authentication credentials for future use.

Classes

- **class** `GoogleSheetsTools` (bases: `Toolkit`)
 - **Methods:**
 - `create_duplicate_sheet(self, source_id: str, new_title: Optional[str]=None, copy_permissions: bool=True) -> str` Duplicate a Google Spreadsheet using the Google Drive API[™]s copy feature. This ensures an exact duplicate including formatting and data. Note: Make sure your credentials include the drive scope `https://www.googleapis.com/auth/drive` Args: `source_id`: The ID of the source spreadsheet. `new_title`: Optional new title for the duplicated spreadsheet. If not provided, the source title will be used. `copy_permissions`: Whether to copy the permissions from the source spreadsheet. Defaults to True. Returns: A link to the duplicated spreadsheet.
 - `create_sheet(self, title: str) -> str` Create a Google Sheet with a given title. Args: `title`: The title of the Google Sheet Returns: The ID of the created Google Sheet
 - `read_sheet(self, spreadsheet_id: Optional[str]=None, spreadsheet_range: Optional[str]=None) -> str` Read values from a Google Sheet. Prioritizes instance attributes over method parameters. Args: `spreadsheet_id`: Fallback spreadsheet ID if instance attribute is None `spreadsheet_range`: Fallback range if instance attribute is None Returns: JSON of list of rows, where each row is a list of values
 - `update_sheet(self, data: List[List[Any]], spreadsheet_id: Optional[str]=None, range_name: Optional[str]=None) -> str` Updates a Google Sheet with the provided data. Note: This function can overwrite existing data in the sheet. User needs to ensure that the provided range correctly matches the data that needs to be updated. Args: `data`: The data to update the sheet with `spreadsheet_id`: The ID of the Google Sheet `range_name`: The range of the Google Sheet to update Returns: A message indicating the success or failure of the operation

Functions

- `authenticate(func)` Decorator to ensure authentication before executing a function.

Module `agno.tools.hackernews`

- **Source:** `libs/agno/agno/tools/hackernews.py`

Classes

- **class** `HackerNewsTools` (bases: `Toolkit`)
 - `HackerNews` is a tool for getting top stories from Hacker News.

Args: `enable_get_top_stories (bool)`: Enable getting top stories from Hacker News. Default is True. `enable_get_user_details (bool)`: Enable getting user details from Hacker News. Default is True. `all (bool)`: Enable all tools. Overrides individual flags when True. Default is False.

- **Methods:**
 - `get_top_hackernews_stories(self, num_stories: int=10) -> str` Use this function to get top stories from Hacker News. Args: `num_stories (int)`: Number of stories to return. Defaults to 10. Returns: str: JSON string of top stories.
 - `get_user_details(self, username: str) -> str` Use this function to get the details of a Hacker News user using their username. Args: `username (str)`: Username of the user to get details for. Returns: str: JSON string of the user details.

Module `agno.tools.jina`

- **Source:** `libs/agno/agno/tools/jina.py`

Classes

- **class** `JinaReaderTools` (bases: `Toolkit`)
 - **Methods:**
 - `read_url(self, url: str) -> str` Reads a URL and returns the truncated content using Jina Reader API.
 - `search_query(self, query: str) -> str` Performs a web search using Jina Reader API and returns the truncated results.
- **class** `JinaReaderToolsConfig` (bases: `BaseModel`)

Module `agno.tools.jira`

- **Source:** `libs/agno/agno/tools/jira.py`

Classes

- **class** `JiraTools` (bases: `Toolkit`)
 - **Methods:**
 - `add_comment(self, issue_key: str, comment: str) -> str` Adds a comment to an issue. :param `issue_key`: The key of the issue. :param `comment`: The comment text. :return: A JSON string indicating success or containing an error message.
 - `add_worklog(self, issue_key: str, time_spent: str, comment: Optional[str]=None) -> str` Adds a worklog entry to log time spent on a specific Jira issue. :param `issue_key`: The key of the issue to log work against (e.g., `PROJ-123`). :param `time_spent`: The amount of time spent. Use Jira[™]s format, e.g., `2h`, `30m`, `1d 4h`. :param `comment`: An optional comment describing the work done. :return: A JSON string indicating success or containing an error message.
 - `create_issue(self, project_key: str, summary: str, description: str, issuetype: str='Task') -> str` Creates a new issue in Jira. :param `project_key`: The key of the project in which to create the issue. :param `summary`: The summary of the issue. :param `description`: The description of the issue. :param `issuetype`: The type of issue to create. :return: A JSON string with the new issue[™]s key and URL.
 - `get_issue(self, issue_key: str) -> str` Retrieves issue details from Jira. :param `issue_key`: The key of the issue to retrieve. :return: A JSON string containing issue details.
 - `search_issues(self, jql_str: str, max_results: int=50) -> str` Searches for issues using a JQL query. :param `jql_str`: The JQL query string. :param `max_results`: Maximum number of results to return. :return: A JSON string containing a list of dictionaries with issue details.

Module agno.tools.knowledge

- **Source:** `libs/agno/agno/tools/knowledge.py`

Classes

- **class KnowledgeTools** (bases: Toolkit)
 - **Methods:**
 - `analyze(self, session_state: Dict[str, Any], analysis: str) -> str` Use this tool to evaluate whether the returned documents are correct and sufficient. If not, go back to Think or Search with refined queries. Args: analysis: A thought to think about and log. Returns: str: The full log of thoughts and the new thought.
 - `search_knowledge(self, session_state: Dict[str, Any], query: str) -> str` Use this tool to search the knowledge base for relevant information. After thinking through the question, use this tool as many times as needed to search for relevant information. Args: query: The query to search the knowledge base for. Returns: str: A string containing the response from the knowledge base.
 - `think(self, session_state: Dict[str, Any], thought: str) -> str` Use this tool as a scratchpad to reason about the question, refine your approach, brainstorm search terms, or revise your plan. Call Think whenever you need to figure out what to do next, analyze the user's question, or plan your approach. You should use this tool as frequently as needed. Args: thought: Your thought process and reasoning. Returns: str: The full log of reasoning and the new thought.

Module agno.tools.linear

- **Source:** `libs/agno/agno/tools/linear.py`

Classes

- **class LinearTools** (bases: Toolkit)
 - **Methods:**
 - `create_issue(self, title: str, description: str, team_id: str, project_id: Optional[str]=None, assignee_id: Optional[str]=None) -> Optional[str]` Create a new issue within a specific project and team. Args: title (str): The title of the new issue. description (str): The description of the new issue. team_id (str): The unique identifier of the team in which to create the issue. project_id (Optional[str]): The ID of the project (optional). assignee_id (Optional[str]): The ID of the assignee (optional). Returns: str or None: A string containing the created issue's details like issue id and issue title. Returns None if the issue creation fails. Raises: Exception: If an error occurs during the mutation execution or data retrieval.
 - `get_high_priority_issues(self) -> Optional[str]` Retrieve issues with a high priority (priority <= 2). Returns: str or None: A str representing high-priority issues, where it contains details of an issue (e.g., id, title, priority). Returns None if no issues are retrieved. Raises: Exception: If an error occurs during the query process.
 - `get_issue_details(self, issue_id: str) -> Optional[str]` Retrieve details of a specific issue by issue ID. Args: issue_id (str): The unique identifier of the issue to retrieve. Returns: str or None: A string containing issue details like issue id, issue title, and issue description. Returns None if the issue is not found. Raises: Exception: If an error occurs during the query execution or data retrieval.
 - `get_teams_details(self) -> Optional[str]` Fetch the list of authenticated teams. It will return the unique ID and team name for each team, from the viewer object in the GraphQL response. Returns: str or None: A dictionary containing team details like team name, id. Raises: Exception: If an error occurs during the query execution or data retrieval.
 - `get_user_assigned_issues(self, user_id: str) -> Optional[str]` Retrieve issues assigned to a specific user by user ID. Args: user_id (str): The unique identifier of the user for whom to retrieve assigned issues. Returns: str or None: A string representing the assigned issues to user id, where each issue contains issue details (e.g., id, title). Returns None if the user or issues cannot be retrieved. Raises: Exception: If an error occurs while querying for the user's assigned issues.
 - `get_user_details(self) -> Optional[str]` Fetch authenticated user details. It will return the user's unique ID, name, and email address from the viewer object in the GraphQL response. Returns: str or None: A string containing user details like user id, name, and email. Raises: Exception: If an error occurs during the query execution or data retrieval.
 - `get_workflow_issues(self, workflow_id: str) -> Optional[str]` Retrieve issues within a specific workflow state by workflow ID. Args: workflow_id (str): The unique identifier of the workflow state to retrieve issues from. Returns: str or None: A string representing the issues within the specified workflow state, where each issue contains details of an issue (e.g., title). Returns None if no issues are found or if the workflow state cannot be retrieved. Raises: Exception: If an error occurs while querying issues for the specified workflow state.
 - `update_issue(self, issue_id: str, title: Optional[str]) -> Optional[str]` Update the title or state of a specific issue by issue ID. Args: issue_id (str): The unique identifier of the issue to update. title (str, optional): The new title for the issue. If None, the title remains unchanged. Returns: str or None: A string containing the updated issue's details with issue id, issue title, and issue state (which includes id and name). Returns None if the update is unsuccessful. Raises: Exception: If an error occurs during the mutation execution or data retrieval.

Module agno.tools.linkup

- **Source:** `libs/agno/agno/tools/linkup.py`

Classes

- **class LinkupTools** (bases: Toolkit)
 - **Methods:**
 - `web_search_with_linkup(self, query: str, depth: Optional[str]=None, output_type: Optional[str]=None) -> str` Use this function to search the web for a given query. This function uses the Linkup API to provide realtime online information about the query. Args: query (str): Query to search for. depth (str): (deep|standard) Depth of the search. Defaults to "standard". output_type (str): (sourcedAnswer|searchResults) Type of output. Defaults to "searchResults". Returns: str: string of results related to the query.

Module agno.tools.local_file_system

- **Source:** `libs/agno/agno/tools/local_file_system.py`

Classes

- **class LocalFileSystemTools** (bases: Toolkit)
 - **Methods:**
 - `read_file(self, filename: str, directory: Optional[str]=None) -> str` Read content from a local file.
 - `write_file(self, content: str, filename: Optional[str]=None, directory: Optional[str]=None, extension: Optional[str]=None) -> str` Write content to a local file. Args: content (str): Content to write to the file filename (Optional[str]): Name of the file. Defaults to UUID if not provided directory (Optional[str]): Directory to write file to. Uses target_directory if not provided extension (Optional[str]): File extension. Uses default_extension if not provided Returns: str: Path to the created file or error message

Module agno.tools.lumalab

- **Source:** `libs/agno/agno/tools/lumalab.py`

Classes

- **class KeyframeImage** (bases: TypedDict)
- **class LumaLabTools** (bases: Toolkit)
 - **Methods:**
 - `generate_video(self, agent: Agent, prompt: str, loop: bool=False, aspect_ratio: Literal['1:1', '16:9', '9:16', '4:3', '3:4', '21:9', '9:21']='16:9', keyframes: Optional[Dict[str, Dict[str, str]]]=None) -> ToolResult` Use this function to generate a video given a prompt.
 - `image_to_video(self, agent: Agent, prompt: str, start_image_url: str, end_image_url: Optional[str]=None, loop: bool=False, aspect_ratio: Literal['1:1', '16:9', '9:16', '4:3', '3:4', '21:9', '9:21']='16:9') -> ToolResult` Generate a video from one or two images with a prompt. Args: agent: The agent instance prompt: Text description of the desired video start_image_url: URL of the starting image end_image_url: Optional URL of the ending image loop: Whether the video should loop aspect_ratio: Aspect ratio of the output video Returns: ToolResult: A ToolResult containing the generated video or error message.

Module agno.tools.mcp.mcp

- **Source:** `libs/agno/agno/tools/mcp/mcp.py`

Classes

- **class MCPTools** (bases: Toolkit)

- A toolkit for integrating Model Context Protocol (MCP) servers with Agno agents. This allows agents to access tools, resources, and prompts exposed by MCP servers.

Can be used in three ways: 1. Direct initialization with a ClientSession 2. As an async context manager with StdioServerParameters 3. As an async context manager with SSE or Streamable HTTP client parameters

• **Methods:**

- `async build_tools(self) -> None` â€” Build the tools for the MCP toolkit
- `async close(self) -> None` â€” Close the MCP connection and clean up resources
- `async connect(self, force: bool=False)` â€” Initialize a MCPTools instance and connect to the contextual MCP server
- `async initialize(self) -> None` â€” Initialize the MCP toolkit by getting available tools from the MCP server
- `initialized(self) -> bool` â€” No docstring provided.
- `async is_alive(self) -> bool` â€” No docstring provided.

Module `agno.tools.mcp.multi_mcp`

- **Source:** `libs/agno/agno/tools/mcp/multi_mcp.py`

Classes

- **class `MultiMCPTools`** (bases: Toolkit)
 - A toolkit for integrating multiple Model Context Protocol (MCP) servers with Agno agents. This allows agents to access tools, resources, and prompts exposed by MCP servers.

Can be used in three ways: 1. Direct initialization with a ClientSession 2. As an async context manager with StdioServerParameters 3. As an async context manager with SSE or Streamable HTTP endpoints

• **Methods:**

- `async build_tools(self) -> None` â€” No docstring provided.
- `async close(self) -> None` â€” Close the MCP connections and clean up resources
- `async connect(self, force: bool=False)` â€” Initialize a MultiMCPTools instance and connect to the MCP servers
- `async create_and_connect(cls, commands: Optional[List[str]]=None, urls: Optional[List[str]]=None, urls_transports: Optional[List[Literal['sse', 'streamable-http']]]=None, *, env: Optional[dict[str, str]]=None, server_params_list: Optional[List[Union[SSEClientParams, StdioServerParameters, StreamableHTTPClientParams]]]=None, timeout_seconds: int=5, client=None, include_tools: Optional[List[str]]=None, exclude_tools: Optional[List[str]]=None, refresh_connection: bool=False, **kwargs) -> 'MultiMCPTools'` â€” Initialize a MultiMCPTools instance and connect to the MCP servers
- `async initialize(self, session: ClientSession) -> None` â€” Initialize the MCP toolkit by getting available tools from the MCP server
- `initialized(self) -> bool` â€” No docstring provided.
- `async is_alive(self) -> bool` â€” No docstring provided.

Module `agno.tools.mcp.params`

- **Source:** `libs/agno/agno/tools/mcp/params.py`

Classes

- **class `SSEClientParams`**
 - Parameters for SSE client connection.
- **class `StreamableHTTPClientParams`**
 - Parameters for Streamable HTTP client connection.

Module `agno.tools.mcp_toolbox`

- **Source:** `libs/agno/agno/tools/mcp_toolbox.py`

Classes

- **class `MCPToolbox`** (bases: MCPTools)
 - A toolkit that combines MCPTools server connectivity with MCP Toolbox for Databases client (toolbox-core).

MCPToolbox connects to an MCP Toolbox server and registers all available tools, then uses toolbox-core to filter those tools by toolset or tool name. This enables agents to receive only the specific tools they need while maintaining full MCP execution capabilities.

• **Methods:**

- `async close(self)` â€” Close the underlying asynchronous client.
- `async connect(self)` â€” Initialize MCPToolbox instance and connect to the MCP server.
- `get_client(self) -> ToolboxClient` â€” Get the underlying ToolboxClient.
- `async load_multiple_toolsets(self, toolset_names: List[str], auth_token_getters: dict[str, Callable[[], str]]={}, bound_params: dict[str, Union[Any, Callable[[], Any]]]={}, strict: bool=False) -> List[Function]` â€” Load tools from multiple toolsets. Args: `toolset_names` (List[str]): A list of toolset names to load. `auth_token_getters` (dict[str, Callable[[], str]]): A mapping of authentication source names to functions that retrieve ID tokens. Defaults to {}. `bound_params` (dict[str, Union[Any, Callable[[], Any]]], optional): A mapping of parameter names to their bound values. Defaults to {}. `strict` (bool, optional): If True, raises an error if *any* loaded tool instance fails to utilize all of the given parameters or auth tokens. Defaults to False. Returns: List[Function]: A list of all tools loaded from the specified toolsets.
- `async load_tool(self, tool_name: str, auth_token_getters: dict[str, Callable[[], str]]={}, auth_tokens: Optional[dict[str, Callable[[], str]]]=None, auth_headers: Optional[dict[str, Callable[[], str]]]=None, bound_params: dict[str, Union[Any, Callable[[], Any]]]={}) -> Function` â€” Loads the tool with the given tool name from the Toolbox service. Args: `tool_name` (str): The name of the tool to load. `auth_token_getters` (dict[str, Callable[[], str]]): A mapping of authentication source names to functions that retrieve ID tokens. Defaults to {}. `auth_tokens` (Optional[dict[str, Callable[[], str]]], optional): Deprecated. Use `auth_token_getters` instead. `auth_headers` (Optional[dict[str, Callable[[], str]]], optional): Deprecated. Use `auth_token_getters` instead. `bound_params` (dict[str, Union[Any, Callable[[], Any]]], optional): A mapping of parameter names to their bound values. Defaults to {}. Raises: `RuntimeError`: If the tool is not found in the MCP functions registry. Returns: Function: The loaded tool function.
- `async load_toolset(self, toolset_name: Optional[str]=None, auth_token_getters: dict[str, Callable[[], str]]={}, auth_tokens: Optional[dict[str, Callable[[], str]]]=None, auth_headers: Optional[dict[str, Callable[[], str]]]=None, bound_params: dict[str, Union[Any, Callable[[], Any]]]={}, strict: bool=False) -> List[Function]` â€” Loads tools from the configured toolset. Args: `toolset_name` (Optional[str], optional): The name of the toolset to load. Defaults to None. `auth_token_getters` (dict[str, Callable[[], str]]): A mapping of authentication source names to functions that retrieve ID tokens. Defaults to {}. `auth_tokens` (Optional[dict[str, Callable[[], str]]], optional): Deprecated. Use `auth_token_getters` instead. `auth_headers` (Optional[dict[str, Callable[[], str]]], optional): Deprecated. Use `auth_token_getters` instead. `bound_params` (dict[str, Union[Any, Callable[[], Any]]], optional): A mapping of parameter names to their bound values. Defaults to {}. `strict` (bool, optional): If True, raises an error if *any* loaded tool instance fails to utilize all of the given parameters or auth tokens. (if any provided). If False (default), raises an error only if a user-provided parameter or auth token cannot be applied to *any* loaded tool across the set. Returns: List[Function]: A list of all tools loaded from the Toolbox.
- `async load_toolset_safe(self, toolset_name: str) -> List[str]` â€” Safely load a toolset and return tool names.
- **class `MCPToolsMeta`** (bases: type)
 - Metaclass for MCPTools to ensure proper initialization with AgentOS

Module `agno.tools.mem0`

- **Source:** `libs/agno/agno/tools/mem0.py`

Classes

- **class `Mem0Tools`** (bases: Toolkit)
 - **Methods:**

- `add_memory(self, session_state, content: Union[str, Dict[str, str]]) -> str` Add facts to the user’s memory. Args: `content(Union[str, Dict[str, str]])`: The facts that should be stored. Example: `content = {‘name’: ‘John’, ‘age’: 30, ‘location’: ‘New York’}` Returns: `str`: JSON-encoded Memory response or an error message.
- `delete_all_memories(self, session_state: Dict[str, Any]) -> str` Delete *all* memories associated with the current user
- `get_all_memories(self, session_state: Dict[str, Any]) -> str` Return **all** memories for the current user as a JSON string.
- `search_memory(self, session_state: Dict[str, Any], query: str) -> str` Semantic search for *query* across the user’s stored memories.

Module `agno.tools.memori`

- **Source:** `libs/agno/agno/tools/memori.py`

Classes

- **class** `MemoriTools` (bases: `Toolkit`)
 - `Memori Toolkit` for Agno Agents and Teams, providing persistent memory capabilities.

This toolkit integrates Memori’s memory system with Agno, allowing Agents and Teams to: - Store and retrieve conversation history - Search through past interactions - Maintain user preferences and context - Build long-term memory across sessions

Requirements: - `pip install memorisdk` - Database connection string (SQLite, PostgreSQL, etc.)

Example: `python from agno.tools.memori import MemoriTools`

```
# Initialize with SQLite (default)
memori_tools = MemoriTools(
    database_connect="sqlite:///agent_memory.db",
    namespace="my_agent",
    auto_ingest=True # Automatically ingest conversations
)

# Add to agent
agent = Agent(
    model=OpenAIChat(),
    tools=[memori_tools],
    description="An AI assistant with persistent memory"
)
...
```

- **Methods:**
 - `disable_memory_system(self) -> bool` Disable the Memori memory system.
 - `enable_memory_system(self) -> bool` Enable the Memori memory system.
 - `get_memory_stats(self) -> str` Get statistics about the memory system. Returns information about the current state of the memory system, including total memories, memory distribution by retention type (short-term vs long-term), and system configuration. Returns: `str`: JSON-encoded memory statistics Example: Returns statistics like: { ‘success’: true, ‘total_memories’: 42, ‘memories_by_retention’: { ‘short_term’: 5, ‘long_term’: 37 }, ‘namespace’: ‘my_agent’, ‘conscious_ingest’: true, ‘auto_ingest’: true, ‘memory_system_enabled’: true }
 - `record_conversation(self, content: str) -> str` Add important information or facts to memory. Use this tool to store important information, user preferences, facts, or context that should be remembered for future conversations. Args: `content`: The information/facts to store in memory Returns: `str`: Success message or error details Example: `record_conversation(‘User prefers Python over JavaScript’)` record_conversation(‘User is working on an e-commerce project using Django’)
`record_conversation(‘User’s name is John and they live in NYC’)`
 - `search_memory(self, query: str, limit: Optional[int]=None) -> str` Search the Agent’s memory for past conversations and information. This performs semantic search across all stored memories to find relevant information based on the provided query. Args: `query`: What to search for in memory (e.g., ‘past conversations about AI’, ‘user preferences’) `limit`: Maximum number of results to return (optional) Returns: `str`: JSON-encoded search results or error message Example: `search_memory(‘user’s favorite programming languages’)` `search_memory(‘previous discussions about machine learning’)`

Module `agno.tools.memory`

- **Source:** `libs/agno/agno/tools/memory.py`

Classes

- **class** `MemoryTools` (bases: `Toolkit`)
 - **Methods:**
 - `add_memory(self, session_state: Dict[str, Any], memory: str, topics: Optional[List[str]]=None) -> str` Use this tool to add a new memory to the database. Args: `memory`: The memory content to store topics: Optional list of topics associated with this memory Returns: `str`: JSON string containing the created memory information
 - `analyze(self, session_state: Dict[str, Any], analysis: str) -> str` Use this tool to evaluate whether the memory operations results are correct and sufficient. If not, go back to ‘Think’ or use memory operations with refined parameters. Args: `analysis`: Your analysis of the memory operations results.
 - `delete_memory(self, session_state: Dict[str, Any], memory_id: str) -> str` Use this tool to delete a memory from the database. Args: `memory_id`: The ID of the memory to delete Returns: `str`: JSON string containing the deletion result
 - `get_memories(self, session_state: Dict[str, Any]) -> str` Use this tool to get a list of memories for the current user from the database.
 - `think(self, session_state: Dict[str, Any], thought: str) -> str` Use this tool as a scratchpad to reason about memory operations, refine your approach, brainstorm memory content, or revise your plan. Call `think` whenever you need to figure out what to do next, analyze the user’s requirements, plan memory operations, or decide on execution strategy. You should use this tool as frequently as needed. Args: `thought`: Your thought process and reasoning about memory operations.
 - `update_memory(self, session_state: Dict[str, Any], memory_id: str, memory: Optional[str]=None, topics: Optional[List[str]]=None) -> str` Use this tool to update an existing memory in the database. Args: `memory_id`: The ID of the memory to update memory: Updated memory content (if provided) topics: Updated list of topics (if provided) Returns: `str`: JSON string containing the updated memory information

Module `agno.tools.mlx_transcribe`

- **Source:** `libs/agno/agno/tools/mlx_transcribe.py`

MLX Transcribe Tools - Audio Transcription using Apple’s MLX Framework

Requirements: - `ffmpeg`: Required for audio processing macOS: brew install ffmpeg Ubuntu: apt-get install ffmpeg Windows: Download from <https://ffmpeg.org/download.html>

```
- mlx-whisper: Install via pip
pip install mlx-whisper
```

This module provides tools for transcribing audio files using the MLX Whisper model, optimized for Apple Silicon processors. It supports various audio formats and provides high-quality transcription capabilities.

Classes

- **class** `MLXTranscribeTools` (bases: `Toolkit`)
 - **Methods:**
 - `read_files(self) -> str` Returns a list of files in the base directory Returns: `str`: A JSON string containing the list of files in the base directory.
 - `transcribe(self, file_name: str) -> str` Transcribe uses Apple’s MLX Whisper model. Args: `file_name (str)`: The name of the audio file to transcribe. Returns: `str`: The transcribed text or an error message if the transcription fails.

Module `agno.tools.models.azure_openai`

- **Source:** `libs/agno/agno/tools/models/azure_openai.py`

Classes

- **class AzureOpenAITools** (bases: Toolkit)
 - Toolkit for Azure OpenAI services.

Currently supports: - DALL-E image generation

- **Methods:**
 - `generate_image(self, agent: Agent, prompt: str, n: int=1, size: Optional[Literal['256x256', '512x512', '1024x1024', '1792x1024', '1024x1792']]= '1024x1024', style: Literal['vivid', 'natural'])= 'vivid')` -> `ToolResult` â€œ Generate an image using Azure OpenAI image generation. Args: agent: The agent instance for adding images prompt: Text description of the desired image n: Number of images to generate (default: 1). Note: dall-e-3 only supports n=1, while dall-e-2 supports multiple images. size: Image size. Valid options: â€œ256x256â€œ, â€œ512x512â€œ, â€œ1024x1024â€œ, â€œ1792x1024â€œ, â€œ1024x1792â€œ (default: â€œ1024x1024â€œ) Note: Not all sizes are available for all models. style: Image style. Valid options: â€œvividâ€œ or â€œnaturalâ€œ (default: â€œvividâ€œ) Note: â€œvividâ€œ produces more dramatic images, while â€œnaturalâ€œ produces more realistic ones. Returns: `ToolResult`: A `ToolResult` containing the generated images or error message. Note: Invalid parameters will be automatically corrected to valid values. For example: - Invalid sizes will be changed to â€œ1024x1024â€œ - Invalid quality values will be changed to â€œstandardâ€œ - Invalid style values will be changed to â€œvividâ€œ - For dall-e-3, n will always be set to 1

Module `agno.tools.models.gemini`

- **Source:** `libs/agno/agno/tools/models/gemini.py`

Classes

- **class GeminiTools** (bases: Toolkit)
 - Tools for interacting with Google Gemini API
 - **Methods:**
 - `generate_image(self, agent: Agent, prompt: str) -> ToolResult` â€œ Generate images based on a text prompt using Google Imagen. Args: prompt (str): The text prompt to generate the image from. Returns: `ToolResult`: A `ToolResult` containing the generated images or error message.
 - `generate_video(self, agent: Agent, prompt: str) -> ToolResult` â€œ Generate a video based on a text prompt. Args: prompt (str): The text prompt to generate the video from. Returns: `ToolResult`: A `ToolResult` containing the generated video or error message.

Module `agno.tools.models.groq`

- **Source:** `libs/agno/agno/tools/models/groq.py`

Classes

- **class GroqTools** (bases: Toolkit)
 - Tools for interacting with Groq API
 - **Methods:**
 - `generate_speech(self, agent: Agent, text_input: str) -> ToolResult` â€œ Generate speech from text using Groqâ€™s Text-to-Speech API. Args: text_input: The text to synthesize into speech. Returns: `ToolResult`: Contains the generated audio artifact or error message.
 - `transcribe_audio(self, audio_source: str) -> str` â€œ Transcribe audio file or URL using Groqâ€™s Whisper API. Args: audio_source: Path to the local audio file or a publicly accessible URL to the audio. Returns: str: Transcribed text
 - `translate_audio(self, audio_source: str) -> str` â€œ Translate audio file or URL to English using Groqâ€™s Whisper API. Args: audio_source: Path to the local audio file or a publicly accessible URL to the audio. Returns: str: Translated English text

Module `agno.tools.models.morph`

- **Source:** `libs/agno/agno/tools/models/morph.py`

Classes

- **class MorphTools** (bases: Toolkit)
 - Tools for interacting with Morphâ€™s Fast Apply API for code editing
 - **Methods:**
 - `edit_file(self, target_file: str, instructions: str, code_edit: str, original_code: Optional[str]=None) -> str` â€œ Apply code edits to a target file using Morphâ€™s Fast Apply API. This function reads the specified file, sends its content along with editing instructions and code edits to Morphâ€™s API, and writes the resulting code back to the file. A backup of the original file is created before writing changes. Args: target_file (str): Path to the file to be edited. instructions (str): High-level instructions describing the intended change. code_edit (str): Specific code edit or change to apply. original_code (Optional[str], optional): Original content of the file. If not provided, the function reads from target_file. Returns: str: Result message indicating success or failure, and details about the backup and any errors encountered.

Module `agno.tools.models.nebius`

- **Source:** `libs/agno/agno/tools/models/nebius.py`

Classes

- **class NebiusTools** (bases: Toolkit)
 - Tools for interacting with Nebius AI Studioâ€™s text-to-image API
 - **Methods:**
 - `generate_image(self, agent: Agent, prompt: str) -> ToolResult` â€œ Generate images based on a text prompt using Nebius AI Studio. Args: agent: The agent instance for adding images prompt: The text prompt to generate images from. Returns: `ToolResult`: A `ToolResult` containing the generated image or error message.

Module `agno.tools.models_labs`

- **Source:** `libs/agno/agno/tools/models_labs.py`

Classes

- **class ModelsLabTools** (bases: Toolkit)
 - **Methods:**
 - `generate_media(self, agent: Union[Agent, Team], prompt: str) -> ToolResult` â€œ Generate media (video, image, or audio) given a prompt.

Module `agno.tools.moviepy_video`

- **Source:** `libs/agno/agno/tools/moviepy_video.py`

Classes

- **class MoviePyVideoTools** (bases: Toolkit)
 - Tool for processing video files, extracting audio, transcribing and adding captions
 - **Methods:**
 - `create_caption_clips(self, text_json: Dict, frame_size: tuple, font='Arial', color='white', highlight_color='yellow', stroke_color='black', stroke_width=1.5) -> List[TextClip]` â€œ Create word-level caption clips with highlighting effects Args: text_json: Dictionary containing text and timing information frame_size: Tuple of (width, height) for the video frame font: Font family to use for captions color: Base text color highlight_color: Color for highlighted words stroke_color: Color for text outline stroke_width: Width of text outline Returns: List[TextClip]: List of MoviePy TextClip objects for each word and highlight
 - `create_srt(self, transcription: str, output_path: str) -> str` â€œ Save transcription text to SRT formatted file Args: transcription: Text transcription in SRT format output_path: Path where the SRT file will be saved Returns: str: Path to the created SRT file, or error message if failed

- `embed_captions(self, video_path: str, srt_path: str, output_path: Optional[str]=None, font_size: int=24, font_color: str='white', stroke_color: str='black', stroke_width: int=1) -> str â€”` Create a new video with embedded scrolling captions and word-level highlighting Args: `video_path`: Path to the input video file `srt_path`: Path to the SRT caption file `output_path`: Path for the output video (optional) `font_size`: Size of caption text `font_color`: Color of caption text `stroke_color`: Color of text outline `stroke_width`: Width of text outline Returns: `str`: Path to the captioned video file, or error message if failed
- `extract_audio(self, video_path: str, output_path: str) -> str â€”` Converts video to audio using MoviePy Args: `video_path`: Path to the video file `output_path`: Path where the audio will be saved Returns: `str`: Path to the extracted audio file
- `parse_srt(self, srt_content: str) -> List[Dict] â€”` Convert SRT formatted content into word-level timing data Args: `srt_content`: String containing SRT formatted subtitles Returns: `List[Dict]`: List of words with their timing information
- `split_text_into_lines(self, words: List[Dict]) -> List[Dict] â€”` Split transcribed words into lines based on duration and length constraints Args: `words`: List of dictionaries containing word data with `â€”wordâ€”`, `â€”startâ€”`, and `â€”endâ€”` keys Returns: `List[Dict]`: List of subtitle lines, each containing word, start time, end time, and text contents

Module `agno.tools.neo4j`

- **Source:** `libs/agno/agno/tools/neo4j.py`

Classes

- **class `Neo4jTools`** (bases: Toolkit)
 - **Methods:**
 - `get_schema(self) -> list â€”` Retrieve a visualization of the database schema, including nodes and relationships.
 - `list_labels(self) -> list â€”` Retrieve all node labels present in the connected Neo4j database.
 - `list_relationship_types(self) -> list â€”` Retrieve all relationship types present in the connected Neo4j database.
 - `run_cypher_query(self, query: str) -> list â€”` Execute an arbitrary Cypher query against the connected Neo4j database. Args: `query (str)`: The Cypher query string to execute.

Module `agno.tools.newspaper`

- **Source:** `libs/agno/agno/tools/newspaper.py`

Classes

- **class `NewspaperTools`** (bases: Toolkit)
 - Newspaper is a tool for getting the text of an article from a URL. Args: `get_article_text (bool)`: Whether to get the text of an article from a URL.
 - **Methods:**
 - `get_article_text(self, url: str) -> str â€”` Get the text of an article from a URL. Args: `url (str)`: The URL of the article. Returns: `str`: The text of the article.

Module `agno.tools.newspaper4k`

- **Source:** `libs/agno/agno/tools/newspaper4k.py`

Classes

- **class `Newspaper4kTools`** (bases: Toolkit)
 - Newspaper4kTools is a toolkit for getting the text of an article from a URL. Args: `enable_read_article (bool)`: Whether to read an article from a URL. `include_summary (bool)`: Whether to include the summary of an article. `article_length (Optional[int])`: The length of the article to read.
 - **Methods:**
 - `get_article_data(self, url: str) -> Optional[Dict[str, Any]] â€”` Read and get article data from a URL. Args: `url (str)`: The URL of the article. Returns: `Dict[str, Any]`: The article data.
 - `read_article(self, url: str) -> str â€”` Use this function to read an article from a URL. Args: `url (str)`: The URL of the article. Returns: `str`: JSON containing the article author, publish date, and text.

Module `agno.tools.notion`

- **Source:** `libs/agno/agno/tools/notion.py`

Classes

- **class `NotionTools`** (bases: Toolkit)
 - Notion toolkit for creating and managing Notion pages.

Args: `api_key (Optional[str])`: Notion API key (integration token). If not provided, uses `NOTION_API_KEY` env var. `database_id (Optional[str])`: The ID of the database to work with. If not provided, uses `NOTION_DATABASE_ID` env var. `enable_create_page (bool)`: Enable creating pages. Default is `True`. `enable_update_page (bool)`: Enable updating pages. Default is `True`. `enable_search_pages (bool)`: Enable searching pages. Default is `True`. `all (bool)`: Enable all tools. Overrides individual flags when `True`. Default is `False`.

- **Methods:**
 - `create_page(self, title: str, tag: str, content: str) -> str â€”` Create a new page in the Notion database with a title, tag, and content. Args: `title (str)`: The title of the page `tag (str)`: The tag/category for the page (e.g., travel, tech, general-blogs, fashion, documents) `content (str)`: The content to add to the page Returns: `str`: JSON string with page creation details
 - `search_pages(self, tag: str) -> str â€”` Search for pages in the database by tag. Args: `tag (str)`: The tag to search for Returns: `str`: JSON string with list of matching pages
 - `update_page(self, page_id: str, content: str) -> str â€”` Add content to an existing Notion page. Args: `page_id (str)`: The ID of the page to update content (`str`): The content to append to the page Returns: `str`: JSON string with update status

Module `agno.tools.openai`

- **Source:** `libs/agno/agno/tools/openai.py`

Classes

- **class `OpenAITools`** (bases: Toolkit)
 - Tools for interacting with OpenAI API.

Args: `api_key (str, optional)`: OpenAI API key. Retrieved from `OPENAI_API_KEY` env variable if not provided. `enable_transcription (bool)`: Enable audio transcription functionality. Default is `True`. `enable_image_generation (bool)`: Enable image generation functionality. Default is `True`. `enable_speech_generation (bool)`: Enable speech generation functionality. Default is `True`. `all (bool)`: Enable all tools. Overrides individual flags when `True`. Default is `False`. `transcription_model (str)`: Model to use for transcription. Default is `â€”o1whisper-1â€”`. `text_to_speech_voice (OpenAIVoice)`: Voice to use for TTS. Default is `â€”o1alloyâ€”`. `text_to_speech_model (OpenAITTSModel)`: Model to use for TTS. Default is `â€”o1etts-1â€”`. `text_to_speech_format (OpenAITTSFormat)`: Audio format for TTS. Default is `â€”o1comp3â€”`. `image_model (str, optional)`: Model to use for image generation. Default is `â€”o1dall-e-3â€”`. `image_quality (str, optional)`: Quality setting for image generation. `image_size (str, optional)`: Size setting for image generation. `image_style (str, optional)`: Style setting for image generation.

- **Methods:**
 - `generate_image(self, prompt: str) -> ToolResult â€”` Generate images based on a text prompt. Args: `prompt (str)`: The text prompt to generate the image from.
 - `generate_speech(self, agent: Union[Agent, Team], text_input: str) -> ToolResult â€”` Generate speech from text using OpenAIâ€”s Text-to-Speech API. Args: `text_input (str)`: The text to synthesize into speech.
 - `transcribe_audio(self, audio_path: str) -> str â€”` Transcribe audio file using OpenAIâ€”s Whisper API Args: `audio_path`: Path to the audio file

Module `agno.tools.openbb`

- **Source:** `libs/agno/agno/tools/openbb.py`

Classes

- **class** `OpenBBTools` (bases: Toolkit)
 - **Methods:**
 - `get_company_news(self, symbol: str, num_stories: int=10) -> str â€œ` Use this function to get company news for a stock symbol or list of symbols. Args: symbol (str): The stock symbol or list of stock symbols. Eg: â€œAAPLâ€ or â€œAAPL,MSFT,GOOGLâ€ num_stories (int): The number of news stories to return. Defaults to 10. Returns: str: JSON containing company news and press releases.
 - `get_company_profile(self, symbol: str) -> str â€œ` Use this function to get company profile and overview for a stock symbol or list of symbols. Args: symbol (str): The stock symbol or list of stock symbols. Eg: â€œAAPLâ€ or â€œAAPL,MSFT,GOOGLâ€ Returns: str: JSON containing company profile and overview.
 - `get_price_targets(self, symbol: str) -> str â€œ` Use this function to get consensus price target and recommendations for a stock symbol or list of symbols. Args: symbol (str): The stock symbol or list of stock symbols. Eg: â€œAAPLâ€ or â€œAAPL,MSFT,GOOGLâ€ Returns: str: JSON containing consensus price target and recommendations.
 - `get_stock_price(self, symbol: str) -> str â€œ` Use this function to get the current stock price for a stock symbol or list of symbols. Args: symbol (str): The stock symbol or list of stock symbols. Eg: â€œAAPLâ€ or â€œAAPL,MSFT,GOOGLâ€ Returns: str: The current stock prices or error message.
 - `search_company_symbol(self, company_name: str) -> str â€œ` Use this function to get a list of ticker symbols for a company. Args: company_name (str): The name of the company. Returns: str: A JSON string containing the ticker symbols.

Module `agno.tools.opencv`

- **Source:** `libs/agno/agno/tools/opencv.py`

Classes

- **class** `OpenCVTools` (bases: Toolkit)
 - Tools for capturing images and videos from the webcam using OpenCV
 - **Methods:**
 - `capture_image(self, agent: Agent, prompt: str='Webcam capture') -> ToolResult â€œ` Capture an image from the webcam. Args: prompt (str): Description of the image capture. Defaults to â€œWebcam captureâ€ Returns: ToolResult: A ToolResult containing the captured image or error message.
 - `capture_video(self, agent: Agent, duration: int=10, prompt: str='Webcam video capture') -> ToolResult â€œ` Capture a video from the webcam. Args: duration (int): Duration in seconds to record video. Defaults to 10 seconds. prompt (str): Description of the video capture. Defaults to â€œWebcam video captureâ€ Returns: ToolResult: A ToolResult containing the captured video or error message.

Module `agno.tools.openweather`

- **Source:** `libs/agno/agno/tools/openweather.py`

Classes

- **class** `OpenWeatherTools` (bases: Toolkit)
 - OpenWeather is a toolkit for accessing weather data from OpenWeatherMap API.
- Args: api_key (Optional[str]): OpenWeatherMap API key. If not provided, will try to get from OPENWEATHER_API_KEY env var. units (str): Units of measurement. Options are â€˜standardâ€™, â€˜metricâ€™, and â€˜imperialâ€™. Default is â€˜metricâ€™. enable_current_weather (bool): Enable current weather function. Default is True. enable_forecast (bool): Enable forecast function. Default is True. enable_air_pollution (bool): Enable air pollution function. Default is True. enable_geocoding (bool): Enable geocoding function. Default is True. all (bool): Enable all functions. Default is False.
- **Methods:**
 - `geocode_location(self, location: str, limit: int=1) -> str â€œ` Convert a location name to geographic coordinates. Args: location (str): The name of the city, e.g., â€œLondonâ€, â€œParisâ€, â€œNew Yorkâ€. limit (int): Maximum number of location results. Default is 1. Returns: str: JSON string containing location data with coordinates.
 - `get_air_pollution(self, location: str) -> str â€œ` Get current air pollution data for a location. Args: location (str): The name of the city, e.g., â€œLondonâ€, â€œParisâ€, â€œNew Yorkâ€. Returns: str: JSON string containing air pollution data.
 - `get_current_weather(self, location: str) -> str â€œ` Get current weather data for a location. Args: location (str): The name of the city, e.g., â€œLondonâ€, â€œParisâ€, â€œNew Yorkâ€. Returns: str: JSON string containing current weather data.
 - `get_forecast(self, location: str, days: int=5) -> str â€œ` Get weather forecast for a location. Args: location (str): The name of the city, e.g., â€œLondonâ€, â€œParisâ€, â€œNew Yorkâ€. days (int): Number of days for forecast (max 5). Default is 5. Returns: str: JSON string containing forecast data.

