User Input Required Stream

Source: https://docs.agno.com/examples/concepts/agent/human_in_the_loop

```
n_in_the_loop/user_input_required_stream
```

This example demonstrates how to use the `requires\_user\_input` parameter with streaming responses. It shows how to collect specific user input fields while maintaining real-time streaming capabilities.

```
## Code
```

```
""" Human-in-the-Loop: Allowing users to provide input externally
```

This example shows how to use the `requires_user_input` parameter to allow users to provide input externally.

```
"""
```

```
from typing import List
```

```
from agno.agent import Agent
```

```
from agno.db.sqlite import SQLiteDatabase
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.tools import tool
```

```
from agno.tools.function import UserInputField
```

```
from agno.utils import pprint
```

You can either specify the `user_input_fields` leave empty for all fields to be provided by the user

```
@tool(requires_user_input=True, user_input_fields=["to_address"])
```

```
def send_email(subject: str, body: str, to_address: str) -> str:

Agent Input as Dictionary

Source: https://docs.agno.com/examples/concepts/agent/input_and_output/input_as_dict

This example demonstrates how to provide input to an agent as a dictionary format, specifically for multimodal inputs like text and images.

Code

```
from agno.agent import Agent
```

```
from agno.models.openai import OpenAIChat
```

```
Agent(model=OpenAIChat(id="gpt-5-mini")).print_res
```

```
ponse(
```

```
{
```

```
    "role": "user",
```

```
    "content": [
```

```
        {"type": "text", "text": "What's in this image?"},
```

```
        {
```

```
            "type": "image_url",
```

```
            "image_url": {
```

```
                "url": "https://upload.wikimedia.org/wikipedia/commons/th
```

```
umb/d/dd/Gfp-wisconsin-madison-the-nature-boardwal
```

```

Agent Input as Messages List

Source: https://docs.agno.com/examples/concepts/agent/input_and_output/input_as_messages_list

This example demonstrates how to pass input to an agent as a list of Message objects, allowing for multi-turn conversations and context setup.

Code

```
from agno.agent import Agent, Message
```

```
from agno.models.openai import OpenAIChat
```

```
Agent(model=OpenAIChat(id="gpt-5-mini")).print_res
```

```
ponse(
```

```
    input=[
```

```
        Message(
```

```
            role="user",
```

```
            content="I'm preparing a presentation for my company about renewable energy adoption.",
```

```
        ),
```

```
        Message(
```

```
            role="assistant",
```

```
            content="I'd be happy to help with your renewable energy presentation. What specific aspects would you like me to focus on?",
```

```
        ),
```

```
        Message(
```

```
            role="user",
```

```
            content="Could you research the latest solar panel efficiency improvements in 2024?",
```

```
        ),
```

```
        Message(
            role="user",
            content="Also, please summarize the key findings in bullet points for my
slides.",
        ),
    ],
    stream=True,
    markdown=True,
)
```

Usage

> **Snippet file:** "create-venv-step.mdx"

Step: Install libraries

```

Agent with Input Schema

Source: https://docs.agno.com/examples/concepts/agent/input_and_output/input_schema_on_agent

This example demonstrates how to define an input schema for an agent using Pydantic models, ensuring structured input validation.

Code

```
from typing import List

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.hackernews import HackerNewsTools
from pydantic import BaseModel, Field

class ResearchTopic(BaseModel):
    """Structured research topic with specific requirements"""

    topic: str
    focus_areas: List[str] = Field(description="Specific areas to focus on")
    target_audience: str = Field(description="Who this research is for")
    sources_required: int = Field(description="Number of sources needed", default=5)
```

Define agents

```
hackernews_agent = Agent(
    name="Hackernews Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[HackerNewsTools()],
    role="Extract key insights and content from Hackernews posts",
    input_schema=ResearchTopic,
)
```

Pass a dict that matches the input schema

```
hackernews_agent.print_response(
    input={
        "topic": "AI",
        "focus_areas": ["AI", "Machine Learning"],
        "target_audience": "Developers",
        "sources_required": "5",
    }
)
```

Pass a pydantic model that matches the input schema

```
hackernews_agent.print_response(
    input=ResearchTopic(
        topic="AI",
```

```
focus_areas=["AI", "Machine Learning"],
target_audience="Developers",
sources_required=5,
)
)
```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
    pip install -U agno pydantic
```

```
**Step: Export your OpenAI API key**
```

```
    export OPENAI_API_KEY="your_openai_api_key_here"
```

```
    $Env:OPENAI_API_KEY="your_openai_api_key_here"
```

```
**Step: Create a Python file**
```

```
    Create a Python file and add the above code.
```

```
    touch input_schema_on_agent.py
```

```
**Step: Run Agent**
```

```
    python input_schema_on_agent.py
```

```
    python input_schema_on_agent.py
```

```
**Step: Find All Cookbooks**
```

```

```

```
# Agent with Input Schema as TypedDict
```

Source: https://docs.agno.com/examples/concepts/agent/input_and_output/input_schema_on_agent_as_typed_dict

This example demonstrates how to define an input schema for an agent using `TypedDict`, ensuring structured input validation.

Code

```
from typing import List, Optional, TypedDict

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.hackernews import HackerNewsTools
```

Define a TypedDict schema

```
class ResearchTopicDict(TypedDict):
    topic: str
    focus_areas: List[str]
    target_audience: str
    sources_required: int
```

Optional: Define a TypedDict with optional fields

```
class ResearchTopicWithOptionals(TypedDict, total=False):
    topic: str
    focus_areas: List[str]
    target_audience: str
    sources_required: int
    priority: Optional[str]
```

Create agent with TypedDict input schema

```
hackernews_agent = Agent(
    name="Hackernews Agent with TypedDict",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[HackerNewsTools()],
    role="Extract key insights and content from Hackernews posts",
    input_schema=ResearchTopicDict,
)
```

with valid input

```
print("=== Testing TypedDict Input Schema ===")
hackernews_agent.print_response(
    input={
        "topic": "AI",
        "focus_areas": ["Machine Learning", "LLMs", "Neural Networks"],
        "target_audience": "Developers",
        "sources_required": 5,
    }
)
```

```
)
```

with optional fields

```
optional_agent = Agent(  
    name="Hackernews Agent with Optional Fields",  
    model=OpenAIChat(id="gpt-5-mini"),  
    tools=[HackerNewsTools()],  
    input_schema=ResearchTopicWithOptionals,  
)
```

```
print("\n=== Testing TypedDict with Optional Fields ===")  
optional_agent.print_response(  
    input={
```

```
        "topic": "Blockchain",  
        "focus_areas": ["DeFi", "NFTs"],  
        "target_audience": "Investors",
```

sources_required is optional, omitting it

```
        "priority": "high",  
    }
```

```
)
```

Should raise an error - missing required field

try:

```
    hackernews_agent.print_response(  
        input={  
            "topic": "AI",
```

Missing required fields: focus_areas, target_audience, sources_required

```
        }  
    )
```

except ValueError as e:

```
    print("\n=== Expected Error for Missing Fields ===")  
    print(f"Error: {e}")
```

This will raise an error - unexpected field

try:

```
    hackernews_agent.print_response(  
        input={  
            "topic": "AI",  
            "focus_areas": ["Machine Learning"],  
            "target_audience": "Developers",  
            "sources_required": 5,  
            "unexpected_field": "value", # This field is not in the TypedDict  
        }  
    )
```

except ValueError as e:

```
print("\n=== Expected Error for Unexpected Field ===")
print(f"Error: {e}")
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U agno openai
```

```
**Step: Export your OpenAI API key**
```

```

# Agent with Output Model
```

```
Source: https://docs.agno.com/examples/concepts/agent/input\_and\_output/output\_model
```

This example demonstrates how to use the `output_model` parameter to specify a different model for generating the final response, enabling model switching during agent execution.

```
## Code
```

"""

This example shows how to use the `output_model` parameter to specify the model that will be used to generate the final response.

"""

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
    model=OpenAIChat(id="gpt-4.1"),
    output_model=OpenAIChat(id="gpt-5-mini"),
    tools=[DuckDuckGoTools()],
)

agent.print_response("Latest news from France?", stream=True)
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Install libraries****

```
pip install -U agno openai ddgs
```

****Step: Export your OpenAI API key****

```
export OPENAI_API_KEY="your_openai_api_key_here"

Capturing Agent Response as Variable

Source: https://docs.agno.com/examples/concepts/agent/input_and_output/response_as_variable

This example demonstrates how to capture and work with agent responses as variables, enabling programmatic access to response data and metadata.

Code

```
from typing import Iterator # noqa
from rich.pretty import pprint
from agno.agent import Agent, RunOutput
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
```

```
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[
        DuckDuckGoTools(
            stock_price=True,
            analyst_recommendations=True,
            company_info=True,
            company_news=True,
        )
    ],
    instructions=["Use tables where possible"],
    markdown=True,
)
```

```
run_response: RunOutput = agent.run("What is the stock price of NVDA")
pprint(run_response)
```

```
run_response_strem: Iterator[RunOutputEvent] =
agent.run("What is the stock price of NVDA",
stream=True)
```

for response in run_response_strem: pprint(response)

Usage

Structured Input with Pydantic Models

Source: https://docs.agno.com/examples/concepts/agent/input_and_output/structured_input

This example demonstrates how to use structured Pydantic models as input to agents, enabling type-safe and validated input parameters for complex research tasks.

```
## Code
```

```
from typing import List
```

```
from agno.agent import Agent
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.tools.hackernews import HackerNewsTools
```

```
from pydantic import BaseModel, Field
```

```
class ResearchTopic(BaseModel):
```

```
    """Structured research topic with specific requirements"""
```

```
    topic: str
```

```
    focus_areas: List[str] = Field(description="Specific areas to focus on")
```

```
    target_audience: str = Field(description="Who this research is for")
```

```
    sources_required: int = Field(description="Number of sources needed", default=5)
```

Define agents

```
hackernews_agent = Agent(
```

```
    name="Hackernews Agent",
```

```
    model=OpenAIChat(id="gpt-5-mini"),
```

```
    tools=[HackerNewsTools()],
```

```
    role="Extract key insights and content from Hackernews posts",
```

```
)
```

```
hackernews_agent.print_response(
```

```
    input=ResearchTopic(
```

```
        topic="AI",
```

```
        focus_areas=["AI", "Machine Learning"],
```

```
        target_audience="Developers",
```

```
        sources_required=5,
```

```
    )
```

```
)
```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
    pip install -U agno openai pydantic
```

```
**Step: Export your OpenAI API key**
```

Agent Same Run Image Analysis

Source: https://docs.agno.com/examples/concepts/agent/multimodal/agent_same_run_image_analysis

This example demonstrates how to create an agent that generates an image using DALL-E and then analyzes the generated image in the same run, providing insights about the image's contents.