Module `agno.tools.oxylabs`

- **Source:** `libs/agno/agno/tools/oxylabs.py`

Classes

- **class** `OxylabsTools` (bases: Toolkit)
 - **Methods:**
 - `get_amazon_product(self, asin: str, domain_code: str='com') -> str â€œ` Get detailed information about an Amazon product by ASIN. Args: asin: Amazon Standard Identification Number (10 alphanumeric characters, e.g., â€œB07FZ8S74Râ€) domain_code: Amazon domain (e.g., â€œcomâ€, â€œco.ukâ€, â€œdeâ€, default: â€œcomâ€) Returns: JSON of product details
 - `scrape_website(self, url: str, render_javascript: bool=False) -> str â€œ` Scrape content from any website URL. Args: url: Website URL to scrape (must start with http:// or ht ps://) render_javascript: Whether to enable JavaScript rendering for dynamic content (default: False) Returns: JSON of results
 - `search_amazon_products(self, query: str, domain_code: str='com') -> str â€œ` Search Amazon for products and return search results. Args: query: Product search query domain_code: Amazon domain (e.g., â€œcomâ€, â€œco.ukâ€, â€œdeâ€, default: â€œcomâ€) Returns: JSON string with search results containing: - success: boolean indicating if search was successful - query: the original search query - total_products: number of products found - products: list of product results with title, asin, price, rating, etc.
 - `search_google(self, query: str, domain_code: str='com') -> str â€œ` Search Google for a query. Args: query: Search query domain_code: Google domain to search (e.g., â€œcomâ€, â€œco.ukâ€, â€œdeâ€, default: â€œcomâ€) Returns: JSON of search results

Module `agno.tools.pandas`

- **Source:** `libs/agno/agno/tools/pandas.py`

Classes

- **class** `PandasTools` (bases: Toolkit)
 - **Methods:**
 - `create_pandas_dataframe(self, dataframe_name: str, create_using_function: str, function_parameters: Dict[str, Any]) -> str â€œ` Creates a pandas dataframe named dataframe_name by running a function create_using_function with the parameters function_parameters. Returns the created dataframe name as a string if successful, otherwise returns an error message. For Example: - To create a dataframe csv_data by reading a CSV file, use: {â€œdataframe_nameâ€: â€œcsv_dataâ€, â€œcreate_using_functionâ€: â€œread_csvâ€, â€œfunction_parametersâ€: {â€œfilepath_or_bufferâ€: â€œdata.csvâ€}} - To create a dataframe csv_data by reading a JSON file, use: {â€œdataframe_nameâ€: â€œjson_dataâ€, â€œcreate_using_functionâ€: â€œread_jsonâ€, â€œfunction_parametersâ€: {â€œpath_or_bufâ€: â€œdata.jsonâ€}} :param dataframe_name: The name of the dataframe to create. :param create_using_function: The function to use to create the dataframe. :param function_parameters: The parameters to pass to the function. :return: The name of the created dataframe if successful, otherwise an error message.
 - `run_dataframe_operation(self, dataframe_name: str, operation: str, operation_parameters: Dict[str, Any]) -> str â€œ` Runs an operation operation on a dataframe dataframe_name with the parameters operation_parameters. Returns the result of the operation as a string if successful, otherwise returns an error message. For Example: - To get the first 5 rows of a dataframe csv_data, use: {â€œdataframe_nameâ€: â€œcsv_dataâ€, â€œoperationâ€: â€œheadâ€, â€œoperation_parametersâ€: {â€œnâ€: 5}} - To get the last 5 rows of a dataframe csv_data, use: {â€œdataframe_nameâ€: â€œcsv_dataâ€, â€œoperationâ€: â€œtailâ€, â€œoperation_parametersâ€: {â€œnâ€: 5}} :param dataframe_name: The name of the dataframe to run the operation on. :param operation: The operation to run on the dataframe. :param operation_parameters: The parameters to pass to the operation. :return: The result of the operation if successful, otherwise an error message.

Module `agno.tools.parallel`

- **Source:** `libs/agno/agno/tools/parallel.py`

Classes

- **class CustomJSONEncoder** (bases: json.JSONEncoder)
 - Custom JSON encoder that handles non-serializable types by converting them to strings.
 - **Methods:**
 - `default(self, obj)` – No docstring provided.
- **class ParallelTools** (bases: Toolkit)
 - ParallelTools provides access to Parallel[™]s web search and extraction APIs.

Parallel offers powerful APIs optimized for AI agents: - Search API: AI-optimized web search that returns relevant excerpts tailored for LLMs - Extract API: Extract content from specific URLs in clean markdown format, handling JavaScript-heavy pages and PDFs

Args: api_key (Optional[str]): Parallel API key. If not provided, will use PARALLEL_API_KEY environment variable. enable_search (bool): Enable Search API functionality. Default is True. enable_extract (bool): Enable Extract API functionality. Default is True, all (bool): Enable all tools. Overrides individual flags when True. Default is False, max_results (int): Default maximum number of results for search operations. Default is 10. max_chars_per_result (int): Default maximum characters per result for search operations. Default is 10000. beta_version (str): Beta API version header. Default is 'search-extract-2025-10-10a'. mode (Optional[str]): Default search mode. Options: 'one-shot' or 'agentic'. Default is None. include_domains (Optional[List[str]]): Default domains to restrict results to. Default is None. exclude_domains (Optional[List[str]]): Default domains to exclude from results. Default is None. max_age_seconds (Optional[int]): Default cache age threshold (minimum 600). Default is None. timeout_seconds (Optional[float]): Default timeout for content retrieval. Default is None. disable_cache_fallback (Optional[bool]): Default cache fallback behavior. Default is None.

- **Methods:**
 - `parallel_extract(self, urls: List[str], objective: Optional[str]=None, search_queries: Optional[List[str]]=None, excerpts: bool=True, max_chars_per_excerpt: Optional[int]=None, full_content: bool=False, max_chars_full_content: Optional[int]=None) -> str` Use this function to extract content from specific URLs using ParallelExtract™s Extract API. Args: `urls` (List[str]): List of public URLs to extract content from. `objective` (Optional[str]): Search focus to guide content extraction. `search_queries` (Optional[List[str]]): Keywords for targeting relevant content. `excerpts` (bool): Include relevant text snippets. `max_chars_per_excerpt` (Optional[int]): Upper bound on total characters per url. Only used when `excerpts` is True. `full_content` (bool): Include complete page text. `max_chars_full_content` (Optional[int]): Limit on characters per url. Only used when `full_content` is True. Returns: `str`: A JSON formatted string containing extracted content with titles, publish dates, excerpts and/or full content.
 - `parallel_search(self, objective: Optional[str]=None, search_queries: Optional[List[str]]=None, max_results: Optional[int]=None, max_chars_per_result: Optional[int]=None) -> str` Use this function to search the web using ParallelSearch™s Search API with a natural language objective. You must provide at least one of `objective` or `search_queries`. Args: `objective` (Optional[str]): Natural-language description of what the web search is trying to find. `search_queries` (Optional[List[str]]): Traditional keyword queries with optional search operators. `max_results` (Optional[int]): Upper bound on results returned. Overrides constructor default. `max_chars_per_result` (Optional[int]): Upper bound on total characters per url for excerpts. Returns: `str`: A JSON formatted string containing the search results with URLs, titles, publish dates, and relevant excerpts.

Module agno.tools.postgres

- **Source:** `libs/agno/agno/tools/postgres.py`

Classes

- **class PostgresTools** (bases: Toolkit)
 - **Methods:**
 - `close(self)` â€” Closes the database connection if itâ€™s open.
 - `connection(self)` -> `PgConnection[DictRow]` â€” Returns the Postgres psycopg connection. :return psycopg.connection.Connection: psycopg connection
 - `describe_table(self, table: str)` -> `str` â€” Provides the schema (column name, data type, is nullable) for a given table. Args: table: The name of the table to describe. Returns: A string describing the tableâ€™s columns and data types.
 - `export_table_to_path(self, table: str, path: str)` -> `str` â€” Exports a tableâ€™s data to a local CSV file. :param table: The name of the table to export. :param path: The local file path to save the file. :return: A confirmation message with the file path.
 - `inspect_query(self, query: str)` -> `str` â€” Shows the execution plan for a SQL query (using EXPLAIN). :param query: The SQL query to inspect. :return: The queryâ€™s execution plan.
 - `run_query(self, query: str)` -> `str` â€” Runs a read-only SQL query and returns the result. :param query: The SQL query to run. :return: The query result as a formatted string.
 - `show_tables(self)` -> `str` â€” Lists all tables in the configured schema.
 - `summarize_table(self, table: str)` -> `str` â€” Computes and returns key summary statistics for a tableâ€™s columns. Args: table: The name of the table to summarize. Returns: A string containing a summary of the table.

Module agno.tools.pubmed

- **Source:** `libs/agno/agno/tools/pubmed.py`

Classes

- **class PubmedTools** (bases: Toolkit)
 - **Methods:**
 - `fetch_details(self, pubmed_ids: List[str]) -> ElementTree.Element` â€” No docstring provided.
 - `fetch_pubmed_ids(self, query: str, max_results: int, email: str) -> List[str]` â€” No docstring provided.
 - `parse_details(self, xml_root: ElementTree.Element) -> List[Dict[str, Any]]` â€” No docstring provided.
 - `search_pubmed(self, query: str, max_results: Optional[int]=10) -> str` â€” Use this function to search PubMed for articles. Args: query (str): The search query. max_results (int): The maximum number of results to return (default 10). Returns: str: A JSON string containing the search results.

Module agno.tools.python

- **Source:** `libs/agno/agno/tools/python.py`

Classes

- **class PythonTools (bases: Toolkit)**
 - **Methods:**
 - `list_files(self)` -> str â€œ Returns a list of files in the base directory :return: Comma separated list of files in the base directory.
 - `pip_install_package(self, package_name: str)` -> str â€œ This function installs a package using pip in the current environment. If successful, returns a success message. If failed, returns an error message. :param package_name: The name of the package to install. :return: success message if successful, otherwise returns an error message.
 - `read_file(self, file_name: str)` -> str â€œ Reads the contents of the file `file_name` and returns the contents if successful. :param file_name: The name of the file to read. :return: The contents of the file if successful, otherwise returns an error message.
 - `run_python_code(self, code: str, variable_to_return: Optional[str]=None)` -> str â€œ This function to runs Python code in the current environment. If successful, returns the value of `variable_to_return` if provided otherwise returns a success message. If failed, returns an error message. Returns the value of `variable_to_return` if successful, otherwise returns an error message. :param code: The code to run. :param variable_to_return: The variable to return. :return: value of `variable_to_return` if successful, otherwise returns an error message.
 - `run_python_file_return_variable(self, file_name: str, variable_to_return: Optional[str]=None)` -> str â€œ This function runs code in a Python file. If successful, returns the value of `variable_to_return` if provided otherwise returns a success message. If failed, returns an error message. :param file_name: The name of the file to run. :param variable_to_return: The variable to return. :return: if run is successful, the value of `variable_to_return` if provided else file name.
 - `save_to_file_and_run(self, file_name: str, code: str, variable_to_return: Optional[str]=None, overwrite: bool=True)` -> str â€œ This function saves Python code to a file called `file_name` and then runs it. If successful, returns the value of `variable_to_return` if provided otherwise returns a success message. If failed, returns an error message. Make sure the file name ends with `.py` :param file_name: The name of the file the code will be saved to. :param code: The code to save and run. :param variable_to_return: The variable to return. :param overwrite: Overwrite the file if it already exists. :return: if run is successful, the value of `variable_to_return` if provided else file name.
 - `uv_pip_install_package(self, package_name: str)` -> str â€œ This function installs a package using uv and pip in the current environment. If successful, returns a success message. If failed, returns an error message. :param package_name: The name of the package to install. :return: success message if successful, otherwise returns an error message.

Functions

- warn() -> None “ No docstring provided.

Module agno.tools.reasoning

- **Source:** libs/agno/agno/tools/reasoning.py

Classes

- **class ReasoningTools** (bases: Toolkit)
 - **Methods:**
 - analyze(self, session_state: Dict[str, Any], title: str, result: str, analysis: str, next_action: str='continue', confidence: float=0.8) -> str “ Use this tool to analyze results from a reasoning step and determine next actions. Args: title: A concise title for this analysis step result: The outcome of the previous action analysis: Your analysis of the results next_action: What to do next (“continue”, “validate”, or “final_answer”) confidence: How confident you are in this analysis (0.0 to 1.0) Returns: A list of previous thoughts and the new analysis
 - think(self, session_state: Dict[str, Any], title: str, thought: str, action: Optional[str]=None, confidence: float=0.8) -> str “ Use this tool as a scratchpad to reason about the question and work through it step-by-step. This tool will help you break down complex problems into logical steps and track the reasoning process. You can call it as many times as needed. These internal thoughts are never revealed to the user. Args: title: A concise title for this step thought: Your detailed thought for this step action: What you’ll do based on this thought confidence: How confident you are about this thought (0.0 to 1.0) Returns: A list of previous thoughts and the new thought

Module agno.tools.reddit

- **Source:** libs/agno/agno/tools/reddit.py

Classes

- **class RedditTools** (bases: Toolkit)
 - **Methods:**
 - create_post(self, subreddit: str, title: str, content: str, flair: Optional[str]=None, is_self: bool=True) -> str “ Create a new post in a subreddit. Args: subreddit (str): Name of the subreddit to post in. title (str): Title of the post. content (str): Content of the post (text for self posts, URL for link posts). flair (Optional[str]): Flair to add to the post. Must be an available flair in the subreddit. is_self (bool): Whether this is a self (text) post (True) or link post (False). Returns: str: JSON string containing the created post information.
 - get_subreddit_info(self, subreddit_name: str) -> str “ Get information about a specific subreddit. Args: subreddit_name (str): Name of the subreddit. Returns: str: JSON string containing subreddit information.
 - get_subreddit_stats(self, subreddit: str) -> str “ Get statistics about a subreddit. Args: subreddit (str): Name of the subreddit. Returns: str: JSON string containing subreddit statistics
 - get_top_posts(self, subreddit: str, time_filter: str='week', limit: int=10) -> str “ Get top posts from a subreddit for a specific time period. Args: subreddit (str): Name of the subreddit. time_filter: Time period to filter posts. limit (int): Number of posts to fetch. Returns: str: JSON string containing top posts.
 - get_trending_subreddits(self) -> str “ Get currently trending subreddits.
 - get_user_info(self, username: str) -> str “ Get information about a Reddit user.
 - reply_to_comment(self, comment_id: str, content: str, subreddit: Optional[str]=None) -> str “ Post a reply to an existing Reddit comment. Args: comment_id (str): The ID of the comment to reply to. Can be a full URL, permalink, or just the ID. content (str): The content of the reply. subreddit (Optional[str]): The subreddit name if known. This helps with error handling and validation. Returns: str: JSON string containing information about the created reply.
 - reply_to_post(self, post_id: str, content: str, subreddit: Optional[str]=None) -> str “ Post a reply to an existing Reddit post or comment. Args: post_id (str): The ID of the post or comment to reply to. Can be a full URL, permalink, or just the ID. content (str): The content of the reply. subreddit (Optional[str]): The subreddit name if known. This helps with error handling and validation. Returns: str: JSON string containing information about the created reply.

Module agno.tools.replicate

- **Source:** libs/agno/agno/tools/replicate.py

Classes

- **class ReplicateTools** (bases: Toolkit)
 - **Methods:**
 - generate_media(self, agent: Union[Agent, Team], prompt: str) -> ToolResult “ Use this function to generate an image or a video using a replicate model. Args: prompt (str): A text description of the content. Returns: ToolResult: A ToolResult containing the generated media or error message.

Module agno.tools.resend

- **Source:** libs/agno/agno/tools/resend.py

Classes

- **class ResendTools** (bases: Toolkit)
 - **Methods:**
 - send_email(self, to_email: str, subject: str, body: str) -> str “ Send an email using the Resend API. Returns if the email was sent successfully or an error message. :to_email: The email address to send the email to. :subject: The subject of the email. :body: The body of the email. :return: A string indicating if the email was sent successfully or an error message.

Module agno.tools.scrapergraph

- **Source:** libs/agno/agno/tools/scrapegraph.py

Classes

- **class ScrapeGraphTools** (bases: Toolkit)
 - **Methods:**
 - agentic_crawler(self, url: str, steps: List[str], use_session: bool=True, user_prompt: Optional[str]=None, output_schema: Optional[dict]=None, ai_extraction: bool=False) -> str “ Perform agentic crawling with automated browser actions and optional AI extraction. This tool can: 1. Navigate to a website 2. Perform a series of automated actions (like filling forms, clicking buttons) 3. Extract the resulting HTML content as markdown 4. Optionally use AI to extract structured data Args: url (str): The URL to scrape steps (List[str]): List of steps to perform on the webpage (e.g., [“email in input box”, “click login”]) use_session (bool): Whether to use session for the scraping (default: True) user_prompt (Optional[str]): Prompt for AI extraction (only used when ai_extraction=True) output_schema (Optional[dict]): Schema for structured data extraction (only used when ai_extraction=True) ai_extraction (bool): Whether to use AI for data extraction from the scraped content (default: False) Returns: JSON string containing the scraping results, including request_id, status, and extracted data
 - crawl(self, url: str, prompt: str, schema: dict, cache_website: bool=True, depth: int=2, max_pages: int=2, same_domain_only: bool=True, batch_size: int=1) -> str “ Crawl a website and extract structured data Args: url (str): The URL to crawl prompt (str): Natural language prompt describing what to extract schema (dict): JSON schema for extraction cache_website (bool): Whether to cache the website depth (int): Crawl depth max_pages (int): Max number of pages to crawl same_domain_only (bool): Restrict to same domain batch_size (int): Batch size for crawling Returns: The structured data extracted from the website
 - markdownify(self, url: str) -> str “ Convert a webpage to markdown format. Args: url (str): The URL to convert Returns: The markdown version of the webpage
 - scrape(self, website_url: str, headers: Optional[dict]=None) -> str “ Get raw HTML content from a website using the ScrapeGraphAI scrape API. Args: website_url (str): The URL of the website to scrape headers (Optional[dict]): Optional headers to send with the request Returns: JSON string containing the HTML content and metadata
 - searchscraper(self, user_prompt: str) -> str “ Search the web and extract information from the web. Args: user_prompt (str): Search query Returns: JSON of the search results
 - smartscraper(self, url: str, prompt: str) -> str “ Extract structured data from a webpage using LLM. Args: url (str): The URL to scrape prompt (str): Natural language prompt describing what to extract Returns: The structured data extracted from the webpage

Module agno.tools.searxng

- **Source:** `libs/agno/agno/tools/searxng.py`

Classes

- **class** `Searxng` (bases: `Toolkit`)
 - **Methods:**
 - `image_search(self, query: str, max_results: int=5) -> str` Use this function to search for images. Args: `query (str)`: The query to search images with. `max_results (int, optional)`: The maximum number of results to return. Defaults to 5. Returns: The results of the search.
 - `it_search(self, query: str, max_results: int=5) -> str` Use this function to search for IT related information. Args: `query (str)`: The query to search for IT related information. `max_results (int, optional)`: The maximum number of results to return. Defaults to 5. Returns: The results of the search.
 - `map_search(self, query: str, max_results: int=5) -> str` Use this function to search maps Args: `query (str)`: The query to search maps with. `max_results (int, optional)`: The maximum number of results to return. Defaults to 5. Returns: The results of the search.
 - `music_search(self, query: str, max_results: int=5) -> str` Use this function to search for information related to music. Args: `query (str)`: The query to search music with. `max_results (int, optional)`: The maximum number of results to return. Defaults to 5. Returns: The results of the search.
 - `news_search(self, query: str, max_results: int=5) -> str` Use this function to search for news. Args: `query (str)`: The query to search news with. `max_results (int, optional)`: The maximum number of results to return. Defaults to 5. Returns: The results of the search.
 - `science_search(self, query: str, max_results: int=5) -> str` Use this function to search for information related to science. Args: `query (str)`: The query to search science with. `max_results (int, optional)`: The maximum number of results to return. Defaults to 5. Returns: The results of the search.
 - `search_web(self, query: str, max_results: int=5) -> str` Use this function to search the web. Args: `query (str)`: The query to search the web with. `max_results (int, optional)`: The maximum number of results to return. Defaults to 5. Returns: The results of the search.
 - `video_search(self, query: str, max_results: int=5) -> str` Use this function to search for videos. Args: `query (str)`: The query to search videos with. `max_results (int, optional)`: The maximum number of results to return. Defaults to 5. Returns: The results of the search.

Module `agno.tools.serpapi`

- **Source:** `libs/agno/agno/tools/serpapi.py`

Classes

- **class** `SerpApiTools` (bases: `Toolkit`)
 - **Methods:**
 - `search_google(self, query: str, num_results: int=10) -> str` Search Google using the Serpapi API. Returns the search results. Args: `query(str)`: The query to search for. `num_results(int)`: The number of results to return. Returns: `str`: The search results from Google. Keys: - `search_results`: List of organic search results. - `recipes_results`: List of recipes search results. - `shopping_results`: List of shopping search results. - `knowledge_graph`: The knowledge graph. - `related_questions`: List of related questions.
 - `search_youtube(self, query: str) -> str` Search Youtube using the Serpapi API. Returns the search results. Args: `query(str)`: The query to search for. Returns: `str`: The video search results from Youtube. Keys: - `video_results`: List of video results. - `movie_results`: List of movie results. - `channel_results`: List of channel results.

Module `agno.tools.serper`

- **Source:** `libs/agno/agno/tools/serper.py`

Classes

- **class** `SerperTools` (bases: `Toolkit`)
 - **Methods:**
 - `scrape_webpage(self, url: str, markdown: bool=False) -> str` Scrapes and extracts content from a webpage using the Serper scraping API. Args: `url (str)`: The URL of the webpage to scrape. `markdown (bool, optional)`: Return content in markdown format (default: False). Returns: `str`: A JSON-formatted string containing the scraped webpage content or an error message.
 - `search_news(self, query: str, num_results: Optional[int]=None) -> str` Searches for news articles using the Serper News API. Args: `query (str)`: The search query for news articles. `num_results (int, optional)`: Number of news results to retrieve. Returns: `str`: A JSON-formatted string containing the news search results or an error message.
 - `search_scholar(self, query: str, num_results: Optional[int]=None) -> str` Searches for academic papers using Google Scholar via Serper API. Args: `query (str)`: The search query for academic papers. `num_results (int, optional)`: Number of academic papers to retrieve. Returns: `str`: A JSON-formatted string containing the scholar search results or an error message.
 - `search_web(self, query: str, num_results: Optional[int]=None) -> str` Searches Google for the provided query using the Serper API. Args: `query (str)`: The search query to search for on Google. `num_results (int, optional)`: Number of search results to retrieve. Returns: `str`: A JSON-formatted string containing the search results or an error message if the search fails.

Module `agno.tools.shell`

- **Source:** `libs/agno/agno/tools/shell.py`

Classes

- **class** `ShellTools` (bases: `Toolkit`)
 - **Methods:**
 - `run_shell_command(self, args: List[str], tail: int=100) -> str` Runs a shell command and returns the output or error. Args: `args (List[str])`: The command to run as a list of strings. `tail (int)`: The number of lines to return from the output. Returns: `str`: The output of the command.

Module `agno.tools.slack`

- **Source:** `libs/agno/agno/tools/slack.py`

Classes

- **class** `SlackTools` (bases: `Toolkit`)
 - **Methods:**
 - `get_channel_history(self, channel: str, limit: int=100) -> str` Get the message history of a Slack channel. Args: `channel (str)`: The channel ID to fetch history from. `limit (int)`: The maximum number of messages to fetch. Defaults to 100. Returns: `str`: A JSON string containing the channel's message history.
 - `list_channels(self) -> str` List all channels in the Slack workspace. Returns: `str`: A JSON string containing the list of channels.
 - `send_message(self, channel: str, text: str) -> str` Send a message to a Slack channel. Args: `channel (str)`: The channel ID or name to send the message to. `text (str)`: The text of the message to send. Returns: `str`: A JSON string containing the response from the Slack API.
 - `send_message_thread(self, channel: str, text: str, thread_ts: str) -> str` Send a message to a Slack channel. Args: `channel (str)`: The channel ID or name to send the message to. `text (str)`: The text of the message to send. `thread_ts (ts)`: The thread to reply to. Returns: `str`: A JSON string containing the response from the Slack API.

Module `agno.tools.sleep`

- **Source:** `libs/agno/agno/tools/sleep.py`

Classes

- **class** `SleepTools` (bases: `Toolkit`)
 - **Methods:**
 - `sleep(self, seconds: int) -> str` Use this function to sleep for a given number of seconds.

Module agno.tools.spider

- **Source:** libs/agno/agno/tools/spider.py

Classes

- **class SpiderTools** (bases: Toolkit)
 - Spider is a toolkit for web searching, scraping, and crawling.

Args: enable_search (bool): Enable web search functionality. Default is True. enable_scrape (bool): Enable web scraping functionality. Default is True. enable_crawl (bool): Enable web crawling functionality. Default is True. all (bool): Enable all tools. Overrides individual flags when True. Default is False. max_results (Optional[int]): Default maximum number of results. url (Optional[str]): Default URL for operations. optional_params (Optional[dict]): Additional parameters for operations.

- **Methods:**
 - crawl(self, url: str, limit: Optional[int]=None) -> str Use this function to crawl the web. Args: url (str): The URL of the webpage to crawl. limit (int, optional): The maximum number of pages to crawl. Defaults to 10. Returns: The results of the crawl.
 - scrape(self, url: str) -> str Use this function to scrape the content of a webpage. Args: url (str): The URL of the webpage to scrape. Returns: Markdown of the webpage.
 - search_web(self, query: str, max_results: int=5) -> str Use this function to search the web. Args: query (str): The query to search the web with. max_results (int, optional): The maximum number of results to return. Defaults to 5. Returns: The results of the search.

Module agno.tools.sql

- **Source:** libs/agno/agno/tools/sql.py

Classes

- **class SQLTools** (bases: Toolkit)
 - **Methods:**
 - describe_table(self, table_name: str) -> str Use this function to describe a table. Args: table_name (str): The name of the table to get the schema for. Returns: str: schema of a table
 - list_tables(self) -> str Use this function to get a list of table names in the database. Returns: str: list of tables in the database.
 - run_sql(self, sql: str, limit: Optional[int]=None) -> List[dict] Internal function to run a sql query. Args: sql (str): The sql query to run. limit (int, optional): The number of rows to return. Defaults to None. Returns: List[dict]: The result of the query.
 - run_sql_query(self, query: str, limit: Optional[int]=10) -> str Use this function to run a SQL query and return the result. Args: query (str): The query to run. limit (int, optional): The number of rows to return. Defaults to 10. Use None to show all results. Returns: str: Result of the SQL query. Notes: - The result may be empty if the query does not return any data.

Module agno.tools.streamlit.components

- **Source:** libs/agno/agno/tools/streamlit/components.py

Functions

- check_password(password_env_var: str='APP_PASSWORD') -> bool Component to check if a password entered by the user is correct. To use this component, set the environment variable APP_PASSWORD. Args: password_env_var (str, optional): The environment variable to use for the password. Defaults to APP_PASSWORD. Returns: bool: True if the user had the correct password.
- get_openai_key_sidebar() -> Optional[str] Sidebar component to get OpenAI API key
- get_username_sidebar() -> Optional[str] Sidebar component to get username
- reload_button_sidebar(text: str='Reload Session', **kwargs) -> None Sidebar component to show reload button

Module agno.tools.tavily

- **Source:** libs/agno/agno/tools/tavily.py

Classes

- **class TavilyTools** (bases: Toolkit)
 - **Methods:**
 - extract_url_content(self, urls: str) -> str Extract content from one or more URLs using Tavily's Extract API. This function retrieves the main content from web pages in markdown or text format. Args: urls (str): Single URL or multiple comma-separated URLs to extract content from. Example: https://example.com or https://example.com,https://another.com Returns: str: Extracted content in the specified format (markdown or text). For multiple URLs, returns combined content with URL headers. Failed extractions are noted in the output.
 - web_search_using_tavily(self, query: str, max_results: int=5) -> str Use this function to search the web for a given query. This function uses the Tavily API to provide realtime online information about the query. Args: query (str): Query to search for. max_results (int): Maximum number of results to return. Defaults to 5. Returns: str: JSON string of results related to the query.
 - web_search_with_tavily(self, query: str) -> str Use this function to search the web for a given query. This function uses the Tavily API to provide realtime online information about the query. Args: query (str): Query to search for. Returns: str: JSON string of results related to the query.

Module agno.tools.telegram

- **Source:** libs/agno/agno/tools/telegram.py

Classes

- **class TelegramTools** (bases: Toolkit)
 - **Methods:**
 - send_message(self, message: str) -> str This function sends a message to the chat ID. :param message: The message to send. :return: The response from the API.

Module agno.tools.todoist

- **Source:** libs/agno/agno/tools/todoist.py

Classes

- **class TodoistTools** (bases: Toolkit)
 - A toolkit for interacting with Todoist tasks and projects.
 - **Methods:**
 - close_task(self, task_id: str) -> str Mark a task as completed.
 - create_task(self, content: str, project_id: Optional[str]=None, due_string: Optional[str]=None, priority: Optional[int]=None, labels: Optional[List[str]]=None) -> str Create a new task in Todoist. Args: content: The task content/description project_id: Optional ID of the project to add the task to due_string: Optional due date in natural language (e.g., tomorrow at 12:00) priority: Optional priority level (1-4, where 4 is highest) labels: Optional list of label names to apply to the task Returns: str: JSON string containing the created task
 - delete_task(self, task_id: str) -> str Delete a task.
 - get_active_tasks(self) -> str Get all active (not completed) tasks.
 - get_projects(self) -> str Get all projects.

- `get_task(self, task_id: str) -> str` Get a specific task by ID.
- `update_task(self, task_id: str, content: Optional[str]=None, description: Optional[str]=None, labels: Optional[List[str]]=None, priority: Optional[int]=None, due_string: Optional[str]=None, due_date: Optional[str]=None, due_datetime: Optional[str]=None, due_lang: Optional[str]=None, assignee_id: Optional[str]=None, section_id: Optional[str]=None) -> str` Update an existing task with the specified parameters. Args: task_id: The ID of the task to update content: The task content/name description: The task description labels: Array of label names priority: Task priority from 1 (normal) to 4 (urgent) due_string: Human readable date (âœnext Mondayâœ, âœtomorrowâœ, etc) due_date: Specific date in YYYY-MM-DD format due_datetime: Specific date and time in RFC3339 format due_lang: 2-letter code specifying language of due_string (âœenâœ, âœfrâœ, etc) assignee_id: The responsible user ID section_id: ID of the section to move task to Returns: str: JSON string containing success status or error message

Module agno.tools.toolkit

- **Source:** `libs/agno/agno/tools/toolkit.py`

Classes

- **class Toolkit**
 - **Methods:**
 - `register(self, function: Callable[...], Any], name: Optional[str]=None) âœ` Register a function with the toolkit. Args: function: The callable to register name: Optional custom name for the function Returns: The registered function

Module agno.tools.trafilatura

- **Source:** `libs/agno/agno/tools/trafilatura.py`

Classes

- **class TrafilaturaTools** (bases: Toolkit)
 - TrafilaturaTools is a toolkit for web scraping and text extraction.

Args: output_format (str): Default output format for extractions. Options: âœtxtâœ, âœjsonâœ, âœxmlâœ, âœmarkdownâœ, âœcsvâœ, âœhtmlâœ, âœxmlteiâœ. include_comments (bool): Whether to extract comments along with main text by default. include_tables (bool): Whether to include table content by default. include_images (bool): Whether to include image information by default (experimental). include_formatting (bool): Whether to preserve formatting by default. include_links (bool): Whether to preserve links by default (experimental). with_metadata (bool): Whether to include metadata in extractions by default. favor_precision (bool): Whether to prefer precision over recall by default. favor_recall (bool): Whether to prefer recall over precision by default. target_language (Optional[str]): Default target language filter (ISO 639-1 format). deduplicate (bool): Whether to remove duplicate segments by default. max_tree_size (Optional[int]): Maximum tree size for processing. max_crawl_urls (int): Maximum number of URLs to crawl per website. max_known_urls (int): Maximum number of known URLs during crawling.

- **Methods:**
 - `crawl_website(self, homepage_url: str, extract_content: bool=False) -> str` Crawl a website and optionally extract content from discovered pages. Args: homepage_url (str): The starting URL (preferably homepage) to crawl from. extract_content (bool): Whether to extract content from discovered URLs. Returns: str: JSON containing crawl results and optionally extracted content.
 - `extract_batch(self, urls: List[str]) -> str` Extract content from multiple URLs in batch. Args: urls (List[str]): List of URLs to extract content from. Returns: str: JSON containing batch extraction results.
 - `extract_metadata_only(self, url: str, as_json: bool=True) -> str` Extract only metadata from a web page URL. Args: url (str): The URL to extract metadata from. as_json (bool): Whether to return metadata as JSON string. Returns: str: Extracted metadata as JSON string or formatted text.
 - `extract_text(self, url: str, output_format: Optional[str]=None) -> str` Extract main text content from a web page URL using Trafilatura. Args: url (str): The URL to extract content from. output_format (Optional[str]): Output format. Options: âœtxtâœ, âœjsonâœ, âœxmlâœ, âœmarkdownâœ, âœcsvâœ, âœhtmlâœ, âœxmlteiâœ. Returns: str: Extracted content in the specified format, or error message if extraction fails.
 - `html_to_text(self, html_content: str, clean: bool=True) -> str` Convert HTML content to plain text using Trafilaturaâœs html2txt function. Args: html_content (str): The HTML content to convert. clean (bool): Whether to remove potentially undesirable elements. Returns: str: Plain text extracted from HTML.

Module agno.tools.trello

- **Source:** `libs/agno/agno/tools/trello.py`

Classes

- **class TrelloTools** (bases: Toolkit)
 - **Methods:**
 - `create_board(self, name: str, default_lists: bool=False) -> str` Create a new Trello board. Args: name (str): Name of the board default_lists (bool): Whether the default lists should be created Returns: str: JSON string containing board details or error message
 - `create_card(self, board_id: str, list_name: str, card_title: str, description: str='') -> str` Create a new card in the specified board and list. Args: board_id (str): ID of the board to create the card in list_name (str): Name of the list to add the card to card_title (str): Title of the card description (str): Description of the card Returns: str: JSON string containing card details or error message
 - `create_list(self, board_id: str, list_name: str, pos: str='bottom') -> str` Create a new list on a specified board. Args: board_id (str): ID of the board to create the list in list_name (str): Name of the new list pos (str): Position of the list - âœtopâœ, âœbottomâœ, or a positive number Returns: str: JSON string containing list details or error message
 - `get_board_lists(self, board_id: str) -> str` Get all lists on a board. Args: board_id (str): ID of the board Returns: str: JSON string containing lists information
 - `get_cards(self, list_id: str) -> str` Get all cards in a list. Args: list_id (str): ID of the list Returns: str: JSON string containing cards information
 - `list_boards(self, board_filter: str='all') -> str` Get a list of all boards for the authenticated user. Args: board_filter (str): Filter for boards. Options: âœallâœ, âœopenâœ, âœclosedâœ, âœorganizationâœ, âœpublicâœ, âœstarredâœ. Defaults to âœallâœ. Returns: str: JSON string containing list of boards
 - `move_card(self, card_id: str, list_id: str) -> str` Move a card to a different list. Args: card_id (str): ID of the card to move list_id (str): ID of the destination list Returns: str: JSON string containing result of the operation

Module agno.tools.twilio

- **Source:** `libs/agno/agno/tools/twilio.py`

Classes

- **class TwilioTools** (bases: Toolkit)
 - **Methods:**
 - `get_call_details(self, call_sid: str) -> Dict[str, Any]` Get details about a specific call. Args: call_sid: The SID of the call to lookup Returns: Dict: Call details including status, duration, etc.
 - `list_messages(self, limit: int=20) -> List[Dict[str, Any]]` List recent SMS messages. Args: limit: Maximum number of messages to return Returns: List[Dict]: List of message details
 - `send_sms(self, to: str, from_: str, body: str) -> str` Send an SMS message using Twilio. Args: to: Recipient phone number (E.164 format) from_: Sender phone number (must be a Twilio number) body: Message content Returns: str: Message SID if successful, error message if failed
 - `validate_phone_number(phone: str) -> bool` Validate E.164 phone number format

Module agno.tools.user_control_flow

- **Source:** `libs/agno/agno/tools/user_control_flow.py`

Classes

- **class UserControlFlowTools** (bases: Toolkit)
 - **Methods:**

- `get_user_input(self, user_input_fields: list[dict]) -> str` Use this tool to get user input for the given fields. Provide all the fields that you require the user to fill in, as if they were filling in a form. Args: `user_input_fields (list[dict[str, str]]):` A list of dictionaries, each containing the following keys: - `field_name`: The name of the field to get input for. - `field_type`: The type of the field to get input for. Only valid python types are supported (e.g. `str`, `int`, `float`, `bool`, `list`, `dict`, etc.). - `field_description`: A description of the field to get input for.

Module `agno.tools.valyu`

- **Source:** `libs/agno/agno/tools/valyu.py`

Classes

- **class `ValyuTools`** (bases: `Toolkit`)
 - `Valyu` is a toolkit for academic and web search capabilities.

Args: `api_key (Optional[str]):` Valyu API key. Retrieved from VALYU_API_KEY env variable if not provided. `enable_academic_search (bool):` Enable academic sources search functionality. Default is `True`. `enable_web_search (bool):` Enable web search functionality. Default is `True`. `enable_paper_search (bool):` Enable search within paper functionality. Default is `True`. `all (bool):` Enable all tools. Overrides individual flags when `True`. Default is `False`. `text_length (int):` Maximum length of text content per result. Default is `1000`. `max_results (int):` Maximum number of results to return. Default is `10`. `relevance_threshold (float):` Minimum relevance score for results. Default is `0.5`. `content_category (Optional[str]):` Content category for filtering. `search_start_date (Optional[str]):` Start date for search filtering (YYYY-MM-DD). `search_end_date (Optional[str]):` End date for search filtering (YYYY-MM-DD). `search_domains (Optional[List[str]]):` List of domains to search within. `sources (Optional[List[str]]):` List of specific sources to search. `max_price (float):` Maximum price for API calls. Default is `30.0`. `tool_call_mode (bool):` Enable tool call mode. Default is `False`.

- **Methods:**
 - `search_academic_sources(self, query: str, start_date: Optional[str]=None, end_date: Optional[str]=None) -> str` Search academic sources (ArXiv, PubMed, academic publishers). Args: `query`: Research question or topic `start_date`: Filter papers after this date (YYYY-MM-DD) `end_date`: Filter papers before this date (YYYY-MM-DD) Returns: JSON array of academic papers
 - `search_web(self, query: str, start_date: Optional[str]=None, end_date: Optional[str]=None, content_category: Optional[str]=None) -> str` Search web sources for real-time information. Args: `query`: Search query `start_date`: Filter content after this date (YYYY-MM-DD) `end_date`: Filter content before this date (YYYY-MM-DD) `content_category`: Description of the category of the query Returns: JSON array of web search results
 - `search_within_paper(self, paper_url: str, query: str) -> str` Search within a specific ArXiv paper. Args: `paper_url`: ArXiv paper URL `query`: Search query Returns: JSON array of relevant sections from the paper

Module `agno.tools.visualization`

- **Source:** `libs/agno/agno/tools/visualization.py`

Classes

- **class `VisualizationTools`** (bases: `Toolkit`)
 - **Methods:**
 - `create_bar_chart(self, data: Union[Dict[str, Union[int, float]], List[Dict[str, Any]], str], title: str='Bar Chart', x_label: str='Categories', y_label: str='Values', filename: Optional[str]=None) -> str` Create a bar chart from the provided data. Args: `data`: Dictionary with categories as keys and values as numbers, or list of dictionaries, or JSON string `title (str)`: Title of the chart `x_label (str)`: Label for x-axis `y_label (str)`: Label for y-axis `filename (Optional[str])`: Custom filename for the chart image Returns: `str`: JSON string with chart information and file path
 - `create_histogram(self, data: List[Union[int, float]], bins: int=10, title: str='Histogram', x_label: str='Values', y_label: str='Frequency', filename: Optional[str]=None) -> str` Create a histogram from the provided data. Args: `data`: List of numeric values to plot `bins (int)`: Number of bins for the histogram `title (str)`: Title of the chart `x_label (str)`: Label for x-axis `y_label (str)`: Label for y-axis `filename (Optional[str])`: Custom filename for the chart image Returns: `str`: JSON string with chart information and file path
 - `create_line_chart(self, data: Union[Dict[str, Union[int, float]], List[Dict[str, Any]], str], title: str='Line Chart', x_label: str='X-axis', y_label: str='Y-axis', filename: Optional[str]=None) -> str` Create a line chart from the provided data. Args: `data`: Dictionary with x-values as keys and y-values as numbers, or list of dictionaries, or JSON string `title (str)`: Title of the chart `x_label (str)`: Label for x-axis `y_label (str)`: Label for y-axis `filename (Optional[str])`: Custom filename for the chart image Returns: `str`: JSON string with chart information and file path
 - `create_pie_chart(self, data: Union[Dict[str, Union[int, float]], List[Dict[str, Any]], str], title: str='Pie Chart', filename: Optional[str]=None) -> str` Create a pie chart from the provided data. Args: `data`: Dictionary with categories as keys and values as numbers, or list of dictionaries, or JSON string `title (str)`: Title of the chart `filename (Optional[str])`: Custom filename for the chart image Returns: `str`: JSON string with chart information and file path
 - `create_scatter_plot(self, x_data: Optional[List[Union[int, float]]]=None, y_data: Optional[List[Union[int, float]]]=None, title: str='Scatter Plot', x_label: str='X-axis', y_label: str='Y-axis', filename: Optional[str]=None, x: Optional[List[Union[int, float]]]=None, y: Optional[List[Union[int, float]]]=None, data: Optional[Union[List[List[Union[int, float]]], Dict[str, List[Union[int, float]]]])=None) -> str` Create a scatter plot from the provided data. Args: `x_data`: List of x-values (can also use `â€ˆxâ€ˆ` parameter) `y_data`: List of y-values (can also use `â€ˆyâ€ˆ` parameter) `title (str)`: Title of the chart `x_label (str)`: Label for x-axis `y_label (str)`: Label for y-axis `filename (Optional[str])`: Custom filename for the chart image `data`: Alternative format - list of [x,y] pairs or dict with `â€ˆxâ€ˆ` and `â€ˆyâ€ˆ` keys Returns: `str`: JSON string with chart information and file path

Module `agno.tools.webbrowser`

- **Source:** `libs/agno/agno/tools/webbrowser.py`

Classes

- **class `WebBrowserTools`** (bases: `Toolkit`)
 - Tools for opening a page on the web browser
 - **Methods:**
 - `open_page(self, url: str, new_window: bool=False) â€ˆ` Open a URL in a browser window Args: `url (str)`: URL to open `new_window (bool)`: If `True`, open in a new window, otherwise open in a new tab. Default is `False`. Returns: `None`

Module `agno.tools.webex`

- **Source:** `libs/agno/agno/tools/webex.py`

Classes

- **class `WebexTools`** (bases: `Toolkit`)
 - **Methods:**
 - `list_rooms(self) -> str` List all rooms in the Webex. Returns: `str`: A JSON string containing the list of rooms.
 - `send_message(self, room_id: str, text: str) -> str` Send a message to a Webex Room. Args: `room_id (str)`: The Room ID to send the message to. `text (str)`: The text of the message to send. Returns: `str`: A JSON string containing the response from the Webex.

Module `agno.tools.website`

- **Source:** `libs/agno/agno/tools/website.py`

Classes

- **class `WebsiteTools`** (bases: `Toolkit`)
 - **Methods:**
 - `add_website_to_knowledge(self, url: str) -> str` This function adds a websites content to the knowledge base. NOTE: The website must start with `https://` and should be a valid website. USE THIS FUNCTION TO GET INFORMATION ABOUT PRODUCTS FROM THE INTERNET. :param `url`: The url of the website to add. :return: `â€ˆSuccessâ€ˆ` if the website was added to the knowledge base.
 - `read_url(self, url: str) -> str` This function reads a url and returns the content. :param `url`: The url of the website to read. :return: Relevant documents from the website.

Module `agno.tools.webtools`

- **Source:** `libs/agno/agno/tools/webtools.py`

Classes

- **class** `WebTools` (bases: Toolkit)
 - A toolkit for working with web-related tools.
- **Methods:**
 - `expand_url(self, url: str) -> str` Expands a shortened URL to its final destination using HTTP HEAD requests with retries. :param url: The URL to expand. :return: The final destination URL if successful; otherwise, returns the original URL.

Module `agno.tools.whatsapp`

- **Source:** `libs/agno/agno/tools/whatsapp.py`

Classes

- **class** `WhatsAppTools` (bases: Toolkit)
 - WhatsApp Business API toolkit for sending messages.
- **Methods:**
 - `async send_template_message_async(self, recipient: Optional[str]=None, template_name: str='', language_code: str='en_US', components: Optional[List[Dict[str, Any]]]=None) -> str` Send a template message to a WhatsApp user (asynchronous version). Args: recipient: Recipient’s WhatsApp ID or phone number (e.g., +1234567890). If not provided, uses default recipient template_name: Name of the template to use language_code: Language code for the template (e.g., en_US) components: Optional list of template components (header, body, buttons) Returns: Success message with message ID
 - `send_template_message_sync(self, recipient: Optional[str]=None, template_name: str='', language_code: str='en_US', components: Optional[List[Dict[str, Any]]]=None) -> str` Send a template message to a WhatsApp user (synchronous version). Args: recipient: Recipient’s WhatsApp ID or phone number (e.g., +1234567890). If not provided, uses default recipient template_name: Name of the template to use language_code: Language code for the template (e.g., en_US) components: Optional list of template components (header, body, buttons) Returns: Success message with message ID
 - `async send_text_message_async(self, text: str='', recipient: Optional[str]=None, preview_url: bool=False, recipient_type: str='individual') -> str` Send a text message to a WhatsApp user (asynchronous version). Args: text: The text message to send recipient: Recipient’s WhatsApp ID or phone number (e.g., +1234567890). If not provided, uses default_recipient preview_url: Whether to generate previews for links in the message Returns: Success message with message ID
 - `send_text_message_sync(self, text: str='', recipient: Optional[str]=None, preview_url: bool=False, recipient_type: str='individual') -> str` Send a text message to a WhatsApp user (synchronous version). Args: text: The text message to send recipient: Recipient’s WhatsApp ID or phone number (e.g., +1234567890). If not provided, uses default_recipient preview_url: Whether to generate previews for links in the message Returns: Success message with message ID

Module `agno.tools.wikipedia`

- **Source:** `libs/agno/agno/tools/wikipedia.py`

Classes

- **class** `WikipediaTools` (bases: Toolkit)
 - **Methods:**
 - `search_wikipedia(self, query: str) -> str` Searches Wikipedia for a query. :param query: The query to search for. :return: Relevant documents from wikipedia.
 - `search_wikipedia_and_update_knowledge_base(self, topic: str) -> str` This function searches wikipedia for a topic, adds the results to the knowledge base and returns them. USE THIS FUNCTION TO GET INFORMATION WHICH DOES NOT EXIST. :param topic: The topic to search Wikipedia and add to knowledge base. :return: Relevant documents from Wikipedia knowledge base.

Module `agno.tools.workflow`

- **Source:** `libs/agno/agno/tools/workflow.py`

Classes

- **class** `RunWorkflowInput` (bases: BaseModel)
- **class** `WorkflowTools` (bases: Toolkit)
 - **Methods:**
 - `analyze(self, session_state: Dict[str, Any], analysis: str) -> str` Use this tool to evaluate whether the workflow execution results are correct and sufficient. If not, go back to Think or Run with refined inputs or parameters. Args: analysis: Your analysis of the workflow execution results.
 - `async async_analyze(self, session_state: Dict[str, Any], analysis: str) -> str` Use this tool to evaluate whether the workflow execution results are correct and sufficient. If not, go back to Think or Run with refined inputs or parameters. Args: analysis: Your analysis of the workflow execution results.
 - `async async_run_workflow(self, session_state: Dict[str, Any], input: RunWorkflowInput) -> str` Use this tool to execute the workflow with the specified inputs and parameters. After thinking through the requirements, use this tool to run the workflow with appropriate inputs. Args: input_data: The input data for the workflow (use a str for a simple input) additional_data: The additional data for the workflow. This is a dictionary of key-value pairs that will be passed to the workflow. E.g. {topic: food, style: Humor}
 - `async async_think(self, session_state: Dict[str, Any], thought: str) -> str` Use this tool as a scratchpad to reason about the workflow execution, refine your approach, brainstorm workflow inputs, or revise your plan. Call Think whenever you need to figure out what to do next, analyze the user’s requirements, plan workflow inputs, or decide on execution strategy. You should use this tool as frequently as needed. Args: thought: Your thought process and reasoning about workflow execution.
 - `run_workflow(self, session_state: Dict[str, Any], input: RunWorkflowInput) -> str` Use this tool to execute the workflow with the specified inputs and parameters. After thinking through the requirements, use this tool to run the workflow with appropriate inputs. Args: input_data: The input data for the workflow.
 - `think(self, session_state: Dict[str, Any], thought: str) -> str` Use this tool as a scratchpad to reason about the workflow execution, refine your approach, brainstorm workflow inputs, or revise your plan. Call Think whenever you need to figure out what to do next, analyze the user’s requirements, plan workflow inputs, or decide on execution strategy. You should use this tool as frequently as needed. Args: thought: Your thought process and reasoning about workflow execution.

Module `agno.tools.x`

- **Source:** `libs/agno/agno/tools/x.py`

Classes

- **class** `XTools` (bases: Toolkit)
 - **Methods:**
 - `create_post(self, text: str) -> str` Create a new X post. Args: text (str): The content of the post to create. Returns: A JSON-formatted string containing the response from X API (Twitter API) with the created post details, or an error message if the post creation fails.
 - `get_home_timeline(self, max_results: int=10) -> str` Retrieve the authenticated user’s home timeline. Args: max_results (int): The maximum number of tweets to retrieve. Default is 10. Returns: A JSON-formatted string containing a list of tweets from the user’s home timeline, including tweet id, text, creation time, and author id, or an error message if fetching the timeline fails.
 - `get_my_info(self) -> str` Retrieve information about the authenticated user. Returns: A JSON-formatted string containing the user’s profile information, including id, name, username, description, and follower/following counts, or an error message if fetching the information fails.
 - `get_user_info(self, username: str) -> str` Retrieve information about a specific user. Args: username (str): The username of the user to fetch information about. Returns: A JSON-formatted string containing the user’s profile information, including id, name, username, description, and follower/following counts, or an error message if fetching the information fails.
 - `reply_to_post(self, post_id: str, text: str) -> str` Reply to an existing post. Args: post_id (str): The ID of the post to reply to. text (str): The content of the reply post. Returns: A JSON-formatted string containing the response from Twitter API with the reply post details, or an error message if the reply fails.
 - `search_posts(self, query: str, max_results: int=10) -> str` Search for tweets based on a search query. Args: query (str): The search query. max_results (int): The maximum number of posts to retrieve. Returns: A list of posts matching the search query

- `send_dm(self, recipient: str, text: str) -> str` â€” Send a direct message to a user. Args: `recipient (str)`: The username or user ID of the recipient. `text (str)`: The content of the direct message. Returns: A JSON-formatted string containing the response from Twitter API with the sent message details, or an error message if sending the DM fails.

Module `agno.tools.yfinance`

- **Source:** `libs/agno/agno/tools/yfinance.py`

Classes

- **class `YFinanceTools`** (bases: Toolkit)
 - `YFinanceTools` is a toolkit for getting financial data from Yahoo Finance. Includes all available financial data tools.
 - **Methods:**
 - `get_analyst_recommendations(self, symbol: str) -> str` â€” Use this function to get analyst recommendations for a given stock symbol. Args: `symbol (str)`: The stock symbol. Returns: `str`: JSON containing analyst recommendations.
 - `get_company_info(self, symbol: str) -> str` â€” Use this function to get company information and overview for a given stock symbol. Args: `symbol (str)`: The stock symbol. Returns: `str`: JSON containing company profile and overview.
 - `get_company_news(self, symbol: str, num_stories: int=3) -> str` â€” Use this function to get company news and press releases for a given stock symbol. Args: `symbol (str)`: The stock symbol. `num_stories (int)`: The number of news stories to return. Defaults to 3. Returns: `str`: JSON containing company news and press releases.
 - `get_current_stock_price(self, symbol: str) -> str` â€” Use this function to get the current stock price for a given symbol. Args: `symbol (str)`: The stock symbol. Returns: `str`: The current stock price or error message.
 - `get_historical_stock_prices(self, symbol: str, period: str='1mo', interval: str='1d') -> str` â€” Use this function to get the historical stock price for a given symbol. Args: `symbol (str)`: The stock symbol. `period (str)`: The period for which to retrieve historical prices. Defaults to `1mo`. Valid periods: `1d,5d,1mo,3mo,6mo,1y,2y,5y,10y,ytd,max` interval `(str)`: The interval between data points. Defaults to `1d`. Valid intervals: `1d,5d,1wk,1mo,3mo` Returns: `str`: The current stock price or error message.
 - `get_income_statements(self, symbol: str) -> str` â€” Use this function to get income statements for a given stock symbol. Args: `symbol (str)`: The stock symbol. Returns: `dict`: JSON containing income statements or an empty dictionary.
 - `get_key_financial_ratios(self, symbol: str) -> str` â€” Use this function to get key financial ratios for a given stock symbol. Args: `symbol (str)`: The stock symbol. Returns: `dict`: JSON containing key financial ratios.
 - `get_stock_fundamentals(self, symbol: str) -> str` â€” Use this function to get fundamental data for a given stock symbol yfinance API. Args: `symbol (str)`: The stock symbol. Returns: `str`: A JSON string containing fundamental data or an error message. Keys: - `symbol`: The stock symbol. - `company_name`: The long name of the company. - `sector`: The sector to which the company belongs. - `industry`: The industry to which the company belongs. - `market_cap`: The market capitalization of the company. - `pe_ratio`: The forward price-to-earnings ratio. - `pb_ratio`: The price-to-book ratio. - `dividend_yield`: The dividend yield. - `eps`: The trailing earnings per share. - `beta`: The beta value of the stock. - `52_week_high`: The 52-week high price of the stock. - `52_week_low`: The 52-week low price of the stock.
 - `get_technical_indicators(self, symbol: str, period: str='3mo') -> str` â€” Use this function to get technical indicators for a given stock symbol. Args: `symbol (str)`: The stock symbol. `period (str)`: The time period for which to retrieve technical indicators. Valid periods: `1d, 5d, 1mo, 3mo, 6mo, 1y, 2y, 5y, 10y, ytd, max`. Defaults to `3mo`. Returns: `str`: JSON containing technical indicators.

Module `agno.tools.youtube`

- **Source:** `libs/agno/agno/tools/youtube.py`

Classes

- **class `YouTubeTools`** (bases: Toolkit)
 - **Methods:**
 - `get_video_timestamps(self, url: str) -> str` â€” Generate timestamps for a YouTube video based on captions. Args: `url`: The URL of the YouTube video. Returns: `str`: Timestamps and summaries for the video.
 - `get_youtube_video_captions(self, url: str) -> str` â€” Use this function to get captions from a YouTube video. Args: `url`: The URL of the YouTube video. Returns: `str`: The captions of the YouTube video.
 - `get_youtube_video_data(self, url: str) -> str` â€” Function to get video data from a YouTube URL. Data returned includes `{title, author_name, author_url, type, height, width, version, provider_name, provider_url, thumbnail_url}` Args: `url`: The URL of the YouTube video. Returns: `str`: JSON data of the YouTube video.
 - `get_youtube_video_id(self, url: str) -> Optional[str]` â€” Function to get the video ID from a YouTube URL. Args: `url`: The URL of the YouTube video. Returns: `str`: The video ID of the YouTube video.

Module `agno.tools.zendesk`

- **Source:** `libs/agno/agno/tools/zendesk.py`

Classes

- **class `ZendeskTools`** (bases: Toolkit)
 - A toolkit class for interacting with the Zendesk API to search articles. It requires authentication details and the company name to configure the API access.
 - **Methods:**
 - `search_zendesk(self, search_string: str) -> str` â€” Searches for articles in Zendesk Help Center that match the given search string. Parameters: `search_string (str)`: The search query to look for in Zendesk articles. Returns: `str`: A JSON-formatted string containing the list of articles without HTML tags. Raises: `ConnectionError`: If the API request fails due to connection-related issues.

Module `agno.tools.zep`

- **Source:** `libs/agno/agno/tools/zep.py`

Classes

- **class `ZepAsyncTools`** (bases: Toolkit)
 - **Methods:**
 - `async add_zep_message(self, role: str, content: str) -> str` â€” Adds a message to the current Zep session memory. Args: `role (str)`: The role of the message sender (e.g., `user`, `assistant`, `system`). `content (str)`: The text content of the message. Returns: A confirmation message or an error string.
 - `async get_zep_memory(self, memory_type: str='context') -> str` â€” Retrieves the memory for the current Zep session. Args: `memory_type`: The type of memory to retrieve (`context`, `messages`). Returns: The requested memory content as a string, or an error string.
 - `async initialize(self) -> bool` â€” Initialize the AsyncZep client and ensure session/user setup.
 - `async search_zep_memory(self, query: str, scope: str='edges', limit: int=5) -> str` â€” Searches the Zep knowledge graph for relevant facts or nodes. Args: `query`: The search term to find relevant facts or nodes. `scope`: The scope of the search to perform. Can be `edges` (for facts) or `nodes`. `limit`: The maximum number of results to return. Returns: A string of the search result
- **class `ZepTools`** (bases: Toolkit)
 - **Methods:**
 - `add_zep_message(self, role: str, content: str) -> str` â€” Adds a message to the current Zep session memory. Args: `role (str)`: The role of the message sender (e.g., `user`, `assistant`, `system`). `content (str)`: The text content of the message. Returns: A confirmation message or an error string.
 - `get_zep_memory(self, memory_type: str='context') -> str` â€” Retrieves the memory for the current Zep session. Args: `memory_type`: The type of memory to retrieve (`context`, `messages`). Returns: The requested memory content as a string, or an error string.
 - `initialize(self) -> bool` â€” Initialize the Zep client and ensure session/user setup.
 - `search_zep_memory(self, query: str, search_scope: str='edges') -> str` â€” Searches the Zep knowledge graph for relevant facts or nodes. Args: `query`: The search term to find relevant facts or nodes. `search_scope`: The scope of the search to perform. Can be `edges` (for facts) or `nodes`. Returns: A string of the search result

Module agno.tools.zoom

- **Source:** libs/agno/agno/tools/zoom.py

Classes

- **class** ZoomTools (bases: Toolkit)
 - **Methods:**
 - delete_meeting(self, meeting_id: str, schedule_for_reminder: bool=True) -> str â€œ Delete a scheduled Zoom meeting. Args: meeting_id (str): The ID of the meeting to delete schedule_for_reminder (bool): Send cancellation email to registrants. Defaults to True. Returns: A JSON-formatted string containing the response status, or an error message if the deletion fails.
 - get_access_token(self) -> str â€œ Get a valid access token, refreshing if necessary using Zoomâ€™s Server-to-Server OAuth. Returns: str: The current access token or empty string if token generation fails.
 - get_meeting(self, meeting_id: str) -> str â€œ Get the details of a specific Zoom meeting. Args: meeting_id (str): The ID of the meeting to retrieve Returns: A JSON-formatted string containing the meeting details, or an error message if the request fails.
 - get_meeting_recordings(self, meeting_id: str, include_download_token: bool=False, token_ttl: Optional[int]=None) -> str â€œ Get all recordings for a specific meeting. Args: meeting_id (str): The meeting ID or UUID to get recordings for. include_download_token (bool): Whether to include download access token in response. token_ttl (int, optional): Time to live for download token in seconds (max 604800). Returns: A JSON-formatted string containing the meeting recordings information, or an error message if the request fails.
 - get_upcoming_meetings(self, user_id: str='me') -> str â€œ Get a list of upcoming meetings for a specified user. Args: user_id (str): The user ID or â€œmeâ€™ for the authenticated user. Defaults to â€œmeâ€™. Returns: A JSON-formatted string containing the upcoming meetings information, or an error message if the request fails.
 - instructions(self) -> str â€œ Provide instructions for using the ZoomTool. Returns: A string containing instructions on how to use the ZoomTool.
 - list_meetings(self, user_id: str='me', type: str='scheduled') -> str â€œ List all meetings for a specified user. Args: user_id (str): The user ID or â€œmeâ€™ for the authenticated user. Defaults to â€œmeâ€™. type (str): The type of meetings to return. Options are: â€œscheduledâ€ - All valid scheduled meetings â€œliveâ€ - All live meetings â€œupcomingâ€ - All upcoming meetings â€œpreviousâ€ - All previous meetings Defaults to â€œscheduledâ€. Returns: A JSON-formatted string containing the meetings information, or an error message if the request fails.
 - schedule_meeting(self, topic: str, start_time: str, duration: int, timezone: str='UTC') -> str â€œ Schedule a new Zoom meeting. Args: topic (str): The topic or title of the meeting. start_time (str): The start time of the meeting in ISO 8601 format. duration (int): The duration of the meeting in minutes. timezone (str): The timezone for the meeting (e.g., â€œAmerica/New_Yorkâ€, â€œAsia/Tokyoâ€). Returns: A JSON-formatted string containing the response from Zoom API with the scheduled meeting details, or an error message if the scheduling fails.

Module agno.utils.agent

- **Source:** libs/agno/agno/utils/agent.py

Functions

- async aget_chat_history_util(entity: Union['Agent', 'Team'], session_id: str) -> List[Message] â€œ Read the chat history from the session Args: session_id: The session ID to get the chat history for. If not provided, the current cached session ID is used. Returns: List[Message]: The chat history from the session.
- async aget_last_run_output_util(entity: Union['Agent', 'Team'], session_id: Optional[str]=None) -> Optional[Union[RunOutput, TeamRunOutput]] â€œ Get the last run response from the database. Args: session_id (Optional[str]): The session_id to load from storage. Returns: RunOutput: The last run response from the database.
- async aget_run_output_util(entity: Union['Agent', 'Team'], run_id: str, session_id: Optional[str]=None) -> Optional[Union[RunOutput, TeamRunOutput]] â€œ Get a RunOutput from the database. Args: run_id (str): The run_id to load from storage. session_id (Optional[str]): The session_id to load from storage.
- async aget_session_metrics_util(entity: Union['Agent', 'Team'], session_id: str) -> Optional[Metrics] â€œ Get the session metrics for the given session ID and user ID.
- async aget_session_name_util(entity: Union['Agent', 'Team'], session_id: str) -> str â€œ Get the session name for the given session ID and user ID.
- async aget_session_state_util(entity: Union['Agent', 'Team'], session_id: str) -> Dict[str, Any] â€œ Get the session state for the given session ID and user ID.
- async aset_session_name_util(entity: Union['Agent', 'Team'], session_id: str, autogenerate: bool=False, session_name: Optional[str]=None) -> Union[AgentSession, TeamSession] â€œ Set the session name and save to storage
- async aupdate_session_state_util(entity: Union['Agent', 'Team'], session_state_updates: Dict[str, Any], session_id: str) -> str â€œ Update the session state for the given session ID and user ID. Args: session_state_updates: The updates to apply to the session state. Should be a dictionary of key-value pairs. session_id: The session ID to update. If not provided, the current cached session ID is used. Returns: dict: The updated session state.
- async await_for_background_tasks(memory_task: Optional[Task]=None, cultural_knowledge_task: Optional[Task]=None) -> None â€œ No docstring provided.
- async await_for_background_tasks_stream(run_response: Union[RunOutput, TeamRunOutput], memory_task: Optional[Task]=None, cultural_knowledge_task: Optional[Task]=None, stream_events: bool=False, events_to_skip: Optional[List[RunEvent]]=None, store_events: bool=False) -> AsyncIterator[RunOutputEvent] â€œ No docstring provided.
- collect_joint_audios(run_input: Optional[RunInput]=None, session: Optional[Union[AgentSession, TeamSession]]=None) -> Optional[Sequence[Audio]] â€œ Collect audios from input, session history, and current run response.
- collect_joint_files(run_input: Optional[RunInput]=None) -> Optional[Sequence[File]] â€œ Collect files from input and session history.
- collect_joint_images(run_input: Optional[RunInput]=None, session: Optional[Union[AgentSession, TeamSession]]=None) -> Optional[Sequence[Image]] â€œ Collect images from input, session history, and current run response.
- collect_joint_videos(run_input: Optional[RunInput]=None, session: Optional[Union[AgentSession, TeamSession]]=None) -> Optional[Sequence[Video]] â€œ Collect videos from input, session history, and current run response.
- get_chat_history_util(entity: Union['Agent', 'Team'], session_id: str) -> List[Message] â€œ Read the chat history from the session Args: session_id: The session ID to get the chat history for. If not provided, the current cached session ID is used. Returns: List[Message]: The chat history from the session.
- get_last_run_output_util(entity: Union['Agent', 'Team'], session_id: Optional[str]=None) -> Optional[Union[RunOutput, TeamRunOutput]] â€œ Get the last run response from the database. Args: session_id (Optional[str]): The session_id to load from storage. Returns: RunOutput: The last run response from the database.
- get_run_output_util(entity: Union['Agent', 'Team'], run_id: str, session_id: Optional[str]=None) -> Optional[Union[RunOutput, TeamRunOutput]] â€œ Get a RunOutput from the database. Args: run_id (str): The run_id to load from storage. session_id (Optional[str]): The session_id to load from storage.
- get_session_metrics_util(entity: Union['Agent', 'Team'], session_id: str) -> Optional[Metrics] â€œ Get the session metrics for the given session ID and user ID.
- get_session_name_util(entity: Union['Agent', 'Team'], session_id: str) -> str â€œ Get the session name for the given session ID and user ID.
- get_session_state_util(entity: Union['Agent', 'Team'], session_id: str) -> Dict[str, Any] â€œ Get the session state for the given session ID and user ID.
- scrub_history_messages_from_run_output(run_response: Union[RunOutput, TeamRunOutput]) -> None â€œ Remove all history messages from TeamRunOutput when store_history_messages=False. This removes messages that were loaded from the teamâ€™s memory.
- scrub_media_from_message(message: Message) -> None â€œ Remove all media from a Message object.
- scrub_media_from_run_output(run_response: Union[RunOutput, TeamRunOutput]) -> None â€œ Completely remove all media from RunOutput when store_media=False. This includes media in input, output artifacts, and all messages.
- scrub_tool_results_from_run_output(run_response: Union[RunOutput, TeamRunOutput]) -> None â€œ Remove all tool-related data from RunOutput when store_tool_messages=False. This removes both the tool call and its corresponding result to maintain API consistency.
- set_session_name_util(entity: Union['Agent', 'Team'], session_id: str, autogenerate: bool=False, session_name: Optional[str]=None) -> Union[AgentSession, TeamSession] â€œ Set the session name and save to storage
- store_media_util(run_response: Union[RunOutput, TeamRunOutput], model_response: ModelResponse) â€œ Store media from model response in run_response for persistence
- update_session_state_util(entity: Union['Agent', 'Team'], session_state_updates: Dict[str, Any], session_id: str) -> str â€œ Update the session state for the given session ID and user ID. Args: session_state_updates: The updates to apply to the session state. Should be a dictionary of key-value pairs. session_id: The session ID to update. If not provided, the current cached session ID is used. Returns: dict: The updated session state.
- validate_media_object_id(images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, audios: Optional[Sequence[Audio]]=None, files: Optional[Sequence[File]]=None) -> tuple â€œ No docstring provided.
- wait_for_background_tasks(memory_future: Optional[Future]=None, cultural_knowledge_future: Optional[Future]=None) -> None â€œ No docstring provided.
- wait_for_background_tasks_stream(run_response: Union[TeamRunOutput, RunOutput], memory_future: Optional[Future]=None, cultural_knowledge_future: Optional[Future]=None, stream_events: bool=False,

events_to_skip: Optional[List[RunEvent]]=None, store_events: bool=False) -> Iterator[Union[RunOutputEvent, TeamRunOutputEvent]] â€” No docstring provided.

Module agno.utils.audio

- **Source:** libs/agno/agno/utils/audio.py

Functions

- write_audio_to_file(audio, filename: str) â€” Write base64 encoded audio file to disk. :param audio: Base64 encoded audio file :param filename: The filepath or filename to save the audio to
- write_wav_audio_to_file(filename: str, pcm_data: bytes, channels: int=1, rate: int=24000, sample_width: int=2) â€” Create a WAV file from raw PCM audio data. Args: filename: The filepath to save the WAV file to pcm_data: Raw PCM audio data as bytes channels: Number of audio channels (1 for mono, 2 for stereo) rate: Sample rate in Hz (e.g., 24000, 44100, 48000) sample_width: Sample width in bytes (1, 2, or 4)

Module agno.utils.certs

- **Source:** libs/agno/agno/utils/certs.py

Functions

- download_cert(cert_url: str, filename: str='cert.pem') â€” Downloads a CA certificate bundle if it doesnâ€™t exist locally. Returns: str: Path to the certificate file

Module agno.utils.code_execution

- **Source:** libs/agno/agno/utils/code_execution.py

Utils for our multiple integrations with external code execution environments.

Functions

- prepare_python_code(code: str) -> str â€” Fix common problems with LLM-generated Python code.

Module agno.utils.common

- **Source:** libs/agno/agno/utils/common.py

Functions

- check_type_compatibility(value: Any, expected_type: Type) -> bool â€” Basic type compatibility checking.
- dataclass_to_dict(dataclass_object, exclude: Optional[set[str]]=None, exclude_none: bool=False) -> dict â€” No docstring provided.
- get_image_str(repo: str, tag: str) -> str â€” No docstring provided.
- is_empty(val: Any) -> bool â€” Returns True if val is None or empty
- is_typed_dict(cls: Type[Any]) -> bool â€” Check if a class is a TypedDict
- isinstanceany(obj: Any, class_list: List[Type]) -> bool â€” Returns True if obj is an instance of the classes in class_list
- nested_model_dump(value) â€” No docstring provided.
- validate_typed_dict(data: dict, schema_cls) -> dict â€” Validate input data against a TypedDict schema.

Module agno.utils.dttm

- **Source:** libs/agno/agno/utils/dttm.py

Functions

- current_datetime() -> datetime â€” No docstring provided.
- current_datetime_utc() -> datetime â€” No docstring provided.
- current_datetime_utc_str() -> str â€” No docstring provided.

Module agno.utils.enum

- **Source:** libs/agno/agno/utils/enum.py

Classes

- class ExtendedEnum (bases: Enum)
 - **Methods:**
 - from_str(cls: Any, str_to_convert_to_enum: Optional[str]) -> Optional[Any] â€” Convert a string value to an enum object. Case Sensitive
 - values_list(cls: Any) -> List[Any] â€” No docstring provided.

Module agno.utils.env

- **Source:** libs/agno/agno/utils/env.py

Functions

- get_from_env(key: str, default: Optional[str]=None, required: bool=False) -> Optional[str] â€” Get the value for an environment variable. Use default if not found, or raise an error if required is True.

Module agno.utils.events

- **Source:** libs/agno/agno/utils/events.py

Functions

- create_memory_update_completed_event(from_run_response: RunOutput) -> MemoryUpdateCompletedEvent â€” No docstring provided.
- create_memory_update_started_event(from_run_response: RunOutput) -> MemoryUpdateStartedEvent â€” No docstring provided.
- create_output_model_response_completed_event(from_run_response: RunOutput) -> OutputModelResponseCompletedEvent â€” No docstring provided.
- create_output_model_response_started_event(from_run_response: RunOutput) -> OutputModelResponseStartedEvent â€” No docstring provided.
- create_parser_model_response_completed_event(from_run_response: RunOutput) -> ParserModelResponseCompletedEvent â€” No docstring provided.
- create_parser_model_response_started_event(from_run_response: RunOutput) -> ParserModelResponseStartedEvent â€” No docstring provided.
- create_post_hook_completed_event(from_run_response: RunOutput, post_hook_name: Optional[str]=None) -> PostHookCompletedEvent â€” No docstring provided.
- create_post_hook_started_event(from_run_response: RunOutput, post_hook_name: Optional[str]=None) -> PostHookStartedEvent â€” No docstring provided.
- create_pre_hook_completed_event(from_run_response: RunOutput, pre_hook_name: Optional[str]=None, run_input: Optional[RunInput]=None) -> PreHookCompletedEvent â€” No docstring provided.
- create_pre_hook_started_event(from_run_response: RunOutput, pre_hook_name: Optional[str]=None, run_input: Optional[RunInput]=None) -> PreHookStartedEvent â€” No docstring provided.
- create_reasoning_completed_event(from_run_response: RunOutput, content: Optional[Any]=None, content_type: Optional[str]=None) -> ReasoningCompletedEvent â€” No docstring provided.
- create_reasoning_started_event(from_run_response: RunOutput) -> ReasoningStartedEvent â€” No docstring provided.

- `create_reasoning_step_event(from_run_response: RunOutput, reasoning_step: ReasoningStep, reasoning_content: str) -> ReasoningStepEvent` â€” No docstring provided.
- `create_run_cancelled_event(from_run_response: RunOutput, reason: str) -> RunCancelledEvent` â€” No docstring provided.
- `create_run_completed_event(from_run_response: RunOutput) -> RunCompletedEvent` â€” No docstring provided.
- `create_run_content_completed_event(from_run_response: RunOutput) -> RunContentCompletedEvent` â€” No docstring provided.
- `create_run_continued_event(from_run_response: RunOutput) -> RunContinuedEvent` â€” No docstring provided.
- `create_run_error_event(from_run_response: RunOutput, error: str) -> RunErrorEvent` â€” No docstring provided.
- `create_run_output_content_event(from_run_response: RunOutput, content: Optional[Any]=None, content_type: Optional[str]=None, reasoning_content: Optional[str]=None, redacted_reasoning_content: Optional[str]=None, model_provider_data: Optional[Dict[str, Any]]=None, citations: Optional[Citations]=None, response_audio: Optional[Audio]=None, image: Optional[Image]=None) -> RunContentEvent` â€” No docstring provided.
- `create_run_paused_event(from_run_response: RunOutput, tools: Optional[List[ToolExecution]]=None) -> RunPausedEvent` â€” No docstring provided.
- `create_run_started_event(from_run_response: RunOutput) -> RunStartedEvent` â€” No docstring provided.
- `create_session_summary_completed_event(from_run_response: RunOutput, session_summary: Optional[SessionSummary]=None) -> SessionSummaryCompletedEvent` â€” No docstring provided.
- `create_session_summary_started_event(from_run_response: RunOutput) -> SessionSummaryStartedEvent` â€” No docstring provided.
- `create_team_memory_update_completed_event(from_run_response: TeamRunOutput) -> TeamMemoryUpdateCompletedEvent` â€” No docstring provided.
- `create_team_memory_update_started_event(from_run_response: TeamRunOutput) -> TeamMemoryUpdateStartedEvent` â€” No docstring provided.
- `create_team_output_model_response_completed_event(from_run_response: TeamRunOutput) -> TeamOutputModelResponseCompletedEvent` â€” No docstring provided.
- `create_team_output_model_response_started_event(from_run_response: TeamRunOutput) -> TeamOutputModelResponseStartedEvent` â€” No docstring provided.
- `create_team_parser_model_response_completed_event(from_run_response: TeamRunOutput) -> TeamParserModelResponseCompletedEvent` â€” No docstring provided.
- `create_team_parser_model_response_started_event(from_run_response: TeamRunOutput) -> TeamParserModelResponseStartedEvent` â€” No docstring provided.
- `create_team_post_hook_completed_event(from_run_response: TeamRunOutput, post_hook_name: Optional[str]=None) -> TeamPostHookCompletedEvent` â€” No docstring provided.
- `create_team_post_hook_started_event(from_run_response: TeamRunOutput, post_hook_name: Optional[str]=None) -> TeamPostHookStartedEvent` â€” No docstring provided.
- `create_team_pre_hook_completed_event(from_run_response: TeamRunOutput, pre_hook_name: Optional[str]=None, run_input: Optional[TeamRunInput]=None) -> TeamPreHookCompletedEvent` â€” No docstring provided.
- `create_team_pre_hook_started_event(from_run_response: TeamRunOutput, pre_hook_name: Optional[str]=None, run_input: Optional[TeamRunInput]=None) -> TeamPreHookStartedEvent` â€” No docstring provided.
- `create_team_reasoning_completed_event(from_run_response: TeamRunOutput, content: Optional[Any]=None, content_type: Optional[str]=None) -> TeamReasoningCompletedEvent` â€” No docstring provided.
- `create_team_reasoning_started_event(from_run_response: TeamRunOutput) -> TeamReasoningStartedEvent` â€” No docstring provided.
- `create_team_reasoning_step_event(from_run_response: TeamRunOutput, reasoning_step: ReasoningStep, reasoning_content: str) -> TeamReasoningStepEvent` â€” No docstring provided.
- `create_team_run_cancelled_event(from_run_response: TeamRunOutput, reason: str) -> TeamRunCancelledEvent` â€” No docstring provided.
- `create_team_run_completed_event(from_run_response: TeamRunOutput) -> TeamRunCompletedEvent` â€” No docstring provided.
- `create_team_run_content_completed_event(from_run_response: TeamRunOutput) -> TeamRunContentCompletedEvent` â€” No docstring provided.
- `create_team_run_error_event(from_run_response: TeamRunOutput, error: str) -> TeamRunErrorEvent` â€” No docstring provided.
- `create_team_run_output_content_event(from_run_response: TeamRunOutput, content: Optional[Any]=None, content_type: Optional[str]=None, reasoning_content: Optional[str]=None, redacted_reasoning_content: Optional[str]=None, citations: Optional[Citations]=None, model_provider_data: Optional[Dict[str, Any]]=None, response_audio: Optional[Audio]=None, image: Optional[Image]=None) -> TeamRunContentEvent` â€” No docstring provided.
- `create_team_run_started_event(from_run_response: TeamRunOutput) -> TeamRunStartedEvent` â€” No docstring provided.
- `create_team_session_summary_completed_event(from_run_response: TeamRunOutput, session_summary: Optional[SessionSummary]=None) -> TeamSessionSummaryCompletedEvent` â€” No docstring provided.
- `create_team_session_summary_started_event(from_run_response: TeamRunOutput) -> TeamSessionSummaryStartedEvent` â€” No docstring provided.
- `create_team_tool_call_completed_event(from_run_response: TeamRunOutput, tool: ToolExecution, content: Optional[Any]=None) -> TeamToolCallCompletedEvent` â€” No docstring provided.
- `create_team_tool_call_started_event(from_run_response: TeamRunOutput, tool: ToolExecution) -> TeamToolCallStartedEvent` â€” No docstring provided.
- `create_tool_call_completed_event(from_run_response: RunOutput, tool: ToolExecution, content: Optional[Any]=None) -> ToolCallCompletedEvent` â€” No docstring provided.
- `create_tool_call_started_event(from_run_response: RunOutput, tool: ToolExecution) -> ToolCallStartedEvent` â€” No docstring provided.
- `handle_event(event: Union[RunOutputEvent, TeamRunOutputEvent], run_response: Union[RunOutput, TeamRunOutput], events_to_skip: Optional[List[Union[RunEvent, TeamRunEvent]]]=None, store_events: bool=False) -> Union[RunOutputEvent, TeamRunOutputEvent]` â€” No docstring provided.

Module agno.utils.format_str

- **Source:** `libs/agno/agno/utils/format_str.py`

Functions

- `remove_indent(s: Optional[str]) -> Optional[str]` â€” Remove the indent from a string. Args: s (str): String to remove indent from Returns: str: String with indent removed

Module agno.utils.functions

- **Source:** `libs/agno/agno/utils/functions.py`

Functions

- `cache_result(enable_cache: bool=True, cache_dir: Optional[str]=None, cache_ttl: int=3600) â€”` Decorator factory that creates a file-based caching decorator for function results. Args: `enable_cache (bool):` Enable caching of function results. `cache_dir (Optional[str]):` Directory to store cache files. Defaults to system temp dir. `cache_ttl (int):` Time-to-live for cached results in seconds. Returns: A decorator function that caches results on the filesystem.
- `get_function_call(name: str, arguments: Optional[str]=None, call_id: Optional[str]=None, functions: Optional[Dict[str, Function]]=None) -> Optional[FunctionCall]` â€” No docstring provided.

Module agno.utils.gemini

- **Source:** `libs/agno/agno/utils/gemini.py`

Functions

- `convert_schema(schema_dict: Dict[str, Any], root_schema: Optional[Dict[str, Any]]=None, visited_refs: Optional[set]=None) -> Optional[Schema]` â€” Recursively convert a JSON-like schema dictionary to a `types.Schema` object. Parameters: `schema_dict (dict):` The JSON schema dictionary with keys like `â€œtypeâ€`, `â€œdescriptionâ€`, `â€œpropertiesâ€`, and `â€œrequiredâ€`. `root_schema (dict, optional):` The root schema containing `$defs` for resolving `$ref` visited_refs (set, optional): Set of visited `$ref` paths to detect circular references Returns: `types.Schema`: The converted schema.
- `format_function_definitions(tools_list: List[Dict[str, Any]]) -> Optional[Tool]` â€” No docstring provided.
- `format_image_for_message(image: Image) -> Optional[Dict[str, Any]]` â€” No docstring provided.
- `has_additional_properties(schema: Any) -> bool` â€” Check if schema has `additionalProperties` (Dict fields)
- `has_self_reference(schema: Dict, target_ref: str) -> bool` â€” Check if a schema references itself (directly or indirectly)
- `needs_conversion(schema_dict: Dict[str, Any]) -> bool` â€” Check if a schema needs conversion for Gemini. Returns True if the schema has: - Self-references or circular references - Dict fields (`additionalProperties`) that Gemini doesnâ€™t handle well - Empty object definitions that Gemini rejects
- `prepare_response_schema(pydantic_model: Type[BaseModel]) -> Union[Type[BaseModel], Schema]` â€” Prepare a Pydantic model for use as Gemini response schema. Returns the model directly if Gemini can handle it natively, otherwise converts to Geminiâ€™s Schema format. Args: `pydantic_model:` A Pydantic model class Returns: Either the original Pydantic model or a converted

Schema object

Module agno.utils.hooks

- **Source:** `libs/agno/agno/utils/hooks.py`

Functions

- `filter_hook_args(hook: Callable[... , Any], all_args: Dict[str, Any]) -> Dict[str, Any]` â€” Filter arguments to only include those that the hook function accepts.
- `normalize_hooks(hooks: Optional[List[Union[Callable[... , Any], BaseGuardrail]]], async_mode: bool=False) -> Optional[List[Callable[... , Any]]]` â€” Normalize hooks to a list format

Module agno.utils.http

- **Source:** `libs/agno/agno/utils/http.py`

Functions

- `async_async_fetch_with_retry(url: str, client: Optional[httpx.AsyncClient]=None, max_retries: int=DEFAULT_MAX_RETRIES, backoff_factor: int=DEFAULT_BACKOFF_FACTOR, proxy: Optional[str]=None) -> httpx.Response` â€” Asynchronous HTTP GET with retry logic.
- `fetch_with_retry(url: str, max_retries: int=DEFAULT_MAX_RETRIES, backoff_factor: int=DEFAULT_BACKOFF_FACTOR, proxy: Optional[str]=None) -> httpx.Response` â€” Synchronous HTTP GET with retry logic.

Module agno.utils.json_schema

- **Source:** `libs/agno/agno/utils/json_schema.py`

Functions

- `get_json_schema(type_hints: Dict[str, Any], param_descriptions: Optional[Dict[str, str]]=None, strict: bool=False) -> Dict[str, Any]` â€” No docstring provided.
- `get_json_schema_for_arg(type_hint: Any) -> Optional[Dict[str, Any]]` â€” No docstring provided.
- `get_json_type_for_py_type(arg: str) -> str` â€” Get the JSON schema type for a given type. :param arg: The type to get the JSON schema type for. :return: The JSON schema type.
- `inline_pydantic_schema(schema: Dict[str, Any]) -> Dict[str, Any]` â€” Recursively inline Pydantic model schemas by replacing \$ref with actual schema.
- `is_origin_union_type(origin: Any) -> bool` â€” No docstring provided.

Module agno.utils.knowledge

- **Source:** `libs/agno/agno/utils/knowledge.py`

Functions

- `get_agentic_or_user_search_filters(filters: Optional[Dict[str, Any]], effective_filters: Optional[Dict[str, Any]]) -> Dict[str, Any]` â€” Helper function to determine the final filters to use for the search. Args: filters: Filters passed by the agent. effective_filters: Filters passed by user. Returns: Dict[str, Any]: The final filters to use for the search.

Module agno.utils.location

- **Source:** `libs/agno/agno/utils/location.py`

Functions

- `get_location() -> Dict[str, Any]` â€” Get approximate location using IP geolocation.

Module agno.utils.log

- **Source:** `libs/agno/agno/utils/log.py`

Classes

- **class AgnoLogger** (bases: logging.Logger)
 - **Methods:**
 - `debug(self, msg: str, center: bool=False, symbol: str='', *args, **kwargs)` â€” No docstring provided.
 - `info(self, msg: str, center: bool=False, symbol: str='', *args, **kwargs)` â€” No docstring provided.
- **class ColoredRichHandler** (bases: RichHandler)
 - **Methods:**
 - `get_level_text(self, record: logging.LogRecord) -> Text` â€” No docstring provided.

Functions

- `build_logger(logger_name: str, source_type: Optional[str]=None) -> Any` â€” No docstring provided.
- `center_header(message: str, symbol: str='') -> str` â€” No docstring provided.
- `configure_agno_logging(custom_default_logger: Optional[Any]=None, custom_agent_logger: Optional[Any]=None, custom_team_logger: Optional[Any]=None, custom_workflow_logger: Optional[Any]=None) -> None` â€” Util to set custom loggers. These will be used everywhere across the Agno library. Args: custom_default_logger: Default logger to use (overrides agent logger for default) custom_agent_logger: Custom logger for agent operations custom_team_logger: Custom logger for team operations custom_workflow_logger: Custom logger for workflow operations
- `log_debug(msg, center: bool=False, symbol: str='', log_level: Literal[1, 2]=1, *args, **kwargs)` â€” No docstring provided.
- `log_error(msg, *args, **kwargs)` â€” No docstring provided.
- `log_exception(msg, *args, **kwargs)` â€” No docstring provided.
- `log_info(msg, center: bool=False, symbol: str='', *args, **kwargs)` â€” No docstring provided.
- `log_warning(msg, *args, **kwargs)` â€” No docstring provided.
- `set_log_level_to_debug(source_type: Optional[str]=None, level: Literal[1, 2]=1)` â€” No docstring provided.
- `set_log_level_to_error(source_type: Optional[str]=None)` â€” No docstring provided.
- `set_log_level_to_info(source_type: Optional[str]=None)` â€” No docstring provided.
- `set_log_level_to_warning(source_type: Optional[str]=None)` â€” No docstring provided.
- `use_agent_logger()` â€” Switch the default logger to use the default agent logger
- `use_team_logger()` â€” Switch the default logger to use team_logger
- `use_workflow_logger()` â€” Switch the default logger to use workflow_logger

Module agno.utils.mcp

- **Source:** `libs/agno/agno/utils/mcp.py`

Functions

- `get_entrypoint_for_tool(tool: MCPTool, session: ClientSession) â€”` Return an entrypoint for an MCP tool. Args: tool: The MCP tool to create an entrypoint for session: The session to use Returns: Callable: The entrypoint function for the tool

- `prepare_command(command: str) -> list[str]` â€” Sanitize a command and split it into parts before using it to run a MCP server.