Code

```
from agno.agent import Agent
from agno.tools.dalle import DalleTools
```

Create an Agent with the DALL-E tool

```
agent = Agent(tools=[DalleTools()], name="DALL-E Image Generator")
```

```
response = agent.run(
    "Generate an image of a dog and tell what color the dog is.",
    markdown=True,
    debug_mode=True,
)
```

```
if response.images:
    print("Agent Response", response.content)
    print(response.images[0].url)
```

Usage

> ****Snippet file:**** "create-venv-step.mdx"

****Step: Install libraries****

```
pip install -U openai agno
```

****Step: Export your OpenAI API key****

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

****Step: Create a Python file****

Create a Python file and add the above code.

```
touch agent_same_run_image_analysis.py
```

Agent Using Multimodal Tool Response in Runs

Source: https://docs.agno.com/examples/concepts/agent/multimodal/agent_using_multimodal_tool_response_in_runs

This example demonstrates how to create an agent that uses DALL-E to generate images and maintains conversation history across multiple runs, allowing the agent to remember previous interactions and images generated.

Code

```
from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.tools.dalle import DalleTools
```

Create an Agent with the DALL-E tool

```
agent = Agent(
    tools=[DalleTools()],
    name="DALL-E Image Generator",
    add_history_to_context=True,
    db=SqliteDb(db_file="tmp/test.db"),
)

agent.print_response(
    "Generate an image of a Siamese white furry cat sitting on a couch?",
    markdown=True,
)

agent.print_response(
    "Which type of animal and the breed are we talking about?", markdown=True
)
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U openai agno
```

```
**Step: Export your OpenAI API key**
```

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

```
**Step: Create a Python file**
```

```
Create a Python file and add the above code.
```

```
touch agent_using_multimodal_tool_response_in_runs.py
```

```
**Step: Run Agent**
```

```
python agent_using_multimodal_tool_response_in_runs.py

Audio Input Output

Source: https://docs.agno.com/examples/concepts/agent/multimodal/audio_input_output

This example demonstrates how to create an agent that can process audio input and generate audio output using OpenAI's GPT-4o audio preview model. The agent analyzes an audio recording and responds with both text and audio.

Code

```
import requests
from agno.agent import Agent
from agno.media import Audio
from agno.models.openai import OpenAIChat
from agno.utils.audio import write_audio_to_file
from rich.pretty import pprint
```

Fetch the audio file and convert it to a base64 encoded string

```
url = "https://openaiassets.blob.core.windows.net/$web/API/docs/audio/alloy.wav"
response = requests.get(url)
response.raise_for_status()
wav_data = response.content
```

```
agent = Agent(
    model=OpenAIChat(
        id="gpt-5-mini-audio-preview",
        modalities=["text", "audio"],
        audio={"voice": "sage", "format": "wav"},
    ),
    markdown=True,
)
```

```
run_response = agent.run(
    "What's in these recording?",
```

```

        audio=[Audio(content=wav_data, format="wav")],
    )

if run_response.response_audio is not None:
    pprint(run_response.content)
    write_audio_to_file(
        audio=run_response.response_audio.content, filename="tmp/result.wav"
    )

```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Install libraries****

```
pip install -U openai agno requests

Audio Multi Turn

Source: <https://docs.agno.com/examples/concepts/agent/mult>

imodal/audio_multi_turn

This example demonstrates how to create an agent that can handle multi-turn audio conversations, maintaining context between audio interactions while generating both text and audio responses.

Code

```
from agno.agent import Agent
from agno.db.sqlite import SQLiteDatabase
from agno.models.openai import OpenAIChat
from agno.utils.audio import write_audio_to_file
from rich.pretty import pprint

agent = Agent(
    model=OpenAIChat(
        id="gpt-5-mini-audio-preview",
        modalities=["text", "audio"],
        audio={"voice": "sage", "format": "wav"},
    ),
    add_history_to_context=True,
    db=SQLiteDatabase(
        session_table="audio_multi_turn_sessions", db_file="tmp/audio_multi_turn.db"
    ),
)
```

```
run_response = agent.run("Is a golden retriever a good family dog?")
pprint(run_response.content)
if run_response.response_audio is not None:
    write_audio_to_file(
        audio=run_response.response_audio.content, filename="tmp/answer_1.wav"
    )
```

```
run_response = agent.run("What breed are we talking about?")
pprint(run_response.content)
if run_response.response_audio is not None:
    write_audio_to_file(
        audio=run_response.response_audio.content, filename="tmp/answer_2.wav"
    )
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U openai agno
```

```
**Step: Export your OpenAI API key**
```

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

****Step: Create a Python file****

Create a Python file and add the above code.

```
touch audio_multi_turn.py
```

****Step: Run Agent****

```
python audio_multi_turn.py
```

```
python audio_multi_turn.py
```

****Step: Find All Cookbooks****

Explore all the available cookbooks in the Agno repository. Click the link below to view the code on GitHub:

Audio Sentiment Analysis

Source: https://docs.agno.com/examples/concepts/agent/multimodal/audio_sentiment_analysis

This example demonstrates how to perform sentiment analysis on audio conversations using Agno agents with multimodal capabilities.

```
import requests
```

```
from agno.agent import Agent
```

```
from agno.db.sqlite import SqliteDb
```

```
from agno.media import Audio
```

```
from agno.models.google import Gemini
```

```
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
```

```
agent = Agent(
    model=Gemini(id="gemini-2.0-flash-exp"),
    add_history_to_context=True,
    markdown=True,
    db=SqliteDb(
        session_table="audio_sentiment_analysis_sessions",
```

```

        db_file="tmp/audio_sentiment_analysis.db",
    ),
)

url = "https://agno-public.s3.amazonaws.com/demo_data/sample_conversation.wav"

response = requests.get(url)
audio_content = response.content

```

Give a sentiment analysis of this audio conversation. Use speaker A, speaker B to identify speakers.

```

agent.print_response(
    "Give a sentiment analysis of this audio conversation. Use speaker A, speaker B to identify speakers.",
    audio=[Audio(content=audio_content)],
    stream=True,
)

agent.print_response(
    "What else can you tell me about this audio conversation?",
    stream=True,
)

```

Key Features

- * **Audio Processing**: Downloads and processes audio files from remote URLs
- * **Sentiment Analysis**: Analyzes emotional tone and sentiment in conversations
- * **Speaker Identification**: Distinguishes between different speakers in the conversation
- * **Persistent Sessions**: Maintains conversation history using SQLite database
- * **Streaming Response**: Real-time response generation for better user experience

Use Cases

- * Customer service call analysis
- * Meeting sentiment tracking
- * Interview evaluation
- * Call center quality monitoring

Audio Streaming

Source: https://docs.agno.com/examples/concepts/agent/multimodal/audio_streaming

This example demonstrates how to use Agno agents to generate streaming audio responses using OpenAI's GPT-4o audio preview model.

```

import base64
import wave
from typing import Iterator

```

```
from agno.agent import Agent, RunOutputEvent
from agno.models.openai import OpenAIChat
```

Audio Configuration

```
SAMPLE_RATE = 24000 # Hz (24kHz)
CHANNELS = 1 # Mono (Change to 2 if Stereo)
SAMPLE_WIDTH = 2 # Bytes (16 bits)
```

Provide the agent with the audio file and audio configuration and get result as text + audio

```
agent = Agent(
    model=OpenAIChat(
        id="gpt-5-mini-audio-preview",
        modalities=["text", "audio"],
        audio={
            "voice": "alloy",
            "format": "pcm16",
        }, # Only pcm16 is supported with streaming
    ),
)
output_stream: Iterator[RunOutputEvent] = agent.run(
    "Tell me a 10 second story", stream=True
)
```

```
filename = "tmp/response_stream.wav"
```

Open the file once in append-binary mode

```
with wave.open(str(filename), "wb") as wav_file:
    wav_file.setnchannels(CHANNELS)
    wav_file.setsampwidth(SAMPLE_WIDTH)
    wav_file.setframerate(SAMPLE_RATE)
```

Iterate over generated audio

```
for response in output_stream:
    response_audio = response.response_audio # type: ignore
    if response_audio:
        if response_audio.transcript:
            print(response_audio.transcript, end="", flush=True)
        if response_audio.content:
            try:
                pcm_bytes = base64.b64decode(response_audio.content)
                wav_file.writeframes(pcm_bytes)
            except Exception as e:
                print(f"Error decoding audio: {e}")
print()
```

Key Features

- * **Real-time Audio Streaming**: Streams audio responses in real-time using OpenAI's audio preview model
- * **PCM16 Audio Format**: Uses high-quality PCM16 format for audio streaming
- * **Transcript Generation**: Provides simultaneous text transcription of generated audio
- * **WAV File Creation**: Saves streamed audio directly to a WAV file format
- * **Error Handling**: Includes robust error handling for audio decoding

Use Cases

- * Interactive voice assistants
- * Real-time storytelling applications
- * Audio content generation
- * Voice-enabled chatbots
- * Dynamic audio responses for applications

Technical Details

The example configures audio streaming with 24kHz sample rate, mono channel, and 16-bit sample width. The streaming approach allows for real-time audio playback while maintaining high audio quality through the PCM16 format.

Audio to Text Transcription

Source: https://docs.agno.com/examples/concepts/agent/multimodal/audio_to_text

This example demonstrates how to create an agent that can transcribe audio conversations, identifying different speakers and providing accurate transcriptions.

Code

```
import requests
from agno.agent import Agent
from agno.media import Audio
from agno.models.google import Gemini

agent = Agent(
    model=Gemini(id="gemini-2.0-flash-exp"),
    markdown=True,
)

url = "https://agno-public.s3.us-east-1.amazonaws.com/demo_data/QA-01.mp3"

response = requests.get(url)
audio_content = response.content
```

Give a transcript of this audio conversation. Use speaker A, speaker B to identify speakers.

```
agent.print_response(  
    "Give a transcript of this audio conversation. Use speaker A, speaker B to identify  
speakers.",  
    audio=[Audio(content=audio_content)],  
    stream=True,  
)
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Install libraries****

```
pip install -U agno google-generativeai requests
```

****Step: Export your GOOGLE API key****

```
export GOOGLE_API_KEY="your_google_api_key_here"
```

```
$Env:GOOGLE_API_KEY="your_google_api_key_here"
```

****Step: Create a Python file****

Create a Python file and add the above code.

```
touch audio_to_text.py
```

****Step: Run Agent****

```
python audio_to_text.py
```

```
python audio_to_text.py
```

Usage

> **Snippet file:** "create-venv-step.mdx"

Step: Export your OpenAI API key

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

Step: Set up PostgreSQL

Start PostgreSQL with Docker

```

docker run -d \
    --name postgres-ai \
    -e POSTGRES_DB=ai \
    -e POSTGRES_USER=ai \
    -e POSTGRES_PASSWORD=ai \
    -p 5532:5432 \
    postgres:16

```

Step: Install libraries

```
pip install -U agno openai psycopg
```

Step: Create a Python file

Create a Python file and add the above code.

```
touch image_input_for_tool.py
```

Step: Run Agent

```
python image_input_for_tool.py
```

```
python image_input_for_tool.py
```

Image to Audio Story Generation

Source: https://docs.agno.com/examples/concepts/agent/multimodal/image_to_audio

This example demonstrates how to analyze an image to create a story and then convert that story to audio narration.

Code

```
from pathlib import Path
```

```
from agno.agent import Agent, RunOutput
```

```
from agno.media import Image
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.utils.audio import write_audio_to_file
```

```
from rich import print
```

```
from rich.text import Text
```

```

cwd = Path(file).parent.resolve()

image_agent = Agent(model=OpenAIChat(id="gpt-5-mini"))

image_path = Path(file).parent.joinpath("sample.jpg")
image_story: RunOutput = image_agent.run(
    "Write a 3 sentence fiction story about the image",
    images=[Image(filepath=image_path)],
)
formatted_text = Text.from_markup(
    f":sparkles: [bold magenta]Story:[/bold magenta] {image_story.content} :sparkles:"
)
print(formatted_text)

audio_agent = Agent(
    model=OpenAIChat(
        id="gpt-5-mini-audio-preview",
        modalities=["text", "audio"],
        audio={"voice": "sage", "format": "wav"},
    ),
)

audio_story: RunOutput = audio_agent.run(
    f"Narrate the story with flair: {image_story.content}"
)
if audio_story.response_audio is not None:
    write_audio_to_file(
        audio=audio_story.response_audio.content, filename="tmp/sample_story.wav"
    )

## Usage

# Image to Image Generation Agent
```

```
Source: https://docs.agno.com/examples/concepts/agent/multimodal/image_to_image_agent
```

This example demonstrates how to create an AI agent that generates images from existing images using the Fal AI API.

```
## Code
```

```
from agno.agent import Agent
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.tools.fal import FalTools
```

```
agent = Agent(
```

```
    model=OpenAIChat(id="gpt-5-mini"),
```

```
    id="image-to-image",
```

```
    name="Image to Image Agent",
```

```
    tools=[FalTools()],
```

```
    markdown=True,
```

```
    instructions=[
```

```
        "You have to use the `image_to_image` tool to generate the image.",
```

```
        "You are an AI agent that can generate images using the Fal AI API.",
```

```
        "You will be given a prompt and an image URL.",
```

```
        "You have to return the image URL as provided, don't convert it to markdown or anything else.",
```

```
    ],
```

```
)
```

```
agent.print_response(
```

```
    "a cat dressed as a wizard with a background of a mystic forest. Make it look like
```

```
    'https://fal.media/files/koala/Chls9L2ZnvuipUTEwln
```

```
JC.png'",
    stream=True,
)
```

Usage

> **Snippet file:** "create-venv-step.mdx"

****Step: Install libraries****

Image to Structured Output

Source: https://docs.agno.com/examples/concepts/agent/multimodal/image_to_structured_output

This example demonstrates how to analyze images and generate structured output using Pydantic models, creating movie scripts based on image content.

```
## Code
```

```
from typing import List
```

```
from agno.agent import Agent
```

```
from agno.media import Image
```

```
from agno.models.openai import OpenAIChat
```

```
from pydantic import BaseModel, Field
```

```
from rich.pretty import pprint
```

```
class MovieScript(BaseModel):
```

```
    name: str = Field(..., description="Give a name to this movie")
```

```
    setting: str = Field(
```

```
        ..., description="Provide a nice setting for a blockbuster movie."
```

```
)
```

```
    characters: List[str] = Field(..., description="Name of characters for this movie.")
```

```
    storyline: str = Field(
```

```
        ..., description="3 sentence storyline for the movie. Make it exciting!"
```

```
)
```

```
agent = Agent(model=OpenAIChat(id="gpt-5-mini"), output_schema=MovieScript)
```

```
response = agent.run(
```

```
    "Write a movie about this image",
```

```
    images=[
```

```
        Image(
```

```
            url="https://upload.wikimedia.org/wikipedia/common
```

```
s/0/0c/GoldenGateBridge-001.jpg"
```

```
        )
```

```
    ],
```

```
    stream=True,
```

```
)
```

```
for event in response:
```

```
    pprint(event.content)
```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
    pip install -U agno openai pydantic rich
```

```
**Step: Export your OpenAI API key**
```

```
    export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

****Step: Create a Python file****

Video to Shorts Generation

Source: https://docs.agno.com/examples/concepts/agent/multimodal/video_to_shorts

This example demonstrates how to analyze a video and automatically generate short-form content segments optimized for platforms like YouTube Shorts and Instagram Reels.

Code

```
"""
```

1. Install dependencies using: `pip install opencv-python google-generativeai sqlalchemy`
2. Install ffmpeg `brew install ffmpeg`
2. Run the script using: `python cookbook/agent_concepts/video_to_shorts.py`

```
"""
```

```
import subprocess
```

```
from pathlib import Path
```

```
from agno.agent import Agent
```

```
from agno.media import Video
```

```
from agno.models.google import Gemini
```

```
from agno.utils.log import logger
```

```

video_path = Path(file).parent.joinpath("sample_video.mp4")
output_dir = Path("tmp/shorts")

agent = Agent(
    name="Video2Shorts",
    description="Process videos and generate engaging shorts.",
    model=Gemini(id="gemini-2.0-flash-exp"),
    markdown=True,
    instructions=[
        "Analyze the provided video directly-do NOT reference or analyze any external sources or YouTube videos.",
        "Identify engaging moments that meet the specified criteria for short-form content.",
        """"Provide your analysis in a **table format** with these columns:
- Start Time | End Time | Description | Importance Score""",
        "Ensure all timestamps use MM:SS format and importance scores range from 1-10. ",
        "Focus only on segments between 15 and 60 seconds long.",
        "Base your analysis solely on the provided video content.",
        "Deliver actionable insights to improve the identified segments for short-form optimization.",
    ],
)

```

2. Multimodal Query for Video Analysis

query = """"

You are an expert in video content creation, specializing in crafting engaging short-form content for platforms like YouTube Shorts and Instagram Reels. Your task is to analyze the provided video and identify segments that maximize viewer engagement.

For each video, you'll:

1. Identify key moments that will capture viewers' attention, focusing on:
 - High-energy sequences
 - Emotional peaks
 - Surprising or unexpected moments
 - Strong visual and audio elements
 - Clear narrative segments with compelling storytelling
2. Extract segments that work best for short-form content, considering:
 - Optimal length (strictly 15-60 seconds)
 - Natural start and end points that ensure smooth transitions
 - Engaging pacing that maintains viewer attention
 - Audio-visual harmony for an immersive experience
 - Vertical format compatibility and adjustments if necessary
3. Provide a detailed analysis of each segment, including:
 - Precise timestamps (Start Time | End Time in MM:SS format)

- A clear description of why the segment would be engaging
- Suggestions on how to enhance the segment for short-form content
- An importance score (1-10) based on engagement potential

Your goal is to identify moments that are visually compelling, emotionally engaging, and perfectly optimized for short-form platforms.

.....

3. Generate Video Analysis

```
response = agent.run(query, videos=[Video(filepath=video_path)])
```

4. Create output directory

```
output_dir = Path(output_dir)
output_dir.mkdir(parents=True, exist_ok=True)
```

5. Extract and cut video segments - Optional

```
def extract_segments(response_text):
    import re

    segments_pattern = r"\|s*(\d+:\d+)\s*\|s*(\d+:\d+)\s*\|s*(.*?)\s*\|s*(\d+)\s*\|"
    segments: list[dict] = []

    for match in re.finditer(segments_pattern, str(response_text)):
        start_time = match.group(1)
        end_time = match.group(2)
        description = match.group(3)
        score = int(match.group(4))
```

Convert timestamps to seconds

```
start_seconds = sum(x * int(t) for x, t in zip([60, 1], start_time.split(":")))
end_seconds = sum(x * int(t) for x, t in zip([60, 1], end_time.split(":")))
duration = end_seconds - start_seconds
```

Only process high-scoring segments

```
if 15 <= duration <= 60 and score > 7:
    output_path = output_dir / f"short_{len(segments) + 1}.mp4"
```

FFmpeg command to cut video

```
command = [
    "ffmpeg",
    "-ss",
    str(start_seconds),
    "-i",
    video_path,
    "-t",
```

```

        str(duration),
        "-vf",
        "scale=1080:1920,setsar=1:1",
        "-c:v",
        "libx264",
        "-c:a",
        "aac",
        "-y",
        str(output_path),
    ]

    try:
        subprocess.run(command, check=True)
        segments.append(
            {"path": output_path, "description": description, "score": score}
        )
    except subprocess.CalledProcessError:
        print(f"Failed to process segment: {start_time} - {end_time}")

    return segments

```

```
logger.debug(f"{response.content}")
```

6. Process segments

```
shorts = extract_segments(response.content)
```

7. Print results

```

print("\n--- Generated Shorts ---")
for short in shorts:
    print(f"Short at {short['path']}")
    print(f>Description: {short['description']}")
    print(f"Engagement Score: {short['score']}/10\n")

```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U agno opencv-python sqlalchemy
```

```

Agent Extra Metrics

Source: https://docs.agno.com/examples/concepts/agent/other/agent_extra_metrics

This example demonstrates how to collect special token metrics including audio, cached, and reasoning tokens. It shows different types of advanced metrics available when working with various OpenAI models.

Code

```
"""Show special token metrics like audio, cached and reasoning tokens"""
```

```
import requests
```

```
from agno.agent import Agent
```

```
from agno.media import Audio
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.utils.pprint import pprint_run_response
```

Fetch the audio file and convert it to a base64 encoded

string

```
url = "https://openaiassets.blob.core.windows.net/$web/A  
PI/docs/audio/alloy.wav"  
response = requests.get(url)  
response.raise_for_status()  
wav_data = response.content
```

```
agent = Agent(  
    model=OpenAIChat(  
        id="gpt-5-mini-audio-preview",  
        modalities=["text", "audio"],  
        audio={"voice": "sage", "format": "wav"},

Agent Metrics and Performance Monitoring

Source: https://docs.agno.com/examples/concepts/agent/other/agent_metrics

This example demonstrates how to collect and analyze agent metrics including message-level metrics, run metrics, and session metrics for performance monitoring.