Module `agno.utils.media`

- **Source:** `libs/agno/agno/utils/media.py`

Classes

- `class SampleDataFileExtension` (bases: `str`, `Enum`)

Functions

- `download_file(url: str, output_path: str) -> None` â€” Download a file from a given URL and save it to the specified path. Args: `url (str)`: The URL of the file to download `output_path (str)`: The local path where the file should be saved Raises: `httpx.HTTPError`: If the download fails
- `download_image(url: str, output_path: str) -> bool` â€” Downloads an image from the specified URL and saves it to the given local path. Parameters: - `url (str)`: URL of the image to download. - `output_path (str)`: Local filesystem path to save the image
- `download_knowledge_filters_sample_data(num_files: int=5, file_extension: SampleDataFileExtension=SampleDataFileExtension.DOCX) -> List[str]` â€” Download sample data files with configurable file extension. Args: `num_files (int)`: Number of files to download `file_extension (SampleDataFileExtension)`: File extension type (DOCX, PDF, TXT, JSON) Returns: `List[str]`: List of paths to downloaded files
- `download_video(url: str, output_path: str) -> str` â€” Download video from URL
- `reconstruct_audio_from_dict(aud_data)` â€” Reconstruct an Audio object from dictionary data. Handles both base64-encoded content (from database) and regular audio data (`url/filepath`).
- `reconstruct_audio_list(audio: Optional[List[dict]]) -> Optional[List[Audio]]` â€” Reconstruct a list of Audio objects from list of dictionaries. Failed reconstructions are skipped with a warning logged.
- `reconstruct_file_from_dict(file_data)` â€” Reconstruct a File object from dictionary data. Handles both base64-encoded content (from database) and regular file data (`url/filepath`).
- `reconstruct_files(files: Optional[List[dict]]) -> Optional[List[File]]` â€” Reconstruct a list of File objects from list of dictionaries. Failed reconstructions are skipped with a warning logged.
- `reconstruct_image_from_dict(img_data)` â€” Reconstruct an Image object from dictionary data. Handles both base64-encoded content (from database) and regular image data (`url/filepath`).
- `reconstruct_images(images: Optional[List[dict]]) -> Optional[List[Image]]` â€” Reconstruct a list of Image objects from list of dictionaries. Failed reconstructions are skipped with a warning logged.
- `reconstruct_response_audio(audio: Optional[dict]) -> Optional[Audio]` â€” Reconstruct a single Audio object for response audio.
- `reconstruct_video_from_dict(vid_data)` â€” Reconstruct a Video object from dictionary data. Handles both base64-encoded content (from database) and regular video data (`url/filepath`).
- `reconstruct_videos(videos: Optional[List[dict]]) -> Optional[List[Video]]` â€” Reconstruct a list of Video objects from list of dictionaries. Failed reconstructions are skipped with a warning logged.
- `save_base64_data(base64_data: str, output_path: str) -> bool` â€” Saves base64 string to the specified path as bytes.
- `wait_for_media_ready(url: str, timeout: int=120, interval: int=5, verbose: bool=True) -> bool` â€” Wait for media to be ready at URL by polling with HEAD requests. Args: `url (str)`: The URL to check for media availability `timeout (int)`: Maximum time to wait in seconds (default: 120) `interval (int)`: Seconds between each check (default: 5) `verbose (bool)`: Whether to print progress messages (default: True) Returns: `bool`: True if media is ready, False if timeout reached

Module `agno.utils.merge_dict`

- **Source:** `libs/agno/agno/utils/merge_dict.py`

Functions

- `merge_dictionaries(a: Dict[str, Any], b: Dict[str, Any]) -> None` â€” Recursively merges two dictionaries. If there are conflicting keys, values from `a` will take precedence. Args: `a (Dict[str, Any])`: The first dictionary to be merged. `b (Dict[str, Any])`: The second dictionary, whose values will take precedence. Returns: `None`: The function modifies the first dictionary in place.
- `merge_parallel_session_states(original_state: Dict[str, Any], modified_states: List[Dict[str, Any]]) -> None` â€” Smart merge for parallel session states that only applies actual changes. This prevents parallel steps from overwriting each otherâ€™s changes.

Module `agno.utils.message`

- **Source:** `libs/agno/agno/utils/message.py`

Functions

- `filter_tool_calls(messages: List[Message], max_tool_calls: int) -> None` â€” Filter messages (in-place) to keep only the most recent N tool calls. Args: `messages: List[Message]`: List of messages to filter (modified in-place) `max_tool_calls: int`: Number of recent tool calls to keep
- `get_text_from_message(message: Union[List, Dict, str, Message, BaseModel]) -> str` â€” Return the user texts from the message

Module `agno.utils.models.ai_foundry`

- **Source:** `libs/agno/agno/utils/models/ai_foundry.py`

Functions

- `format_message(message: Message) -> Dict[str, Any]` â€” Format a message into the format expected by OpenAI. Args: `message (Message)`: The message to format. Returns: `Dict[str, Any]`: The formatted message.

Module `agno.utils.models.claude`

- **Source:** `libs/agno/agno/utils/models/claude.py`

Classes

- `class MCPServerConfiguration`
- `class MCPToolConfiguration`

Functions

- `format_messages(messages: List[Message]) -> Tuple[List[Dict[str, str]], str]` â€” Process the list of messages and separate them into API messages and system messages. Args: `messages (List[Message])`: The list of messages to process. Returns: `Tuple[List[Dict[str, str]], str]`: A tuple containing the list of API messages and the concatenated system messages.
- `format_tools_for_model(tools: Optional[List[Dict[str, Any]])=None) -> Optional[List[Dict[str, Any]]]` â€” Transforms function definitions into a format accepted by the Anthropic API.

Module `agno.utils.models.cohere`

- **Source:** `libs/agno/agno/utils/models/cohere.py`

Functions

- `format_messages(messages: List[Message]) -> List[Dict[str, Any]]` â€” Format messages for the Cohere API. Args: `messages (List[Message])`: The list of messages. Returns: `List[Dict[str, Any]]`: The formatted messages.

Module `agno.utils.models.llama`

- **Source:** `libs/agno/agno/utils/models/llama.py`

Functions

- `format_message(message: Message, openai_like: bool=False, tool_calls: bool=False) -> Dict[str, Any]` â€” Format a message into the format expected by Llama API. Args: `message (Message)`: The message to format. `openai_like (bool)`: Whether to format the message as an OpenAI-like message. Returns: `Dict[str, Any]`: The formatted message.

Module agno.utils.models.mistral

- **Source:** `libs/agno/agno/utils/models/mistral.py`

Functions

- `format_messages(messages: List[Message]) -> List[MistralMessage]` â€” No docstring provided.

Module agno.utils.models.openai_responses

- **Source:** `libs/agno/agno/utils/models/openai_responses.py`

Functions

- `images_to_message(images: Sequence[Image]) -> List[Dict[str, Any]]` â€” Add images to a message for the model. By default, we use the OpenAI image format but other Models can override this method to use a different image format. Args: images: Sequence of images in various formats: - str: base64 encoded image, URL, or file path - Dict: pre-formatted image data - bytes: raw image data Returns: Message content with images added in the format expected by the model
- `sanitize_response_schema(schema: dict)` â€” Recursively sanitize a Pydantic-generated JSON schema to comply with OpenAIâ€™s response_format rules: - Sets â€œadditionalPropertiesâ€: false for all object types to disallow extra fields, EXCEPT when additionalProperties is already defined with a schema (Dict types). - Removes â€œdefaultâ€: null from optional fields. - Ensures that all fields defined in â€œpropertiesâ€ are listed in â€œrequiredâ€, making every property explicitly required as per OpenAIâ€™s expectations, EXCEPT for Dict fields which should not be in the required array.

Module agno.utils.models.schema_utils

- **Source:** `libs/agno/agno/utils/models/schema_utils.py`

Utility functions for handling JSON schemas across different model providers. This module provides model-agnostic schema transformations and validations.

Functions

- `get_dict_value_type(schema: Dict[str, Any]) -> str` â€” Extract the value type from a Dict field schema. Args: schema: JSON schema dictionary for a Dict field Returns: str: The type of values in the dictionary (e.g., â€œintegerâ€, â€œstringâ€)
- `get_response_schema_for_provider(output_schema: Type[BaseModel], provider: str) -> Dict[str, Any]` â€” Get a properly formatted response schema for a specific model provider. Args: output_schema: Pydantic BaseModel class provider: Model provider name Returns: Dict[str, Any]: Provider-specific schema
- `is_dict_field(schema: Dict[str, Any]) -> bool` â€” Check if a schema represents a Dict[str, T] field. Args: schema: JSON schema dictionary Returns: bool: True if the schema represents a Dict field
- `normalize_schema_for_provider(schema: Dict[str, Any], provider: str) -> Dict[str, Any]` â€” Normalize a Pydantic-generated schema for a specific model provider. Args: schema: Original Pydantic JSON schema provider: Model provider name (â€œopenaiâ€, â€œgeminiâ€, â€œanthropicâ€, etc.) Returns: Dict[str, Any]: Normalized schema for the provider

Module agno.utils.models.watsonx

- **Source:** `libs/agno/agno/utils/models/watsonx.py`

Functions

- `format_images_for_message(message: Message, images: Sequence[Image]) -> Message` â€” Format an image into the format expected by WatsonX.

Module agno.utils.openai

- **Source:** `libs/agno/agno/utils/openai.py`

Functions

- `audio_to_message(audio: Sequence[Audio]) -> List[Dict[str, Any]]` â€” Add audio to a message for the model. By default, we use the OpenAI audio format but other Models can override this method to use a different audio format. Args: audio: Pre-formatted audio data like { â€œcontentâ€: encoded_string, â€œformatâ€: â€œwavâ€ } Returns: Message content with audio added in the format expected by the model
- `images_to_message(images: Sequence[Image]) -> List[Dict[str, Any]]` â€” Add images to a message for the model. By default, we use the OpenAI image format but other Models can override this method to use a different image format. Args: images: Sequence of images in various formats: - str: base64 encoded image, URL, or file path - Dict: pre-formatted image data - bytes: raw image data Returns: Message content with images added in the format expected by the model
- `process_image(image: Image) -> Optional[Dict[str, Any]]` â€” Process an image based on the format.

Module agno.utils.pickle

- **Source:** `libs/agno/agno/utils/pickle.py`

Functions

- `pickle_object_to_file(obj: Any, file_path: Path) -> Any` â€” Pickles and saves object to file_path
- `unpickle_object_from_file(file_path: Path, verify_class: Optional[Any]=None) -> Any` â€” Reads the contents of file_path and unpickles the binary content into an object. If verify_class is provided, checks if the object is an instance of that class.

Module agno.utils.pprint

- **Source:** `libs/agno/agno/utils/pprint.py`

Functions

- `async aprint_run_response(run_response: Union[RunOutput, AsyncIterable[RunOutput], TeamRunOutput, AsyncIterable[TeamRunOutput], WorkflowRunOutput, AsyncIterable[WorkflowRunOutputEvent]], markdown: bool=False, show_time: bool=False) -> None` â€” No docstring provided.
- `pprint_run_response(run_response: Union[RunOutput, Iterable[RunOutputEvent], TeamRunOutput, Iterable[TeamRunOutputEvent], WorkflowRunOutput, Iterable[WorkflowRunOutputEvent]], markdown: bool=False, show_time: bool=False) -> None` â€” No docstring provided.

Module agno.utils.print_response.agent

- **Source:** `libs/agno/agno/utils/print_response/agent.py`

Functions

- `async aprint_response(agent: 'Agent', input: Union[List, Dict, str, Message, BaseModel, List[Message]], session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, knowledge_filters: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, markdown: bool=False, show_message: bool=True, show_reasoning: bool=True, show_full_reasoning: bool=False, tags_to_include_in_markdown: Set[str]={'think', 'thinking'}, console: Optional[Any]=None, add_history_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, metadata: Optional[Dict[str, Any]]=None, **kwargs: Any) â€” No docstring provided.`
- `async aprint_response_stream(agent: 'Agent', input: Union[List, Dict, str, Message, BaseModel, List[Message]], session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, stream_events: bool=False, stream_intermediate_steps: bool=False, knowledge_filters: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, markdown: bool=False, show_message: bool=True, show_reasoning: bool=True, show_full_reasoning: bool=False, tags_to_include_in_markdown: Set[str]={'think', 'thinking'}, console: Optional[Any]=None, add_history_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, metadata: Optional[Dict[str, Any]]=None, **kwargs: Any) â€” No docstring provided.`
- `build_panels(run_response: RunOutput, response_timer: Timer, output_schema: Optional[BaseModel]=None, show_reasoning: bool=True, show_full_reasoning: bool=False, tags_to_include_in_markdown: Optional[Set[str]]=None, markdown: bool=False) â€” No docstring provided.`
- `build_panels_stream(response_content: Union[str, JSON, Markdown], response_event: RunOutputEvent, response_timer: Timer, response_reasoning_content_buffer: str, reasoning_steps: List[ReasoningStep], show_reasoning: bool=True, show_full_reasoning: bool=False, accumulated_tool_calls: Optional[List]=None) â€” No docstring provided.`
- `print_response(agent: 'Agent', input: Union[List, Dict, str, Message, BaseModel, List[Message]], session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, knowledge_filters: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, markdown: bool=False, show_message: bool=True, show_reasoning: bool=True, show_full_reasoning: bool=False,`

tags_to_include_in_markdown: Set[str]={'think', 'thinking'}, console: Optional[Any]=None, add_history_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, metadata: Optional[Dict[str, Any]]=None, **kwargs: Any) â€” No docstring provided.

- print_response_stream(agent: 'Agent', input: Union[List, Dict, str, Message, BaseModel, List[Message]], session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, stream_events: bool=False, stream_intermediate_steps: bool=False, knowledge_filters: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, markdown: bool=False, show_message: bool=True, show_reasoning: bool=True, show_full_reasoning: bool=False, tags_to_include_in_markdown: Set[str]={'think', 'thinking'}, console: Optional[Any]=None, add_history_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, metadata: Optional[Dict[str, Any]]=None, **kwargs: Any) â€” No docstring provided.

Module agno.utils.print_response.team

- Source:** libs/agno/agno/utils/print_response/team.py

Functions

- async aprint_response(team: 'Team', input: Union[List, Dict, str, Message, BaseModel, List[Message]], console: Optional[Any]=None, show_message: bool=True, show_reasoning: bool=True, show_full_reasoning: bool=False, tags_to_include_in_markdown: Optional[Set[str]]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, markdown: bool=False, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, **kwargs: Any) -> None â€” No docstring provided.
- async aprint_response_stream(team: 'Team', input: Union[List, Dict, str, Message, BaseModel, List[Message]], console: Optional[Any]=None, show_message: bool=True, show_reasoning: bool=True, show_full_reasoning: bool=False, tags_to_include_in_markdown: Optional[Set[str]]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, markdown: bool=False, stream_events: bool=False, stream_intermediate_steps: bool=False, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, **kwargs: Any) -> None â€” No docstring provided.
- print_response(team: 'Team', input: Union[List, Dict, str, Message, BaseModel, List[Message]], console: Optional[Any]=None, show_message: bool=True, show_reasoning: bool=True, show_full_reasoning: bool=False, tags_to_include_in_markdown: Optional[Set[str]]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, markdown: bool=False, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, **kwargs: Any) -> None â€” No docstring provided.
- print_response_stream(team: 'Team', input: Union[List, Dict, str, Message, BaseModel, List[Message]], console: Optional[Any]=None, show_message: bool=True, show_reasoning: bool=True, show_full_reasoning: bool=False, tags_to_include_in_markdown: Optional[Set[str]]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, audio: Optional[Sequence[Audio]]=None, images: Optional[Sequence[Image]]=None, videos: Optional[Sequence[Video]]=None, files: Optional[Sequence[File]]=None, markdown: bool=False, stream_events: bool=False, stream_intermediate_steps: bool=False, knowledge_filters: Optional[Dict[str, Any]]=None, add_history_to_context: Optional[bool]=None, dependencies: Optional[Dict[str, Any]]=None, add_dependencies_to_context: Optional[bool]=None, add_session_state_to_context: Optional[bool]=None, metadata: Optional[Dict[str, Any]]=None, debug_mode: Optional[bool]=None, **kwargs: Any) -> None â€” No docstring provided.

Module agno.utils.print_response.workflow

- Source:** libs/agno/agno/utils/print_response/workflow.py

Functions

- async aprint_response(workflow: 'Workflow', input: Union[str, Dict[str, Any], List[Any], BaseModel, List[Message]], additional_data: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, audio: Optional[List[Audio]]=None, images: Optional[List[Image]]=None, videos: Optional[List[Video]]=None, files: Optional[List[File]]=None, markdown: bool=True, show_time: bool=True, show_step_details: bool=True, console: Optional[Any]=None, **kwargs: Any) -> None â€” Print workflow execution with rich formatting (non-streaming)
- async aprint_response_stream(workflow: 'Workflow', input: Union[str, Dict[str, Any], List[Any], BaseModel, List[Message]], additional_data: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, audio: Optional[List[Audio]]=None, images: Optional[List[Image]]=None, videos: Optional[List[Video]]=None, files: Optional[List[File]]=None, markdown: bool=False, stream_events: bool=False, stream_intermediate_steps: bool=False, markdown: bool=True, show_time: bool=True, show_step_details: bool=True, console: Optional[Any]=None, **kwargs: Any) -> None â€” Print workflow execution with clean streaming - orange step blocks displayed once
- format_step_content_for_display(step_output: StepOutput) -> str â€” Format content for display, handling structured outputs. Works for both raw content and StepOutput objects.
- print_response(workflow: 'Workflow', input: Union[str, Dict[str, Any], List[Any], BaseModel, List[Message]], user_id: Optional[str]=None, session_id: Optional[str]=None, additional_data: Optional[Dict[str, Any]]=None, audio: Optional[List[Audio]]=None, images: Optional[List[Image]]=None, videos: Optional[List[Video]]=None, files: Optional[List[File]]=None, markdown: bool=True, show_time: bool=True, show_step_details: bool=True, console: Optional[Any]=None, **kwargs: Any) -> None â€” Print workflow execution with rich formatting (non-streaming)
- print_response_stream(workflow: 'Workflow', input: Union[str, Dict[str, Any], List[Any], BaseModel, List[Message]], user_id: Optional[str]=None, session_id: Optional[str]=None, additional_data: Optional[Dict[str, Any]]=None, audio: Optional[List[Audio]]=None, images: Optional[List[Image]]=None, videos: Optional[List[Video]]=None, files: Optional[List[File]]=None, stream_events: bool=False, stream_intermediate_steps: bool=False, markdown: bool=True, show_time: bool=True, show_step_details: bool=True, console: Optional[Any]=None, **kwargs: Any) -> None â€” Print workflow execution with clean streaming
- print_step_output_recursive(step_output: StepOutput, step_number: int, markdown: bool, console, depth: int=0) -> None â€” Recursively print step output and its nested steps

Module agno.utils.prompts

- Source:** libs/agno/agno/utils/prompts.py

Functions

- get_json_output_prompt(output_schema: Union[str, list, BaseModel]) -> str â€” Return the JSON output prompt for the Agent. This is added to the system prompt when the output_schema is set and structured_outputs is False.
- get_response_model_format_prompt(output_schema: Type[BaseModel]) -> str â€” Return the format prompt for the response model.

Module agno.utils.reasoning

- Source:** libs/agno/agno/utils/reasoning.py

Functions

- add_reasoning_metrics_to_metadata(run_response: Union['RunOutput', 'TeamRunOutput'], reasoning_time_taken: float) -> None â€” No docstring provided.
- add_reasoning_step_to_metadata(run_response: Union['RunOutput', 'TeamRunOutput'], reasoning_step: ReasoningStep) -> None â€” No docstring provided.
- append_to_reasoning_content(run_response: Union['RunOutput', 'TeamRunOutput'], content: str) -> None â€” Helper to append content to the reasoning_content field.
- extract_thinking_content(content: str) -> Tuple[Optional[str], str] â€” Extract thinking content from response text between tags.
- update_run_output_with_reasoning(run_response: Union['RunOutput', 'TeamRunOutput'], reasoning_steps: List[ReasoningStep], reasoning_agent_messages: List[Message]) -> None â€” No docstring provided.

Module agno.utils.response

- Source:** libs/agno/agno/utils/response.py

Functions

- async async_generator_wrapper(event: Union[RunOutputEvent, TeamRunOutputEvent]) -> AsyncIterator[Union[RunOutputEvent, TeamRunOutputEvent]] â€” No docstring provided.
- build_reasoning_step_panel(step_idx: int, step: ReasoningStep, show_full_reasoning: bool=False, color: str='green') â€” No docstring provided.
- check_if_run_cancelled(run_output: Union[RunOutput, RunOutputEvent, TeamRunOutput, TeamRunOutputEvent]) â€” No docstring provided.
- create_panel(content, title, border_style='blue') â€” No docstring provided.
- create_paused_run_output_panel(run_output: Union[RunPausedEvent, RunOutput]) â€” No docstring provided.
- escape_markdown_tags(content: str, tags: Set[str]) -> str â€” Escape special tags in markdown content.
- format_tool_calls(tool_calls: List[ToolExecution]) -> List[str] â€” Format tool calls for display in a readable format. Args: tool_calls: List of tool call dictionaries containing tool_name and tool_args Returns: List[str]: List of formatted tool call strings
- generator_wrapper(event: Union[RunOutputEvent, TeamRunOutputEvent]) -> Iterator[Union[RunOutputEvent, TeamRunOutputEvent]] â€” No docstring provided.
- get_paused_content(run_output: RunOutput) -> str â€” No docstring provided.

Module agno.utils.response_iterator

- **Source:** libs/agno/agno/utils/response_iterator.py

Classes

- **class** ResponseIterator
 - **Methods:**
 - add(self, item) â€” No docstring provided.

Module agno.utils.safe_formatter

- **Source:** libs/agno/agno/utils/safe_formatter.py

Classes

- **class** SafeFormatter (bases: string.Formatter)
 - **Methods:**
 - format_field(self, value, format_spec) â€” If Python sees something like â€”somekey:â€œstuffâ€œâ€” , it tries to parse it as a format spec and might raise ValueError. We catch it here and just return the literal placeholder.
 - get_value(self, key, args, kwargs) â€” Handle missing keys by returning â€”{key}â€”.

Module agno.utils.serialize

- **Source:** libs/agno/agno/utils/serialize.py

JSON serialization utilities for handling datetime and enum objects.

Functions

- json_serializer(obj: Any) -> Any â€” Custom JSON serializer for objects not serializable by default json module. Handles: - datetime, date, time objects -> ISO format strings - Enum objects -> their values (or names if values are not JSON-serializable) - All other objects -> string representation Args: obj: Object to serialize Returns: JSON-serializable representation of the object

Module agno.utils.shell

- **Source:** libs/agno/agno/utils/shell.py

Functions

- run_shell_command(args: List[str], tail: int=100) -> str â€” No docstring provided.

Module agno.utils.streamlit

- **Source:** libs/agno/agno/utils/streamlit.py

Functions

- about_section(description: str) â€” About section
- add_message(role: str, content: str, tool_calls: Optional[List[Dict[str, Any]]]=None) -> None â€” Add a message to the session state.
- display_chat_messages() -> None â€” Display all chat messages from session state.
- display_response(agent: Agent, question: str) -> None â€” Handle agent response with streaming and tool call display.
- display_tool_calls(container, tools: List[Any]) â€” Display tool calls in expandable sections.
- export_chat_history(app_name: str='Chat') -> str â€” Export chat history to markdown.
- get_model_from_id(model_id: str) â€” Get a model instance from a model ID string.
- get_model_with_provider(model_name: str) â€” Get a model instance by inferring the correct provider from the model name. Args: model_name: Model name (e.g., â€œgpt-4oâ€œ, â€œclaude-4-sonnetâ€œ, â€œgemini-2.5-proâ€œ) Returns: Model instance with correct provider
- initialize_agent(model_id: str, agent_creation_callback: Callable[[str, Optional[str]], Agent]) -> Agent â€” Initialize or get agent with proper session management.
- knowledge_base_info_widget(agent: Agent) -> None â€” Display knowledge base information widget.
- reset_session_state(agent: Agent) -> None â€” Update session state.
- session_selector_widget(agent: Agent, model_id: str, agent_creation_callback: Callable[[str, str], Agent]) -> None â€” Session selector widget

Module agno.utils.string

- **Source:** libs/agno/agno/utils/string.py

Functions

- generate_id(seed: Optional[str]=None) -> str â€” Generate a deterministic UUID5 based on a seed string. If no seed is provided, generate a random UUID4. Args: seed (str): The seed string to generate the UUID from. Returns: str: A deterministic UUID5 string.
- generate_id_from_name(name: Optional[str]=None) -> str â€” Generate a deterministic ID from a name string. If no name is provided, generate a random UUID4. Args: name (str): The name string to generate the ID from.
- hash_string_sha256(input_string) â€” No docstring provided.
- is_valid_uuid(uuid_str: str) -> bool â€” Check if a string is a valid UUID Args: uuid_str: String to check Returns: bool: True if string is a valid UUID, False otherwise
- parse_response_model_str(content: str, output_schema: Type[BaseModel]) -> Optional[BaseModel] â€” No docstring provided.
- url_safe_string(input_string) â€” No docstring provided.

Module agno.utils.team

- **Source:** libs/agno/agno/utils/team.py

Functions

- add_interaction_to_team_run_context(team_run_context: Dict[str, Any], member_name: str, task: str, run_response: Union[RunOutput, TeamRunOutput]) -> None â€” No docstring provided.
- format_member_agent_task(task_description: str, team_member_interactions_str: Optional[str]=None, team_history_str: Optional[str]=None) -> str â€” No docstring provided.
- get_member_id(member: Union[Agent, 'Team']) -> str â€” Get the ID of a member If the member has an agent_id or team_id, use that if it is not a valid UUID. Then if the member has a name, convert that to a URL safe string. Then if the member has the default UUID ID, use that. Otherwise, return None.
- get_team_member_interactions_str(team_run_context: Dict[str, Any]) -> str â€” No docstring provided.
- get_team_run_context_audio(team_run_context: Dict[str, Any]) -> List[Audio] â€” No docstring provided.
- get_team_run_context_files(team_run_context: Dict[str, Any]) -> List[File] â€” No docstring provided.
- get_team_run_context_images(team_run_context: Dict[str, Any]) -> List[Image] â€” No docstring provided.
- get_team_run_context_videos(team_run_context: Dict[str, Any]) -> List[Video] â€” No docstring provided.

Module agno.utils.timer

- **Source:** libs/agno/agno/utils/timer.py

Classes

- **class** `Timer`
 - Timer class for timing code execution
 - **Methods:**
 - `elapsed(self)` -> float â€” No docstring provided.
 - `start(self)` -> float â€” No docstring provided.
 - `stop(self)` -> float â€” No docstring provided.
 - `to_dict(self)` â€” No docstring provided.

Module agno.utils.tools

- **Source:** libs/agno/agno/utils/tools.py

Functions

- `extract_tool_call_from_string(text: str, start_tag: str='<tool_call>', end_tag: str='</tool_call>')` â€” No docstring provided.
- `extract_tool_from_xml(xml_str)` â€” No docstring provided.
- `get_function_call_for_tool_call(tool_call: Dict[str, Any], functions: Optional[Dict[str, Function]]=None)` -> Optional[FunctionCall] â€” No docstring provided.
- `get_function_call_for_tool_execution(tool_execution: ToolExecution, functions: Optional[Dict[str, Function]]=None)` -> Optional[FunctionCall] â€” No docstring provided.
- `remove_function_calls_from_string(text: str, start_tag: str='<function_calls>', end_tag: str='</function_calls>')` â€” Remove multiple function calls from a string.
- `remove_tool_calls_from_string(text: str, start_tag: str='<tool_call>', end_tag: str='</tool_call>')` â€” Remove multiple tool calls from a string.

Module agno.utils.web

- **Source:** libs/agno/agno/utils/web.py

Functions

- `open_html_file(file_path: Path)` â€” Opens the specified HTML file in the default web browser. :param file_path: Path to the HTML file.

Module agno.utils.whatsapp

- **Source:** libs/agno/agno/utils/whatsapp.py

Functions

- `get_access_token()` -> str â€” No docstring provided.
- `get_media(media_id: str)` -> Union[dict, bytes] â€” Sends a GET request to the Facebook Graph API to retrieve media information. Args: media_id (str): The ID of the media to retrieve.
- `async get_media_async(media_id: str)` -> Union[dict, bytes] â€” Sends a GET request to the Facebook Graph API to retrieve media information. Args: media_id (str): The ID of the media to retrieve.
- `get_phone_number_id()` -> str â€” No docstring provided.
- `send_image_message(media_id: str, recipient: str, text: Optional[str]=None)` â€” Send an image message to a WhatsApp user (synchronous version). Args: image: The media id for the image to send recipient: Recipientâ€™s WhatsApp ID or phone number (e.g., â€œ+1234567890â€œ). text: Caption for the image Returns: Success message with message ID
- `async send_image_message_async(media_id: str, recipient: str, text: Optional[str]=None)` â€” Send an image message to a WhatsApp user (asynchronous version). Args: media_id: The media id for the image to send recipient: Recipientâ€™s WhatsApp ID or phone number (e.g., â€œ+1234567890â€œ). text: Caption for the image Returns: Success message with message ID
- `typing_indicator(message_id: Optional[str]=None)` â€” No docstring provided.
- `async typing_indicator_async(message_id: Optional[str]=None)` â€” No docstring provided.
- `upload_media(media_data: bytes, mime_type: str, filename: str='file')` â€” Sends a POST request to the Facebook Graph API to upload media for WhatsApp. Args: media_data: Bytes buffer containing the file data mime_type (str): The MIME type of the file filename (str): The name to use for the file in the upload. Defaults to â€œfileâ€
- `async upload_media_async(media_data: bytes, mime_type: str, filename: str='file')` â€” Sends a POST request to the Facebook Graph API to upload media for WhatsApp. Args: media_data: Bytes buffer containing the file data mime_type (str): The MIME type of the file filename (str): The name to use for the file in the upload. Defaults to â€œfileâ€

Module agno.utils.yaml_io

- **Source:** libs/agno/agno/utils/yaml_io.py

Functions

- `read_yaml_file(file_path: Optional[Path])` -> Optional[Dict[str, Any]] â€” No docstring provided.
- `write_yaml_file(file_path: Optional[Path], data: Optional[Dict[str, Any]], **kwargs)` -> None â€” No docstring provided.

Module agno.vectordb.base

- **Source:** libs/agno/agno/vectordb/base.py

Classes

- **class** `VectorDb` (bases: ABC)
 - Base class for Vector Databases
 - **Methods:**
 - `async async_create(self)` -> None â€” No docstring provided.
 - `async async_drop(self)` -> None â€” No docstring provided.
 - `async async_exists(self)` -> bool â€” No docstring provided.
 - `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None)` -> None â€” No docstring provided.
 - `async_name_exists(self, name: str)` -> bool â€” No docstring provided.
 - `async async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None)` -> List[Document] â€” No docstring provided.
 - `async async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None)` -> None â€” No docstring provided.
 - `content_hash_exists(self, content_hash: str)` -> bool â€” No docstring provided.
 - `create(self)` -> None â€” No docstring provided.
 - `delete(self)` -> bool â€” No docstring provided.
 - `delete_by_content_id(self, content_id: str)` -> bool â€” No docstring provided.
 - `delete_by_id(self, id: str)` -> bool â€” No docstring provided.

- `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` No docstring provided.
- `delete_by_name(self, name: str) -> bool` No docstring provided.
- `drop(self) -> None` No docstring provided.
- `exists(self) -> bool` No docstring provided.
- `get_supported_search_types(self) -> List[str]` No docstring provided.
- `id_exists(self, id: str) -> bool` No docstring provided.
- `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` No docstring provided.
- `name_exists(self, name: str) -> bool` No docstring provided.
- `optimize(self) -> None` No docstring provided.
- `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` No docstring provided.
- `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` No docstring provided.
- `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` No docstring provided.
- `upsert_available(self) -> bool` No docstring provided.

Module `agno.vectordb.cassandra.cassandra`

- **Source:** `libs/agno/agno/vectordb/cassandra/cassandra.py`

Classes

- **class `Cassandra`** (bases: `VectorDb`)
 - **Methods:**
 - `async async_create(self) -> None` Create the table asynchronously by running in a thread.
 - `async async_drop(self) -> None` Drop the table asynchronously by running in a thread.
 - `async async_exists(self) -> bool` Check if table exists asynchronously by running in a thread.
 - `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` Insert documents asynchronously by running in a thread.
 - `async async_name_exists(self, name: str) -> bool` Check if a document with given name exists asynchronously.
 - `async async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` Search asynchronously by running in a thread.
 - `async async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` Upsert documents asynchronously by running in a thread.
 - `content_hash_exists(self, content_hash: str) -> bool` Check if a document exists by content hash.
 - `create(self) -> None` Create the table in Cassandra for storing vectors and metadata.
 - `delete(self) -> bool` Delete all documents in the table.
 - `delete_by_content_hash(self, content_hash: str) -> bool` Delete documents by content hash. Args: `content_hash (str)`: The content hash to delete Returns: `bool`: True if documents were deleted, False otherwise
 - `delete_by_content_id(self, content_id: str) -> bool` Delete documents by content ID. Args: `content_id (str)`: The content ID to delete Returns: `bool`: True if documents were deleted, False otherwise
 - `delete_by_id(self, id: str) -> bool` Delete a document by its ID. Args: `id (str)`: The document ID to delete Returns: `bool`: True if document was deleted, False otherwise
 - `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` Delete documents by metadata. Args: `metadata (Dict[str, Any])`: The metadata to match for deletion Returns: `bool`: True if documents were deleted, False otherwise
 - `delete_by_name(self, name: str) -> bool` Delete documents by name. Args: `name (str)`: The document name to delete Returns: `bool`: True if documents were deleted, False otherwise
 - `drop(self) -> None` Drop the vector table in Cassandra.
 - `exists(self) -> bool` Check if the table exists in Cassandra.
 - `get_supported_search_types(self) -> List[str]` Get the supported search types for this vector database.
 - `id_exists(self, id: str) -> bool` Check if a document exists by ID.
 - `initialize_table(self)` No docstring provided.
 - `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` No docstring provided.
 - `name_exists(self, name: str) -> bool` Check if a document exists by name.
 - `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` Keyword-based search on document metadata.
 - `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` Update the metadata for a document. Args: `content_id (str)`: The content ID to update metadata (`Dict[str, Any]`): The metadata to update
 - `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` Insert or update documents based on primary key.
 - `vector_search(self, query: str, limit: int=5) -> List[Document]` Vector similarity search implementation.

Module `agno.vectordb.cassandra.extra_param_mixin`

- **Source:** `libs/agno/agno/vectordb/cassandra/extra_param_mixin.py`

Classes

- **class `ExtraParamMixin`** (bases: `BaseTableMixin`)

Module `agno.vectordb.cassandra.index`

- **Source:** `libs/agno/agno/vectordb/cassandra/index.py`

Classes

- **class `AgnoMetadataVectorCassandraTable`** (bases: `ExtraParamMixin`, `TypeNormalizerMixin`, `MetadataMixin`, `VectorMixin`, `BaseTable`)

Module `agno.vectordb.chroma.chromadb`

- **Source:** `libs/agno/agno/vectordb/chroma/chromadb.py`

Classes

- **class `ChromaDb`** (bases: `VectorDb`)
 - **Methods:**
 - `async async_create(self) -> None` Create the collection asynchronously by running in a thread.
 - `async async_drop(self) -> None` Drop the collection asynchronously by running in a thread.
 - `async async_exists(self) -> bool` Check if collection exists asynchronously by running in a thread.

- `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` Insert documents asynchronously by running in a thread.
- `async async_name_exists(self, name: str) -> bool` Check if a document with given name exists asynchronously.
- `async async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` Search asynchronously by running in a thread.
- `async async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` Upsert documents asynchronously by running in a thread.
- `client(self) -> ClientAPI` No docstring provided.
- `content_hash_exists(self, content_hash: str) -> bool` Check if documents with the given content hash exist.
- `create(self) -> None` Create the collection in ChromaDb.
- `delete(self) -> bool` No docstring provided.
- `delete_by_content_id(self, content_id: str) -> bool` Delete documents by content ID.
- `delete_by_id(self, id: str) -> bool` Delete document by ID.
- `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` Delete documents by metadata.
- `delete_by_name(self, name: str) -> bool` Delete documents by name.
- `drop(self) -> None` Delete the collection.
- `exists(self) -> bool` Check if the collection exists.
- `get_count(self) -> int` Get the count of documents in the collection.
- `get_supported_search_types(self) -> List[str]` Get the supported search types for this vector database.
- `id_exists(self, id: str) -> bool` Check if a document with the given ID exists in the collection. Args: id (str): The document ID to check. Returns: bool: True if the document exists, False otherwise.
- `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` Insert documents into the collection. Args: documents (List[Document]): List of documents to insert filters (Optional[Dict[str, Any]]): Filters to merge with document metadata
- `name_exists(self, name: str) -> bool` Check if a document with a given name exists in the collection. Args: name (str): Name of the document to check. Returns: bool: True if document exists, False otherwise.
- `optimize(self) -> None` No docstring provided.
- `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` Search the collection for a query. Args: query (str): Query to search for. limit (int): Number of results to return. filters (Optional[Dict[str, Any]]): Filters to apply while searching. Supports ChromaDB's filtering operators: - \$eq, \$ne: Equality/Inequality - \$gt, \$gte, \$lt, \$lte: Numeric comparisons - \$in, \$nin: List inclusion/exclusion - \$and, \$or: Logical operators Returns: List[Document]: List of search results.
- `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` Update the metadata for documents with the given content_id. Args: content_id (str): The content ID to update metadata (Dict[str, Any]): The metadata to update
- `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` Upsert documents into the collection. Args: documents (List[Document]): List of documents to upsert filters (Optional[Dict[str, Any]]): Filters to apply while upserting
- `upsert_available(self) -> bool` Check if upsert is available in ChromaDB.

Module `agno.vectordb.clickhouse.clickhousedb`

- **Source:** `libs/agno/agno/vectordb/clickhouse/clickhousedb.py`

Classes

- **class** `Clickhouse` (bases: `VectorDb`)
 - **Methods:**
 - `async async_create(self) -> None` Create database and table asynchronously.
 - `async async_drop(self) -> None` Drop the table asynchronously.
 - `async async_exists(self) -> bool` No docstring provided.
 - `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` Insert documents asynchronously.
 - `async async_name_exists(self, name: str) -> bool` Check if a document with given name exists asynchronously.
 - `async async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` Search for documents asynchronously.
 - `async async_table_exists(self) -> bool` Check if a table exists asynchronously.
 - `async async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` Upsert documents asynchronously.
 - `content_hash_exists(self, content_hash: str) -> bool` Validate if a row with this content_hash exists or not Args: content_hash (str): Content hash to check
 - `create(self) -> None` No docstring provided.
 - `delete(self) -> bool` No docstring provided.
 - `delete_by_content_id(self, content_id: str) -> bool` Delete documents by content ID. Args: content_id (str): The content ID to delete Returns: bool: True if documents were deleted, False otherwise
 - `delete_by_id(self, id: str) -> bool` Delete a document by its ID. Args: id (str): The document ID to delete Returns: bool: True if document was deleted, False otherwise
 - `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` Delete documents by metadata. Args: metadata (Dict[str, Any]): The metadata to match for deletion Returns: bool: True if documents were deleted, False otherwise
 - `delete_by_name(self, name: str) -> bool` Delete documents by name. Args: name (str): The document name to delete Returns: bool: True if documents were deleted, False otherwise
 - `drop(self) -> None` No docstring provided.
 - `exists(self) -> bool` No docstring provided.
 - `get_count(self) -> int` No docstring provided.
 - `get_supported_search_types(self) -> List[str]` Get the supported search types for this vector database.
 - `id_exists(self, id: str) -> bool` Validate if a row with this id exists or not Args: id (str): Id to check
 - `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` No docstring provided.
 - `name_exists(self, name: str) -> bool` Validate if a row with this name exists or not Args: name (str): Name to check
 - `optimize(self) -> None` No docstring provided.
 - `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` No docstring provided.
 - `table_exists(self) -> bool` No docstring provided.
 - `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` Update the metadata for documents with the given content_id. Args: content_id (str): The content ID to update metadata (Dict[str, Any]): The metadata to update
 - `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` Upsert documents into the database.
 - `upsert_available(self) -> bool` No docstring provided.

Module `agno.vectordb.clickhouse.index`

- **Source:** `libs/agno/agno/vectordb/clickhouse/index.py`

Classes

- `class HNSW` (bases: `BaseModel`)

Module `agno.vectordb.couchbase.couchbase`

- **Source:** `libs/agno/agno/vectordb/couchbase/couchbase.py`

Classes

- `class CouchbaseSearch` (bases: `VectorDb`)
 - Couchbase Vector Database implementation with FTS (Full Text Search) index support.
 - **Methods:**
 - `async __async_get_doc_from_kv(self, response: AsyncSearchIndex) -> List[Document]` â€” Convert search results to Document objects by fetching full documents from KV store concurrently. Args: `response: SearchResult` from Couchbase search query Returns: List of Document objects
 - `__get_doc_from_kv(self, response: SearchResult) -> List[Document]` â€” Convert search results to Document objects by fetching full documents from KV store. Args: `response: SearchResult` from Couchbase search query Returns: List of Document objects
 - `async async_create(self) -> None` â€” No docstring provided.
 - `async async_drop(self) -> None` â€” No docstring provided.
 - `async async_exists(self) -> bool` â€” No docstring provided.
 - `async async_id_exists(self, id: str) -> bool` â€” No docstring provided.
 - `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” No docstring provided.
 - `async async_name_exists(self, name: str) -> bool` â€” No docstring provided.
 - `async async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” No docstring provided.
 - `async async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Upsert documents asynchronously.
 - `bucket(self) -> Bucket` â€” Get the Couchbase bucket.
 - `cluster(self) -> Cluster` â€” Create or retrieve the Couchbase cluster connection.
 - `collection(self) -> Collection` â€” Get the Couchbase collection.
 - `content_hash_exists(self, content_hash: str) -> bool` â€” Check if a document exists in the bucket based on its content hash.
 - `create(self) -> None` â€” Create the collection and FTS index if they donâ€™t exist.
 - `delete(self) -> bool` â€” Delete the collection from the scope.
 - `delete_by_content_id(self, content_id: str) -> bool` â€” Delete documents by content ID. Args: `content_id (str):` The content ID to delete Returns: `bool: True` if documents were deleted, `False` otherwise
 - `delete_by_id(self, id: str) -> bool` â€” Delete a document by its ID. Args: `id (str):` The document ID to delete Returns: `bool: True` if document was deleted, `False` otherwise
 - `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` â€” Delete documents by metadata. Args: `metadata (Dict[str, Any]):` The metadata to match for deletion Returns: `bool: True` if documents were deleted, `False` otherwise
 - `delete_by_name(self, name: str) -> bool` â€” Delete documents by name. Args: `name (str):` The document name to delete Returns: `bool: True` if documents were deleted, `False` otherwise
 - `drop(self) -> None` â€” Delete the collection from the scope.
 - `exists(self) -> bool` â€” Check if the collection exists.
 - `async get_async_bucket(self) -> AsyncBucket` â€” Gets or creates the cached AsyncBucket instance.
 - `async get_async_cluster(self) -> AsyncCluster` â€” Gets or creates the cached AsyncCluster instance.
 - `async get_async_collection(self) -> AsyncCollection` â€” Gets or creates the cached AsyncCollection instance.
 - `async get_async_scope(self) -> AsyncScope` â€” Gets or creates the cached AsyncScope instance.
 - `get_count(self) -> int` â€” Get the count of documents in the Couchbase bucket.
 - `get_supported_search_types(self) -> List[str]` â€” Get the supported search types for this vector database.
 - `id_exists(self, id: str) -> bool` â€” Check if a document exists in the bucket based on its ID.
 - `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Insert documents into the Couchbase bucket. Fails if any document already exists. Args: `documents: List` of documents to insert `filters: Optional` filters to apply to the documents
 - `name_exists(self, name: str) -> bool` â€” Check if a document exists in the bucket based on its name.
 - `prepare_doc(self, content_hash: str, document: Document) -> Dict[str, Any]` â€” Prepare a document for insertion into Couchbase. Args: `document: Document` to prepare Returns: Dictionary containing document data ready for insertion Raises: `ValueError:` If embedding generation fails
 - `scope(self) -> Scope` â€” Get the Couchbase scope.
 - `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Search the Couchbase bucket for documents relevant to the query.
 - `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` â€” Update the metadata for documents with the given `content_id`. Args: `content_id (str):` The content ID to update `metadata (Dict[str, Any]):` The metadata to update
 - `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Update existing documents or insert new ones into the Couchbase bucket. Args: `documents: List` of documents to upsert `filters: Optional` filters to apply to the documents
 - `upsert_available(self) -> bool` â€” Check if upsert is available in Couchbase.

Module `agno.vectordb.distance`

- **Source:** `libs/agno/agno/vectordb/distance.py`

Classes

- `class Distance` (bases: `str`, `Enum`)

Module `agno.vectordb.lancedb.lance_db`

- **Source:** `libs/agno/agno/vectordb/lancedb/lance_db.py`

Classes

- `class LanceDb` (bases: `VectorDb`)
 - LanceDb class for managing vector operations with LanceDb

Args: `uri:` The URI of the LanceDB database. `name:` Name of the vector database. `description:` Description of the vector database. `connection:` The LanceDB connection to use. `table:` The LanceDB table instance to use. `async_connection:` The LanceDB async connection to use. `async_table:` The LanceDB async table instance to use. `table_name:` The name of the LanceDB table to use. `api_key:` The API key to use for the LanceDB connection. `embedder:` The embedder to use when embedding the document contents. `search_type:` The search type to use when searching for documents. `distance:` The distance metric to use when searching for documents. `nprobes:` The number of probes to use when searching for documents. `reranker:` The reranker to use when reranking documents. `use_tantivy:` Whether to use Tantivy for full text search. `on_bad_vectors:` What to do if the vector is bad. One of `â€œerrorâ€`, `â€œdropâ€`, `â€œfillâ€`, `â€œnullâ€`. `fill_value:`

The value to fill the vector with if on_bad_vectors is âœŒfillâœŒ.

• **Methods:**

- `async async_create(self) -> None` âœŒ Create the table asynchronously if it does not exist.
- `async async_doc_exists(self, document: Document) -> bool` âœŒ Asynchronously validate if the document exists Args: document (Document): Document to validate Returns: bool: True if document exists, False otherwise
- `async async_drop(self) -> None` âœŒ Drop the table asynchronously.
- `async async_exists(self) -> bool` âœŒ Check if the table exists asynchronously.
- `async async_get_count(self) -> int` âœŒ Get the number of rows in the table asynchronously.
- `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` âœŒ Asynchronously insert documents into the database. Args: documents (List[Document]): List of documents to insert filters (Optional[Dict[str, Any]]): Filters to apply while inserting documents
- `async async_name_exists(self, name: str) -> bool` âœŒ No docstring provided.
- `async async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` âœŒ Asynchronously search for documents matching the query. Args: query (str): Query string to search for limit (int): Maximum number of results to return filters (Optional[Dict[str, Any]]): Filters to apply to the search Returns: List[Document]: List of matching documents
- `async async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` âœŒ No docstring provided.
- `content_hash_exists(self, content_hash: str) -> bool` âœŒ Check if documents with the given content hash exist.
- `create(self) -> None` âœŒ Create the table if it does not exist.
- `delete(self) -> bool` âœŒ No docstring provided.
- `delete_by_content_id(self, content_id: str) -> bool` âœŒ Delete content by content ID.
- `delete_by_id(self, id: str) -> bool` âœŒ Delete content by ID.
- `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` âœŒ Delete content by metadata.
- `delete_by_name(self, name: str) -> bool` âœŒ Delete content by name.
- `doc_exists(self, document: Document) -> bool` âœŒ Validating if the document exists or not Args: document (Document): Document to validate
- `drop(self) -> None` âœŒ No docstring provided.
- `exists(self) -> bool` âœŒ No docstring provided.
- `get_count(self) -> int` âœŒ No docstring provided.
- `get_supported_search_types(self) -> List[str]` âœŒ Get the supported search types for this vector database.
- `hybrid_search(self, query: str, limit: int=5) -> List[Document]` âœŒ No docstring provided.
- `id_exists(self, id: str) -> bool` âœŒ Check if a document with the given ID exists in the database
- `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` âœŒ Insert documents into the database. Args: documents (List[Document]): List of documents to insert filters (Optional[Dict[str, Any]]): Filters to add as metadata to documents
- `keyword_search(self, query: str, limit: int=5) -> List[Document]` âœŒ No docstring provided.
- `name_exists(self, name: str) -> bool` âœŒ Check if a document with the given name exists in the database
- `optimize(self) -> None` âœŒ No docstring provided.
- `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` âœŒ Search for documents matching the query. Args: query (str): Query string to search for limit (int): Maximum number of results to return filters (Optional[Dict[str, Any]]): Filters to apply to the search Returns: List[Document]: List of matching documents
- `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` âœŒ Update the metadata for documents with the given content_id. Args: content_id (str): The content ID to update metadata (Dict[str, Any]): The metadata to update
- `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` âœŒ Upsert documents into the database. Args: documents (List[Document]): List of documents to upsert filters (Optional[Dict[str, Any]]): Filters to apply while upserting
- `upsert_available(self) -> bool` âœŒ Check if upsert is available in LanceDB.
- `vector_search(self, query: str, limit: int=5) -> List[Document]` âœŒ No docstring provided.

Module `agno.vectordb.langchaindb.langchaindb`

- **Source:** `libs/agno/agno/vectordb/langchaindb/langchaindb.py`

Classes

- **class** `LangChainVectorDb` (bases: `VectorDb`)

◦ **Methods:**

- `async async_create(self) -> None` âœŒ No docstring provided.
- `async async_drop(self) -> None` âœŒ No docstring provided.
- `async async_exists(self) -> bool` âœŒ No docstring provided.
- `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` âœŒ No docstring provided.
- `async_name_exists(self, name: str) -> bool` âœŒ No docstring provided.
- `async async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` âœŒ No docstring provided.
- `async async_upsert(self, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` âœŒ No docstring provided.
- `content_hash_exists(self, content_hash: str) -> bool` âœŒ No docstring provided.
- `create(self) -> None` âœŒ No docstring provided.
- `delete(self) -> bool` âœŒ No docstring provided.
- `delete_by_content_id(self, content_id: str) -> None` âœŒ No docstring provided.
- `delete_by_id(self, id: str) -> bool` âœŒ No docstring provided.
- `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` âœŒ No docstring provided.
- `delete_by_name(self, name: str) -> bool` âœŒ No docstring provided.
- `drop(self) -> None` âœŒ No docstring provided.
- `exists(self) -> bool` âœŒ No docstring provided.
- `get_supported_search_types(self) -> List[str]` âœŒ Get the supported search types for this vector database.
- `id_exists(self, id: str) -> bool` âœŒ No docstring provided.
- `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` âœŒ No docstring provided.
- `name_exists(self, name: str) -> bool` âœŒ No docstring provided.
- `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` âœŒ Returns relevant documents matching the query

- `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` â€” Update the metadata for documents with the given `content_id`. Not implemented for LangChain wrapper. Args: `content_id (str)`: The content ID to update metadata (`Dict[str, Any]`): The metadata to update
- `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” No docstring provided.

Module `agno.vectordb.lightrag.lightrag`

- **Source:** `libs/agno/agno/vectordb/lightrag/lightrag.py`

Classes

- **class `LightRag`** (bases: `VectorDb`)
 - LightRAG VectorDB implementation
 - **Methods:**
 - `async async_create(self) -> None` â€” Async create the vector database
 - `async async_delete_by_external_id(self, external_id: str) -> bool` â€” Delete documents by external ID
 - `async async_drop(self) -> None` â€” Async drop the vector database
 - `async async_exists(self) -> bool` â€” Async check if the vector database exists
 - `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Async insert documents into the vector database
 - `async async_name_exists(self, name: str) -> bool` â€” Async check if a document with the given name exists
 - `async async_search(self, query: str, limit: Optional[int]=None, filters: Optional[Dict[str, Any]]=None) -> Optional[List[Document]]` â€” No docstring provided.
 - `async async_upsert(self, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Async upsert documents into the vector database
 - `content_hash_exists(self, content_hash: str) -> bool` â€” Check if content with the given hash exists
 - `create(self) -> None` â€” Create the vector database
 - `delete(self) -> bool` â€” Delete all documents from the vector database
 - `delete_by_content_id(self, content_id: str) -> None` â€” Delete documents by content ID
 - `delete_by_external_id(self, external_id: str) -> bool` â€” Delete documents by external ID (sync wrapper)
 - `delete_by_id(self, id: str) -> bool` â€” Delete documents by ID
 - `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` â€” Delete documents by metadata
 - `delete_by_name(self, name: str) -> bool` â€” Delete documents by name
 - `drop(self) -> None` â€” Drop the vector database
 - `exists(self) -> bool` â€” Check if the vector database exists
 - `get_supported_search_types(self) -> List[str]` â€” Get the supported search types for this vector database.
 - `id_exists(self, id: str) -> bool` â€” Check if a document with the given ID exists
 - `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Insert documents into the vector database
 - `async insert_file_bytes(self, file_content: bytes, filename: Optional[str]=None, content_type: Optional[str]=None, send_metadata: bool=False, skip_if_exists: bool=False) -> Optional[str]` â€” Insert file from raw bytes into the LightRAG server.
 - `async insert_text(self, file_source: str, text: str) -> Optional[str]` â€” Insert text into the LightRAG server.
 - `async lightrag_knowledge_retriever(self, query: str) -> Optional[List[Document]]` â€” Custom knowledge retriever function to search the LightRAG server for relevant documents. Args: `query`: The search query string `num_documents`: Number of documents to retrieve (currently unused by LightRAG) `mode`: Query mode - â€œlocalâ€, â€œglobalâ€, or â€œhybridâ€ `lightrag_server_url`: URL of the LightRAG server Returns: List of retrieved documents or None if search fails
 - `name_exists(self, name: str) -> bool` â€” Check if a document with the given name exists
 - `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” No docstring provided.
 - `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` â€” Update metadata is not supported for LightRag as it manages its own graph structure. Args: `content_id (str)`: The content ID to update metadata (`Dict[str, Any]`): The metadata to update
 - `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Upsert documents into the vector database

Module `agno.vectordb.llamaindex.llamaindexdb`

- **Source:** `libs/agno/agno/vectordb/llamaindex/llamaindexdb.py`

Classes

- **class `LlamaIndexVectorDb`** (bases: `VectorDb`)
 - **Methods:**
 - `async async_create(self) -> None` â€” No docstring provided.
 - `async async_drop(self) -> None` â€” No docstring provided.
 - `async async_exists(self) -> bool` â€” No docstring provided.
 - `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” No docstring provided.
 - `async async_name_exists(self, name: str) -> bool` â€” No docstring provided.
 - `async async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” No docstring provided.
 - `async async_upsert(self, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” No docstring provided.
 - `content_hash_exists(self, content_hash: str) -> bool` â€” No docstring provided.
 - `create(self) -> None` â€” No docstring provided.
 - `delete(self) -> bool` â€” No docstring provided.
 - `delete_by_content_id(self, content_id: str) -> bool` â€” Delete documents by content ID. Not implemented for LlamaIndex wrapper. Args: `content_id (str)`: The content ID to delete Returns: `bool`: False as this operation is not supported
 - `delete_by_id(self, id: str) -> bool` â€” No docstring provided.
 - `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` â€” No docstring provided.
 - `delete_by_name(self, name: str) -> bool` â€” No docstring provided.
 - `drop(self) -> None` â€” No docstring provided.
 - `exists(self) -> bool` â€” No docstring provided.
 - `get_supported_search_types(self) -> List[str]` â€” Get the supported search types for this vector database.
 - `id_exists(self, id: str) -> bool` â€” No docstring provided.
 - `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” No docstring provided.
 - `name_exists(self, name: str) -> bool` â€” No docstring provided.

- `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Returns relevant documents matching the query. Args: query (str): The query string to search for. limit (int): The maximum number of documents to return. Defaults to 5. filters (Optional[Dict[str, Any]]): Filters to apply to the search. Defaults to None. Returns: List[Document]: A list of relevant documents matching the query. Raises: ValueError: If the knowledge retriever is not of type BaseRetriever.
- `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` â€” Update the metadata for documents with the given content_id. Not implemented for LlamaIndex wrapper. Args: content_id (str): The content ID to update metadata (Dict[str, Any]): The metadata to update
- `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” No docstring provided.

Module `agno.vectordb.milvus.milvus`

- **Source:** `libs/agno/agno/vectordb/milvus/milvus.py`

Classes

- **class** `Milvus` (bases: `VectorDb`)

◦ **Methods:**

- `async_client(self) -> AsyncMilvusClient` â€” No docstring provided.
- `async_async_create(self) -> None` â€” Create collection asynchronously based on search type.
- `async_async_doc_exists(self, document: Document) -> bool` â€” Check if document exists asynchronously. AsyncMilvusClient supports get().
- `async_async_drop(self) -> None` â€” Drop collection asynchronously. AsyncMilvusClient supports drop_collection().
- `async_async_exists(self) -> bool` â€” Check if collection exists asynchronously. has_collection() is not supported by AsyncMilvusClient, so we use the synchronous client.
- `async_async_hybrid_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Perform an asynchronous hybrid search combining dense and sparse vector similarity. Args: query (str): Query string to search for limit (int): Maximum number of results to return filters (Optional[Dict[str, Any]]): Filters to apply to the search Returns: List[Document]: List of matching documents
- `async_async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Insert documents asynchronously based on search type.
- `async_name_exists(self, name: str) -> bool` â€” No docstring provided.
- `async_async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” No docstring provided.
- `async_async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” No docstring provided.
- `client(self) -> MilvusClient` â€” No docstring provided.
- `content_hash_exists(self, content_hash: str) -> bool` â€” Check if a document with the given content hash exists. Args: content_hash (str): The content hash to check. Returns: bool: True if a document with the given content hash exists, False otherwise.
- `create(self) -> None` â€” Create a collection based on search type if it doesnâ€™t exist.
- `delete(self) -> bool` â€” No docstring provided.
- `delete_by_content_id(self, content_id: str) -> bool` â€” Delete documents by content ID. Args: content_id (str): The content ID to delete Returns: bool: True if documents were deleted, False otherwise
- `delete_by_id(self, id: str) -> bool` â€” Delete a document by its ID. Args: id (str): The document ID to delete Returns: bool: True if document was deleted, False otherwise
- `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` â€” Delete documents by metadata. Args: metadata (Dict[str, Any]): The metadata to match for deletion Returns: bool: True if documents were deleted, False otherwise
- `delete_by_name(self, name: str) -> bool` â€” Delete documents by name. Args: name (str): The document name to delete Returns: bool: True if documents were deleted, False otherwise
- `doc_exists(self, document: Document) -> bool` â€” Validating if the document exists or not Args: document (Document): Document to validate
- `drop(self) -> None` â€” No docstring provided.
- `exists(self) -> bool` â€” No docstring provided.
- `get_count(self) -> int` â€” No docstring provided.
- `get_supported_search_types(self) -> List[str]` â€” Get the supported search types for this vector database.
- `hybrid_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Perform a hybrid search combining dense and sparse vector similarity. Args: query (str): Query string to search for limit (int): Maximum number of results to return filters (Optional[Dict[str, Any]]): Filters to apply to the search Returns: List[Document]: List of matching documents
- `id_exists(self, id: str) -> bool` â€” No docstring provided.
- `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Insert documents based on search type.
- `name_exists(self, name: str) -> bool` â€” Validates if a document with the given name exists in the collection. Args: name (str): The name of the document to check. Returns: bool: True if a document with the given name exists, False otherwise.
- `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Search for documents matching the query. Args: query (str): Query string to search for limit (int): Maximum number of results to return filters (Optional[Dict[str, Any]]): Filters to apply to the search Returns: List[Document]: List of matching documents
- `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` â€” Update the metadata for documents with the given content_id. Args: content_id (str): The content ID to update metadata (Dict[str, Any]): The metadata to update
- `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Upsert documents into the database. Args: documents (List[Document]): List of documents to upsert filters (Optional[Dict[str, Any]]): Filters to apply while upserting
- `upsert_available(self) -> bool` â€” Check if upsert operation is available. Returns: bool: Always returns True.

Module `agno.vectordb.mongodb.mongodb`

- **Source:** `libs/agno/agno/vectordb/mongodb/mongodb.py`

Classes

- **class** `MongoDb` (bases: `VectorDb`)

- MongoDB Vector Database implementation with elegant handling of Atlas Search index creation.

◦ **Methods:**

- `async_async_create(self) -> None` â€” Create the MongoDB collection and indexes asynchronously.
- `async_async_doc_exists(self, document: Document) -> bool` â€” Check if a document exists asynchronously.
- `async_async_drop(self) -> None` â€” Drop the collection asynchronously.
- `async_async_exists(self) -> bool` â€” Check if the collection exists asynchronously.
- `async_async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Insert documents asynchronously.
- `async_async_name_exists(self, name: str) -> bool` â€” Check if a document with a given name exists asynchronously.
- `async_async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Search for documents asynchronously.
- `async_async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Upsert documents asynchronously.
- `collection_exists(self) -> bool` â€” Check if the collection exists in the database.
- `content_hash_exists(self, content_hash: str) -> bool` â€” Check if documents with the given content hash exist in the collection. Args: content_hash (str): The content hash to check. Returns: bool: True if documents with the content hash exist, False otherwise.

- `create(self) -> None` â€” Create the MongoDB collection and indexes if they do not exist.
- `delete(self) -> bool` â€” Delete all documents from the collection.
- `delete_by_content_id(self, content_id: str) -> bool` â€” Delete documents by content ID.
- `delete_by_id(self, id: str) -> bool` â€” Delete document by ID.
- `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` â€” Delete documents by metadata.
- `delete_by_name(self, name: str) -> bool` â€” Delete documents by name.
- `doc_exists(self, document: Document) -> bool` â€” Check if a document exists in the MongoDB collection based on its content.
- `drop(self) -> None` â€” Drop the collection and clean up indexes.
- `exists(self) -> bool` â€” Check if the MongoDB collection exists.
- `get_count(self) -> int` â€” Get the count of documents in the MongoDB collection.
- `get_supported_search_types(self) -> List[str]` â€” Get the supported search types for this vector database.
- `hybrid_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Perform a hybrid search combining vector and keyword-based searches using Reciprocal Rank Fusion. Weights for vector and keyword search are configured at the instance level (`hybrid_vector_weight`, `hybrid_keyword_weight`). The rank constant `k` is used in the RRF formula $1 / (rank + k)$ to smooth scores. Reference: <https://www.mongodb.com/docs/atlas/atlas-vector-search/tutorials/reciprocal-rank-fusion>
- `id_exists(self, id: str) -> bool` â€” Check if a document with the given ID exists in the collection. Args: `id (str)`: The document ID to check. Returns: `bool`: True if the document exists, False otherwise.
- `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Insert documents into the MongoDB collection.
- `keyword_search(self, query: str, limit: int=5) -> List[Document]` â€” Perform a keyword-based search.
- `name_exists(self, name: str) -> bool` â€” Check if a document with a given name exists in the collection.
- `optimize(self) -> None` â€” TODO: not implemented
- `prepare_doc(self, content_hash: str, document: Document, filters: Optional[Dict[str, Any]]=None) -> Dict[str, Any]` â€” Prepare a document for insertion or upsertion into MongoDB.
- `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None, min_score: float=0.0) -> List[Document]` â€” Search for documents using vector similarity.
- `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` â€” Update the metadata for documents with the given `content_id`. Args: `content_id (str)`: The content ID to update metadata (`Dict[str, Any]`): The metadata to update
- `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Upsert documents into the MongoDB collection.
- `upsert_available(self) -> bool` â€” Indicate that upsert functionality is available.
- `vector_search(self, query: str, limit: int=5) -> List[Document]` â€” Perform a vector-based search.

Module `agno.vectordb.pgvector.index`

- **Source:** `libs/agno/agno/vectordb/pgvector/index.py`

Classes

- **class** `HNSW` (bases: `BaseModel`)
- **class** `Ivfflat` (bases: `BaseModel`)

Module `agno.vectordb.pgvector.pgvector`

- **Source:** `libs/agno/agno/vectordb/pgvector/pgvector.py`

Classes

- **class** `PgVector` (bases: `VectorDb`)
 - `PgVector` class for managing vector operations with PostgreSQL and pgvector.

This class provides methods for creating, inserting, searching, and managing vector data in a PostgreSQL database using the pgvector extension.

- **Methods:**
 - `async async_create(self) -> None` â€” Create the table asynchronously by running in a thread.
 - `async async_drop(self) -> None` â€” Drop the table asynchronously by running in a thread.
 - `async async_exists(self) -> bool` â€” Check if table exists asynchronously by running in a thread.
 - `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None, batch_size: int=100) -> None` â€” Insert documents asynchronously with parallel embedding.
 - `async async_name_exists(self, name: str) -> bool` â€” Check if name exists asynchronously by running in a thread.
 - `async async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Search asynchronously by running in a thread.
 - `async async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None, batch_size: int=100) -> None` â€” Upsert documents asynchronously by running in a thread.
 - `content_hash_exists(self, content_hash: str) -> bool` â€” Check if a document with the given content hash exists in the table.
 - `create(self) -> None` â€” Create the table if it does not exist.
 - `delete(self) -> bool` â€” Delete all records from the table. Returns: `bool`: True if deletion was successful, False otherwise.
 - `delete_by_content_id(self, content_id: str) -> bool` â€” Delete content by content ID.
 - `delete_by_id(self, id: str) -> bool` â€” Delete content by ID.
 - `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` â€” Delete content by metadata.
 - `delete_by_name(self, name: str) -> bool` â€” Delete content by name.
 - `drop(self) -> None` â€” Drop the table from the database.
 - `enable_prefix_matching(self, query: str) -> str` â€” Preprocess the query for prefix matching. Args: `query (str)`: The original query. Returns: `str`: The processed query with prefix matching enabled.
 - `exists(self) -> bool` â€” Check if the table exists in the database. Returns: `bool`: True if the table exists, False otherwise.
 - `get_count(self) -> int` â€” Get the number of records in the table. Returns: `int`: The number of records in the table.
 - `get_supported_search_types(self) -> List[str]` â€” No docstring provided.
 - `get_table(self) -> Table` â€” Get the SQLAlchemy Table object based on the current schema version. Returns: `Table`: SQLAlchemy Table object representing the database table.
 - `get_table_v1(self) -> Table` â€” Get the SQLAlchemy Table object for schema version 1. Returns: `Table`: SQLAlchemy Table object representing the database table.
 - `hybrid_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Perform a hybrid search combining vector similarity and full-text search. Args: `query (str)`: The search query. `limit (int)`: Maximum number of results to return. `filters (Optional[Dict[str, Any]])`: Filters to apply to the search. Returns: `List[Document]`: List of matching documents.
 - `id_exists(self, id: str) -> bool` â€” Check if a document with the given ID exists in the table. Args: `id (str)`: The ID to check. Returns: `bool`: True if a document with the ID exists, False otherwise.

- `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None, batch_size: int=100) -> None` Insert documents into the database. Args: `content_hash (str)`: The content hash to insert. `documents (List[Document])`: List of documents to insert. `filters (Optional[Dict[str, Any]])`: Filters to apply to the documents. `batch_size (int)`: Number of documents to insert in each batch.
- `keyword_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` Perform a keyword search on the `content` column. Args: `query (str)`: The search query. `limit (int)`: Maximum number of results to return. `filters (Optional[Dict[str, Any]])`: Filters to apply to the search. Returns: `List[Document]`: List of matching documents.
- `name_exists(self, name: str) -> bool` Check if a document with the given name exists in the table. Args: `name (str)`: The name to check. Returns: `bool`: True if a document with the name exists, False otherwise.
- `optimize(self, force_recreate: bool=False) -> None` Optimize the vector database by creating or recreating necessary indexes. Args: `force_recreate (bool)`: If True, existing indexes will be dropped and recreated.
- `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` Perform a search based on the configured search type. Args: `query (str)`: The search query. `limit (int)`: Maximum number of results to return. `filters (Optional[Dict[str, Any]])`: Filters to apply to the search. Returns: `List[Document]`: List of matching documents.
- `table_exists(self) -> bool` Check if the table exists in the database. Returns: `bool`: True if the table exists, False otherwise.
- `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` Update the metadata for a document. Args: `id (str)`: The ID of the document. `metadata (Dict[str, Any])`: The metadata to update.
- `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None, batch_size: int=100) -> None` Upsert documents by content hash. First delete all documents with the same content hash. Then upsert the new documents.
- `upsert_available(self) -> bool` Check if upsert operation is available. Returns: `bool`: Always returns True for PgVector.
- `vector_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` Perform a vector similarity search. Args: `query (str)`: The search query. `limit (int)`: Maximum number of results to return. `filters (Optional[Dict[str, Any]])`: Filters to apply to the search. Returns: `List[Document]`: List of matching documents.

Module agno.vectordb.pineconedb.pineconedb

- **Source:** `libs/agno/agno/vectordb/pineconedb/pineconedb.py`

Classes

- **class PineconeDb** (bases: `VectorDb`)
 - A class representing a Pinecone database.

Args: `name (str)`: The name of the index. `dimension (int)`: The dimension of the embeddings. `spec (Union[Dict, ServerlessSpec, PodSpec])`: The index spec. `metric (Optional[str], optional)`: The metric used for similarity search. Defaults to `cosine`. `additional_headers (Optional[Dict[str, str]], optional)`: Additional headers to pass to the Pinecone client. Defaults to `{}`. `pool_threads (Optional[int], optional)`: The number of threads to use for the Pinecone client. Defaults to 1. `namespace (Optional[str], optional)`: The namespace partition within the index that will be used. Defaults to None. `timeout (Optional[int], optional)`: The timeout for Pinecone operations. Defaults to None. `index_api (Optional[Any], optional)`: The Index API object. Defaults to None. `api_key (Optional[str], optional)`: The Pinecone API key. Defaults to None. `host (Optional[str], optional)`: The Pinecone host. Defaults to None. `config (Optional[Config], optional)`: The Pinecone config. Defaults to None. ****kwargs**: Additional keyword arguments.

Attributes: `client (Pinecone)`: The Pinecone client. `index: The Pinecone index`. `api_key (Optional[str])`: The Pinecone API key. `host (Optional[str])`: The Pinecone host. `config (Optional[Config])`: The Pinecone config. `additional_headers (Optional[Dict[str, str]])`: Additional headers to pass to the Pinecone client. `pool_threads (Optional[int])`: The number of threads to use for the Pinecone client. `index_api (Optional[Any])`: The Index API object. `name (str)`: The name of the index. `dimension (int)`: The dimension of the embeddings. `spec (Union[Dict, ServerlessSpec, PodSpec])`: The index spec. `metric (Optional[str])`: The metric used for similarity search. `timeout (Optional[int])`: The timeout for Pinecone operations. `kwargs (Optional[Dict[str, str]])`: Additional keyword arguments.

- **Methods:**
 - `async async_create(self) -> None` Create the index asynchronously if it does not exist.
 - `async async_doc_exists(self, document: Document) -> bool` Check if a document exists in the index asynchronously.
 - `async async_drop(self) -> None` No docstring provided.
 - `async async_exists(self) -> bool` Check if the index exists asynchronously.
 - `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` No docstring provided.
 - `async async_name_exists(self, name: str) -> bool` Check if an index with the given name exists asynchronously.
 - `async async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Union[str, float, int, bool, List, dict]]]=None, namespace: Optional[str]=None, include_values: Optional[bool]=None) -> List[Document]` Search for similar documents in the index asynchronously.
 - `async async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None, namespace: Optional[str]=None, batch_size: Optional[int]=None, show_progress: bool=False) -> None` Upsert documents into the index asynchronously with batching.
 - `client(self) -> Pinecone` The Pinecone client. Returns: `Pinecone`: The Pinecone client.
 - `content_hash_exists(self, content_hash: str) -> bool` Check if documents with the given content hash exist in the index. Args: `content_hash (str)`: The content hash to check. Returns: `bool`: True if documents with the content hash exist, False otherwise.
 - `create(self) -> None` Create the index if it does not exist.
 - `delete(self, namespace: Optional[str]=None) -> bool` Clear the index. Args: `namespace (Optional[str], optional)`: The namespace to clear. Defaults to None.
 - `delete_by_content_id(self, content_id: str) -> bool` Delete documents by content ID (stored in metadata).
 - `delete_by_id(self, id: str) -> bool` Delete a document by ID.
 - `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` Delete documents by metadata.
 - `delete_by_name(self, name: str) -> bool` Delete documents by name (stored in metadata).
 - `doc_exists(self, document: Document) -> bool` Check if a document exists in the index. Args: `document (Document)`: The document to check. Returns: `bool`: True if the document exists, False otherwise.
 - `drop(self) -> None` Delete the index if it exists.
 - `exists(self) -> bool` Check if the index exists. Returns: `bool`: True if the index exists, False otherwise.
 - `get_count(self) -> int` Get the count of documents in the index.
 - `get_supported_search_types(self) -> List[str]` Get the supported search types for this vector database.
 - `id_exists(self, id: str) -> bool` Check if a document with the given ID exists in the index. Args: `id (str)`: The ID to check. Returns: `bool`: True if the document exists, False otherwise.
 - `index(self)` The Pinecone index. Returns: `Pinecone.Index`: The Pinecone index.
 - `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` No docstring provided.
 - `name_exists(self, name: str) -> bool` Check if an index with the given name exists. Args: `name (str)`: The name of the index. Returns: `bool`: True if the index exists, False otherwise.
 - `optimize(self) -> None` Optimize the index. This method can be left empty as Pinecone automatically optimizes indexes.
 - `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Union[str, float, int, bool, List, dict]]]=None, namespace: Optional[str]=None, include_values: Optional[bool]=None) -> List[Document]` Search for similar documents in the index. Args: `query (str)`: The query to search for. `limit (int, optional)`: The maximum number of results to return. Defaults to 5. `filters (Optional[Dict[str, Union[str, float, int, bool, List, dict]]], optional)`: The filter for the search. Defaults to None. `namespace (Optional[str], optional)`: The namespace to search in. Defaults to None. `include_values (Optional[bool], optional)`: Whether to include values in the search results. Defaults to None. `include_metadata (Optional[bool], optional)`: Whether to include metadata in the search results. Defaults to None. Returns: `List[Document]`: The list of matching documents.
 - `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` Update the metadata for documents with the given content_id. Args: `content_id (str)`: The content ID to update metadata (`Dict[str, Any]`): The metadata to update
 - `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` No docstring provided.
 - `upsert_available(self) -> bool` Check if upsert operation is available. Returns: `bool`: True if upsert is available, False otherwise.

Module agno.vectordb.qdrant.qdrant

- **Source:** `libs/agno/agno/vectordb/qdrant/qdrant.py`

Classes

- **class Qdrant** (bases: VectorDb)
 - Vector DB implementation powered by Qdrant - <https://qdrant.tech/>
 - **Methods:**
 - `async_client(self)` -> AsyncQdrantClient â€œ Get or create the async Qdrant client.
 - `async_async_close(self)` -> None â€œ Close the Qdrant client connections asynchronously.
 - `async_async_create(self)` -> None â€œ Create the collection asynchronously.
 - `async_async_doc_exists(self, document: Document)` -> bool â€œ Check if a document exists asynchronously.
 - `async_async_drop(self)` -> None â€œ Drop the collection asynchronously.
 - `async_async_exists(self)` -> bool â€œ Check if the collection exists asynchronously.
 - `async_async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None)` -> None â€œ Insert documents asynchronously. Args: documents (List[Document]): List of documents to insert filters (Optional[Dict[str, Any]]): Filters to apply while inserting documents
 - `async_async_name_exists(self, name: str)` -> bool â€œ Asynchronously validates if a document with the given name exists in the collection. Args: name (str): The name of the document to check. Returns: bool: True if a document with the given name exists, False otherwise.
 - `async_async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None)` -> List[Document] â€œ No docstring provided.
 - `async_async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None)` -> None â€œ Upsert documents asynchronously.
 - `client(self)` -> QdrantClient â€œ No docstring provided.
 - `close(self)` -> None â€œ Close the Qdrant client connections.
 - `content_hash_exists(self, content_hash: str)` -> bool â€œ Check if any points with the given content hash exist in the collection. Args: content_hash (str): The content hash to check. Returns: bool: True if points with the content hash exist, False otherwise.
 - `create(self)` -> None â€œ No docstring provided.
 - `delete(self)` -> bool â€œ No docstring provided.
 - `delete_by_content_id(self, content_id: str)` -> bool â€œ Delete all points that have the specified content_id in their payload.
 - `delete_by_id(self, id: str)` -> bool â€œ No docstring provided.
 - `delete_by_metadata(self, metadata: Dict[str, Any])` -> bool â€œ Delete all points where the given metadata is contained in the meta_data payload field.
 - `delete_by_name(self, name: str)` -> bool â€œ Delete all points that have the specified name in their payload (precise match).
 - `doc_exists(self, document: Document)` -> bool â€œ Validating if the document exists or not Args: document (Document): Document to validate
 - `drop(self)` -> None â€œ No docstring provided.
 - `exists(self)` -> bool â€œ Check if the collection exists.
 - `get_count(self)` -> int â€œ No docstring provided.
 - `get_supported_search_types(self)` -> List[str] â€œ Get the supported search types for this vector database.
 - `id_exists(self, id: str)` -> bool â€œ Check if a point with the given ID exists in the collection. Args: id (str): The ID to check. Returns: bool: True if the point exists, False otherwise.
 - `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None, batch_size: int=10)` -> None â€œ Insert documents into the database. Args: documents (List[Document]): List of documents to insert filters (Optional[Dict[str, Any]]): Filters to apply while inserting documents batch_size (int): Batch size for inserting documents
 - `name_exists(self, name: str)` -> bool â€œ Validates if a document with the given name exists in the collection. Args: name (str): The name of the document to check. Returns: bool: True if a document with the given name exists, False otherwise.
 - `optimize(self)` -> None â€œ No docstring provided.
 - `point_exists(self, id: str)` -> bool â€œ Check if a point with the given ID exists in the collection.
 - `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None)` -> List[Document] â€œ Search for documents in the collection. Args: query (str): Query to search for limit (int): Number of search results to return filters (Optional[Dict[str, Any]]): Filters to apply while searching
 - `update_metadata(self, content_id: str, metadata: Dict[str, Any])` -> None â€œ Update the metadata for documents with the given content_id. Args: content_id (str): The content ID to update metadata (Dict[str, Any]): The metadata to update
 - `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None)` -> None â€œ Upsert documents into the database. Args: documents (List[Document]): List of documents to upsert filters (Optional[Dict[str, Any]]): Filters to apply while upserting

Module `agno.vectordb.redis.redisdb`

- **Source:** `libs/agno/agno/vectordb/redis/redisdb.py`

Classes

- **class RedisDB** (bases: VectorDb)
 - Redis class for managing vector operations with Redis and RedisVL.

This class provides methods for creating, inserting, searching, and managing vector data in a Redis database using the RedisVL library.

- **Methods:**
 - `async_async_create(self)` -> None â€œ Async version of create method.
 - `async_async_doc_exists(self, document: Document)` -> bool â€œ Async version of doc_exists method.
 - `async_async_drop(self)` -> None â€œ Async version of drop method.
 - `async_async_exists(self)` -> bool â€œ Async version of exists method.
 - `async_async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None)` -> None â€œ Async version of insert method.
 - `async_async_name_exists(self, name: str)` -> bool â€œ Async version of name_exists method.
 - `async_async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None)` -> List[Document] â€œ Async version of search method.
 - `async_async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None)` -> None â€œ Async version of upsert method. Strategy: delete existing docs with the same content_hash, then insert new docs.
 - `content_hash_exists(self, content_hash: str)` -> bool â€œ Check if a document with the given content hash exists.
 - `create(self)` -> None â€œ Create the Redis index if it does not exist.
 - `delete(self)` -> bool â€œ Delete the Redis index (same as drop).
 - `delete_by_content_id(self, content_id: str)` -> bool â€œ Delete documents by content ID.
 - `delete_by_id(self, id: str)` -> bool â€œ Delete documents by ID.
 - `delete_by_metadata(self, metadata: Dict[str, Any])` -> bool â€œ Delete documents by metadata.
 - `delete_by_name(self, name: str)` -> bool â€œ Delete documents by name.

- `doc_exists(self, document: Document) -> bool` â€” Check if a document exists in the index.
- `drop(self) -> bool` â€” Drop the Redis index.
- `exists(self) -> bool` â€” Check if the Redis index exists.
- `get_supported_search_types(self) -> List[str]` â€” Get list of supported search types.
- `hybrid_search(self, query: str, limit: int=5) -> List[Document]` â€” Perform hybrid search combining vector and keyword search.
- `id_exists(self, id: str) -> bool` â€” Check if a document with the given ID exists.
- `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Insert documents into the Redis index.
- `keyword_search(self, query: str, limit: int=5) -> List[Document]` â€” Perform keyword search using Redis text search.
- `name_exists(self, name: str) -> bool` â€” Check if a document with the given name exists.
- `optimize(self) -> None` â€” Optimize the Redis index (no-op for Redis).
- `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Search for documents using the specified search type.
- `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` â€” Update metadata for documents with the given content ID.
- `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Upsert documents into the Redis index. Strategy: delete existing docs with the same `content_hash`, then insert new docs.
- `upsert_available(self) -> bool` â€” Check if upsert is available (always True for Redis).
- `vector_search(self, query: str, limit: int=5) -> List[Document]` â€” Perform vector similarity search.

Module `agno.vectordb.search`

- **Source:** `libs/agno/agno/vectordb/search.py`

Classes

- **class** `SearchType` (bases: `str`, `Enum`)

Module `agno.vectordb.singlestore.index`

- **Source:** `libs/agno/agno/vectordb/singlestore/index.py`

Classes

- **class** `HNSWFlat` (bases: `BaseModel`)
- **class** `HNSWPQ` (bases: `BaseModel`)
- **class** `IvfPQ` (bases: `BaseModel`)
- **class** `IvfFlat` (bases: `BaseModel`)

Module `agno.vectordb.singlestore.singlestore`

- **Source:** `libs/agno/agno/vectordb/singlestore/singlestore.py`

Classes

- **class** `SingleStore` (bases: `VectorDb`)

◦ **Methods:**

- `async async_create(self) -> None` â€” No docstring provided.
- `async async_drop(self) -> None` â€” No docstring provided.
- `async async_exists(self) -> bool` â€” No docstring provided.
- `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” No docstring provided.
- `async async_name_exists(self, name: str) -> bool` â€” No docstring provided.
- `async async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” No docstring provided.
- `async async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Upsert (insert or update) documents in the table. Args: `documents` (`List[Document]`): List of documents to upsert. `filters` (`Optional[Dict[str, Any]]`): Optional filters for the upsert. `batch_size` (`int`): Number of documents to upsert in each batch.
- `content_hash_exists(self, content_hash: str) -> bool` â€” Validating if the document exists or not Args: `document` (`Document`): Document to validate
- `create(self) -> None` â€” Create the table if it does not exist.
- `delete(self) -> bool` â€” Clear all rows from the table. Returns: `bool`: True if the table was cleared, False otherwise.
- `delete_by_content_id(self, content_id: str) -> bool` â€” Delete a document by its content ID.
- `delete_by_id(self, id: str) -> bool` â€” Delete a document by its ID.
- `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` â€” Delete documents by metadata.
- `delete_by_name(self, name: str) -> bool` â€” Delete a document by its name.
- `drop(self) -> None` â€” Delete the table.
- `exists(self) -> bool` â€” Check if the table exists. Returns: `bool`: True if the table exists, False otherwise.
- `get_count(self) -> int` â€” Get the count of rows in the table. Returns: `int`: The count of rows.
- `get_supported_search_types(self) -> List[str]` â€” Get the supported search types for this vector database.
- `get_table(self) -> Table` â€” Define the table structure. Returns: `Table`: SQLAlchemy Table object.
- `id_exists(self, id: str) -> bool` â€” Validate if a row with this id exists or not Args: `id` (`str`): Id to check
- `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None, batch_size: int=10) -> None` â€” Insert documents into the table. Args: `documents` (`List[Document]`): List of documents to insert. `filters` (`Optional[Dict[str, Any]]`): Optional filters for the insert. `batch_size` (`int`): Number of documents to insert in each batch.
- `name_exists(self, name: str) -> bool` â€” Validate if a row with this name exists or not Args: `name` (`str`): Name to check
- `optimize(self) -> None` â€” No docstring provided.
- `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Search for documents based on a query and optional filters. Args: `query` (`str`): The search query. `limit` (`int`): The maximum number of results to return. `filters` (`Optional[Dict[str, Any]]`): Optional filters for the search. Returns: `List[Document]`: List of documents that match the query.
- `table_exists(self) -> bool` â€” Check if the table exists. Returns: `bool`: True if the table exists, False otherwise.
- `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` â€” Update the metadata for documents with the given `content_id`. Args: `content_id` (`str`): The content ID to update metadata (`Dict[str, Any]`): The metadata to update
- `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None, batch_size: int=20) -> None` â€” No docstring provided.
- `upsert_available(self) -> bool` â€” Indicate that upsert functionality is available.