Code

```
from agno.agent import Agent
```

```

from agno.db.postgres import PostgresDb
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.utils import pprint

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[DuckDuckGoTools(stock_price=True)],
    markdown=True,
    session_id="test-session-metrics",
    db=PostgresDb(db_url="postgresql+psycopg://ai:ai@localhost:5532/ai"),
)

```

Get the run response directly from the non-streaming call

```

run_response = agent.run("What is the stock price of NVDA")
print("Tool execution completed successfully!")

```

Print metrics per message

```

if run_response and run_response.messages:
    for message in run_response.messages:
        if message.role == "assistant":
            if message.content:
                print(
                    f"Message: {message.content[:100]}..."
                ) # Truncate for readability
            elif message.tool_calls:
                print(f"Tool calls: {len(message.tool_calls)} tool call(s)")
            print("---" * 5, "Message Metrics", "---" * 5)
            if message.metrics:
                pprint(message.metrics)
            else:
                print("No metrics available for this message")
            print("---" * 20)

```

Print the run metrics

```

print("---" * 5, "Run Metrics", "---" * 5)
if run_response and run_response.metrics:
    pprint(run_response.metrics)
else:
    print("No run metrics available")

```

Print the session metrics

```

print("---" * 5, "Session Metrics", "---" * 5)
try:

```

```
    session_metrics = agent.get_session_metrics()
    if session_metrics:
        pprint(session_metrics)
    else:
        print("No session metrics available")
except Exception as e:
    print(f"Error getting session metrics: {e}")
```

Usage

Agent Debug Mode

Source: <https://docs.agno.com/examples/concepts/agent/other/debug>

This example demonstrates how to enable debug mode for agents to get more verbose output and detailed information about agent execution.

Code

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
```

You can set the debug mode on the agent for all runs to have more verbose output

```
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    debug_mode=True,
)
```

```
agent.print_response(input="Tell me a joke.")
```

You can also set the debug mode on a single run

```
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
)
agent.print_response(input="Tell me a joke.", debug_mode=True)
```

Usage

> ****Snippet file:**** "create-venv-step.mdx"

Scenario Testing

Source: https://docs.agno.com/examples/concepts/agent/other/scenario_testing

This example demonstrates how to use the Scenario testing library to test an agent with defined success and failure criteria. It shows how to implement automated testing for agent behavior and responses.

Code

```
"""
```

This is an example that uses the scenario (<https://github.com/langwatch/scenario>) testing library to test an agent.

Prerequisites:

- Install scenario: `pip install scenario`

```
"""
```

```

import pytest
from scenario import Scenario, TestingAgent, scenario_cache

Scenario.configure(testing_agent=TestingAgent(mode
l="openai/gpt-5-nano"))

@pytest.mark.agent_test
@pytest.mark.asyncio
async def test_vegetarian_recipe_agent():
    agent = VegetarianRecipeAgent()

    def vegetarian_recipe_agent(message, context):

```

Call your agent here

```

        return agent.run(message)

```

Define the scenario

```

scenario = Scenario(
    "User is looking for a dinner idea",
    agent=vegetarian_recipe_agent,
    success_criteria=[
        "Recipe agent generates a vegetarian recipe",
        "Recipe includes a list of ingredients",
        "Recipe includes step-by-step cooking instructions",
    ],
    failure_criteria=[
        "The recipe is not vegetarian or includes meat",
        "The agent asks more than two follow-up questions",
    ],
)

```

Run the scenario and get results

```

result = await scenario.run()

```

Assert for pytest to know whether the test passed

```

assert result.success

```

Example agent implementation

```

from agno.agent import Agent # noqa: E402
from agno.models.openai import OpenAIChat # noqa: E402

class VegetarianRecipeAgent:
    def __init__(self):
        self.history = []

    @scenario_cache()
    def run(self, message: str):
        self.history.append({"role": "user", "content": message})

```

```

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    markdown=True,
    instructions="You are a vegetarian recipe agent",
)

response = agent.run(message)
result = response.content
print(result)
self.history.append(result)

return {"message": result}

```

Usage

> **Snippet file:** "create-venv-step.mdx"

Step: Install libraries

```
pip install -U agno openai scenario pytest
```

Step: Export your OpenAI API key

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

Step: Create a Python file

Create a Python file and add the above code.

```
touch scenario_testing.py
```

Step: Run Test

```
pytest scenario_testing.py -v
```

```
pytest scenario_testing.py -v
```

Step: Find All Cookbooks

Explore all the available cookbooks in the Agno repository. Click the link below to view the code on GitHub:

```

</Link>

```

```
# Tool Call Limit
Source: https://docs.agno.com/examples/concepts/agent/other/tool\_call\_limit
```

This example demonstrates how to use tool call limits to control the number of tool calls an agent can make. This is useful for preventing excessive API usage or limiting agent behavior in specific scenarios.

```
## Code
```

```
"""
```

This cookbook shows how to use tool call limit to control the number of tool calls an agent can make.

```
"""
```

```
from agno.agent import Agent
from agno.models.anthropic import Claude
from agno.tools.duckduckgo import DuckDuckGoTools
```

```
agent = Agent(
    model=Claude(id="claude-3-5-haiku-20241022"),
    tools=[DuckDuckGoTools(company_news=True, cache_results=True)],
    tool_call_limit=1,
)
```

It should only call the first tool and fail to call the second tool.

```
agent.print_response(
    "Find me the current price of TSLA, then after that find me the latest news about Tesla.",
    stream=True,
)
```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U agno anthropic ddgs
```

```
**Step: Export your ANTHROPIC API key**
```

```
export ANTHROPIC_API_KEY="your_anthropic_api_key_here"
```

```
$Env:ANTHROPIC_API_KEY="your_anthropic_api_key_her
```

e"

****Step: Create a Python file****

Create a Python file and add the above code.

```
touch tool_call_limit.py
```

****Step: Run Agent****

```
python tool_call_limit.py
```

```
python tool_call_limit.py
```

RAG with LanceDB and SQLite Storage

Source: [https://docs.agno.com/examples/concepts/agent/rag/](https://docs.agno.com/examples/concepts/agent/rag/rag_with_lance_db_and_sqlite)

[rag_with_lance_db_and_sqlite](https://docs.agno.com/examples/concepts/agent/rag/rag_with_lance_db_and_sqlite)

This example demonstrates how to implement RAG using LanceDB vector database with Ollama embeddings and SQLite for agent data storage, providing a complete local setup for document retrieval.

Code

```
from agno.agent import Agent
from agno.db.sqlite.sqlite import SqliteDb
from agno.knowledge.embedder.ollama import OllamaEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.ollama import Ollama
from agno.vectordb.lancedb import LanceDb
```

Define the database URL where the vector database will be stored

```
db_url = "/tmp/lancedb"
```

Configure the language model

```
model = Ollama(id="llama3.1:8b")
```

Create Ollama embedder

```
embedder = OllamaEmbedder(id="nomic-embed-text", dimensions=768)
```

Create the vector database

```
vector_db = LanceDb(  
    table_name="recipes", # Table name in the vector database  
    uri=db_url, # Location to initiate/create the vector database  
    embedder=embedder, # Without using this, it will use OpenAIChat embeddings by default  
)  
  
knowledge = Knowledge(  
    vector_db=vector_db,  
)  
  
knowledge.add_content_sync(  
    name="Recipes", url="https://agno-public.s3.amazonaws.com/recipes/  
ThaiRecipes.pdf"  
)
```

Set up SQL storage for the agent's data

```
db = SqliteDb(db_file="data.db")
```

Initialize the Agent with various configurations including the knowledge base and storage

```
agent = Agent(  
    session_id="session_id", # use any unique identifier to identify the run  
    user_id="user", # user identifier to identify the user  
    model=model,  
    knowledge=knowledge,  
    db=db,  
)
```

Use the agent to generate and print a response to a query, formatted in Markdown

```
agent.print_response(  
    "What is the first step of making Gluai Buat Chi from the knowledge base?",  
    markdown=True,  
)
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Install libraries****

```
pip install -U agno lancedb ollama
```

****Step: Setup Ollama****

Install and start Ollama

Pull required models

```
ollama pull llama3.1:8b
ollama pull nomic-embed-text
```

****Step: Export your OpenAI API key****

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

****Step: Create a Python file****

Create a Python file and add the above code.

```
touch rag_with_lance_db_and_sqlite.py
```

****Step: Run Agent****

```
python rag_with_lance_db_and_sqlite.py
```

```
python rag_with_lance_db_and_sqlite.py
```

Traditional RAG with LanceDB

Source: https://docs.agno.com/examples/concepts/agent/rag/traditional_rag_lancedb

This example demonstrates how to implement traditional RAG using LanceDB vector database, where knowledge is added to context rather than searched dynamically by the agent.