Module agno.vectordb.surrealdb.surrealdb

- **Source:** libs/agno/agno/vectordb/surrealdb/surrealdb.py

Classes

- **class SurrealDb** (bases: VectorDb)
 - SurrealDB Vector Database implementation supporting both sync and async operations.
 - **Methods:**
 - `async_client(self) -> Union[AsyncWsSurrealConnection, AsyncHttpSurrealConnection]` â€” Check if the async client is initialized. Raises: RuntimeError: If the async client is not initialized. Returns: The async client.
 - `async_create(self) -> None` â€” Create the vector collection and index asynchronously.
 - `async_doc_exists(self, document: Document) -> bool` â€” Check if a document exists by its content asynchronously. Returns: True if the document exists, False otherwise.
 - `async_drop(self) -> None` â€” Drop the vector collection asynchronously.
 - `async_exists(self) -> bool` â€” Check if the vector collection exists asynchronously. Returns: True if the collection exists, False otherwise.
 - `async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Insert documents into the vector store asynchronously. Args: `content_hash`: The content hash for the documents. `documents`: A list of documents to insert. `filters`: A dictionary of filters to apply to the query.
 - `async_name_exists(self, name: str) -> bool` â€” Check if a document exists by its name asynchronously. Returns: True if the document exists, False otherwise.
 - `async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Search for similar documents asynchronously. Args: `query`: The query to search for. `limit`: The maximum number of documents to return. `filters`: A dictionary of filters to apply to the query. Returns: A list of documents that are similar to the query.
 - `async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Upsert documents into the vector store asynchronously. Args: `content_hash`: The content hash for the documents. `documents`: A list of documents to upsert. `filters`: A dictionary of filters to apply to the query.
 - `client(self) -> Union[BlockingHttpSurrealConnection, BlockingWsSurrealConnection]` â€” Check if the client is initialized. Returns: The client.
 - `content_hash_exists(self, content_hash: str) -> bool` â€” Check if a document exists by its content hash. Args: `content_hash`: The content hash of the document to check. Returns: True if the document exists, False otherwise.
 - `create(self) -> None` â€” Create the vector collection and index.
 - `delete(self) -> bool` â€” Delete all documents from the vector store. Returns: True if the collection was deleted, False otherwise.
 - `delete_by_content_id(self, content_id: str) -> bool` â€” Delete documents by their content ID. Args: `content_id`: The content ID of the documents to delete. Returns: True if documents were deleted, False otherwise.
 - `delete_by_id(self, id: str) -> bool` â€” Delete a document by its ID. Args: `id`: The ID of the document to delete. Returns: True if the document was deleted, False otherwise.
 - `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` â€” Delete documents by their metadata. Args: `metadata`: The metadata to match for deletion. Returns: True if documents were deleted, False otherwise.
 - `delete_by_name(self, name: str) -> bool` â€” Delete documents by their name. Args: `name`: The name of the documents to delete. Returns: True if documents were deleted, False otherwise.
 - `doc_exists(self, document: Document) -> bool` â€” Check if a document exists by its content. Args: `document`: The document to check. Returns: True if the document exists, False otherwise.
 - `drop(self) -> None` â€” Drop the vector collection.
 - `exists(self) -> bool` â€” Check if the vector collection exists. Returns: True if the collection exists, False otherwise.
 - `get_supported_search_types(self) -> List[str]` â€” Get the supported search types for this vector database.
 - `id_exists(self, id: str) -> bool` â€” Check if a document exists by its ID. Args: `id`: The ID of the document to check. Returns: True if the document exists, False otherwise.
 - `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Insert documents into the vector store. Args: `content_hash`: The content hash for the documents. `documents`: A list of documents to insert. `filters`: A dictionary of filters to apply to the query.
 - `name_exists(self, name: str) -> bool` â€” Check if a document exists by its name. Args: `name`: The name of the document to check. Returns: True if the document exists, False otherwise.
 - `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Search for similar documents. Args: `query`: The query to search for. `limit`: The maximum number of documents to return. `filters`: A dictionary of filters to apply to the query. Returns: A list of documents that are similar to the query.
 - `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` â€” Update the metadata for documents with the given `content_id`. Args: `content_id (str)`: The content ID to update metadata (`Dict[str, Any]`): The metadata to update
 - `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Upsert documents into the vector store. Args: `content_hash`: The content hash for the documents. `documents`: A list of documents to upsert. `filters`: A dictionary of filters to apply to the query.
 - `upsert_available() -> bool` â€” Check if upsert is available. Returns: True if upsert is available, False otherwise.

Module agno.vectordb.upstashdb.upstashdb

- **Source:** libs/agno/agno/vectordb/upstashdb/upstashdb.py

Classes

- **class UpstashVectorDb** (bases: VectorDb)
 - This class provides an interface to Upstash Vector database with support for both custom embeddings and Upstashâ€™s hosted embedding models.

Args: `url (str)`: The Upstash Vector database URL. `token (str)`: The Upstash Vector API token. `retries (Optional[int], optional)`: Number of retry attempts for operations. Defaults to 3. `retry_interval (Optional[float], optional)`: Time interval between retries in seconds. Defaults to 1.0. `dimension (Optional[int], optional)`: The dimension of the embeddings. Defaults to None. `embedder (Optional[Embedder], optional)`: The embedder to use. If None, uses Upstash hosted embedding models. `namespace (Optional[str], optional)`: The namespace to use. Defaults to DEFAULT_NAMESPACE. `reranker (Optional[Reranker], optional)`: The reranker to use. Defaults to None. `name (Optional[str], optional)`: The name of the vector database. Defaults to None. `description (Optional[str], optional)`: The description of the vector database. Defaults to None. `**kwargs`: Additional keyword arguments.

- **Methods:**
 - `async_create(self) -> None` â€” No docstring provided.
 - `async_drop(self) -> None` â€” No docstring provided.
 - `async_exists(self) -> bool` â€” No docstring provided.
 - `async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” No docstring provided.
 - `async_name_exists(self, name: str) -> bool` â€” No docstring provided.
 - `async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” No docstring provided.
 - `async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None, namespace: Optional[str]=None) -> None` â€” Async Upsert documents into the index. Args: `documents (List[Document])`: The documents to upsert. `filters (Optional[Dict[str, Any]], optional)`: The filters for the upsert. Defaults to None. `namespace (Optional[str], optional)`: The namespace for the documents. Defaults to None, which uses the instance namespace.
 - `content_hash_exists(self, content_hash: str) -> bool` â€” Check if documents with the given content hash exist in the index. Args: `content_hash (str)`: The content hash to check. Returns: `bool`: True if documents with the content hash exist, False otherwise.
 - `create(self) -> None` â€” You can create indexes via Upstash Console.
 - `delete(self, namespace: Optional[str]=None, delete_all: bool=False) -> bool` â€” Clear the index. Args: `namespace (Optional[str], optional)`: The namespace to clear. Defaults to None, which uses the instance namespace. `delete_all (bool, optional)`: Whether to delete all documents in the index. Defaults to False. Returns: `bool`: True if the index was deleted, False otherwise.

- `delete_by_content_id(self, content_id: str) -> bool` â€” Delete documents by content id. Args: `content_id (str)`: The content ID to delete Returns: `bool`: True if deletion was successful, False otherwise
- `delete_by_id(self, id: str) -> bool` â€” Delete document by ID. Args: `id (str)`: The document ID to delete Returns: `bool`: True if deletion was successful, False otherwise
- `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` â€” Delete documents by metadata filter. Args: `metadata (Dict[str, Any])`: Metadata criteria for deletion Returns: `bool`: True if deletion was successful, False otherwise
- `delete_by_name(self, name: str) -> bool` â€” Delete documents by name using metadata filter. Args: `name (str)`: The document name to delete Returns: `bool`: True if deletion was successful, False otherwise
- `drop(self) -> None` â€” You can drop indexes via Upstash Console.
- `drop_namespace(self, namespace: Optional[str]=None) -> None` â€” Delete a namespace from the index. Args: `namespace (Optional[str], optional)`: The namespace to drop. Defaults to None, which uses the instance namespace.
- `exists(self) -> bool` â€” Check if the index exists and is accessible. Returns: `bool`: True if the index exists and is accessible, False otherwise. Raises: `Exception`: If thereâ€™s an error communicating with Upstash.
- `get_all_namespaces(self) -> List[str]` â€” Get all namespaces in the index. Returns: `List[str]`: A list of namespaces.
- `get_index_info(self) -> InfoResult` â€” Get information about the index. Returns: `InfoResult`: Information about the index including size, vector count, etc.
- `get_supported_search_types(self) -> List[str]` â€” Get the supported search types for this vector database.
- `id_exists(self, id: str) -> bool` â€” Check if a document with the given ID exists in the index. Args: `id (str)`: The document ID to check. Returns: `bool`: True if the document exists, False otherwise.
- `index(self) -> Index` â€” The Upstash Vector index. Returns: `upstash_vector.Index`: The Upstash Vector index.
- `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Insert documents into the index. This method is not supported by Upstash. Use `upsert` instead. Args: `documents (List[Document])`: The documents to insert. `filters (Optional[Dict[str, Any]], optional)`: The filters for the insert. Defaults to None.
- `name_exists(self, name: str) -> bool` â€” You can check if an index exists in Upstash Console. Args: `name (str)`: The name of the index to check. Returns: `bool`: True if the index exists, False otherwise. (Name is not used.)
- `namespace_exists(self, namespace: str) -> bool` â€” Check if an namespace exists. Args: `namespace (str)`: The name of the namespace to check. Returns: `bool`: True if the namespace exists, False otherwise.
- `optimize(self) -> None` â€” Optimize the index. This method is empty as Upstash automatically optimizes indexes.
- `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None, namespace: Optional[str]=None) -> List[Document]` â€” Search for documents in the index. Args: `query (str)`: The query string to search for. `limit (int, optional)`: Maximum number of results to return. Defaults to 5. `filters (Optional[Dict[str, Any]], optional)`: Metadata filters for the search. `namespace (Optional[str], optional)`: The namespace to search in. Defaults to None, which uses the instance namespace. Returns: `List[Document]`: List of matching documents.
- `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` â€” Update the metadata for documents with the given `content_id`. Args: `content_id (str)`: The content ID to update `metadata (Dict[str, Any])`: The metadata to update
- `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None, namespace: Optional[str]=None) -> None` â€” Upsert documents into the index. Args: `documents (List[Document])`: The documents to upsert. `filters (Optional[Dict[str, Any]], optional)`: The filters for the upsert. Defaults to None. `namespace (Optional[str], optional)`: The namespace for the documents. Defaults to None, which uses the instance namespace.
- `upsert_available(self) -> bool` â€” Check if upsert operation is available. Returns: `True`

Module `agno.vectordb.weaviate.index`

- **Source:** `libs/agno/agno/vectordb/weaviate/index.py`

Classes

- **class `Distance`** (bases: `Enum`)
- **class `VectorIndex`** (bases: `Enum`)

Module `agno.vectordb.weaviate.weaviate`

- **Source:** `libs/agno/agno/vectordb/weaviate/weaviate.py`

Classes

- **class `Weaviate`** (bases: `VectorDb`)
 - Weaviate class for managing vector operations with Weaviate vector database (v4 client).
 - **Methods:**
 - `async async_create(self) -> None` â€” No docstring provided.
 - `async async_drop(self) -> None` â€” Delete the Weaviate collection asynchronously.
 - `async async_exists(self) -> bool` â€” Check if the collection exists in Weaviate asynchronously.
 - `async async_hybrid_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Perform a hybrid search combining vector and keyword search in Weaviate asynchronously. Args: `query (str)`: The keyword query. `limit (int)`: Maximum number of results to return. Returns: `List[Document]`: List of matching documents.
 - `async async_insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Insert documents into Weaviate asynchronously. Args: `documents (List[Document])`: List of documents to insert `filters (Optional[Dict[str, Any]])`: Filters to apply while inserting documents
 - `async async_keyword_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Perform a keyword search in Weaviate asynchronously. Args: `query (str)`: The search query. `limit (int)`: Maximum number of results to return. Returns: `List[Document]`: List of matching documents.
 - `async async_name_exists(self, name: str) -> bool` â€” Asynchronously validate if a document with the given name exists in Weaviate. Args: `name (str)`: The name of the document to check. Returns: `bool`: True if a document with the given name exists, False otherwise.
 - `async async_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Perform a search based on the configured search type asynchronously. Args: `query (str)`: The search query. `limit (int)`: Maximum number of results to return. `filters (Optional[Dict[str, Any]])`: Filters to apply to the search. Returns: `List[Document]`: List of matching documents.
 - `async async_upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Upsert documents into Weaviate asynchronously. When documents with the same ID already exist, they will be replaced. Otherwise, new documents will be created. Args: `documents (List[Document])`: List of documents to upsert `filters (Optional[Dict[str, Any]])`: Filters to apply while upserting
 - `async async_vector_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Perform a vector search in Weaviate asynchronously. Args: `query (str)`: The search query. `limit (int)`: Maximum number of results to return. Returns: `List[Document]`: List of matching documents.
 - `content_hash_exists(self, content_hash: str) -> bool` â€” Check if a document with the given content hash exists in the collection.
 - `create(self) -> None` â€” Create the collection in Weaviate if it doesnâ€™t exist.
 - `delete(self) -> bool` â€” Delete all records from the database.
 - `delete_by_content_hash(self, content_hash: str) -> bool` â€” Delete content by content hash using direct filter deletion.
 - `delete_by_content_id(self, content_id: str) -> bool` â€” Delete content by content ID using direct filter deletion.
 - `delete_by_id(self, id: str) -> bool` â€” Delete document by ID.
 - `delete_by_metadata(self, metadata: Dict[str, Any]) -> bool` â€” Delete content by metadata using direct filter deletion.
 - `delete_by_name(self, name: str) -> bool` â€” Delete content by name using direct filter deletion.
 - `drop(self) -> None` â€” Delete the Weaviate collection.
 - `exists(self) -> bool` â€” Check if the collection exists in Weaviate.

- `async get_async_client(self) -> WeaviateAsyncClient` â€” Get or create the async client.
- `get_client(self) -> weaviate.WeaviateClient` â€” Initialize and return a Weaviate client instance. Attempts to create a client using WCD (Weaviate Cloud Deployment) credentials if provided, otherwise falls back to local connection. Maintains a singleton pattern by reusing an existing client if already initialized. Returns: `weaviate.WeaviateClient`: An initialized Weaviate client instance.
- `get_search_results(self, response: Any) -> List[Document]` â€” Create search results from the Weaviate response. Args: `response (Any)`: The Weaviate response object. Returns: `List[Document]`: List of matching documents.
- `get_supported_search_types(self) -> List[str]` â€” Get the supported search types for this vector database.
- `get_vector_index_config(self, index_type: VectorIndex, distance_metric: Distance) â€”` Returns the appropriate vector index configuration with the specified distance metric. Args: `index_type (VectorIndex)`: Type of vector index (HNSW, FLAT, DYNAMIC). `distance_metric (Distance)`: Distance metric (COSINE, DOT, etc). Returns: `Configure.VectorIndex`: The configured vector index instance.
- `hybrid_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” No docstring provided.
- `id_exists(self, id: str) -> bool` â€” Check if a document with the given ID exists in the collection. Args: `id (str)`: The document ID to check. Returns: `bool`: True if the document exists, False otherwise.
- `insert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Insert documents into Weaviate. Args: `documents (List[Document])`: List of documents to insert `filters (Optional[Dict[str, Any]])`: Filters to apply while inserting documents
- `keyword_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” No docstring provided.
- `name_exists(self, name: str) -> bool` â€” Validate if a document with the given name exists in Weaviate. Args: `name (str)`: The name of the document to check. Returns: `bool`: True if a document with the given name exists, False otherwise.
- `optimize(self) -> None` â€” Optimize the vector database (e.g., rebuild indexes).
- `search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” Perform a search based on the configured search type. Args: `query (str)`: The search query. `limit (int)`: Maximum number of results to return. `filters (Optional[Dict[str, Any]])`: Filters to apply to the search. Returns: `List[Document]`: List of matching documents.
- `update_metadata(self, content_id: str, metadata: Dict[str, Any]) -> None` â€” Update the metadata for documents with the given `content_id`. Args: `content_id (str)`: The content ID to update `metadata (Dict[str, Any])`: The metadata to update
- `upsert(self, content_hash: str, documents: List[Document], filters: Optional[Dict[str, Any]]=None) -> None` â€” Upsert documents into Weaviate. Args: `documents (List[Document])`: List of documents to upsert `filters (Optional[Dict[str, Any]])`: Filters to apply while upserting
- `upsert_available(self) -> bool` â€” Indicate that upsert functionality is available.
- `vector_search(self, query: str, limit: int=5, filters: Optional[Dict[str, Any]]=None) -> List[Document]` â€” No docstring provided.

Module `agno.workflow.agent`

- **Source:** `libs/agno/agno/workflow/agent.py`

WorkflowAgent - A restricted Agent for workflow orchestration

Classes

- **class WorkflowAgent** (bases: Agent)
 - A restricted Agent class specifically designed for workflow orchestration. This agent can:
 1. Decide whether to run the workflow or answer directly from history
 2. Call the workflow execution tool when needed
 3. Access workflow session history for context Restrictions:
 - Only model configuration allowed
 - No custom tools (tools are set by workflow)
 - No knowledge base
 - Limited configuration options
 - **Methods:**
 - `async_create_workflow_tool(self, workflow: 'Any', session: 'WorkflowSession', execution_input: 'WorkflowExecutionInput', run_context: RunContext, stream: bool=False, websocket_handler: Optional[WebSocketHandler]=None) -> Callable` â€” Create the async workflow execution tool that this agent can call. This is the async counterpart of `create_workflow_tool`. Args: `workflow`: The workflow instance `session`: The workflow session `execution_input`: The execution input `run_context`: The run context `stream`: Whether to stream the workflow execution Returns: Async callable tool function
 - `create_workflow_tool(self, workflow: 'Any', session: 'WorkflowSession', execution_input: 'WorkflowExecutionInput', run_context: RunContext, stream: bool=False) -> Callable` â€” Create the workflow execution tool that this agent can call. This is similar to how Agent has `search_knowledge_base()` method. Args: `workflow`: The workflow instance `session`: The workflow session `execution_input`: The execution input `run_context`: The run context `stream`: Whether to stream the workflow execution Returns: Callable tool function

Module `agno.workflow.condition`

- **Source:** `libs/agno/agno/workflow/condition.py`

Classes

- **class Condition**
 - A condition that executes a step (or list of steps) if the condition is met
 - **Methods:**
 - `async aeexecute(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, workflow_run_response: Optional[WorkflowRunOutput]=None, store_executor_outputs: bool=True, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> StepOutput` â€” Async execute the condition and its steps with sequential chaining
 - `async aeexecute_stream(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, stream_events: bool=False, stream_intermediate_steps: bool=False, stream_executor_events: bool=True, workflow_run_response: Optional[WorkflowRunOutput]=None, step_index: Optional[Union[int, tuple]]=None, store_executor_outputs: bool=True, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, parent_step_id: Optional[str]=None, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> AsyncIterator[Union[WorkflowRunOutputEvent, TeamRunOutputEvent, RunOutputEvent, StepOutput]]` â€” Async execute the condition with streaming support - mirrors Loop logic
 - `execute(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, workflow_run_response: Optional[WorkflowRunOutput]=None, store_executor_outputs: bool=True, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, parent_step_id: Optional[str]=None, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> StepOutput` â€” Execute the condition and its steps with sequential chaining if condition is true
 - `execute_stream(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, stream_events: bool=False, stream_intermediate_steps: bool=False, stream_executor_events: bool=True, workflow_run_response: Optional[WorkflowRunOutput]=None, step_index: Optional[Union[int, tuple]]=None, store_executor_outputs: bool=True, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, parent_step_id: Optional[str]=None, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> Iterator[Union[WorkflowRunOutputEvent, StepOutput]]` â€” Execute the condition with streaming support - mirrors Loop logic

Module `agno.workflow.loop`

- **Source:** `libs/agno/agno/workflow/loop.py`

Classes

- **class Loop**
 - A loop of steps that execute in order
 - **Methods:**
 - `async aeexecute(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, workflow_run_response: Optional[WorkflowRunOutput]=None, store_executor_outputs:`

```
pool=True, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps
optional[bool]=False, num history runs: int=3) -> StepOutput &quot; Execute loop steps asynchronously with iteration control - mirrors workflow execution logic
```

```

    async aexecute_stream(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, stream_events: bool=False, stream_intermediate_steps: bool=False,
stream_executor_events: bool=True, workflow_run_response: Optional[WorkflowRunOutput]=None, step_index: Optional[Union[int, tuple]]=None, num_store_executor_outputs: bool=True, run_context:
Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, parent_step_id: Optional[str]=None, workflow_session: Optional[WorkflowSession]=None,
add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> AsyncIterator[Union[WorkflowRunOutputEvent, TeamRunOutputEvent, RunOutputEvent, StepOutput]] â€œ Execute
loop steps with async streaming support - mirrors workflow execution logic

```

```

* execute(self, step_input: StepInput, sessionid: Optional[str]=None, user_id: Optional[str]=None, workflow_run_response: Optional[WorkflowRunOutput]=None, store_executor_outputs:
bool=True, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps:
Optional[bool]=False, num_history_runs: int=3) -> StepOutput â€œ Execute loop steps with iteration control - mirrors workflow execution logic

```

```

execute_stream(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, stream_events: bool=False, stream_intermediate_steps: bool=False,
stream_executor_events: bool=True, workflow_run_response: Optional[WorkflowRunOutputEvent]=None, step_index: Optional[Union[int, tuple]]=None, store_executor_outputs: bool=True, run_context:
Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, parent_step_id: Optional[str]=None, workflow_session: Optional[WorkflowSession]=None,
add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> Iterator[Union[WorkflowRunOutputEvent, StepOutput]] â€” Execute loop steps with streaming support -
mirrors workflow execution logic

```

Module agno.workflow.parallel

- **Source:** `libs/agno/agno/workflow/parallel.py`

Classes

- `class Parallel`

- A list of steps that execute in parallel

- **Methods:**

```

    async_execute(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, workflow_run_response: Optional[WorkflowRunOutput]=None, store_executor_outputs:
        bool=True, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps:
        Optional[bool]=False, num_history_runs: int=3) -> StepOutput """ Execute all steps in parallel using asyncio and return aggregated result

```

```

async execute_stream(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, stream_events: bool=False, stream_intermediate_steps: bool=False,
stream_executor_events: bool=True, workflow_run_response: Optional[WorkflowRunOutput]=None, step_index: Optional[Union[int, tuple]]=None, state_executor_outputs: bool=True, run_context:
Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, parent_step_id: Optional[str]=None, workflow_session: Optional[WorkflowSession]=None,
add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> AsyncIterator[Union[WorkflowRunOutputEvent, TeamRunOutputEvent, RunOutputEvent, StepOutput]] @â€œ Execute
all steps in parallel with async streaming support

```

```

    execute(self, step_input: StepInput, sessionid: Optional[str]=None, user_id: Optional[str]=None, workflow_run_response: Optional[WorkflowRunOutput]=None, store_executor_outputs: bool=True, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> StepOutput â€œ Execute all steps in parallel and return aggregated result

```

```

execute_stream(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, stream_events: bool=False, stream_intermediate_steps: bool=False,
stream_executor_events: bool=True, workflow_run_response: Optional[WorkflowRunResponse]=None, step_index: Optional[Union[int, tuple]]=None, store_executor_outputs: bool=True, run_context:
Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, parent_step_id: Optional[str]=None, workflow_session: Optional[WorkflowSession]=None,
add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> Iterator[Union[WorkflowRunOutputEvent, StepOutput]] â€” Execute all steps in parallel with streaming
support

```

Module agno.workflow.router

- **Source:** `libs/agno/agno/workflow/router.py`

Classes

- `class Router`

- A router that dynamically selects which step(s) to execute based on input

- **Methods:**

```

- async aexecute(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, workflow_run_response: Optional[WorkflowRunOutput]=None, run_context:
  Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, store_executor_outputs: bool=True, workflow_session: Optional[WorkflowSession]=None,
  add_workflow_history to steps: Optional[bool]=False, num_history_runs: int=3) -> StepOutput â€œ Async execute the router and its selected steps with sequential chaining

```

```

async execute_stream(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, stream_events: bool=False, stream_intermediate_steps: bool=False, stream_executor_events: bool=True, workflow_run_response: Optional[WorkflowRunOutput]=None, step_index: Optional[Union[int, tuple]]=None, store_executor_outputs: bool=True, parent_step_id: Optional[str]=None, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> AsyncIterator[Union[WorkflowRunOutputEvent, TeamRunOutputEvent, RunOutputEvent, StepOutput]] â€” Async execute the router with streaming support

```

```

* execute(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, workflow_run_response: Optional[WorkflowRunOutput]=None, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, store_executor_outputs: bool=True, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> StepOutput â€œ Execute the router and its selected steps with sequential chaining

```

```

    execute_stream(self, step_index: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, stream_events: bool=False, stream_intermediate_steps: bool=False, stream_executor_events: bool=True, workflow_run_response: Optional[WorkflowRunOutput]=None, step_index: Optional[Union[int, tuple)]=None, store_executor_outputs: bool=True, parent_step_id: Optional[str]=None, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> Iterator[Union[WorkflowRunOutputEvent, StepOutput]]
    """ Execute the router with streaming support

```

Module agno.workflow.step

- **Source:** `libs/agno/agno/workflow/step.py`

Classes

- `class Step`

- A single unit of work in a workflow pipeline

- **Methods:**

```

    async aexecute(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, workflow_run_response: Optional[WorkflowRunOutput]=None, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, state_executor_outputs: bool=True, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> StepOutput â€œ Execute the step with StepInput, returning final StepOutput (non-streaming)

```

```
async aexecute_stream(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, stream_events: bool=False, stream_intermediate_steps: bool=False, stream_executor_events: bool=True, workflow_run_response: Optional[WorkflowRunOutputEvent]=None, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, step_index: Optional[Union[int, tuple]]=None, store_executor_outputs: bool=True, parent_step_id: Optional[str]=None, workflow_session: Optional['WorkflowSession']=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> AsyncIterator[Union[WorkflowRunOutputEvent, StepOutput]] â€œ Execute the step with event-driven streaming support
```

```
execute(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, workflow_run_response: Optional[WorkflowRunOutput]=None, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, store_executor_outputs: bool=True, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> StepOutput â€œ Execute the step with StepInput, returning final StepOutput (non-streaming)
```

```
execute_stream(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, stream_events: bool=False, stream_intermediate_steps: bool=False,
stream_executor_events: bool=True, workflow_run_response: Optional['WorkflowRunOutput']=None, step_run_context: Optional[RunContext]=None, stream_state: Optional[Dict[str, Any]]=None,
step_index: Optional[Union[int, tuple]]=None, store_executor_outputs: bool=True, parent_step_id: Optional[str]=None, workflow_session: Optional['WorkflowSession']=None,
add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> Iterator[Union[WorkflowRunOutputEvent, StepOutput]] â€œ Execute the step with event-driven streaming
support
```

- `executor name(self) -> str` " Get the name of the current executor

- `executor type(self) -> str` "Get the type of the current executor"

Module agno.workflow.steps

- **Source:** `libs/agno/agno/workflow/steps.py`

Classes

- **class Steps**
 - A pipeline of steps that execute in order
 - **Methods:**
 - `async aexecute(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, workflow_run_response: Optional[WorkflowRunOutput]=None, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, store_executor_outputs: bool=True, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> StepOutput` â€” Execute all steps in sequence asynchronously and return the final result
 - `async aexecute_stream(self, step_input: StepInput, workflow_run_response: WorkflowRunOutput, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, session_id: Optional[str]=None, user_id: Optional[str]=None, stream_events: bool=False, stream_intermediate_steps: bool=False, stream_executor_events: bool=True, step_index: Optional[Union[int, tuple]]=None, store_executor_outputs: bool=True, parent_step_id: Optional[str]=None, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> AsyncIterator[Union[WorkflowRunOutputEvent, TeamRunOutputEvent, RunOutputEvent, StepOutput]]` â€” Execute all steps in sequence with async streaming support
 - `execute(self, step_input: StepInput, session_id: Optional[str]=None, user_id: Optional[str]=None, workflow_run_response: Optional[WorkflowRunOutput]=None, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, store_executor_outputs: bool=True, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> StepOutput` â€” Execute all steps in sequence and return the final result
 - `execute_stream(self, step_input: StepInput, workflow_run_response: WorkflowRunOutput, run_context: Optional[RunContext]=None, session_state: Optional[Dict[str, Any]]=None, session_id: Optional[str]=None, user_id: Optional[str]=None, stream_events: bool=False, stream_intermediate_steps: bool=False, stream_executor_events: bool=True, step_index: Optional[Union[int, tuple]]=None, store_executor_outputs: bool=True, parent_step_id: Optional[str]=None, workflow_session: Optional[WorkflowSession]=None, add_workflow_history_to_steps: Optional[bool]=False, num_history_runs: int=3) -> Iterator[Union[WorkflowRunOutputEvent, TeamRunOutputEvent, RunOutputEvent, StepOutput]]` â€” Execute all steps in sequence with streaming support

Module `agno.workflow.types`

- **Source:** `libs/agno/agno/workflow/types.py`

Classes

- **class StepInput**
 - Input data for a step execution
 - **Methods:**
 - `get_all_previous_content(self) -> str` â€” Get concatenated content from all previous steps
 - `get_input_as_string(self) -> Optional[str]` â€” Convert input to string representation
 - `get_last_step_content(self) -> Optional[str]` â€” Get content from the most recent step (for backward compatibility)
 - `get_step_content(self, step_name: str) -> Optional[Union[str, Dict[str, str]]]` â€” Get content from a specific previous step by name For parallel steps, if you ask for the parallel step name, returns a dict with {step_name: content} for each sub-step. For other nested steps (Condition, Router, Loop, Steps), returns the deepest content.
 - `get_step_output(self, step_name: str) -> Optional['StepOutput']` â€” Get output from a specific previous step by name
 - `get_workflow_history(self, num_runs: Optional[int]=None) -> List[Tuple[str, str]]` â€” Get workflow conversation history as structured data for custom function steps Args: num_runs: Number of recent runs to include. If None, returns all available history.
 - `get_workflow_history_context(self, num_runs: Optional[int]=None) -> Optional[str]` â€” Get formatted workflow conversation history context for custom function steps Args: num_runs: Number of recent runs to include. If None, returns all available history.
 - `to_dict(self) -> Dict[str, Any]` â€” Convert to dictionary
- **class StepMetrics**
 - Metrics for a single step execution
 - **Methods:**
 - `from_dict(cls, data: Dict[str, Any]) -> 'StepMetrics'` â€” Create StepMetrics from dictionary
 - `to_dict(self) -> Dict[str, Any]` â€” Convert to dictionary
- **class StepOutput**
 - Output data from a step execution
 - **Methods:**
 - `from_dict(cls, data: Dict[str, Any]) -> 'StepOutput'` â€” Create StepOutput from dictionary
 - `to_dict(self) -> Dict[str, Any]` â€” Convert to dictionary
- **class StepType** (bases: str, Enum)
- **class WebSocketHandler**
 - Generic WebSocket handler for real-time workflow events
 - **Methods:**
 - `format_sse_event(self, json_data: str) -> str` â€” Parse JSON data into SSE-compliant format. Args: json_data: JSON string containing the event data Returns: SSE-formatted response with event type and data
 - `async handle_dict(self, data: Dict[str, Any]) -> None` â€” Handle a dictionary directly
 - `async handle_event(self, event: Any) -> None` â€” Handle an event object - serializes and sends via WebSocket
 - `async handle_text(self, message: str) -> None` â€” Handle a plain text message
- **class WorkflowExecutionInput**
 - Input data for a step execution
 - **Methods:**
 - `get_input_as_string(self) -> Optional[str]` â€” Convert input to string representation
 - `to_dict(self) -> Dict[str, Any]` â€” Convert to dictionary
- **class WorkflowMetrics**
 - Complete metrics for a workflow execution
 - **Methods:**
 - `from_dict(cls, data: Dict[str, Any]) -> 'WorkflowMetrics'` â€” Create WorkflowMetrics from dictionary
 - `start_timer(self)` â€” No docstring provided.
 - `stop_timer(self, set_duration: bool=True)` â€” No docstring provided.
 - `to_dict(self) -> Dict[str, Any]` â€” Convert to dictionary

Module `agno.workflow.workflow`

- **Source:** `libs/agno/agno/workflow/workflow.py`

Classes

- **class Workflow**

- Pipeline-based workflow execution

- **Methods:**

- `async acli_app(self, input: Optional[str]=None, session_id: Optional[str]=None, user_id: Optional[str]=None, user: str='User', emoji: str=':technologist:', stream: Optional[bool]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, markdown: bool=True, show_time: bool=True, show_step_details: bool=True, exit_on: Optional[List[str]]=None, **kwargs: Any) -> None` Run an interactive command-line interface to interact with the workflow. This method creates a CLI interface that allows users to interact with the workflow either by providing a single input or through continuous interactive prompts. Arguments: input: Optional initial input to process before starting interactive mode. session_id: Optional session identifier for maintaining conversation context. user_id: Optional user identifier for tracking user-specific data. user: Display name for the user in the CLI prompt. Defaults to `æœUser`. emoji: Emoji to display next to the user name in prompts. Defaults to `æœ:technologist:æœ`. stream: Whether to stream the workflow response. If None, uses workflow default. stream_events: Whether to stream events from the workflow. If None, uses workflow default. markdown: Whether to render output as markdown. Defaults to True. show_time: Whether to display timestamps in the output. Defaults to True. show_step_details: Whether to show detailed step information. Defaults to True. exit_on: List of commands that will exit the CLI. Defaults to `[æœexitæœ, æœquitæœ, æœbyeæœ, æœstopæœ]`. (deprecated) stream_intermediate_steps: Whether to stream intermediate step outputs. If None, uses workflow default. **kwargs: Additional keyword arguments passed to the workflow's `print_response` method. Returns: None: This method runs interactively and does not return a value.
- `async delete_session(self, session_id: str)` Delete the current session and save to storage
- `async aget_last_run_output(self, session_id: Optional[str]=None) -> Optional[WorkflowRunOutput]` Get the last run response from the database.
- `async aget_run(self, run_id: str) -> Optional[WorkflowRunOutput]` Get the status and details of a background workflow run - SIMPLIFIED
- `async aget_run_output(self, run_id: str, session_id: Optional[str]=None) -> Optional[WorkflowRunOutput]` Get a RunOutput from the database.
- `async aget_session(self, session_id: Optional[str]=None) -> Optional[WorkflowSession]` Load an WorkflowSession from database. Args: session_id: The session_id to load from storage. Returns: WorkflowSession: The WorkflowSession loaded from the database or created if it does not exist.
- `async aget_session_metrics(self, session_id: Optional[str]=None) -> Optional[Metrics]` Get the session metrics for the given session ID and user ID.
- `async aget_session_name(self, session_id: Optional[str]=None) -> str` Get the session name for the given session ID and user ID.
- `async aget_session_state(self, session_id: Optional[str]=None) -> Dict[str, Any]` Get the session state for the given session ID and user ID.
- `async aprint_response(self, input: Union[str, Dict[str, Any], List[Any], BaseModel, List[Message]], additional_data: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, audio: Optional[List[Audio]]=None, images: Optional[List[Image]]=None, videos: Optional[List[Video]]=None, files: Optional[List[File]]=None, stream: Optional[bool]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, markdown: bool=True, show_time: bool=True, show_step_details: bool=True, console: Optional[Any]=None, **kwargs: Any) -> None` Print workflow execution with rich formatting and optional streaming Args: input: The main message/input for the workflow additional_data: Attached message data to the input user_id: User ID session_id: Session ID audio: Audio input images: Image input videos: Video input files: File input stream: Whether to stream the response content stream_events: Whether to stream intermediate steps markdown: Whether to render content as markdown show_time: Whether to show execution time show_step_details: Whether to show individual step outputs console: Rich console instance (optional) (deprecated) stream_intermediate_steps: Whether to stream intermediate step outputs. If None, uses workflow default.
- `async aread_or_create_session(self, session_id: str, user_id: Optional[str]=None) -> WorkflowSession` No docstring provided.
- `async arun(self, input: Optional[Union[str, Dict[str, Any], List[Any], BaseModel, List[Message]]]=None, additional_data: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, audio: Optional[List[Audio]]=None, images: Optional[List[Image]]=None, videos: Optional[List[Video]]=None, files: Optional[List[File]]=None, stream: Literal[False]=False, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, background: Optional[bool]=False, websocket: Optional[WebSocket]=None) -> WorkflowRunOutput` No docstring provided.
- `arun(self, input: Optional[Union[str, Dict[str, Any], List[Any], BaseModel, List[Message]]]=None, additional_data: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, audio: Optional[List[Audio]]=None, images: Optional[List[Image]]=None, videos: Optional[List[Video]]=None, files: Optional[List[File]]=None, stream: Literal[True]=True, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, background: Optional[bool]=False, websocket: Optional[WebSocket]=None) -> AsyncIterator[WorkflowRunOutputEvent]` No docstring provided.
- `arun(self, input: Optional[Union[str, Dict[str, Any], List[Any], BaseModel, List[Message]]]=None, additional_data: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, audio: Optional[List[Audio]]=None, images: Optional[List[Image]]=None, videos: Optional[List[Video]]=None, files: Optional[List[File]]=None, stream: bool=False, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=False, background: Optional[bool]=False, websocket: Optional[WebSocket]=None, **kwargs: Any) -> Union[WorkflowRunOutput, AsyncIterator[WorkflowRunOutputEvent]]` Execute the workflow synchronously with optional streaming
- `async asave_session(self, session: WorkflowSession) -> None` Save the WorkflowSession to storage, using an async database. Returns: Optional[WorkflowSession]: The saved WorkflowSession or None if not saved.
- `async aset_session_name(self, session_id: Optional[str]=None, autogenerate: bool=False, session_name: Optional[str]=None) -> WorkflowSession` Set the session name and save to storage, using an async database
- `async aupdate_session_state(self, session_state_updates: Dict[str, Any], session_id: Optional[str]=None) -> Dict[str, Any]` Update the session state for the given session ID (async). Args: session_state_updates: The updates to apply to the session state. Should be a dictionary of key-value pairs. session_id: The session ID to update. If not provided, the current cached session ID is used. Returns: dict: The updated session state.
- `cancel_run(self, run_id: str) -> bool` Cancel a running workflow execution. Args: run_id (str): The run_id to cancel. Returns: bool: True if the run was found and marked for cancellation, False otherwise.
- `cli_app(self, input: Optional[str]=None, session_id: Optional[str]=None, user_id: Optional[str]=None, user: str='User', emoji: str=':technologist:', stream: Optional[bool]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, markdown: bool=True, show_time: bool=True, show_step_details: bool=True, exit_on: Optional[List[str]]=None, **kwargs: Any) -> None` Run an interactive command-line interface to interact with the workflow. This method creates a CLI interface that allows users to interact with the workflow either by providing a single input or through continuous interactive prompts. Arguments: input: Optional initial input to process before starting interactive mode. session_id: Optional session identifier for maintaining conversation context. user_id: Optional user identifier for tracking user-specific data. user: Display name for the user in the CLI prompt. Defaults to `æœUser`. emoji: Emoji to display next to the user name in prompts. Defaults to `æœ:technologist:æœ`. stream: Whether to stream the workflow response. If None, uses workflow default. stream_events: Whether to stream intermediate step outputs. If None, uses workflow default. markdown: Whether to render output as markdown. Defaults to True. show_time: Whether to display timestamps in the output. Defaults to True. show_step_details: Whether to show detailed step information. Defaults to True. exit_on: List of commands that will exit the CLI. Defaults to `[æœexitæœ, æœquitæœ, æœbyeæœ, æœstopæœ]`. (deprecated) stream_intermediate_steps: Whether to stream intermediate step outputs. If None, uses workflow default. **kwargs: Additional keyword arguments passed to the workflow's `print_response` method. Returns: None: This method runs interactively and does not return a value.
- `delete_session(self, session_id: str)` Delete the current session and save to storage
- `get_last_run_output(self, session_id: Optional[str]=None) -> Optional[WorkflowRunOutput]` Get the last run response from the database.
- `get_run(self, run_id: str) -> Optional[WorkflowRunOutput]` Get the status and details of a background workflow run - SIMPLIFIED
- `get_run_output(self, run_id: str, session_id: Optional[str]=None) -> Optional[WorkflowRunOutput]` Get a RunOutput from the database.
- `get_session(self, session_id: Optional[str]=None) -> Optional[WorkflowSession]` Load an WorkflowSession from database. Args: session_id: The session_id to load from storage. Returns: WorkflowSession: The WorkflowSession loaded from the database or created if it does not exist.
- `get_session_metrics(self, session_id: Optional[str]=None) -> Optional[Metrics]` Get the session metrics for the given session ID and user ID.
- `get_session_name(self, session_id: Optional[str]=None) -> str` Get the session name for the given session ID and user ID.
- `get_session_state(self, session_id: Optional[str]=None) -> Dict[str, Any]` Get the session state for the given session ID and user ID.
- `initialize_workflow(self)` No docstring provided.
- `print_response(self, input: Union[str, Dict[str, Any], List[Any], BaseModel, List[Message]], additional_data: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, audio: Optional[List[Audio]]=None, images: Optional[List[Image]]=None, videos: Optional[List[Video]]=None, files: Optional[List[File]]=None, stream: Optional[bool]=None, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, markdown: bool=True, show_time: bool=True, show_step_details: bool=True, console: Optional[Any]=None, **kwargs: Any) -> None` Print workflow execution with rich formatting and optional streaming Args: input: The main query/input for the workflow additional_data: Attached message data to the input user_id: User ID session_id: Session ID audio: Audio input images: Image input videos: Video input files: File input stream: Whether to stream the response content stream_events: Whether to stream intermediate steps markdown: Whether to render content as markdown show_time: Whether to show execution time show_step_details: Whether to show individual step outputs console: Rich console instance (optional) (deprecated) stream_intermediate_steps: Whether to stream intermediate step outputs. If None, uses workflow default.
- `read_or_create_session(self, session_id: str, user_id: Optional[str]=None) -> WorkflowSession` No docstring provided.
- `run(self, input: Optional[Union[str, Dict[str, Any], List[Any], BaseModel]]=None, additional_data: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, audio: Optional[List[Audio]]=None, images: Optional[List[Image]]=None, videos: Optional[List[Video]]=None, files: Optional[List[File]]=None, stream: Literal[False]=False, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, background: Optional[bool]=False) -> WorkflowRunOutput` No docstring provided.
- `run(self, input: Optional[Union[str, Dict[str, Any], List[Any], BaseModel]]=None, additional_data: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, audio: Optional[List[Audio]]=None, images: Optional[List[Image]]=None, videos: Optional[List[Video]]=None, files: Optional[List[File]]=None, stream: Literal[True]=True, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, background: Optional[bool]=False) -> Iterator[WorkflowRunOutputEvent]` No docstring provided.
- `run(self, input: Optional[Union[str, Dict[str, Any], List[Any], BaseModel]]=None, additional_data: Optional[Dict[str, Any]]=None, user_id: Optional[str]=None, session_id: Optional[str]=None, session_state: Optional[Dict[str, Any]]=None, audio: Optional[List[Audio]]=None, images: Optional[List[Image]]=None, videos: Optional[List[Video]]=None, files: Optional[List[File]]=None, stream: bool=False, stream_events: Optional[bool]=None, stream_intermediate_steps: Optional[bool]=None, background: Optional[bool]=False, **kwargs: Any) ->`

```
Union[WorkflowRunOutput, Iterator[WorkflowRunOutputEvent]] â€” Execute the workflow synchronously with optional streaming

■ run_parameters(self) -> Dict[str, Any] â€” Get the run parameters for the workflow

■ save_session(self, session: WorkflowSession) -> None â€” Save the WorkflowSession to storage Returns: Optional[WorkflowSession]: The saved WorkflowSession or None if not saved.

■ set_id(self) -> None â€” No docstring provided.

■ set_session_name(self, session_id: Optional[str]=None, autogenerate: bool=False, session_name: Optional[str]=None) -> WorkflowSession â€” Set the session name and save to storage

■ to_dict(self) -> Dict[str, Any] â€” Convert workflow to dictionary representation

■ update_agents_and_teams_session_info(self) â€” Update agents and teams with workflow session information

■ update_session_state(self, session_state_updates: Dict[str, Any], session_id: Optional[str]=None) -> Dict[str, Any] â€” Update the session state for the given session ID. Args: session_state_updates: The updates to apply to the session state. Should be a dictionary of key-value pairs. session_id: The session ID to update. If not provided, the current cached session ID is used. Returns: dict: The updated session state.
```