```
## Code
```

```
.....
```

1. Run: `pip install openai lancedb tantivy pypdf sqlalchemy agno` to install the dependencies
2. Run: `python cookbook/rag/03_traditional_rag_lancedb.py` to run the agent

```
.....
```

```
from agno.agent import Agent
from agno.knowledge.embedder.openai import OpenAIEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.openai import OpenAIChat
from agno.vectordb.lancedb import LanceDb, SearchType
```

```
knowledge = Knowledge(
```

Use LanceDB as the vector database and store embeddings in the recipes table

```
    vector_db=LanceDb(
        table_name="recipes",
        uri="tmp/lancedb",
        search_type=SearchType.vector,
        embedder=OpenAIEmbedder(id="text-embedding-3-small"
    ),
),
)
```

```
knowledge.add_content(
    name="Recipes",
    url="https://agno-public.s3.amazonaws.com/recipes/
ThaiRecipes.pdf",
)
```

```
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    knowledge=knowledge,
```

Enable RAG by adding references from Knowledge to the user prompt.

```
    add_knowledge_to_context=True,
```

Set `search_knowledge=False` because Agents default to `search_knowledge=True`

```
    search_knowledge=False,
    markdown=True,
)
agent.print_response(
    "How do I make chicken and galangal in coconut milk soup", stream=True
)
```

Usage

> ****Snippet file:**** "create-venv-step.mdx"

****Step: Install libraries****

```
pip install -U agno openai lancedb tantivy pypdf sqlalchemy
```

****Step: Export your OpenAI API key****

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

****Step: Create a Python file****

Create a Python file and add the above code.

```
touch traditional_rag_lancedb.py
```

****Step: Run Agent****

```
python traditional_rag_lancedb.py
```

```
python traditional_rag_lancedb.py
```

Traditional RAG with PgVector

Source: https://docs.agno.com/examples/concepts/agent/rag/traditional_rag_pgvector

This example demonstrates traditional RAG implementation using PgVector database with OpenAI embeddings, where knowledge context is automatically added to prompts without search functionality.

Code

```

from agno.agent import Agent
from agno.knowledge.embedder.openai import OpenAIEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.openai import OpenAIChat
from agno.vectordb.pgvector import PgVector, SearchType

```

```
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
```

```
knowledge = Knowledge(
```

Use PgVector as the vector database and store embeddings in the ai.recipes table

```

    vector_db=PgVector(
        table_name="recipes",
        db_url=db_url,
        search_type=SearchType.hybrid,
        embedder=OpenAIEmbedder(id="text-embedding-3-small"
    ),
),
)

```

```

knowledge.add_content(
    url="https://agno-public.s3.amazonaws.com/recipes/
ThaiRecipes.pdf"
)

```

```

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    knowledge=knowledge,

```

Enable RAG by adding context from the knowledge to the user prompt.

```
add_knowledge_to_context=True,
```

Set search_knowledge=False because Agents default to search_knowledge=True

```

    search_knowledge=False,
    markdown=True,
)
agent.print_response(
    "How do I make chicken and galangal in coconut milk soup", stream=True
)

```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.md"
```

```
**Step: Install libraries**
```

```
pip install -U agno openai sqlalchemy psycopy pgvector
```

****Step: Setup PgVector****

Start PostgreSQL container with pgvector

```
./cookbook/run_pgvector.sh
```

****Step: Export your OpenAI API key****

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

****Step: Create a Python file****

Create a Python file and add the above code.

```
touch traditional_rag_pgvector.py
```

****Step: Run Agent****

```
python traditional_rag_pgvector.py
```

```
python traditional_rag_pgvector.py
```

Persistent Session Storage

Source: https://docs.agno.com/examples/concepts/agent/session/01_persistent_session

This example demonstrates how to create an agent with persistent session storage using PostgreSQL, enabling conversation history to be maintained across different runs.

Code

```
from agno.agent.agent import Agent
```

```

from agno.db.postgres import PostgresDb
from agno.models.openai import OpenAIChat

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

db = PostgresDb(db_url=db_url, session_table="sessions")

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    session_id="session_storage",
    add_history_to_context=True,
)

agent.print_response("Tell me a new interesting fact about space")

```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U agno openai psycopg2-binary
```

```
**Step: Setup PostgreSQL**
```

Make sure PostgreSQL is running

Update connection string in the code as needed

```
**Step: Export your OpenAI API key**
```

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

```
**Step: Create a Python file**
```

```
Create a Python file and add the above code.
```

```
touch 01_persistent_session.py
```

```
**Step: Run Agent**
```

```
python 01_persistent_session.py
```

```
python 01_persistent_session.py
```

```
**Step: Find All Cookbooks**
```

Session Summary Management

Source: https://docs.agno.com/examples/concepts/agent/session/03_session_summary

This example demonstrates how to enable automatic session summaries that help maintain conversation context across longer interactions by summarizing previous conversations.

Code

.....

This example shows how to use the session summary to store the conversation summary.

.....

```
from agno.agent.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.openai import OpenAIChat
from agno.session.summary import SessionSummaryManager # noqa: F401

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

db = PostgresDb(db_url=db_url, session_table="sessions")
```

Method 1: Set enable_session_summaries to True

```
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    enable_session_summaries=True,
    session_id="session_summary",
)

agent.print_response("Hi my name is John and I live in New York")
agent.print_response("I like to play basketball and hike in the mountains")
```

Method 2: Set session_summary_manager

```
session_summary_manager =
SessionSummaryManager(model=OpenAIChat(id="gpt-5
-m
ini"))

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    session_id="session_summary",
    session_summary_manager=session_summary_manag
er,
)
```

```
agent.print_response("Hi my name is John and I live in New York")
```

```
agent.print_response("I like to play basketball and hike in the mountains")
```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U agno openai psycpg2-binary
```

```
**Step: Setup PostgreSQL**
```

Make sure PostgreSQL is running

Update connection string in the code as needed

```
**Step: Export your OpenAI API key**
```

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

```
**Step: Create a Python file**
```

```
Create a Python file and add the above code.
```

```
touch 03_session_summary.py
```

```
**Step: Run Agent**
```

```
python 03_session_summary.py
```

```
python 03_session_summary.py
```

```
**Step: Find All Cookbooks**

Session Summary with References

Source: https://docs.agno.com/examples/concepts/agent/session/04_session_summary_references

This example demonstrates how to use session summaries with context references, enabling the agent to maintain conversation context and reference previous session summaries.

Code

"""

This example shows how to use the `add_session_summary_to_context` parameter in the Agent config to add session summaries to the Agent context.

Start the postgres db locally on Docker by running: `cookbook/scripts/run_pgvector.sh`

"""

```
from agno.agent.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.openai import OpenAIChat

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

db = PostgresDb(db_url=db_url, session_table="sessions")

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    session_id="session_summary",
    enable_session_summaries=True,
)
```

This will create a new session summary

```
agent.print_response(
    "My name is John Doe and I like to hike in the mountains on weekends.",
)
```

You can use existing session summaries from session storage without creating or updating any new ones.

```
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    session_id="session_summary",
    add_session_summary_to_context=True,
```

```
)  
  
agent.print_response("I also like to play basketball.")
```

Alternatively, you can create a new session summary without adding the session summary to context.

```
agent = Agent(  
model=OpenAIChat(id="gpt-5-mini"),  
db=db,  
session_id="session_summary",  
enable_session_summaries=True,  
add_session_summary_to_context=False,  
)  
  
agent.print_response("I also like to play basketball.")
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U agno openai psycpg
```

```
**Step: Setup PostgreSQL**
```

Start PostgreSQL container with pgvector

```
cookbook/scripts/run_pgvector.sh
```

```
**Step: Export your OpenAI API key**
```

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

```
**Step: Create a Python file**
```

```
Create a Python file and add the above code.
```

```
touch 04_session_summary_references.py
```

****Step: Run Agent****

```
python 04_session_summary_references.py
```

```
python 04_session_summary_references.py
```

```

Chat History Management

Source: https://docs.agno.com/examples/concepts/agent/session/05_chat_history

This example demonstrates how to manage and retrieve chat history in agent conversations, enabling access to previous conversation messages and context.

Code

```
from agno.agent.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.openai import OpenAIChat

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

db = PostgresDb(db_url=db_url, session_table="sessions")

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    session_id="chat_history",
    instructions="You are a helpful assistant that can answer questions about space and oceans.",
    add_history_to_context=True,
)

agent.print_response("Tell me a new interesting fact about space")
print(agent.get_chat_history())

agent.print_response("Tell me a new interesting fact about oceans")
```

```
print(agent.get_chat_history())
```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U agno openai psycpg
```

```
**Step: Setup PostgreSQL**
```

```
# Session Name Management
```

Source: https://docs.agno.com/examples/concepts/agent/session/06_rename_session

This example demonstrates how to set and manage session names, both manually and automatically, allowing for better organization and identification of conversation sessions.

Code

```
from agno.agent.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.openai import OpenAIChat

db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"

db = PostgresDb(db_url=db_url, session_table="sessions")

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    session_id="chat_history",
    instructions="You are a helpful assistant that can answer questions about space and oceans.",
    add_history_to_context=True,
)

agent.print_response("Tell me a new interesting fact about space")
agent.set_session_name(session_name="Interesting Space Facts")

session = agent.get_session(session_id=agent.session_id)
print(session.session_data.get("session_name"))

agent.set_session_name(autogenerate=True)

session = agent.get_session(session_id=agent.session_id)
print(session.session_data.get("session_name"))

## Usage

> **Snippet file:** "create-venv-step.mdx"

**Step: Install libraries**

    pip install -U agno openai psycpg

**Step: Setup PostgreSQL**
```

Make sure PostgreSQL is running

Update connection string in the code as needed

In-Memory Database Storage

Source: https://docs.agno.com/examples/concepts/agent/session/07_in_memory_db

This example demonstrates how to use an in-memory database for session storage, enabling conversation history and context management without requiring a persistent database setup.

Code

"""This example shows how to use an in-memory database.

With this you will be able to store sessions, user memories, etc. without setting up a database. Keep in mind that in production setups it is recommended to use a database.

"""

```
from agno.agent import Agent
```

```
from agno.db.in_memory import InMemoryDb
from agno.models.openai import OpenAIChat
from rich.pretty import pprint
```

Setup the in-memory database

```
db = InMemoryDb()
```

```
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
```

Use the in-memory database. All db features will be available.

```
    db=db,
```

Set `add_history_to_context=True` to add the previous chat history to the context sent to the Model.

```
    add_history_to_context=True,
```

Number of historical responses to add to the messages.

```
    num_history_runs=3,
    description="You are a helpful assistant that always responds in a polite, upbeat and
positive manner.",
)
```

-*- Create a run

```
agent.print_response("Share a 2 sentence horror story", stream=True)
```

-*- Print the messages in the memory

```
pprint(
    [
        m.model_dump(include={"role", "content"})
        for m in agent.get_messages_for_session()
    ]
)
```

-*- Ask a follow up question that continues the conversation

```
agent.print_response("What was my first message?", stream=True)
```

-*- Print the messages in the memory

```
pprint(
    [
        m.model_dump(include={"role", "content"})
        for m in agent.get_messages_for_session()
    ]
)
```

Usage

> **Snippet file:** "create-venv-step.mdx"

Step: Install libraries

```
pip install -U agno openai rich
```

Step: Export your OpenAI API key

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

Step: Create a Python file

Create a Python file and add the above code.

```
touch 07_in_memory_db.py
```

Step: Run Agent

```
python 07_in_memory_db.py
```

```
python 07_in_memory_db.py
```

Step: Find All Cookbooks

Explore all the available cookbooks in the Agno repository. Click the link below to view the code on GitHub:

```
<Link href="https://github.com/agno-agi/agno/tree/main/cookbook/agents/session" target="_blank">
  Agno Cookbooks on GitHub

```

Session Caching

Source: https://docs.agno.com/examples/concepts/agent/session/08_cache_session

This example demonstrates how to enable session caching in memory for faster access to session data, improving performance when working with persistent databases.

Code

"""Example of how to cache the session in memory for faster access."""

```
from agno.agent.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.openai import OpenAIChat
```

Setup the database

```
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
db = PostgresDb(db_url=db_url, session_table="xxx")
```

Setup the agent

```
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    session_id="session_storage",
    add_history_to_context=True,
```

Activate session caching. The session will be cached in memory for faster access.

```
    cache_session=True,
)
```

Running the Agent

```
agent.print_response("Tell me a new interesting fact about space")
```

You can get the cached session:

```
session = agent.get_session()
```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
    pip install -U agno openai psycopg
```

```
**Step: Setup PostgreSQL**
```

Make sure PostgreSQL is running

Update connection string in the code as needed

```
**Step: Export your OpenAI API key**
```

```
    export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

****Step: Create a Python file****

Create a Python file and add the above code.

```
touch 08_cache_session.py
```

****Step: Run Agent****

```
python 08_cache_session.py
```

```
python 08_cache_session.py
```

****Step: Find All Cookbooks****

```

Agentic Session State

Source: https://docs.agno.com/examples/concepts/agent/state/agentic_session_state

This example demonstrates how to enable agentic session state management, allowing the agent to automatically update and manage session state based on conversation context. The agent can modify the shopping list based on user interactions.

Code

```

from agno.agent import Agent
from agno.db.sqlite import SQLiteDatabase
from agno.models.openai import OpenAIChat

db = SQLiteDatabase(db_file="tmp/agents.db")
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    session_state={"shopping_list": []},
    add_session_state_to_context=True, # Required so the agent is aware of the session
    state
    enable_agentic_state=True,
)

agent.print_response("Add milk, eggs, and bread to the shopping list")

agent.print_response("I picked up the eggs, now what's on my list?")

print(f"Session state: {agent.get_session_state()}")

## Usage

> **Snippet file:** "create-venv-step.md"

Dynamic Session State

Source: https://docs.agno.com/examples/concepts/agent/state/dynamic_session_state

This example demonstrates how to use tool hooks to dynamically manage session state. It shows how to create a customer management system that updates session state through tool interactions rather than direct modification.

Code

```
import json
from typing import Any, Callable, Dict

from agno.agent import Agent
from agno.db.in_memory import InMemoryDb
from agno.models.openai import OpenAIChat
from agno.tools.toolkit import Toolkit
from agno.utils.log import log_info, log_warning
from agno.run import RunContext

class CustomerDBTools(Toolkit):
    def __init__(self, *args, **kwargs):
        super().__init__(*args, **kwargs)
        self.register(self.process_customer_request)
```

```

def process_customer_request(
    self,
    agent: Agent,
    customer_id: str,
    action: str = "retrieve",
    name: str = "John Doe",
):
    log_warning("Tool called, this shouldn't happen.")
    return "This should not be seen."

def customer_management_hook(
    run_context: RunContext,
    function_name: str,
    function_call: Callable,
    arguments: Dict[str, Any],
):
    if not run_context.session_state:
        run_context.session_state = {}

    action = arguments.get("action", "retrieve")
    cust_id = arguments.get("customer_id")
    name = arguments.get("name", None)

    if not cust_id:
        raise ValueError("customer_id is required.")

    if action == "create":
        run_context.session_state["customer_profiles"][cust_id] = {"name": name}
        log_info(f"Hook: UPDATED session_state for customer '{cust_id}'.")
        return f"Success! Customer {cust_id} has been created."

    if action == "retrieve":
        profile = run_context.session_state.get("customer_profiles", {}).get(cust_id)
        if profile:
            log_info(f"Hook: FOUND customer '{cust_id}' in session_state.")
            return f"Profile for {cust_id}: {json.dumps(profile)}"
        else:
            raise ValueError(f"Customer '{cust_id}' not found.")

    log_info(f"Session state: {run_context.session_state}")

def run_test():
    agent = Agent(
        model=OpenAIChat(id="gpt-5-mini"),
        tools=[CustomerDBTools()],
        tool_hooks=[customer_management_hook],
        session_state={"customer_profiles": {"123": {"name": "Jane Doe"}}},
        instructions="Your profiles: {customer_profiles}. Use `process_customer_request`. Use either create or retrieve as action for the tool.",
        resolve_in_context=True,
        db=InMemoryDb(),
    )

```

```

    prompt = "First, create customer 789 named 'Tom'. Then, retrieve Tom's profile. Step
by step."
    log_info(f" Prompting: '{prompt}')"
    agent.print_response(prompt, stream=False)

    log_info("\n--- TEST ANALYSIS ---")
    log_info(
        "Check logs for the second tool call. The system prompt will NOT contain customer
'789'."
    )

if name == "main":
    run_test()

# Last N Session Messages
Source: https://docs.agno.com/examples/concepts/agent/state/last_n_session_messages
```

This example demonstrates how to configure agents to search through previous sessions and limit the number of historical sessions included in context. This helps manage context length while maintaining relevant conversation history.

```
## Code
```

```
import os
```

```
from agno.agent import Agent
from agno.db.sqlite import SQLiteDatabase
from agno.models.openai import OpenAIChat
```

Remove the tmp db file before running the script

```
os.remove("tmp/data.db")
```

```
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    user_id="user_1",
    db=SqliteDatabase(db_file="tmp/data.db"),
    add_history_to_context=True,
    num_history_runs=3,
    search_session_history=True, # allow searching previous sessions
    num_history_sessions=2, # only include the last 2 sessions in the search to avoid
    context length issues
)
```

```
session_1_id = "session_1_id"
session_2_id = "session_2_id"
session_3_id = "session_3_id"
session_4_id = "session_4_id"
session_5_id = "session_5_id"
```

```
agent.print_response("What is the capital of South Africa?", session_id=session_1_id)
agent.print_response("What is the capital of China?", session_id=session_2_id)
agent.print_response("What is the capital of France?", session_id=session_3_id)
agent.print_response("What is the capital of Japan?", session_id=session_4_id)
agent.print_response(
    "What did I discuss in my previous conversations?", session_id=session_5_id
) # It should only include the last 2 sessions
```

```
## Usage

# Advanced Session State Management
```

```
Source: https://docs.agno.com/examples/concepts/agent/state/session_state_advanced
```

This example demonstrates advanced session state management with multiple tools for managing a shopping list, including add, remove, and list operations.

```
## Code
```

```
from textwrap import dedent
```

```
from agno.agent import Agent
```

```

from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.run import RunContext

```

Define tools to manage our shopping list

```

def add_item(run_context: RunContext, item: str) -> str:
    """Add an item to the shopping list and return confirmation."""
    if not run_context.session_state:
        run_context.session_state = {}

```

Add the item if it's not already in the list

```

        if item.lower() not in [i.lower() for i in
run_context.session_state["shopping_list"]]:
            run_context.session_state["shopping_list"].append(
item) # type: ignore
            return f"Added '{item}' to the shopping list"
        else:
            return f"'{item}' is already in the shopping list"

```

```

def remove_item(run_context: RunContext, item: str) -> str:
    """Remove an item from the shopping list by name."""
    if not run_context.session_state:
        run_context.session_state = {}

```

Case-insensitive search

```

    for i, list_item in enumerate(run_context.session_state["shopping_list
"]):
        if list_item.lower() == item.lower():
            run_context.session_state["shopping_list"].pop(i)
            return f"Removed '{list_item}' from the shopping list"

    return f"'{item}' was not found in the shopping list"

```

```

def list_items(run_context: RunContext) -> str:
    """List all items in the shopping list."""
    if not run_context.session_state:
        run_context.session_state = {}

    shopping_list = run_context.session_state["shopping_list"]

    if not shopping_list:
        return "The shopping list is empty."

    items_text = "\n".join([f"- {item}" for item in shopping_list])
    return f"Current shopping list:\n{items_text}"

```

Create a Shopping List Manager Agent that maintains state

```

agent = Agent(

```

```
model=OpenAIChat(id="gpt-5-mini"),
```

Initialize the session state with an empty shopping list (default session state for all sessions)

```
session_state={"shopping_list": []},
db=SqliteDb(db_file="tmp/example.db"),
tools=[add_item, remove_item, list_items],
```

You can use variables from the session state in the instructions

```
instructions=dedent("""\
    Your job is to manage a shopping list.
```

The shopping list starts empty. You can add items, remove items by name, and list all items.

```
        Current shopping list: {shopping_list}
    """),
    markdown=True,
)
```

Example usage

```
agent.print_response("Add milk, eggs, and bread to the shopping list", stream=True)
print(f"Session state: {agent.get_session_state()}")
```

```
agent.print_response("I got bread", stream=True)
print(f"Session state: {agent.get_session_state()}")
```

```
agent.print_response("I need apples and oranges", stream=True)
print(f"Session state: {agent.get_session_state()}")
```

```
agent.print_response("whats on my list?", stream=True)
print(f"Session state: {agent.get_session_state()}")
```

```
agent.print_response(
    "Clear everything from my list and start over with just bananas and yogurt",
    stream=True,
)
print(f"Session state: {agent.get_session_state()}")
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
    pip install -U agno openai
```

```
**Step: Export your OpenAI API key**
```

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

****Step: Create a Python file****

Create a Python file and add the above code.