Cookbook Walkthrough

The cookbook directory contains runnable, end-to-end examples. Each entry below includes a friendly summary, notable imports, and a small code excerpt.

cookbook/__init__.py

Purpose: cookbook/init.py example

- **How to Run:** python cookbook/__init__.py (ensure prerequisites from the docstring are satisfied)

cookbook/agent_os/__init__.py

Purpose: cookbook/agent_os/init.py example

- **How to Run:** python cookbook/agent_os/__init__.py (ensure prerequisites from the docstring are satisfied)

cookbook/agent_os/advanced_demo/__init__.py

Purpose: cookbook/agent_os/advanced_demo/init.py example

- **How to Run:** python cookbook/agent_os/advanced_demo/__init__.py (ensure prerequisites from the docstring are satisfied)

cookbook/agent_os/advanced_demo/_agents.py

Purpose: cookbook/agent_os/advanced_demo/_agents.py example

- **Key Agno APIs:** agno.agent.Agent, agno.db.postgres.PostgresDb, agno.knowledge.embedder.openai.OpenAIEmbedder, agno.knowledge.knowledge.Knowledge, agno.models.anthropic.claude.Claude, agno.tools.duckduckgo.DuckDuckGoTools, agno.tools.exa.ExaTools, agno.tools.file.FileTools, agno.vectordb.pgvector.pgvector.PgVector
- **How to Run:** python cookbook/agent_os/advanced_demo/_agents.py (ensure prerequisites from the docstring are satisfied)

```
from datetime import datetime
from pathlib import Path
from textwrap import dedent

from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.knowledge.embedder.openai import OpenAIEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.anthropic.claude import Claude
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.exa import ExaTools
from agno.tools.file import FileTools
from agno.vectordb.pgvector.pgvector import PgVector

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

AGENT_DESCRIPTION = dedent("""\
You are Sage, a cutting-edge Answer Engine built to deliver precise, context-rich, and engaging responses.
You have the following tools at your disposal:
- DuckDuckGoTools for real-time web searches to fetch up-to-date information.
- ExaTools for structured, in-depth analysis.
- FileTools for saving the output upon user confirmation.

Your response should always be clear, concise, and detailed. Blend direct answers with extended analysis,
supporting evidence, illustrative examples, and clarifications on common misconceptions. Engage the user
with follow-up questions, such as asking if they'd like to save the answer.

<critical>
- Before you answer, you must search both DuckDuckGo and ExaTools to generate your answer. If you don't, you will be penalized.
- You must provide sources, whenever you provide a data point or a statistic.
- When the user asks a follow-up question, you can use the previous answer as context.
- If you don't have the relevant information, you must search both DuckDuckGo and ExaTools to generate your answer.
</critical>
""")

AGENT_INSTRUCTIONS = dedent("""\
Here's how you should answer the user's question:

1. Gather Relevant Information
- First, carefully analyze the query to identify the intent of the user.
- Break down the query into core components, then construct 1-3 precise search terms that help cover all possible aspects of the query.
- Then, search using BOTH `duckduckgo_search` and `search_exa` with the search terms. Remember to search both tools.
- Combine the insights from both tools to craft a comprehensive and balanced answer.
- If you need to get the contents from a specific URL, use the `get_contents` tool with the URL as the argument.
- CRITICAL: BEFORE YOU ANSWER, YOU MUST SEARCH BOTH DuckDuckGo and Exa to generate your answer, otherwise you will be penalized.

2. Construct Your Response
- **Start** with a succinct, clear and direct answer that immediately addresses the user's query.
- **Then expand** the answer by including:
    â€¢ A clear explanation with context and definitions.
    â€¢ Supporting evidence such as statistics, real-world examples, and data points.
    â€¢ Clarifications that address common misconceptions.
- Expand the answer only if the query requires more detail. Simple questions like: "What is the weather in Tokyo?" or "What is the capital of France?" don't need an in-depth analysis.
- Ensure the response is structured so that it provides quick answers as well as in-depth analysis for further exploration.

3. Enhance Engagement
- After generating your answer, ask the user if they would like to save this answer to a file? (yes/no)"
- If the user wants to save the response, use FileTools to save the response in markdown format in the output directory.

4. Final Quality Check & Presentation â€”
- Review your response to ensure clarity, depth, and engagement.
- Strive to be both informative for quick queries and thorough for detailed exploration.

5. In case of any uncertainties, clarify limitations and encourage follow-up queries.\

    name="Agno Assist",
    model=Claude(id="claude-sonnet-4-5"),
    db=db,
    # Enable agentic memory
    enable_agentic_memory=True,
    # Add the previous session history to the context
    add_history_to_context=True,
    # Add the current date and time to the context
    add_datetime_to_context=True,
    # Enable markdown formatting
    markdown=True,
    # Add the Agno MCP server to the Agent
    tools=[MCPTools(transport="streamable-http", url="https://docs.agno.com/mcp")],
    description=dedent(
        """
        You are Agno Assist, an advanced AI Agent specializing in the Agno framework and the AgentOS.

        Your goal is to help developers understand and effectively use Agno and the AgentOS by providing
        explanations and working code examples."""
    ),
    instructions=dedent(
        """
        Follow these steps to ensure the best possible response:

        1. **Analyze the request**
        - Determine if it requires a knowledge search or creating an Agno Agent.
        - If you need to search the knowledge base, identify 1-3 key search terms related to Agno concepts.
        - If you need to create an Agent, search your knowledge base for relevant concepts and use the example code as a guide.
        - When the user asks for an Agent, they mean an Agno Agent.
        - All concepts are related to Agno, so you can search your knowledge base for relevant information

        After the analysis, determine if you need to create an Agno Agent.

        2. **Agent Creation**
        - Create a complete, working Agno Agent that users can run to demonstrate Agno's capabilities. For example:
        ```python
 from agno.agent import Agent
 from agno.tools.duckduckgo import DuckDuckGoTools

 agent = Agent(tools=[DuckDuckGoTools()])

 # Perform a web search and capture the response
 response = agent.run("What's happening in France?")
        ```
        - Remember to:
          * Use agent.run() and NOT agent.print_response()
          * Build the complete Agno Agent implementation
          * Include all necessary imports and setup
          * Add comprehensive comments explaining the implementation
          * Ensure all dependencies are listed
          * Include error handling and best practices
          * Add type hints and documentation

        Key topics to cover:
        - Agno Agents and their capabilities
```

- The AgentOS and its features
- Tool integration
- Model support and configuration
- Best practices and common patterns
- How to use the Agno MCP server
- How to use the AgentOS UI""

```
),

***** Demo Scenarios *****

DEMO SCENARIOS - Use these as example queries to showcase the multi-agent system:

1. COMPREHENSIVE INVESTMENT RESEARCH:
Analyze Apple (AAPL) as a potential investment:
 1. Get current stock price and fundamentals
 2. Research recent news and market sentiment
 3. Calculate key financial ratios and risk metrics
 4. Provide a comprehensive investment recommendation
2. SECTOR COMPARISON ANALYSIS:
Compare the tech sector giants (AAPL, GOOGL, MSFT) performance:
 1. Get financial data for all three companies
 2. Analyze recent news affecting the tech sector
 3. Calculate comparative metrics and correlations
 4. Recommend portfolio allocation weights
3. RISK ASSESSMENT SCENARIO:
Evaluate the risk profile of Tesla (TSLA):
 1. Calculate volatility metrics and beta
 2. Analyze recent news for risk factors
 3. Compare risk vs return to market benchmarks
 4. Provide risk-adjusted investment recommendation
4. MARKET SENTIMENT ANALYSIS:
Analyze current market sentiment around AI stocks:
 1. Search for recent AI industry news and developments
 2. Get financial data for key AI companies (NVDA, GOOGL, MSFT, AMD)
 3. Provide outlook for AI sector investing
5. EARNINGS SEASON ANALYSIS:
Prepare for upcoming earnings season - analyze Microsoft (MSFT):
 1. Get current financial metrics and analyst expectations
 2. Research recent news and market sentiment
 3. Calculate historical earnings impact on stock price
 4. Provide trading strategy recommendation

- **How to Run:** python cookbook/agent_os/knowledge/agno_docs_agent.py (ensure prerequisites from the docstring are satisfied)

```
from textwrap import dedent

from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.knowledge.embedder.openai import OpenAIEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.anthropic import Claude
from agno.os import AgentOS
from agno.vectordb.pgvector import PgVector, SearchType

# ***** Database Setup *****
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
db = PostgresDb(db_url, id="agno_assist_db")
# *****

# ***** Description & Instructions *****
description = dedent(
    """
    You are AgnoAssist, an advanced AI Agent specialized in the Agno framework.
    Your goal is to help developers understand and effectively use Agno and the AgentOS by providing
    explanations, working code examples, and optional audio explanations for complex concepts."""
)

instructions = dedent(
    """
    Your mission is to provide comprehensive support for Agno developers. Follow these steps to ensure the best possible response:

    1. **Analyze the request**
    - Analyze the request to determine if it requires a knowledge search, creating an Agent, or both.
    - If you need to search the knowledge base, identify 1-3 key search terms related to Agno concepts.
    - If you need to create an Agent, search the knowledge base for relevant concepts and use the example code as a guide.
    - When the user asks for an Agent, they mean an Agno Agent.
    - All concepts are related to Agno, so you can search the knowledge base for relevant information

    After Analysis, always start the iterative search process. No need to wait for approval from the user.

    2. **Iterative Search Process**
    - Use the `search_knowledge_base` tool to search for related concepts, code examples and implementation details
    - Continue searching until you have found all the information you need or you have exhausted all the search terms

    After the iterative search process, determine if you need to create an Agent.
    If you do, ask the user if they want you to create an Agent for them.

    3. **Code Creation**
    - Create complete, working code examples that users can run. For example:
    ```python
 from agno.agent import Agent
 from agno.tools.duckduckgo import DuckDuckGoTools

 agent = Agent(tools=[DuckDuckGoTools()])

 # Perform a web search and capture the response
 response = agent.run("What's happening in France?")
    ```
    - You must remember to use agent.run() and NOT agent.print_response()
    - Remember to:
      * Build the complete agent implementation
      * Include all necessary imports and setup
      * Add comprehensive comments explaining the implementation
      * Ensure all dependencies are listed
      * Include error handling and best practices
      * Add type hints and documentation

    4. **Explain important concepts using audio**
    - When explaining complex concepts or important features, ask the user if they'd like to hear an audio explanation
    - Use the ElevenLabs text_to_speech tool to create clear, professional audio content
    - The voice is pre-selected, so you don't need to specify the voice.
    - Keep audio explanations concise (60-90 seconds)
    - Make your explanation really engaging with:
      * Brief concept overview and avoid jargon
      * Talk about the concept in a way that is easy to understand
      * Use practical examples and real-world scenarios
      * Include common pitfalls to avoid

    5. **Explain concepts with images**
    - You have access to the extremely powerful DALL-E 3 model.
    - Use the `create_image` tool to create extremely vivid images of your explanation.
    - Don't provide the URL of the image in the response. Only describe what image was generated.

    Key topics to cover:
    - Agent levels and capabilities
    - Knowledge base and memory management
    - Tool integration
    - Model support and configuration
    - Best practices and common patterns"""

cookbook/agents/agentic_search/agentic_rag_infinity_reranker.py

Purpose: This cookbook shows how to implement Agentic RAG using Infinity Reranker.

This cookbook shows how to implement Agentic RAG using Infinity Reranker.

Infinity is a high-performance inference server for text-embeddings, reranking, and classification models. It provides fast and efficient reranking capabilities for RAG applications.

Setup Instructions:

1. Install Dependencies

Run: pip install agno anthropic infinity-client lancedb

2. Set up Infinity Server

You have several options to deploy Infinity:

Local Installation

```
# Install infinity
pip install "infinity-emb[all]"

# Run infinity server with reranking model
infinity_emb v2 --model-id BAAI/bge-reranker-base --port 7997
```

Wait for the engine to start.

For better performance, you can use larger models:

BAAI/bge-reranker-large

BAAI/bge-reranker-v2-m3

ms-marco-MiniLM-L-12-v2

3. Export API Keys

```
export ANTHROPIC_API_KEY="your-anthropic-api-key"
```

4. Run the Example

```
python cookbook/agent_concepts/agentic_search/agentic_rag_infinity_reranker.py
```

About Infinity Reranker:

- Provides fast, local reranking without external API calls
- Supports multiple state-of-the-art reranking models
- Can be deployed on GPU for better performance
- Offers both sync and async reranking capabilities
- More deployment options: <https://michaelfeil.eu/infinity/0.0.76/deploy/>
- **Key Agno APIs:** agno.agent.Agent, agno.knowledge.embedder.cohere.CohereEmbedder, agno.knowledge.knowledge.Knowledge, agno.knowledge.reranker.infinity.InfinityReranker, agno.models.anthropic.Claude, agno.vectordb.lancedb.LanceDb, agno.vectordb.lancedb.SearchType
- **Helper Functions:** test_infinity_connection
- **How to Run:** python cookbook/agents/agentic_search/agentic_rag_infinity_reranker.py (ensure prerequisites from the docstring are satisfied)

 # Example 1: Simple issue resolution
 Message(role="user", content="I forgot my password and can't log in"),
 Message(
 role="assistant",
 content="""
I'll help you reset your password right away.

Steps to Reset Your Password:
. Go to the login page and click "Forgot Password"
. Enter your email address
. Check your email for the reset link
. Follow the link to create a new password
. Use a strong password with uppercase, lowercase, numbers, and symbols

f you don't receive the email within 5 minutes, please check your spam folder. Let me know if you need any assistance with these steps!
""").strip(),

 # Example 2: Billing issue pattern
 Message(
 role="user",
 content="I've been charged twice for the same order and I'm frustrated!"),
 Message(
 role="assistant",
 content="""
I sincerely apologize for the billing error and the frustration this has caused you.

Immediate Action Plan:
1. I'll investigate your account to confirm the duplicate charge
2. Process a full refund for the duplicate transaction
3. Ensure this doesn't happen again by checking your payment method settings
4. Provide you with a confirmation number once the refund is processed

The refund typically takes 3-5 business days to appear on your statement. As an apology for this inconvenience, I'd also like to offer you a 10% discount on your next order.

Is there anything else I can help you with regarding this issue?
""").strip(),
),
]
```

```
Example 3: Technical support pattern
Message(role="user", content="Your app keeps crashing when I try to upload photos"),
Message(
 role="assistant",
 content="""
I'm sorry you're experiencing crashes with photo uploads. Let me help you troubleshoot this issue.

Troubleshooting Steps:
1. **Check App Version:** Ensure you have the latest version from the app store
2. **Restart the App:** Close completely and reopen the application
3. **Check Storage:** Make sure you have sufficient device storage (at least 1GB free)
4. **Photo Size:** Try uploading smaller photos (under 10MB each)
5. **Network Connection:** Ensure you have a stable internet connection

If the issue persists:
- Try uploading one photo at a time instead of multiple
- Clear the app cache in your device settings
- Restart your device

If none of these steps resolve the issue, please let me know your device type and OS version, and I'll escalate this to our technical team for further investigation.

cookbook/agents/context\_management/filter\_tool\_calls\_from\_history.py

**Purpose:** This example demonstrates max\_tool\_calls\_from\_history to limit tool calls sent to the model.

This example demonstrates max\_tool\_calls\_from\_history to limit tool calls sent to the model.

How it works: 1. Database stores ALL runs (no limit) 2. num\_history\_runs loads last N runs from database (default: 3) 3. max\_tool\_calls\_from\_history filters loaded history to keep only M most recent tool calls

Flow: Database â†’ Load History â†’ Filter Tool Calls â†’ Send to Model

Expected behavior (with add\_history\_to\_context=True, no num\_history\_runs limit): - Run 1: No history â†’ Model sees: [1] â†’ DB has: [1] - Run 2: History [1] â†’ Model sees: [1, 2] â†’ DB has: [1, 2] - Run 3: History [1,2] â†’ Model sees: [1, 2, 3] â†’ DB has: [1, 2, 3] - Run 4: History [1,2,3] â†’ Model sees: [1, 2, 3, 4] â†’ DB has: [1, 2, 3, 4] - Run 5: History [1,2,3,4] filtered to [2,3,4] â†’ Model sees: [2, 3, 4, 5] â†’ DB has: [1, 2, 3, 4, 5] - Run 6: History [2,3,4,5] filtered to [3,4,5] â†’ Model sees: [3, 4, 5, 6] â†’ DB has: [1, 2, 3, 4, 5, 6]

Key insight: Filtering affects MODEL INPUT only. Database stores everything, always.

- **Key Agno APIs:** agno.agent.Agent, agno.db.sqlite.SqliteDb, agno.models.openai.OpenAIChat
- **Helper Functions:** get\_weather\_for\_city
- **How to Run:** python cookbook/agents/context\_management/filter\_tool\_calls\_from\_history.py (ensure prerequisites from the docstring are satisfied)

 "Use poetry to answer questions.",
]

agent = Agent(
 name="AgentX",
 instructions=get_instructions,
 markdown=True,
)
agent.print_response("Who are you?", stream=True)
```

cookbook/agents/context\_management/location\_instructions.py

**Purpose:** cookbook/agents/context\_management/location\_instructions.py example

- **Key Agno APIs:** agno.agent.Agent, agno.models.openai.OpenAIChat, agno.tools.duckduckgo.DuckDuckGoTools
- **How to Run:** python cookbook/agents/context\_management/location\_instructions.py (ensure prerequisites from the docstring are satisfied)

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=OpenAIChat(id="gpt-4o"),
 add_location_to_context=True,
 tools=[DuckDuckGoTools(cache_results=True)],
)
agent.print_response("What city am I in?")
agent.print_response("What is current news about my city?")
```

cookbook/agents/culture/01\_create\_cultural\_knowledge.py

**Purpose:** Create cultural knowledge to use with your Agents.

Create cultural knowledge to use with your Agents.

This minimal example demonstrates how to use Agno’s CultureManager to create and persist shared cultural knowledge that can be used with your Agents.

Cultural knowledge represents reusable insights, rules, and values that Agents can reference to stay consistent in tone, reasoning, and best practices.

- **Key Agno APIs:** agno.culture.manager.CultureManager, agno.db.sqlite.SqliteDb, agno.models.anthropic.Claude
- **How to Run:** python cookbook/agents/culture/01\_create\_cultural\_knowledge.py (ensure prerequisites from the docstring are satisfied)

```
"""Create cultural knowledge to use with your Agents.

This minimal example demonstrates how to use Agno's `CultureManager`
to create and persist shared cultural knowledge that can be used with your Agents.

Cultural knowledge represents reusable insights, rules, and values that
Agents can reference to stay consistent in tone, reasoning, and best practices.
"""

from agno.culture.manager import CultureManager
from agno.db.sqlite import SqliteDb
from agno.models.anthropic import Claude
from rich.pretty import pprint
```

```

Step 1. Initialize the database used for storing cultural knowledge

db = SQLiteDatabase(db_file="tmp/demo.db")

Step 2. Create the Culture Manager

The CultureManager distills reusable insights into the shared cultural layer
that your Agents can access for consistent reasoning and behavior.
culture_manager = CultureManager(
 db=db,
 model=Claude(id="claude-sonnet-4-5"),
)

Step 3. Create cultural knowledge from a message

You can feed in any insight, principle, or lesson youâ€™d like the system to remember.
The model will generalize it into structured cultural knowledge entries.
#
For example:
- Communication best practices
- Decision-making patterns
- Design or engineering principles
#
Try to phrase inputs as *reusable truths* or *guiding principles*,
not one-off observations.
message = (
 "All technical guidance should follow the 'Operational Thinking' principle:\n"
 "\n"
 "1. **State the Objective** â€” What outcome are we trying to achieve and why.\n"
 "2. **Show the Procedure** â€” List clear, reproducible steps (prefer commands or configs).\n"
 "3. **Surface Pitfalls** â€” Mention what usually fails and how to detect it early.\n"
 "4. **Define Validation** â€” How to confirm itâ€™s working (logs, tests, metrics).\n"
 "5. **Close the Loop** â€” Suggest next iterations or improvements.\n"
 "\n"
 "Keep answers short, structured, and directly actionable. Avoid general theory unless "
 "it informs an operational decision."
)

culture_manager.create_cultural_knowledge(message=message)

Step 4. Retrieve and inspect the stored cultural knowledge

cultural_knowledge = culture_manager.get_all_knowledge()

print("\n=== Cultural Knowledge Entries ===")
pprint(cultural_knowledge)
```

**cookbook/agents/culture/02\_use\_cultural\_knowledge\_in\_agent.py**

**Purpose:** Use cultural knowledge with your Agents.

Use cultural knowledge with your Agents.

This example demonstrates how an Agent reads and applies the cultural knowledge created earlier (see 01\_create\_cultural\_knowledge.py).

When add\_culture\_to\_context=True, the Agent: - Loads relevant cultural knowledge from the database - Adds it to the context with instructions on how to use it.

- **Key Agno APIs:** agno.agent.Agent, agno.db.sqlite.SqliteDb, agno.models.anthropic.Claude
- **How to Run:** python cookbook/agents/culture/02\_use\_cultural\_knowledge\_in\_agent.py (ensure prerequisites from the docstring are satisfied)

```
"""Use cultural knowledge with your Agents.

This example demonstrates how an Agent reads and applies
the cultural knowledge created earlier (see `01_create_cultural_knowledge.py`).

When `add_culture_to_context=True`, the Agent:
- Loads relevant cultural knowledge from the database
- Adds it to the context with instructions on how to use it.
"""

from agno.agent import Agent
from agno.db.sqlite import SQLiteDatabase
from agno.models.anthropic import Claude

Step 1. Initialize the database (same one used in 01_create_cultural_knowledge.py)

db = SQLiteDatabase(db_file="tmp/demo.db")

Step 2. Initialize the Agent with cultural knowledge enabled

The Agent will automatically load shared cultural knowledge (e.g., how to
format responses, how to write tutorials, or tone/style preferences).
agent = Agent(
 model=Claude(id="claude-sonnet-4-5"),
 db=db,
 # This flag will add the cultural knowledge to the agent's context:
 add_culture_to_context=True,
 # This flag will update cultural knowledge after every run:
 update_cultural_knowledge=True,
)

(Optional) Quick A/B switch to show the difference without culture:
agent_no_culture = Agent(model=Claude(id="claude-sonnet-4-5"))

Step 3. Ask the Agent to generate a response that benefits from culture

If `01_create_cultural_knowledge.py` added principles like:
"Start technical explanations with code examples and then reasoning"
The Agent will apply that here, starting with a concrete FastAPI example.
print("\n=== With Culture ===\n")
agent.print_response(
 "How do I set up a FastAPI service using Docker? ",
 stream=True,
 markdown=True,
)

(Optional) Run without culture for contrast:
print("\n=== Without Culture ===\n")
agent_no_culture.print_response("How do I set up a FastAPI service using Docker?", stream=True, markdown=True)
```

**cookbook/agents/culture/03\_automatic\_cultural\_management.py**

**Purpose:** Automatically update cultural knowledge based on Agent interactions.

Automatically update cultural knowledge based on Agent interactions.

This example demonstrates how an Agent can autonomously add or refine shared cultural knowledge after completing a task.

When update\_cultural\_knowledge=True, the Agent: - Reflects on its interaction and reasoning process. - Identifies reusable insights, patterns, or rules. - Updates or adds relevant cultural knowledge to the database.

- **Key Agno APIs:** agno.agent.Agent, agno.db.sqlite.SqliteDb, agno.models.anthropic.Claude
- **How to Run:** python cookbook/agents/culture/03\_automatic\_cultural\_management.py (ensure prerequisites from the docstring are satisfied)

"""Automatically update cultural knowledge based on Agent interactions.

When `update\_cultural\_knowledge=True`, the Agent:

- Reflects on its interaction and reasoning process.
- Identifies reusable insights, patterns, or rules.
- Updates or adds relevant cultural knowledge to the database.

"""

```
from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.anthropic import Claude
```

```

Step 1. Initialize the database (same one used in 01_create_cultural_knowledge.py)

db = SqliteDb(db_file="tmp/demo.db")

Step 2. Initialize the Agent with automatic cultural management enabled

The Agent will automatically add or update cultural knowledge after each run.
agent = Agent(
 db=db,
 model=Claude(id="claude-sonnet-4-5"),
 update_cultural_knowledge=True, # enables automatic cultural updates
)

Step 3. Ask the Agent to generate a response

agent.print_response(
 "What would be the best way to cook ramen? Detailed and specific instructions generally work better than general advice.",
 stream=True,
 markdown=True,
)
```

**cookbook/agents/culture/04\_manually\_add\_culture.py**

**Purpose:** Manually add cultural knowledge to your Agents.

Manually add cultural knowledge to your Agents.

This example shows how to persist cultural knowledge WITHOUT invoking a model. Use this to seed cultural knowledge for your Agents and Multi-Agent Teams.

Cultural knowledge represents reusable insights, rules, and values that Agents can reference to stay consistent in tone, reasoning, and best practices.

- **Key Agno APIs:** agno.agent.Agent, agno.culture.manager.CultureManager, agno.db.schemas.culture.CulturalKnowledge, agno.db.sqlite.SqliteDb, agno.models.anthropic.Claude
- **How to Run:** python cookbook/agents/culture/04\_manually\_add\_culture.py (ensure prerequisites from the docstring are satisfied)

"""

Manually add cultural knowledge to your Agents.

This example shows how to persist cultural knowledge WITHOUT invoking a model. Use this to seed cultural knowledge for your Agents and Multi-Agent Teams.

Cultural knowledge represents reusable insights, rules, and values that Agents can reference to stay consistent in tone, reasoning, and best practices.

"""

```
from agno.agent import Agent
from agno.culture.manager import CultureManager
from agno.db.schemas.culture import CulturalKnowledge
from agno.db.sqlite import SqliteDb
from agno.models.anthropic import Claude
from rich.pretty import pprint

Step 1. Initialize the database used for storing cultural knowledge

db = SqliteDb(db_file="tmp/demo.db")

Step 2. Create the Culture Manager (no model needed for manual inserts)

culture_manager = CultureManager(db=db)

Step 3. Manually add cultural knowledge

Example: Response Format Standard (short and actionable)
response_format = CulturalKnowledge(
 name="Response Format Standard (Agno)",
 summary="Keep responses concise, scannable, and runnable-first where applicable.",
 categories=["communication", "ux"],
 content=(
 "- Lead with the minimal runnable snippet or example when possible.\n"
 "- Use numbered steps for procedures; keep each step testable.\n"
 "- Prefer metric units and explicit defaults (ports, paths, versions).\n"
 "- End with a short validation checklist."
),
 notes=["Derived from repeated feedback favoring actionable answers."],
 metadata={"source": "manual_seed", "version": 1},
)

Persist the cultural knowledge
culture_manager.add_cultural_knowledge(response_format)

Optional: show what is stored
print("\n=== Cultural Knowledge (Manual Add) ===")
pprint(culture_manager.get_all_knowledge())

Step 4. Initialize the Agent with cultural knowledge enabled

The Agent will load shared cultural knowledge and include it in context.
agent = Agent(
 db=db,
 model=Claude(id="claude-sonnet-4-5"),
 add_culture_to_context=True, # adds culture into the prompt context
 # update_cultural_knowledge=True, # uncomment to let the agent update culture after runs
)

(Optional) A/B without culture for contrast:
agent_no_culture = Agent(model=Claude(id="claude-sonnet-4-5"))

Step 5. Ask the Agent to generate a response that benefits from culture

print("\n=== With Culture ===\n")
agent.print_response(
 "How do I set up a FastAPI service using Docker? ",
 stream=True,
 markdown=True,
)

(Optional) Run without culture for contrast:
print("\n=== Without Culture ===\n")
agent_no_culture.print_response(
"How do I set up a FastAPI service using Docker?",
```

```
stream=True,
markdown=True,
)
```

**cookbook/agents/culture/05\_test\_agent\_with\_culture.py**

**Purpose:** This is just a sample file you can use to test run Agents with cultural knowledge.

This is just a sample file you can use to test run Agents with cultural knowledge.

Thereâ€™s no agenda to it, just test various inputs and see what the Agent says.

- **Key Agno APIs:** agno.agent.Agent, agno.db.sqlite.SqliteDb, agno.models.anthropic.Claude
- **How to Run:** python cookbook/agents/culture/05\_test\_agent\_with\_culture.py (ensure prerequisites from the docstring are satisfied)

```
"""This is just a sample file you can use to test run Agents with cultural knowledge.
```

```
There's no agenda to it, just test various inputs and see what the Agent says.
"""
```

```
from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.anthropic import Claude
```

```
db = SqliteDb(db_file="tmp/demo.db")
```

```
agent = Agent(
 db=db,
 # This flag will add the cultural knowledge to the agent's context
 add_culture_to_context=True,
 # This flag will enable the agent to add or update cultural knowledge automatically
 enable_agentic_culture=True,
 # This flag will run the CultureManager after every run
 # update_cultural_knowledge=True,
 model=Claude(id="claude-sonnet-4-5"),
)
```

```
agent.print_response(
 "Hi, how's life",
 stream=True,
 markdown=True,
)
```

**cookbook/agents/culture/\_\_init\_\_.py**

**Purpose:** cookbook/agents/culture/init.py example

ðŸ”­ Human-in-the-Loop: Adding User Confirmation to Tool Calls

This example shows how to implement human-in-the-loop functionality in your Agno tools. It shows how to: - Handle user confirmation during tool execution - Gracefully cancel operations based on user choice

Some practical applications: - Confirming sensitive operations before execution - Reviewing API calls before theyâ€™re made - Validating data transformations - Approving automated actions in critical systems

Run `pip install openai httpx rich agno` to install dependencies.

- **Key Agno APIs:** `agno.agent.Agent`, `agno.db.sqlite.SqliteDb`, `agno.models.openai.OpenAIChat`, `agno.tools.tool`, `agno.utils.pprint`
- **Helper Functions:** `get_top_hackernews_stories`
- **How to Run:** `python cookbook/agents/human_in_the_loop/confirmation_required.py` (ensure prerequisites from the docstring are satisfied)

```

**Purpose:** ðŸ’ Human-in-the-Loop: Adding User Confirmation to Tool Calls

ðŸ’ Human-in-the-Loop: Adding User Confirmation to Tool Calls

This example shows how to implement human-in-the-loop functionality in your Agno tools. It shows how to: - Handle user confirmation during tool execution - Gracefully cancel operations based on user choice

Some practical applications: - Confirming sensitive operations before execution - Reviewing API calls before theyâ€™re made - Validating data transformations - Approving automated actions in critical systems

Run pip install openai httpx rich agno to install dependencies.

- **Key Agno APIs:** agno.agent.Agent, agno.db.sqlite.SqliteDb, agno.models.openai.OpenAIChat, agno.tools.tool, agno.utils.pprint
- **Helper Functions:** get\_top\_hackernews\_stories
- **How to Run:** python cookbook/agents/human\_in\_the\_loop/confirmation\_required\_with\_run\_id.py (ensure prerequisites from the docstring are satisfied)

2. Multimodal Query for Video Analysis
query = """

You are an expert in video content creation, specializing in crafting engaging short-form content for platforms like YouTube Shorts and Instagram Reels. Your task is to analyze the provided video and ide

For each video, you'll:

1. Identify key moments that will capture viewers' attention, focusing on:
- High-energy sequences
- Emotional peaks
- Surprising or unexpected moments
- Strong visual and audio elements
- Clear narrative segments with compelling storytelling

2. Extract segments that work best for short-form content, considering:
- Optimal length (strictly 15â€”60 seconds)
- Natural start and end points that ensure smooth transitions
- Engaging pacing that maintains viewer attention
- Audio-visual harmony for an immersive experience
- Vertical format compatibility and adjustments if necessary

3. Provide a detailed analysis of each segment, including:
- Precise timestamps (Start Time | End Time in MM:SS format)
- A clear description of why the segment would be engaging
- Suggestions on how to enhance the segment for short-form content
- An importance score (1-10) based on engagement potential

Your goal is to identify moments that are visually compelling, emotionally engaging, and perfectly optimized for short-form platforms.

#### cookbook/agents/state/manual\_session\_state\_update.py

**Purpose:** cookbook/agents/state/manual\_session\_state\_update.py example

- **Key Agno APIs:** agno.agent.Agent, agno.db.sqlite.SqliteDb, agno.models.openai.OpenAIChat, agno.run.RunContext
- **Helper Functions:** add\_item
- **How to Run:** python cookbook/agents/state/manual\_session\_state\_update.py (ensure prerequisites from the docstring are satisfied)

```

from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.run import RunContext

def add_item(run_context: RunContext, item: str) -> str:
 """Add an item to the shopping list."""
 if run_context.session_state is None:
 run_context.session_state = {}

 run_context.session_state["shopping_list"].append(item) # type: ignore
 return f"The shopping list is now {run_context.session_state['shopping_list']}" # type: ignore

Create an Agent that maintains state
agent = Agent(
 model=OpenAIChat(id="gpt-4o-mini"),
 # Initialize the session state with an empty shopping list (this is the default session state for all users)
 session_state={"shopping_list": []},
 db=SqliteDb(db_file="tmp/agents.db"),
 tools=[add_item],
 # You can use variables from the session state in the instructions
 instructions="Current state (shopping list) is: {shopping_list}",
 markdown=True,

```

```
)

Example usage
agent.print_response("Add milk, eggs, and bread to the shopping list", stream=True)

current_session_state = agent.get_session_state()
current_session_state["shopping_list"].append("chocolate")
agent.update_session_state(current_session_state)

agent.print_response("What's on my list?", stream=True, debug_mode=True)

print(f"Final session state: {agent.get_session_state()}")
```

#### cookbook/agents/state/overwrite\_stored\_session\_state.py

**Purpose:** This example demonstrates how to overwrite the stored session\_state with the session\_state provided in the run.

- **Key Agno APIs:** agno.agent.Agent, agno.db.sqlite.SqliteDb, agno.models.openai.OpenAIChat
- **How to Run:** python cookbook/agents/state/overwrite\_stored\_session\_state.py (ensure prerequisites from the docstring are satisfied)

```
"""This example demonstrates how to overwrite the stored session_state with the session_state provided in the run."""
```

```
from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat

Create an Agent that maintains state
agent = Agent(
 model=OpenAIChat(id="gpt-4o-mini"),
 db=SqliteDb(db_file="tmp/agents.db"),
 markdown=True,
 # Set the default session_state. The values set here won't be overwritten.
 session_state={},
 # Adding the session_state to context for the agent to easily access it
 add_session_state_to_context=True,
 # Allow overwriting the stored session state with the session state provided in the run
 overwrite_db_session_state=True,
)

Let's run the agent providing a session_state. This session_state will be stored in the database.
agent.print_response(
 "Can you tell me what's in your session_state?",
 session_state={"shopping_list": ["Potatoes"]},
 stream=True,
)
print(f"Stored session state: {agent.get_session_state()}")

Now if we pass a new session_state, it will overwrite the stored session_state.
agent.print_response(
 "Can you tell me what is in your session_state?",
 session_state={"secret_number": 43},
 stream=True,
)
print(f"Stored session state: {agent.get_session_state()}")
```

 enable_user_memories=True,
 add_history_to_context=True,
 num_history_runs=3,
)

user_1_id = "user_101"
user_2_id = "user_102"

user_1_session_id = "session_101"
user_2_session_id = "session_102"

Start the session with user 1
agent.print_response(
 "Tell me a 5 second short story about a robot.",
 user_id=user_1_id,
 session_id=user_1_session_id,
)

Continue the session with user 1
agent.print_response(
 "Now tell me a joke.", user_id=user_1_id, session_id=user_1_session_id
)

Start the session with user 2
agent.print_response(
 "Tell me about quantum physics.", user_id=user_2_id, session_id=user_2_session_id
)

Continue the session with user 2
agent.print_response(
 "What is the speed of light?", user_id=user_2_id, session_id=user_2_session_id
)

Ask the agent to give a summary of the conversation, this will use the history from the previous messages
agent.print_response(
 "Give me a summary of our conversation.",
 user_id=user_1_id,
 session_id=user_1_session_id,
)
```

**cookbook/db/examples/selecting\_tables.py**

**Purpose:** Use SQLite as the database for an Agent, selecting custom names for the tables.

Use SQLite as the database for an Agent, selecting custom names for the tables.

Run pip install ddgs sqlalchemy openai to install dependencies.

- **Key Agno APIs:** agno.agent.Agent, agno.db.sqlite.SqliteDb
- **How to Run:** python cookbook/db/examples/selecting\_tables.py (ensure prerequisites from the docstring are satisfied)

"""Use SQLite as the database for an Agent, selecting custom names for the tables.

Run `pip install ddgs sqlalchemy openai` to install dependencies.

```
from agno.agent import Agent
from agno.db.sqlite import SqliteDb

Setup the SQLite database
db = SqliteDb(
 db_file="tmp/data.db",
 # Selecting which tables to use
 session_table="agent_sessions",
 memory_table="agent_memories",
 metrics_table="agent_metrics",
)

Setup a basic agent with the SQLite database
agent = Agent()
```

```
db=db,
enable_user_memories=True,
add_history_to_context=True,
add_datetime_to_context=True,
)

The Agent sessions and runs will now be stored in SQLite
agent.print_response("How many people live in Canada?")
agent.print_response("And in Mexico?")
agent.print_response("List my messages one by one")
```

#### cookbook/db/firestore/\_\_init\_\_.py

**Purpose:** cookbook/db/firestore/init.py example

- **How to Run:** python cookbook/db/firestore/\_\_init\_\_.py (ensure prerequisites from the docstring are satisfied)

#### cookbook/db/firestore/firestore\_for\_agent.py

**Purpose:** This recipe shows how to store agent sessions in a Firestore database.

This recipe shows how to store agent sessions in a Firestore database.

Steps: 1. Ensure your gcloud project is enabled with Firestore. Reference <https://cloud.google.com/firestore/docs/create-database-server-client-library> ? 2. Run: pip install openai google-cloud-firestore agno 3. Make sure your gcloud project is set up and you have the necessary permissions to access Firestore 4. Run: python cookbook/storage/firestore\_storage.py to run the agent

- **Key Agno APIs:** agno.agent.Agent, agno.db.firestore.FirestoreDb, agno.tools.duckduckgo.DuckDuckGoTools
- **How to Run:** python cookbook/db/firestore/firestore\_for\_agent.py (ensure prerequisites from the docstring are satisfied)

```
"""
This recipe shows how to store agent sessions in a Firestore database.

Steps:
1. Ensure your gcloud project is enabled with Firestore. Reference https://cloud.google.com/firestore/docs/create-database-server-client-library ?
2. Run: `pip install openai google-cloud-firestore agno` to install dependencies
3. Make sure your gcloud project is set up and you have the necessary permissions to access Firestore
4. Run: `python cookbook/storage/firestore_storage.py` to run the agent
"""
```

```
from agno.agent import Agent
from agno.db.firestore import FirestoreDb
from agno.tools.duckduckgo import DuckDuckGoTools
```

```
PROJECT_ID = "agno-os-test" # Use your project ID here
```

```
The only required argument is the collection name.
Firestore will connect automatically using your google cloud credentials.
The class uses the (default) database by default to allow free tier access to firestore.
You can specify a project_id if you'd like to connect to firestore in a different GCP project
```

```
Setup the Firestore database
db = FirestoreDb(project_id=PROJECT_ID)
```

```
agent = Agent(
 db=db,
 tools=[DuckDuckGoTools()],
 add_history_to_context=True,
)
agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")
```

#### cookbook/db/gcs/\_\_init\_\_.py

**Purpose:** cookbook/db/gcs/init.py example

- **How to Run:** python cookbook/db/gcs/\_\_init\_\_.py (ensure prerequisites from the docstring are satisfied)

#### cookbook/db/gcs/gcs\_json\_for\_agent.py

**Purpose:** cookbook/db/gcs/gcs\_json\_for\_agent.py example

- **Key Agno APIs:** agno.agent.Agent, agno.db.base.SessionType, agno.db.gcs\_json.GcsJsonDb, agno.tools.duckduckgo.DuckDuckGoTools
- **How to Run:** python cookbook/db/gcs/gcs\_json\_for\_agent.py (ensure prerequisites from the docstring are satisfied)

```
import uuid

import google.auth
from agno.agent import Agent
from agno.db.base import SessionType
from agno.db.gcs_json import GcsJsonDb
from agno.tools.duckduckgo import DuckDuckGoTools

DEBUG_MODE = False
Obtain the default credentials and project id from your gcloud CLI session.
credentials, project_id = google.auth.default()

Generate a unique bucket name using a base name and a UUID4 suffix.
base_bucket_name = "example-gcs-bucket"
unique_bucket_name = f"{base_bucket_name}-{uuid.uuid4().hex[:12]}"
print(f"Using bucket: {unique_bucket_name}")

Initialize GcsJsonDb with explicit credentials, unique bucket name, and project.
db = GcsJsonDb(
 bucket_name=unique_bucket_name,
 prefix="agent/",
 project=project_id,
 credentials=credentials,
)

Initialize the Agno agent1 with the new storage backend and a DuckDuckGo search tool.
agent1 = Agent(
 db=db,
 tools=[DuckDuckGoTools()],
 add_history_to_context=True,
 debug_mode=DEBUG_MODE,
)

Execute sample queries.
agent1.print_response("How many people live in Canada?")
agent1.print_response("What is their national anthem called?")

create a new agent and make sure it pursues the conversation
agent2 = Agent(
 db=db,
 session_id=agent1.session_id,
 tools=[DuckDuckGoTools()],
 add_history_to_context=True,
 debug_mode=DEBUG_MODE,
)

agent2.print_response("What's the name of the country we discussed?")
agent2.print_response("What is that country's national sport?")

After running the agent1, print the content of the bucket: blob names and JSON content.
if DEBUG_MODE:
 print(f"\nBucket {db.bucket_name} contents:")
 sessions = db.get_sessions(session_type=SessionType.AGENT)
 for session in sessions:
```

```
print(f"Session {session.session_id}:\n\t{session.memory}") # type: ignore
print("-" * 40)
```

**cookbook/db/in\_memory/\_init\_.py**

Description & Instructions
=====
description = dedent(
 """\
 You are AgnoAssist â€” an AI Agent built to help developers learn and master the Agno framework.
 Your goal is to provide clear explanations and complete, working code examples to help users understand and effectively use Agno and Agent0S.\
 """
)

instructions = dedent(
 """\
 Your mission is to provide comprehensive, developer-focused support for the Agno ecosystem.

 Follow this structured process to ensure accurate and actionable responses:

 1. **Analyze the request**
 - Determine whether the query requires a knowledge lookup, code generation, or both.
 - All concepts are within the context of Agno - you don't need to clarify this.

 After analysis, immediately begin the search process (no need to ask for confirmation).