```
touch session_state_advanced.py
```

Basic Session State Management

Source: https://docs.agno.com/examples/concepts/agent/state/session_state_basic

This example demonstrates how to create an agent with basic session state management, maintaining a shopping list across interactions using SQLite storage.

Code

```
from agno.agent import Agent
```

```
from agno.db.sqlite import SqliteDb
```

```
from agno.models.openai import OpenAIChat
```

```
def add_item(session_state, item: str) -> str:
```

```
    """Add an item to the shopping list."""
```

```
    session_state["shopping_list"].append(item) # type: ignore
```

```
    return f"The shopping list is now {session_state['shopping_list']}" # type: ignore
```

Create an Agent that maintains state

```
agent = Agent(  
    model=OpenAIChat(id="gpt-5-mini"),
```

Initialize the session state with a counter starting at 0 (this is the default session state for all users)

```
    session_state={"shopping_list": []},  
    db=SqliteDb(db_file="tmp/agents.db"),  
    tools=[add_item],
```

You can use variables from the session state in the instructions

```
    instructions="Current state (shopping list) is: {shopping_list}",  
    markdown=True,  
)
```

Example usage

```
agent.print_response("Add milk, eggs, and bread to the shopping list", stream=True)  
print(f"Final session state: {agent.get_session_state()}")
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Install libraries****

```
pip install -U agno openai
```

****Step: Export your OpenAI API key****

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

****Step: Create a Python file****

Create a Python file and add the above code.

```
touch session_state_basic.py
```

****Step: Run Agent****

```
python session_state_basic.py
```

```
python session_state_basic.py
```

Session State In Context

Source: https://docs.agno.com/examples/concepts/agent/state/session_state_in_context

This example demonstrates how to use session state with PostgreSQL database and manage user context across different sessions. It shows how session state persists and can be retrieved for different users and sessions.

Code

```
from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.openai import OpenAIChat

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

db = PostgresDb(db_url=db_url, session_table="sessions")

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    instructions="Users name is {user_name} and age is {age}",
    db=db,
)
```

Sets the session state for the session with the id "user_1_session_1"

```
agent.print_response(
    "What is my name?",
    session_id="user_1_session_1",
    user_id="user_1",
    session_state={"user_name": "John", "age": 30},
)
```

Will load the session state from the session with the id "user_1_session_1"

```
agent.print_response("How old am I?", session_id="user_1_session_1", user_id="user_1")
```

Sets the session state for the session with the id

"user_2_session_1"

```
agent.print_response(  
    "What is my name?",  
    session_id="user_2_session_1",  
    user_id="user_2",  
    session_state={"user_name": "Jane", "age": 25},  
)
```

Will load the session state from the session with the id "user_2_session_1"

```
agent.print_response("How old am I?", session_id="user_2_session_1", user_id="user_2")
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Install libraries****

```
pip install -U agno openai psycpg
```

****Step: Setup PostgreSQL****

Make sure PostgreSQL is running

Update connection string in the code as needed

****Step: Export your OpenAI API key****

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

****Step: Create a Python file****

Create a Python file and add the above code.

```
touch session_state_in_context.py
```

****Step: Run Agent****

```
python session_state_in_context.py
```

```
python session_state_in_context.py
```

****Step: Find All Cookbooks****

Session State In Instructions

Source: https://docs.agno.com/examples/concepts/agent/state/session_state_in_instructions

This example demonstrates how to use session state variables directly in agent instructions. It shows how to initialize session state and reference those variables in the instruction templates.

Code

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
```

```
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
```

Initialize the session state with a variable

```
    session_state={"user_name": "John"},
```

You can use variables from the session state in the instructions

```
    instructions="Users name is {user_name}",
    markdown=True,
)
```

```
agent.print_response("What is my name?", stream=True)
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Install libraries****

```
pip install -U agno openai
```

****Step: Export your OpenAI API key****

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

****Step: Create a Python file****

Create a Python file and add the above code.

```
touch session_state_in_instructions.py
```

****Step: Run Agent****

```
python session_state_in_instructions.py
```

```
python session_state_in_instructions.py
```

```
# Session State for Multiple Users
Source: https://docs.agno.com/examples/concepts/agent/state/session_state_multiple_users
```

This example demonstrates how to maintain separate session state for multiple users in a multi-user environment, with each user having their own shopping lists and sessions.

Code

```
"""
```

This example demonstrates how to maintain state for each user in a multi-user environment.

The shopping list is stored in a dictionary, organized by user ID and session ID.

Agno automatically creates the "current_user_id" and "current_session_id" variables in the session state.

You can access these variables in your functions using the agent.get_session_state() dictionary.

```
"""
```

```
import json
```

```
from agno.agent import Agent
```

```

from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.run.base import run_context

```

In-memory database to store user shopping lists

Organized by user ID and session ID

```
shopping_list = {}
```

```

    session_id="user_1_session_1",

```

```
)
agent.print_response(
    "Add minced beef to the shopping list",
    stream=True,
    user_id=user_id_2,
    session_id="user_2_session_1",
)
```

What is on Mark Smith's shopping list?

```
agent.print_response(
    "What is on Mark Smith's shopping list?",
    stream=True,
    user_id=user_id_2,
    session_id="user_2_session_1",
)
```

New session, so new shopping list

```
agent.print_response(
    "Add chicken and soup to my list.",
    stream=True,
    user_id=user_id_2,
    session_id="user_3_session_2",
)
```

```
print(f"Final shopping lists: \n{json.dumps(shopping_list, indent=2)}")
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U agno openai
```

```
**Step: Export your OpenAI API key**
```

```
export OPENAI_API_KEY="your_openai_api_key_here"
```

```
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

```
**Step: Create a Python file**
```

```
Create a Python file and add the above code.
```

```
touch session_state_multiple_users.py
```

****Step: Run Agent****

```
python session_state_multiple_users.py
```

```
python session_state_multiple_users.py
```

****Step: Find All Cookbooks****

Explore all the available cookbooks in the Agno repository. Click the link below to view the code on GitHub:

```

```

DynamoDB for Agent

Source: https://docs.agno.com/examples/concepts/db/dynamodb/dynamodb_for_agent

Agno supports using DynamoDB as a storage backend for Agents using the `DynamoDb` class.

Usage

You need to provide `aws\_access\_key\_id` and `aws\_secret\_access\_key` parameters to the `DynamoDb` class.

```
from agno.db.dynamo import DynamoDb
```

AWS Credentials

```
AWS_ACCESS_KEY_ID = getenv("AWS_ACCESS_KEY_ID")
```

```
AWS_SECRET_ACCESS_KEY = getenv("AWS_SECRET_ACCESS_KEY")
```

```
db = DynamoDb(
    region_name="us-east-1",
```

aws_access_key_id: AWS access key id

```
    aws_access_key_id=AWS_ACCESS_KEY_ID,
```

aws_secret_access_key: AWS secret access key

```
    aws_secret_access_key=AWS_SECRET_ACCESS_KEY,
```

```
)
```

Add storage to the Agent

```
agent = Agent(db=db)
```

Params

```
> **Snippet file:** "db-dynamodb-params.mdx"
```

```

DynamoDB Workflow Storage

Source: https://docs.agno.com/examples/concepts/db/dynamodb/dynamodb_for_workflow

Agno supports using DynamoDB as a storage backend for Workflows using the ``DynamoDb`` class.

Usage

You need to provide ``aws_access_key_id`` and ``aws_secret_access_key`` parameters to the ``DynamoDb`` class.

```

from agno.agent import Agent
from agno.db.dynamodb import DynamoDb
from agno.models.openai import OpenAIChat
from agno.team import Team
from agno.tools.duckduckgo import DuckDuckGoTools

```

```
from agno.tools.hackernews import HackerNewsTools
from agno.workflow.step import Step
from agno.workflow.workflow import Workflow

db = DynamoDb()
```

Define agents

```
hackernews_agent = Agent(
    name="Hackernews Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[HackerNewsTools()],
    role="Extract key insights and content from Hackernews posts",
)

web_agent = Agent(
    name="Web Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[DuckDuckGoTools()],
    role="Search the web for the latest news and trends",
)
```

Define research team for complex analysis

```
research_team = Team(
    name="Research Team",
    members=[hackernews_agent, web_agent],
    instructions="Research tech topics from Hackernews and the web",
)

content_planner = Agent(
    name="Content Planner",
    model=OpenAIChat(id="gpt-5-mini"),
    instructions=[
        "Plan a content schedule over 4 weeks for the provided topic and research content",
        "Ensure that I have posts for 3 posts per week",
    ],
)
```

Define steps

```
research_step = Step(
    name="Research Step",
    team=research_team,
)

content_planning_step = Step(
    name="Content Planning Step",
    agent=content_planner,
)
```

Create and use workflow

```
if name == "main":
    content_creation_workflow = Workflow(
        name="Content Creation Workflow",
        description="Automated content creation from blog posts to social media",
        db=db,
        steps=[research_step, content_planning_step],
    )
    content_creation_workflow.print_response(
        input="AI trends in 2024",
        markdown=True,
    )
```

Params

> **Snippet file:** "db-dynamodb-params.mdx"

Firestore for Agent

Source: https://docs.agno.com/examples/concepts/db/firestore/firestore_for_agent

Agno supports using Firestore as a storage backend for Agents using the `FirestoreDb` class.

Usage

You need to provide a `project_id` parameter to the `FirestoreDb` class. Firestore will connect automatically using your Google Cloud credentials.

```
from agno.agent import Agent
from agno.db.firestore import FirestoreDb
from agno.tools.duckduckgo import DuckDuckGoTools
```

```
PROJECT_ID = "agno-os-test" # Use your project ID here
```

Setup the Firestore database

```
db = FirestoreDb(project_id=PROJECT_ID)
```

```
agent = Agent(
    db=db,
    tools=[DuckDuckGoTools()],
    add_history_to_context=True,
)
```

```
agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")
```

Prerequisites

1. Ensure your gcloud project is enabled with Firestore. Reference [Firestore documentation](https://cloud.google.com/firestore/docs/create-database-server-client-library)
2. Install dependencies: ``pip install openai google-cloud-firestore agno``
3. Make sure your gcloud project is set up and you have the necessary permissions to access Firestore

Params

> `**Snippet file:** "db-firestore-params.mdx"`

Google Cloud Storage for Agent

Source: https://docs.agno.com/examples/concepts/db/gcs/gcs_for_agent

Agno supports using Google Cloud Storage (GCS) as a storage backend for Agents using the `GcsJsonDb` class. This storage backend stores session data as JSON blobs in a GCS bucket.

Usage

Configure your agent with GCS storage to enable cloud-based session persistence.