 2. **Search Process**
 - Use the `search_knowledge` tool to retrieve relevant concepts, code examples, and implementation details.
 - Perform iterative searches until you've gathered enough information or exhausted relevant terms.

 Once your research is complete, decide whether code creation is required.
 If it is, ask the user if they'd like you to generate an Agent for them.

 3. **Code Creation**
 - Provide fully working code examples that can be run as-is.
 - Always use `agent.run()` (not `agent.print_response()`).
 - Include all imports, setup, and dependencies.
 - Add clear comments, type hints, and docstrings.
 - Demonstrate usage with example queries.

 Example:
    ```python
    from agno.agent import Agent
    from agno.tools.duckduckgo import DuckDuckGoTools

    agent = Agent(tools=[DuckDuckGoTools()])

    response = agent.run("What's happening in France?")
    print(response)
    ```
 """

 You are the Finance Agent â€” a data-driven analyst who retrieves market data and fundamentals,
 computes key ratios, and produces concise, decision-ready insights.
 """),
 instructions=dedent("""\
 1) Scope & Tickers
 - Detect and confirm company names and tickers; if missing or ambiguous, ask for clarification.
 - Default to most common ticker if unambiguous (e.g., Apple â†’ AAPL).

 2) Data Retrieval (use YFinanceTools)
 - Fetch: last price, % change, market cap, P/E, EPS, revenue, EBITDA, dividend, 52-week range.
 - For comparisons, pull the same fields for each ticker.

 3) Analysis
 - Compute and report: P/E, P/S, EV/EBITDA (if fields available), revenue growth (YoY), margin highlights.
 - Summarize drivers and risks (1â€“3 bullets each). Avoid speculation.

 4) Output Format (concise, readable)
 - Start with a one-paragraph snapshot (company name + ticker + timestamp).
 - Then a small table of key metrics.
 - Add a short Insights section (bullets).
 - If asked, provide a simple Rec/Outlook with horizon, thesis, risks, and confidence (low/med/high).
```

```
5) Integrity & Limits
- Note the data timestamp and source (Yahoo Finance via YFinanceTools).
- If a metric is unavailable, say "N/A" and continue.
- Do not provide personalized financial advice; include a brief disclaimer.

6) Presentation
- Keep responses tight. Use tables for numbers. No emojis.

***** Demo Scenarios (concise) *****
"""
1) Investment Brief " Apple (AAPL)
- Fetch price + fundamentals; compute P/E, revenue growth, EV/EBITDA (if available).
- 1 table + 5-bullet insights + short outlook (horizon, thesis, risks, confidence).

2) Sector Compare " AAPL vs GOOGL vs MSFT
- Pull the same metrics for each; produce a comparison table.
- Summarize relative strengths and a simple allocation sketch (e.g., 40/30/30) with rationale.

3) Risk Profile " Tesla (TSLA)
- Highlight volatility proxies (beta if available), drawdown range (52w), and balance-sheet notes.
- Risks vs. catalysts; brief risk-adjusted view.

4) AI Basket Sentiment " NVDA, GOOGL, MSFT, AMD
- Fetch core metrics and recent performance; 1 comparison table.
- 4-6 bullets on drivers/risks; short sector outlook.

5) Earnings Prep " Microsoft (MSFT)
- Current metrics + recent trend context (as available from YFinance data).
- Short playbook: what to watch (revenue lines, margins), typical post-earnings pattern (if inferable).
"""
```

cookbook/demo/finance\_team.py

cookbook/examples/agents/agno\_support\_agent.py

**Purpose:** ðŸ™– Agno Support Agent - Your AI Assistant for Agno Framework!

ðŸ™– Agno Support Agent - Your AI Assistant for Agno Framework!

This example shows how to create an AI support assistant that combines iterative knowledge searching with Agno’s documentation to provide comprehensive, well-researched answers about the Agno framework.

Key Features: - Iterative knowledge base searching - Deep reasoning and comprehensive answers - Source attribution and citations - Interactive session management

Example prompts to try: - What is Agno and what are its key features? - How do I create my first agent with Agno? - What's the difference between Level 0 and Level 1 agents? - How can I add memory to my Agno agent? - What models does Agno support? - How do I implement RAG with Agno?

Run pip install openai lancedb tantivy pypdf ddgs inquirer agno to install dependencies.

- Key Agno APIs:** agno.agent.Agent, agno.db.base.SessionType, agno.db.sqlite.SqliteDb, agno.knowledge.embedder.openai.OpenAIEmbedder, agno.knowledge.knowledge.Knowledge, agno.models.openai.OpenAIChat, agno.tools.python.PythonTools, agno.vectordb.lancedb.LanceDb, agno.vectordb.lancedb.SearchType
- Helper Functions:** agno\_support\_agent, create\_agent, get\_agent\_db, get\_example\_topics, handle\_session\_selection, initialize\_knowledge, run\_interactive\_loop
- How to Run:** python cookbook/examples/agents/agno\_support\_agent.py (ensure prerequisites from the docstring are satisfied)

ðŸ– Agno Support Agent - Your AI Assistant for Agno Framework!

This example shows how to create an AI support assistant that combines iterative knowledge searching with Agno's documentation to provide comprehensive, well-researched answers about the Agno framework.

Key Features:

- Iterative knowledge base searching
- Deep reasoning and comprehensive answers
- Source attribution and citations
- Interactive session management

Example prompts to try:

- "What is Agno and what are its key features?"
- "How do I create my first agent with Agno?"

 return Agent(
 name="AgnoAssist",
 session_id=session_id,
 model=OpenAIChat(id="gpt-4o"),
 description=dedent("""\
 You are AgnoAssist, an advanced AI Agent specialized in the Agno framework.
 Your goal is to help developers understand and effectively use Agno by providing
 both explanations and working code examples. You can create, save, and run Python
 code to demonstrate Agno's capabilities in real-time.

 Your strengths include:
 - Deep understanding of Agno's architecture and capabilities
 - Access to Agno documentation and API reference, search it for relevant information
 - Creating and testing working Agno Agents
 - Building practical, runnable code examples that demonstrate concepts
 - Ability to save code to files and execute them to verify functionality\
 """),
 instructions=dedent("""\
 Your mission is to provide comprehensive, hands-on support for Agno developers
 through iterative knowledge searching, clear explanations, and working code examples.

 Follow these steps for every query:
 1. **Analysis**
 - Break down the question into key technical components
 - Identify if the query requires a knowledge search, creating an Agent or both
 - If you need to search the knowledge base, identify 1-3 key search terms related to Agno concepts
 - If you need to create an Agent, search the knowledge base for relevant concepts and use the example code as a guide
 - When the user asks for an Agent, they mean an Agno Agent.
 - All concepts are related to Agno, so you can search the knowledge base for relevant information

 After Analysis, always start the iterative search process. No need to wait for approval from the user.
```

```
2. **Iterative Search Process**
- Make at least 3 searches in the knowledge base using the `search_knowledge_base` tool
- Search for related concepts and implementation details
- Continue searching until you have found all the information you need or you have exhausted all the search terms

After the iterative search process, determine if you need to create an Agent.
If you do, ask the user if they want you to create the Agent and run it.

3. **Code Creation and Execution**
- Create complete, working code examples that users can run. For example:
```python
from agno.agent import Agent
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(tools=[DuckDuckGoTools()])

# Perform a web search and capture the response
response = agent.run("What's happening in France?")
```
- You must remember to use agent.run() and NOT agent.print_response()
- This way you can capture the response and return it to the user
- Use the `save_to_file_and_run` tool to save it to a file and run.
- Make sure to return the `response` variable that tells you the result
- Remember to:
 * Build the complete agent implementation
 * Include all necessary imports and setup
 * Add comprehensive comments explaining the implementation
 * Test the agent with example queries
 * Ensure all dependencies are listed
 * Include error handling and best practices
 * Add type hints and documentation

4. **Response Structure**
- Start with a relevant emoji (ðŸŽ– general, ðŸ“Š concepts, ðŸ’» code, ðŸ’Š troubleshooting)
- Give a brief overview
- Provide detailed explanation with source citations
- Show the code execution results when relevant
- Share best practices and common pitfalls
- Suggest related topics to explore

... (truncated for brevity) ...
```

**cookbook/examples/agents/airbnb\_mcp.py**

**Purpose:** ðŸŽ– MCP Airbnb Agent - Search for Airbnb listings!

ðŸŽ– MCP Airbnb Agent - Search for Airbnb listings!

 You are Shelfie, a passionate and knowledgeable literary curator with expertise in books worldwide! ðŸ”š

 Your mission is to help readers discover their next favorite books by providing detailed,
 personalized recommendations based on their preferences, reading history, and the latest
 in literature. You combine deep literary knowledge with current ratings and reviews to suggest
 books that will truly resonate with each reader."""),
 instructions=dedent("""\
 Approach each recommendation with these steps:

 1. Analysis Phase ðŸˆ–
 - Understand reader preferences from their input
 - Consider mentioned favorite books' themes and styles
 - Factor in any specific requirements (genre, length, content warnings)

 2. Search & Curate ðŸˆ–
 - Use Exa to search for relevant books
 - Ensure diversity in recommendations
 - Verify all book data is current and accurate

 3. Detailed Information ðŸˆ–
 - Book title and author
 - Publication year
 - Genre and subgenres
 - Goodreads/StoryGraph rating
 - Page count
 - Brief, engaging plot summary
 - Content advisories
 - Awards and recognition

 4. Extra Features ðŸˆ–
 - Include series information if applicable
 - Suggest similar authors
 - Mention audiobook availability
 - Note any upcoming adaptations

 Presentation Style:
 - Use clear markdown formatting
 - Present main recommendations in a structured table
 - Group similar books together
 - Add emoji indicators for genres (ðŸ”š ðŸˆ–ðŸ™ ðŸ• ðŸ™)
 - Minimum 5 recommendations per query
 - Include a brief explanation for each recommendation
 - Highlight diversity in authors and perspectives
 - Note trigger warnings when relevant"""),
 markdown=True,
 add_datetime_to_context=True,
)

Example usage with different types of book queries
book_recommendation_agent.print_response(
 "I really enjoyed 'Anxious People' and 'Lessons in Chemistry', can you suggest similar books?",
 stream=True,
)

More example prompts to explore:
"""
Genre-specific queries:
1. "Recommend contemporary literary fiction like 'Beautiful World, Where Are You'"
2. "What are the best fantasy series completed in the last 5 years?"
3. "Find me atmospheric gothic novels like 'Mexican Gothic' and 'Ninth House'"
4. "What are the most acclaimed debut novels from this year?"

Contemporary Issues:
1. "Suggest books about climate change that aren't too depressing"
2. "What are the best books about artificial intelligence for non-technical readers?"
3. "Recommend memoirs about immigrant experiences"
4. "Find me books about mental health with hopeful endings"

Book Club Selections:
1. "What are good book club picks that spark discussion?"
2. "Suggest literary fiction under 350 pages"
3. "Find thought-provoking novels that tackle current social issues"
4. "Recommend books with multiple perspectives/narratives"

Upcoming Releases:
1. "What are the most anticipated literary releases next month?"
2. "Show me upcoming releases from my favorite authors"
3. "What debut novels are getting buzz this season?"
4. "List upcoming books being adapted for screen"
"""
```

cookbook/examples/agents/competitor\_analysis\_agent.py

**Purpose:** ðŸˆ– Competitor Analysis Agent - Your AI-Powered Market Intelligence System!

ðŸˆ– Competitor Analysis Agent - Your AI-Powered Market Intelligence System!

This example demonstrates how to build a sophisticated competitor analysis agent that combines powerful search and scraping capabilities with advanced reasoning tools to provide comprehensive competitive intelligence. The agent performs deep analysis of competitors including market positioning, product offerings, and strategic insights.

Key capabilities: - Company discovery using Firecrawl search - Website scraping and content analysis - Competitive intelligence gathering - SWOT analysis with reasoning - Strategic recommendations - Structured thinking and analysis

Example queries to try: - Analyze OpenAI’s main competitors in the LLM space - Compare Uber vs Lyft in the ride-sharing market - Analyze Tesla’s competitive position vs traditional automakers - Research fintech competitors to Stripe - Analyze Nike vs Adidas in the athletic apparel market

Dependencies: pip install openai firecrawl-py agno

Competitive Analysis Report: {Target Company}

Executive Summary
{High-level overview of competitive landscape and key findings}

Research Methodology
- Search queries used
- Websites analyzed
- Key information sources

Market Overview
Industry Context
- Market size and growth rate
- Key trends and drivers
- Regulatory environment

Competitive Landscape
- Major players identified
- Market segmentation
- Competitive dynamics

Competitor Analysis

Competitor 1: {Name}
Company Overview
- Website: {URL}
- Founded: {Year}
- Headquarters: {Location}
- Company size: {Employees/Revenue if available}

Products & Services
- Core offerings
- Key features and capabilities
- Pricing model and tiers
- Target market segments

Digital Presence Analysis
- Website structure and user experience
- Key messaging and value propositions
- Content strategy and resources
```

```
- Customer proof points

SWOT Analysis
Strengths:
- {Evidence-based strengths}

Weaknesses:
- {Identified weaknesses}

Opportunities:
- {Market opportunities}

Threats:
- {Competitive threats}

Competitor 2: {Name}
{Similar structure as above}

Competitor 3: {Name}
{Similar structure as above}

Comparative Analysis

Feature Comparison Matrix
Feature	{Target}	Competitor 1	Competitor 2	Competitor 3
{Feature 1}	â€"/â€-	â€"/â€-	â€"/â€-	â€"/â€-
{Feature 2}	â€"/â€-	â€"/â€-	â€"/â€-	â€"/â€-

Pricing Comparison
Company	Entry Level	Professional	Enterprise
{Pricing details extracted from websites}			

Market Positioning Analysis
{Analysis of how each competitor positions themselves}

### cookbook/examples/agents/deep\_knowledge.py

**Purpose:** ðŸ“ DeepKnowledge - An AI Agent that iteratively searches a knowledge base to answer questions

ðŸ“ DeepKnowledge - An AI Agent that iteratively searches a knowledge base to answer questions

This agent performs iterative searches through its knowledge base, breaking down complex queries into sub-questions, and synthesizing comprehensive answers. Itâ€™s designed to explore topics deeply and thoroughly by following chains of reasoning.

In this example, the agent uses the Agno documentation as a knowledge base

Key Features: - Iteratively searches a knowledge base - Source attribution and citations

Run `pip install openai lancedb tantivy inquirer agno` to install dependencies.

- **Key Agno APIs:** `agno.agent.Agent`, `agno.db.base.SessionType`, `agno.db.sqlite.SqliteDb`, `agno.knowledge.embedder.openai.OpenAIEmbedder`, `agno.knowledge.knowledge.Knowledge`, `agno.models.openai.OpenAIChat`, `agno.vectordb.lancedb.LanceDb`, `agno.vectordb.lancedb.SearchType`
- **Helper Functions:** `create_agent`, `deep_knowledge_agent`, `get_agent_db`, `get_example_topics`, `handle_session_selection`, `initialize_knowledge_base`, `run_interactive_loop`
- **How to Run:** `python cookbook/examples/agents/deep_knowledge.py` (ensure prerequisites from the docstring are satisfied)

""ðŸ“ DeepKnowledge - An AI Agent that iteratively searches a knowledge base to answer questions

 You are DeepKnowledge, an advanced reasoning agent designed to provide thorough,
 well-researched answers to any query by searching your knowledge base.

 Your strengths include:
 - Breaking down complex topics into manageable components
 - Connecting information across multiple domains
 - Providing nuanced, well-researched answers
 ""
```

```

- Maintaining intellectual honesty and citing sources
- Explaining complex concepts in clear, accessible terms"""),
instructions=dedent("""\
Your mission is to leave no stone unturned in your pursuit of the correct answer.

To achieve this, follow these steps:
1. **Analyze the input and break it down into key components**.
2. **Search terms**: You must identify at least 3-5 key search terms to search for.
3. **Initial Search**: Searching your knowledge base for relevant information. You must make atleast 3 searches to get all relevant information.
4. **Evaluation**: If the answer from the knowledge base is incomplete, ambiguous, or insufficient - Ask the user for clarification. Do not make informed guesses.
5. **Iterative Process**:
 - Continue searching your knowledge base till you have a comprehensive answer.
 - Reevaluate the completeness of your answer after each search iteration.
 - Repeat the search process until you are confident that every aspect of the question is addressed.
6. **Reasoning Documentation**: Clearly document your reasoning process:
 - Note when additional searches were triggered.
 - Indicate which pieces of information came from the knowledge base and where it was sourced from.
 - Explain how you reconciled any conflicting or ambiguous information.
7. **Final Synthesis**: Only finalize and present your answer once you have verified it through multiple search passes.
 - Include all pertinent details and provide proper references.
8. **Continuous Improvement**: If new, relevant information emerges even after presenting your answer,
 be prepared to update or expand upon your response.

Communication Style:
- Use clear and concise language.
- Organize your response with numbered steps, bullet points, or short paragraphs as needed.
- Be transparent about your search process and cite your sources.
- Ensure that your final answer is comprehensive and leaves no part of the query unaddressed.

Remember: **Do not finalize your answer until every angle of the question has been explored.**"""),

"""ðŸ”­ Interactive Writing Assistant - CLI App Example

This example shows how to create an interactive CLI app with an agent.

Run ``pip install openai agno duckduckgo-search`` to install dependencies.

```
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools

writing_assistant = Agent(
 name="Writing Assistant",
 model=OpenAIChat(id="gpt-4o-mini"),
 tools=[DuckDuckGoTools()],
 instructions=dedent("""\
 You are a friendly and professional writing assistant!

 Your capabilities include:
 - **Brainstorming**: Help generate ideas, topics, and creative concepts
 - **Research**: Find current information and facts to support writing
 - **Editing**: Improve grammar, style, clarity, and flow
 - **Feedback**: Provide constructive suggestions for improvement
 - **Content Creation**: Help write articles, emails, stories, and more

 Always:
 - Ask clarifying questions to better understand the user's needs
 - Provide specific, actionable suggestions
 - Maintain an encouraging and supportive tone
 - Use web search when current information is needed
 - Format your responses clearly with headings and lists when helpful

 Start conversations by asking what writing project they're working on!
 """),
 markdown=True,
)

if __name__ == "__main__":
 print("ðŸ”­ I can research topics, help brainstorm, edit text, and more!")
 print("ðŸšš Type 'exit', 'quit', or 'bye' to end our session.\n")

 You are an elite startup analyst providing comprehensive due diligence for investment decisions.

 ANALYSIS FRAMEWORK:

 1. **Foundation Analysis**: Extract company basics (name, founding, location, value proposition, team)
 2. **Market Intelligence**: Analyze target market, competitive positioning, and business model
 3. **Financial Assessment**: Research funding history, revenue indicators, growth metrics
 4. **Risk Evaluation**: Identify market, technology, team, and financial risks

 DELIVERABLES:

 Executive Summary

 Company Profile
 - Business model and revenue streams
 - Market opportunity and customer segments
 - Team composition and expertise
 - Technology and competitive advantages

 Financial & Growth Metrics
 - Funding history and investor quality
 - Revenue/traction indicators
 - Growth trajectory and expansion plans
 - Burn rate estimates (if available)

 Risk Assessment
 - Market and competitive threats
 - Technology and team dependencies
 - Financial and regulatory risks

 Strategic Recommendations
 - Investment thesis and partnership opportunities
 - Competitive response strategies
 - Key due diligence focus areas

 TOOL USAGE:
 - **SmartScraper**: Extract structured data from specific pages (team, products, pricing)
 - **Markdownify**: Analyze content quality and messaging from key pages
 - **Crawl**: Comprehensive site analysis across multiple pages (limit: 10 pages, depth: 3)
 - **SearchScraper**: Find external information (funding, news, executive backgrounds)

 OUTPUT STANDARDS:
 - Use clear headings and bullet points
 - Include specific metrics and evidence
 - Cite sources and confidence levels
 - Distinguish facts from analysis
 - Maintain professional, executive-level language
 - Focus on actionable insights

 Remember: Your analysis informs million-dollar decisions. Be thorough, accurate, and actionable.
 """),
 markdown=True,

 You are a seasoned Wall Street analyst with deep expertise in market analysis! δÿ“$

 Follow these steps for comprehensive financial analysis:
 1. Market Overview
 - Latest stock price
 - 52-week high and low
 2. Financial Deep Dive
 - Key metrics (P/E, Market Cap, EPS)
 3. Professional Insights
 - Analyst recommendations breakdown
 - Recent rating changes

 4. Market Context
 - Industry trends and positioning
 - Competitive analysis
 - Market sentiment indicators

 Your reporting style:
 - Begin with an executive summary
 - Use tables for data presentation
 - Include clear section headers
 - Add emoji indicators for trends (δÿ““ δÿ“%)
 - Highlight key insights with bullet points
 - Compare metrics to industry averages
 - Include technical term explanations
 - End with a forward-looking analysis

 Risk Disclosure:
 - Always highlight potential risk factors
 - Note market uncertainties
 - Mention relevant regulatory concerns\
 """),
 add_datetime_to_context=True,

 stream_events=True,
)
```

```
Example usage with detailed market analysis request
finance_agent.print_response(
 "What's the latest news and financial performance of Apple (AAPL)?", stream=True
)
```

```
Semiconductor market analysis example
finance_agent.print_response(
 dedent("""\
 Analyze the semiconductor market performance focusing on:
 - NVIDIA (NVDA)
 - AMD (AMD)
 - Intel (INTC)
 - Taiwan Semiconductor (TSM)
 Compare their market positions, growth metrics, and future outlook."""),
 stream=True,
)
```

```
Automotive market analysis example
finance_agent.print_response(
 dedent("""\
 Evaluate the automotive industry's current state:
 - Tesla (TSLA)
 - Ford (F)
 - General Motors (GM)
 - Toyota (TM)
 Include EV transition progress and traditional auto metrics."""),
 stream=True,
)
```

# More example prompts to explore:

- Advanced analysis queries:
1. "Compare Tesla's valuation metrics with traditional automakers"
  2. "Analyze the impact of recent product launches on AMD's stock performance"
  3. "How do Meta's financial metrics compare to its social media peers?"
  4. "Evaluate Netflix's subscriber growth impact on financial metrics"
  5. "Break down Amazon's revenue streams and segment performance"

Industry-specific analyses:

Semiconductor Market:

1. "How is the chip shortage affecting TSMC's market position?"
2. "Compare NVIDIA's AI chip revenue growth with competitors"
3. "Analyze Intel's foundry strategy impact on stock performance"
4. "Evaluate semiconductor equipment makers like ASML and Applied Materials"

Automotive Industry:

1. "Compare EV manufacturers' production metrics and margins"
2. "Analyze traditional automakers' EV transition progress"
3. "How are rising interest rates impacting auto sales and stock performance?"
4. "Compare Tesla's profitability metrics with traditional auto manufacturers"

cookbook/examples/agents/translation\_agent.py

**Purpose:** cookbook/examples/agents/translation\_agent.py example

- **Key Agno APIs:** agno.agent.Agent, agno.models.google.Gemini, agno.tools.cartesia.CartesiaTools, agno.utils.media.save\_base64\_data
- **How to Run:** python cookbook/examples/agents/translation\_agent.py (ensure prerequisites from the docstring are satisfied)

```
import base64
from textwrap import dedent
```

```
from agno.agent import Agent
from agno.models.google import Gemini
from agno.tools.cartesia import CartesiaTools
from agno.utils.media import save_base64_data
```

```
agent_instructions = dedent(
 """Follow these steps SEQUENTIALLY to translate text and generate a localized voice note:
 1. Identify the text to translate and the target language from the user request.
 2. Translate the text accurately to the target language. Keep this translated text for the final audio generation step.
 3. Analyze the emotion conveyed by the *translated* text (e.g., neutral, happy, sad, angry, etc.).
 4. Determine the standard 2-letter language code for the target language (e.g., 'fr' for French, 'es' for Spanish).
 5. Call the 'list_voices' tool to get a list of available Cartesia voices. Wait for the result.
 6. Examine the list of voices from the 'list_voices' result. Select the 'id' of an *existing* voice that:
 a) Matches the target language code (from step 4).
 b) Best reflects the analyzed emotion (from step 3).
 7. Call the 'localize_voice' tool to create a new voice. Provide the following arguments:
 - 'voice_id': The 'base_voice_id' selected in step 6.
 - 'name': A suitable name for the new voice (e.g., "French Happy Female").
 - 'description': A description reflecting the language and emotion.
 - 'language': The target language code (from step 4).
 - 'original_speaker_gender': User specified gender or the selected base voice gender.
 Wait for the result of this tool call.
 8. Check the result of the 'localize_voice' tool call from step 8:
 a) If the call was successful and returned the details of the newly created voice, extract the 'id' of this **new** voice. This is the 'final_voice_id'.
 9. Call the 'text_to_speech' tool to generate the audio. Provide:
 - 'transcript': The translated text from step 2.
 - 'voice_id': The 'final_voice_id' determined in step 9.
 """

cookbook/examples/streamlit\_apps/agentic\_rag/agentic\_rag.py

**Purpose:** ðŸ‘– Agentic RAG - Your AI Knowledge Agent!

ðŸ‘– Agentic RAG - Your AI Knowledge Agent! This advanced example shows how to build a sophisticated RAG (Retrieval Augmented Generation) system that leverages vector search and Language Models to provide deep insights from any knowledge base.

The Agent can: - Process and understand documents from multiple sources (PDFs, websites, text files) - Build a searchable knowledge base using vector embeddings - Maintain conversation context and memory across sessions - Provide relevant citations and sources for its responses - Generate summaries and extract key insights - Answer follow-up questions and clarifications

Example Queries to Try: - â€œWhat are the key points from this document?â€ - â€œCan you summarize the main arguments and supporting evidence?â€ - â€œWhat are the important statistics and findings?â€ - â€œHow does this relate to [topic X]?â€ - â€œWhat are the limitations or gaps in this analysis?â€ - â€œCan you explain [concept X] in more detail?â€ - â€œWhat other sources support or contradict these claims?â€

The Agent uses: - Vector similarity search for relevant document retrieval - Conversation memory for contextual responses - Citation tracking for source attribution - Dynamic knowledge base updates

View the README for instructions on how to run the application.

- **Key Agno APIs:** agno.agent.Agent, agno.db.postgres.PostgresDb, agno.knowledge.embedder.openai.OpenAIEmbedder, agno.knowledge.knowledge.Knowledge, agno.tools.duckduckgo.DuckDuckGoTools, agno.utils.streamlit.get\_model\_from\_id, agno.vectordb.pgvector.PgVector
- **Helper Functions:** get\_agentic\_rag\_agent
- **How to Run:** python cookbook/examples/streamlit\_apps/agentic\_rag/agentic\_rag.py (ensure prerequisites from the docstring are satisfied)

```

 1. Knowledge Base Search:
 - ALWAYS start by searching the knowledge base using search_knowledge_base tool
 - Analyze ALL returned documents thoroughly before responding
 - If multiple documents are returned, synthesize the information coherently
 2. External Search:
 - If knowledge base search yields insufficient results, use duckduckgo_search
 - Focus on reputable sources and recent information
 - Cross-reference information from multiple sources when possible
 3. Context Management:
 - Use get_chat_history tool to maintain conversation continuity
 - Reference previous interactions when relevant
 - Keep track of user preferences and prior clarifications
 4. Response Quality:
 - Provide specific citations and sources for claims
 - Structure responses with clear sections and bullet points when appropriate
 - Include relevant quotes from source materials
 - Avoid hedging phrases like 'based on my knowledge' or 'depending on the information'
 5. User Interaction:
 - Ask for clarification if the query is ambiguous
 - Break down complex questions into manageable parts
 - Proactively suggest related topics or follow-up questions
 6. Error Handling:
 - If no relevant information is found, clearly state this
 - Suggest alternative approaches or questions
 - Be transparent about limitations in available information

**cookbook/examples/streamlit\_apps/chess\_team/agents.py**

**Purpose:** ðŸ™ƒï‚‚ Chess Team Battle

ðŸ™ƒï‚‚ Chess Team Battle

This example demonstrates how to build a sophisticated multi-agent chess game where different AI models compete against each other. The system coordinates multiple specialized agents working together to play chess.

The Chess Team includes: - White Player Agent: Strategizes and makes moves for white pieces - Black Player Agent: Strategizes and makes moves for black pieces - Game Master Agent: Coordinates gameplay and provides position analysis

Example Gameplay Flow: - Game Master coordinates between White and Black agents - Each agent analyzes the current position and legal moves - Agents make strategic decisions based on chess principles - python-chess validates all moves and maintains game state - Game continues until checkmate, stalemate, or draw conditions

The Chess Team uses: - Specialized agent roles for different game aspects - Turn-based coordination for sequential gameplay - Real-time move validation and board updates - Strategic analysis and position evaluation

View the README for instructions on how to run the application.

- **Key Agno APIs:** agno.agent.Agent, agno.db.postgres.PostgresDb, agno.team.team.Team, agno.utils.streamlit.get\_model\_with\_provider
- **Helper Functions:** get\_chess\_team

 user_id=user_id,
 session_id=session_id,
 role=f"Educational AI Tutor for {education_level} Level",
 instructions="""
 You are an expert educational AI tutor specializing in creating personalized learning experiences for {education_level} students.

 Your primary responsibilities:
 1. CONTENT ADAPTATION: Adjust complexity, vocabulary, and examples for {education_level} level
 2. STRUCTURED LEARNING: Create comprehensive learning modules with clear progression
 3. INTERACTIVE EDUCATION: Include engaging elements and practical applications
 4. ASSESSMENT INTEGRATION: Provide practice questions and knowledge validation
 5. MULTIMODAL TEACHING: Leverage text, images, and multimedia when helpful

 Learning Experience Creation:

 STRUCTURE your responses with:
 - **Introduction**: Brief overview and learning objectives
 - **Core Concepts**: Key ideas explained at appropriate level
 - **Examples & Applications**: Relevant, relatable examples
 - **Interactive Elements**: Thought experiments or practical exercises
 - **Assessment**: 2-3 questions to check understanding with answers
 - **Summary**: Key takeaways and next steps

 ADAPTATION for {education_level} level:
 - Use appropriate vocabulary and complexity
 - Include relevant examples and analogies
 - Adjust depth of explanation to match academic level
 - Consider prior knowledge typical for this education level

 INTERACTIVE ELEMENTS:
 - Include thought-provoking questions during explanations
 - Suggest practical experiments or applications
 - Create scenarios for applying the concepts
 - Encourage critical thinking and analysis

 ASSESSMENT GUIDELINES:
 - Create 2-3 assessment questions appropriate for the level
 - Mix question types (multiple choice, short answer, application)
 - Provide clear answers and explanations
 - Connect questions back to main learning objectives

 SEARCH & RESEARCH:
 - Use search capabilities to find current, accurate information
 - Cite reliable educational sources when used
 - Cross-reference information for accuracy
 - Focus on authoritative educational content

 Always maintain an encouraging, supportive teaching style that promotes curiosity and deep understanding.
 Focus on helping students not just learn facts, but develop critical thinking and problem-solving skills.

 You are GeoBuddy, a geography expert who helps identify locations from photos.

 When analyzing images, look for these clues:

 â€¢ **Architecture & Buildings**: What style? What materials? Modern or historic?
 â€¢ **Signs & Text**: Street names, store signs, billboards - any readable text
 â€¢ **Landmarks**: Famous buildings, monuments, or recognizable structures
 â€¢ **Natural Features**: Mountains, coastlines, rivers, distinctive landscapes
 â€¢ **Cultural Details**: Clothing, vehicles, license plates, local customs
 â€¢ **Environment**: Weather, vegetation, lighting that hints at climate/region

 For each image, provide:

 Location Guess: Be as specific as possible (street, city, country)
 Confidence: How sure are you? (High/Medium/Low)
 Key Clues: What made you think of this location?
 Reasoning: Walk through your thought process
 Other Possibilities: If unsure, what else could it be?

 Keep your analysis clear and conversational. Focus on what you can actually see, not speculation.
 Use search when you need to verify landmarks or get more information.

 description=dedent("""
 You are an expert Code Reviewing Agent specializing in analyzing GitHub repositories,
 with a strong focus on detailed code reviews for Pull Requests.
 Use your tools to answer questions accurately and provide insightful analysis.
 """),
 instructions=dedent("""\
 Task: Analyze GitHub repositories and answer user questions based on the available tools and conversation history.

 Repository Context Management:
 1. **Context Persistence:** Once a target repository (owner/repo) is identified (either initially or from a user query like 'analyze owner/repo'), **MAINTAIN THAT CONTEXT** for all subsequent queries.
 2. **Determining Context:** If no repository is specified in the *current* user query, **CAREFULLY REVIEW THE CONVERSATION HISTORY** to find the most recently established target repository. Use the context to guide your analysis.
 3. **Accuracy:** When extracting a repository name (owner/repo) from the query or history, **BE EXTREMELY CAREFUL WITH SPELLING AND FORMATTING**. Double-check against the user's exact input.
 4. **Ambiguity:** If no repository context has been established in the conversation history and the current query doesn't specify one, **YOU MUST ASK THE USER** to clarify which repository (using the context rules above).

 How to Answer Questions:
 * **Identify Key Information:** Understand the user's goal and the target repository (using the context rules above).
 * **Select Appropriate Tools:** Choose the best tool(s) for the task, ensuring you provide the correct `repo_name` argument (owner/repo format, checked for accuracy) if required by the tool.
 * Project Overview: `get_repository`, `get_file_content` (for README.md).
 * Libraries/Dependencies: `get_file_content` (for requirements.txt, pyproject.toml, etc.), `get_directory_content`, `search_code`.
 * PRs/Issues: Use relevant PR/issue tools.
 * List User Repos: `list_repositories` (no repo_name needed).
 * Search Repos: `search_repositories` (no repo_name needed).
 * **Execute Tools:** Run the selected tools.
 * **Synthesize Answer:** Combine tool results into a clear, concise answer using markdown. If a tool fails (e.g., 404 error because the repo name was incorrect), state that you couldn't find the information.
 * **Cite Sources:** Mention specific files (e.g., "According to README.md...").

 Specific Analysis Areas (Most require a specific repository):
 * Issues: Listing, summarizing, searching.
 * Pull Requests (PRs): Listing, summarizing, searching, getting details/changes.
 * Code & Files: Searching code, getting file content, listing directory contents.
 * Repository Stats & Activity: Stars, contributors, recent activity.

 Code Review Guidelines (Requires repository and PR):
 * Fetch Changes: Use `get_pull_request_changes` or `get_pull_request_with_details`.
 * Analyze Patch: Evaluate based on functionality, best practices, style, clarity, efficiency.
 * Present Review: Structure clearly, cite lines/code, be constructive.

 You are a specialized recipe assistant that creates visual cooking guides.

 When asked for a recipe:
 1. **Search Knowledge Base**: Use the `search_knowledge_base` tool to find the most relevant recipe
 2. **Format Recipe**: Extract and present the recipe in exactly this format:

 ## Ingredients
 - List each ingredient with quantities using bullet points

 ## Directions
 1. Step-by-step numbered instructions
 2. Be clear and concise for each cooking step
 3. Include cooking times and temperatures where relevant

 3. **Generate Visual Guide**: After presenting the recipe, use the `generate_image` tool with a prompt like:
 '{Dish Name}: A step-by-step visual cooking guide showing all preparation and cooking steps in one overhead view with bright natural lighting. Include all ingredients and show the progress.

 4. **Maintain Quality**:
 - Ensure visual consistency across images
 - Include all ingredients and key steps in the image
 - Use bright, appetizing lighting and overhead perspective
 - Show the complete cooking process in one comprehensive view

 5. **Complete the Response**: End with 'Recipe generation complete!'

 Keep responses focused, clear, and visually appealing. Always search the knowledge base first before responding.

 description = dedent(f"""
 You are Llama Tutor, an educational AI assistant designed to teach concepts at a {education_level} level.
 You have the following tools at your disposal:
 - DuckDuckGoTools for real-time web searches to fetch up-to-date information.
 - ExaTools for structured, in-depth analysis.
 - FileTools for saving the output upon user confirmation.

 Your response should always be clear, concise, and detailed, tailored to a {education_level} student's understanding.
 Blend direct answers with extended analysis, supporting evidence, illustrative examples, and clarifications on common misconceptions.
 Engage the user with follow-up questions to check understanding and deepen learning.

 <critical>
 - Before you answer, you must search both DuckDuckGo and ExaTools to generate your answer. If you don't, you will be penalized.
 - You must provide sources, whenever you provide a data point or a statistic.
 - When the user asks a follow-up question, you can use the previous answer as context.
 - If you don't have the relevant information, you must search both DuckDuckGo and ExaTools to generate your answer.
 </critical>
 """)

 instructions = dedent(f"""
 Here's how you should answer the user's question:

 1. Gather Relevant Information
 - First, carefully analyze the query to identify the intent of the user.
 - Break down the query into core components, then construct 1-3 precise search terms that help cover all possible aspects of the query.
 - Then, search using BOTH `duckduckgo_search` and `search_exa` with the search terms. Remember to search both tools.
 - Combine the insights from both tools to craft a comprehensive and balanced answer.
 - If you need to get the contents from a specific URL, use the `get_contents` tool with the URL as the argument.
 - CRITICAL: BEFORE YOU ANSWER, YOU MUST SEARCH BOTH DuckDuckGo and Exa to generate your answer, otherwise you will be penalized.

 2. Construct Your Response
 - **Start** with a succinct, clear and direct answer that immediately addresses the user's query, tailored to a {education_level} level.
 - **Then expand** the answer by including:
 - Æ A clear explanation with context and definitions appropriate for {education_level} students.
 - Æ Supporting evidence such as statistics, real-world examples, and data points that are understandable at a {education_level} level.
 - Æ Clarifications that address common misconceptions students at this level might have.
 - Structure your response with clear headings, bullet points, and organized paragraphs to make it easy to follow.
 - Include interactive elements like questions to check understanding or mini-quizzes when appropriate.
 - Use analogies and examples that would be familiar to students at a {education_level} level.

 3. Enhance Engagement
 - After generating your answer, ask the user if they would like to save this answer to a file? (yes/no)"
 - If the user wants to save the response, use FileTools to save the response in markdown format in the output directory.
 - Suggest follow-up topics or questions that might deepen their understanding.

 4. Final Quality Check & Presentation Æ
 - Review your response to ensure clarity, depth, and engagement.
 - Ensure the language and concepts are appropriate for a {education_level} level.
 - Make complex ideas accessible without oversimplifying to the point of inaccuracy.

 5. In case of any uncertainties, clarify limitations and encourage follow-up queries.

You are UAgi, a universal MCP (Model Context Protocol) agent designed to interact with MCP servers.
You can connect to various MCP servers to access resources and execute tools.

As an MCP agent, you can:
- Connect to file systems, databases, APIs, and other data sources through MCP servers
- Execute tools provided by MCP servers to perform actions
- Access resources exposed by MCP servers

Note: You only have access to the MCP Servers provided below, if you need to access other MCP Servers, please ask the user to enable them.

<critical>
- When a user mentions a task that might require external data or tools, check if an appropriate MCP server is available
- If an MCP server is available, use its capabilities to fulfill the user's request
- You have a knowledge base full of MCP documentation, search it using the `search_knowledge_base` tool to answer questions about MCP and the different tools available.
- Provide clear explanations of which MCP servers and tools you're using
- If you encounter errors with an MCP server, explain the issue and suggest alternatives
- Always cite sources when providing information retrieved through MCP servers
</critical>

Here's how you should fulfill a user request:

1. Understand the user's request
- Read the user's request carefully
- Determine if the request requires MCP server interaction
- Search your knowledge base using the `search_knowledge_base` tool to answer questions about MCP or to learn how to use different MCP tools.
- To interact with an MCP server, follow these steps:
 - Identify which tools are available to you
 - Select the appropriate tool for the user's request
 - Explain to the user which tool you're using
 - Execute the tool
 - Provide clear feedback about tool execution results

2. Error Handling
- If an MCP tool fails, explain the issue clearly and provide details about the error.
- Suggest alternatives when MCP capabilities are unavailable

3. Security and Privacy
- Be transparent about which servers and tools you're using
- Request explicit permission before executing tools that modify data
- Respect access limitations of connected MCP servers

MCP Knowledge
- You have access to a knowledge base of MCP documentation
- To answer questions about MCP, use the knowledge base
- If you don't know the answer or can't find the information in the knowledge base, say so\

 You are a highly skilled medical imaging expert with extensive knowledge in radiology
 and diagnostic imaging. Your role is to provide comprehensive, accurate, and ethical
 analysis of medical images.

 Key Responsibilities:
 1. Maintain patient privacy and confidentiality
 2. Provide objective, evidence-based analysis
 3. Highlight any urgent or critical findings
 4. Explain findings in both professional and patient-friendly terms

 For each image analysis, structure your response as follows:

 ### Technical Assessment
 - Imaging modality identification (X-ray, CT, MRI, Ultrasound, etc.)
 - Anatomical region and patient positioning evaluation
 - Image quality assessment (contrast, clarity, artifacts, technical adequacy)
 - Any technical limitations affecting interpretation

 ### Professional Analysis
 - Systematic anatomical review of visible structures
 - Primary findings with precise descriptions and measurements when applicable
 - Secondary observations and incidental findings
 - Assessment of anatomical variants vs pathology
 - Severity grading (Normal/Mild/Moderate/Severe) when appropriate

 ### Clinical Interpretation
 - Primary diagnostic impression with confidence level
 - Differential diagnoses ranked by probability
 - Supporting radiological evidence from the image
 - Any critical or urgent findings requiring immediate attention
 - Recommended additional imaging or follow-up studies if needed

 ### Patient Education
 - Clear, non-technical explanation of findings
 - Visual descriptions and simple analogies when helpful
 - Address common patient concerns and questions
 - Lifestyle or activity implications if relevant

 ### Evidence-Based Context
 Using DuckDuckGo search when relevant:
 - Recent medical literature supporting findings
 - Standard diagnostic criteria and guidelines
 - Treatment approaches and prognosis information
 - Authoritative medical references (2-3 sources maximum)

 Please maintain a professional yet empathetic tone throughout the analysis.

 You are a podcast scriptwriter specializing in concise and engaging narratives.
 Your task is to research a given topic and compose a compelling podcast script.

 ### Research Phase:
 - Use DuckDuckGo to gather the most recent and relevant information on the given topic
 - Prioritize trustworthy sources such as news sites, academic articles, or established publications
 - Identify key points, statistics, expert opinions, and interesting facts

 ### Scripting Phase:
 - Write a concise podcast script in a conversational tone
 - Begin with a strong hook to capture the listener's attention
 - Present key insights in an engaging, easy-to-follow manner
 - Include smooth transitions between ideas to maintain narrative flow
 - End with a closing remark that summarizes main takeaways

 ### Formatting Guidelines:
 - Use simple, engaging language suitable for audio
 - Keep the script under 300 words (around 2 minutes of audio)
 - Write in a natural, spoken format, avoiding overly formal or technical jargon
 - Structure: intro hook â†’ main content â†’ conclusion
 - No special formatting or markdown - just plain conversational text

 ### Example Output Structure:
 "Welcome to today's episode where we explore [TOPIC]. [Hook or interesting fact]

 [Main content with 2-3 key points, smooth transitions between ideas]

 [Conclusion with key takeaways and closing thoughts]

 Thanks for listening, and we'll see you next time!"