```

import uuid
import google.auth
from agno.agent import Agent
from agno.db.base import SessionType
from agno.db.gcs_json import GcsJsonDb
from agno.tools.duckduckgo import DuckDuckGoTools

```

Obtain the default credentials and project id from your gcloud CLI session.

```
credentials, project_id = google.auth.default()
```

Generate a unique bucket name using a base name and a UUID4 suffix.

```
base_bucket_name = "example-gcs-bucket"
unique_bucket_name = f"{base_bucket_name}-{uuid.uuid4().hex[:12]}"
print(f"Using bucket: {unique_bucket_name}")
```

Initialize GCSJsonDb with explicit credentials, unique bucket name, and project.

```
db = GcsJsonDb(
    bucket_name=unique_bucket_name,
    prefix="agent/",
    project=project_id,
    credentials=credentials,
)
```

Initialize the Agno agent with the new storage backend and a DuckDuckGo search tool.

```
agent1 = Agent(
    db=db,
    tools=[DuckDuckGoTools()],
    add_history_to_context=True,
    debug_mode=False,
)
```

Execute sample queries.

```
agent1.print_response("How many people live in Canada?")
agent1.print_response("What is their national anthem called?")
```

Create a new agent and make sure it pursues the conversation

```
agent2 = Agent(
    db=db,
    session_id=agent1.session_id,
    tools=[DuckDuckGoTools()],
    add_history_to_context=True,
    debug_mode=False,
)
```

```
agent2.print_response("What's the name of the country we discussed?")
agent2.print_response("What is that country's national sport?")
```

Selecting Custom Table Names

Source: https://docs.agno.com/examples/concepts/db/miscellaneous/selecting_tables

Agno allows you to customize table names when using databases, providing flexibility in organizing your data storage.

Usage

Specify custom table names when initializing your database connection.

```
from agno.agent import Agent
from agno.db.sqlite import SQLiteDatabase
```

Setup the SQLite database with custom table names

```
db = SQLiteDatabase(
    db_file="tmp/data.db",
```

Selecting which tables to use

```
    session_table="agent_sessions",
    memory_table="agent_memories",
    metrics_table="agent_metrics",
)
```

Setup a basic agent with the SQLite database

```
agent = Agent(
    db=db,
    enable_user_memories=True,
    add_history_to_context=True,
    add_datetime_to_context=True,
)
```

The Agent sessions and runs will now be stored in SQLite with custom table names

```
agent.print_response("How many people live in Canada?")
agent.print_response("And in Mexico?")
agent.print_response("List my messages one by one")
```

Async MongoDB for Agent

Source: https://docs.agno.com/examples/concepts/db/mongodb/async_mongodb_for_agent

Agno supports using MongoDB asynchronously as a storage backend for Agents, with the `AsyncMongoDb` class.

Usage

You need to provide either `db\_url` or `client`. The following example uses `db\_url`.

Run MongoDB

Install [docker desktop](https://docs.docker.com/desktop/install/mac-install/) and run **MongoDB** on port **27017** using:

```
docker run -d \
  --name local-mongo \
  -p 27017:27017 \
  -e MONGO_INITDB_ROOT_USERNAME=mongoadmin \
  -e MONGO_INITDB_ROOT_PASSWORD=secret \
  mongo
```

.....

Run pip install agno openai motor pymongo to install dependencies.

.....

```
from agno.agent import Agent
from agno.db.mongo import AsyncMongoDb
from agno.tools.duckduckgo import DuckDuckGoTools
```

MongoDB connection settings

```
db_url = "mongodb://localhost:27017"
```

```
db = AsyncMongoDb(db_url=db_url)
```

```
agent = Agent(
    db=db,
    tools=[DuckDuckGoTools()],
    add_history_to_context=True,
)
agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")
```

Params

```
> **Snippet file:** "db-async-mongo-params.mdx"
```

# MySQL Workflow Storage
```

```
Source: https://docs.agno.com/examples/concepts/db/mysql/mysql_for_workflow
```

Agno supports using MySQL as a storage backend for Workflows using the `MySQLDb` class.

```
## Usage
```

```
### Run MySQL
```

```
Install [docker desktop](https://docs.docker.com/desktop/install/mac-install/) and run **MySQL** on port **3306** using:
```

```

docker run -d \
  --name mysql \
  -e MYSQL_ROOT_PASSWORD=ai \
  -e MYSQL_DATABASE=ai \
  -e MYSQL_USER=ai \
  -e MYSQL_PASSWORD=ai \
  -p 3306:3306 \
  -d mysql:8

```

```

from agno.agent import Agent
from agno.db.mysql import MySQLDb
from agno.models.openai import OpenAIChat
from agno.team import Team

```

```
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.hackernews import HackerNewsTools
from agno.workflow.step import Step
from agno.workflow.workflow import Workflow
```

```
db_url = "mysql+pymysql://ai:ai@localhost:3306/ai"
```

```
db = MySQLDb(db_url=db_url)
```

Define agents

```
hackernews_agent = Agent(
    name="Hackernews Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[HackerNewsTools()],
    role="Extract key insights and content from Hackernews posts",
)
web_agent = Agent(
    name="Web Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[DuckDuckGoTools()],
    role="Search the web for the latest news and trends",
)
```

Define research team for complex analysis

```
research_team = Team(
    name="Research Team",
    members=[hackernews_agent, web_agent],
    instructions="Research tech topics from Hackernews and the web",
)

content_planner = Agent(
    name="Content Planner",
    model=OpenAIChat(id="gpt-5-mini"),
    instructions=[
        "Plan a content schedule over 4 weeks for the provided topic and research content",
        "Ensure that I have posts for 3 posts per week",
    ],
)
```

Define steps

```
research_step = Step(
    name="Research Step",
    team=research_team,
)

content_planning_step = Step(
```

```

        name="Content Planning Step",
        agent=content_planner,
    )

```

Create and use workflow

```

if name == "main":
    content_creation_workflow = Workflow(
        name="Content Creation Workflow",
        description="Automated content creation from blog posts to social media",
        db=db,
        steps=[research_step, content_planning_step],
    )
    content_creation_workflow.print_response(
        input="AI trends in 2024",
        markdown=True,
    )

```

Async Postgres for Agent

Source: https://docs.agno.com/examples/concepts/db/postgres/async_postgres_for_agent

Agno supports using [PostgreSQL](<https://www.postgresql.org/>) asynchronously, with the `AsyncPostgresDb` class.

Usage

Run PgVector

Install [docker desktop](<https://docs.docker.com/desktop/install/mac-install/>) and run **PgVector** on port **5532** using:

```

docker run -d \
-e POSTGRES_DB=ai \
-e POSTGRES_USER=ai \
-e POSTGRES_PASSWORD=ai \
-e PGDATA=/var/lib/postgresql/data/pgdata \
-v pgvolume:/var/lib/postgresql/data \
-p 5532:5432 \
--name pgvector \
agnohq/pgvector:16

```

```
import asyncio
```

```
from agno.agent import Agent
```

```
from agno.db.postgres import AsyncPostgresDb
from agno.tools.duckduckgo import DuckDuckGoTools
```

```
db_url = "postgresql+psycopg_async://ai:ai@localhost:5532/ai"
```

```
db = AsyncPostgresDb(db_url=db_url)
```

```
agent = Agent(
    db=db,
    tools=[DuckDuckGoTools()],
    add_history_to_context=True,
    add_datetime_to_context=True,
)
```

```
asyncio.run(agent.aprint_response("How many people live in Canada?"))
```

```
asyncio.run(agent.aprint_response("What is their national anthem called?"))
```

```

Redis for Agent

Source: https://docs.agno.com/examples/concepts/db/redis/redis_for_agent

Agno supports using Redis as a storage backend for Agents using the `RedisDb` class.

Usage

Run Redis

Install [docker desktop](<https://docs.docker.com/desktop/install/mac-install/>) and run **Redis** on port **6379** using:

```
docker run -d \
  --name my-redis \
  -p 6379:6379 \
  redis
```

```
from agno.agent import Agent
```

```
from agno.db.base import SessionType
from agno.db.redis import RedisDb
from agno.tools.duckduckgo import DuckDuckGoTools
```

Initialize Redis db (use the right db_url for your setup)

```
db = RedisDb(db_url="redis://localhost:6379")
```

Create agent with Redis db

```
agent = Agent(
    db=db,
    tools=[DuckDuckGoTools()],
    add_history_to_context=True,
)
```

```
agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")
```

Verify db contents

```
print("\nVerifying db contents...")
all_sessions = db.get_sessions(session_type=SessionType.AGENT)
print(f"Total sessions in Redis: {len(all_sessions)}")
```

```
if all_sessions:
    print("\nSession details:")
    session = all_sessions[0]
    print(f"The stored session: {session}")
```

Params

```
> **Snippet file:** "db-redis-params.mdx"
```

# Redis for Workflows
```

```
Source: https://docs.agno.com/examples/concepts/db/redis/redis_for_workflow
```

Agno supports using Redis as a storage backend for Workflows using the `RedisDb` class.

```
## Usage
```

```
### Run Redis
```

```
Install [docker desktop](https://docs.docker.com/desktop/install/mac-install/) and run Redis on port 6379 using:
```

```
docker run --name my-redis -p 6379:6379 -d redis
```

```
"""
```

```
Run: pip install openai httpx newspaper4k redis agno to install the dependencies
```

```
"""
```

```

from agno.agent import Agent
from agno.db.redis import RedisDb
from agno.models.openai import OpenAIChat
from agno.team import Team
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.hackernews import HackerNewsTools
from agno.workflow.step import Step
from agno.workflow.workflow import Workflow

```

Define agents

```
hackernews_agent = Agent(
```

```

        name="Hackernews Agent",
        model=OpenAIChat(id="gpt-5-mini"),
        tools=[HackerNewsTools()],
        role="Extract key insights and content from Hackernews posts",
    )
web_agent = Agent(
    name="Web Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[DuckDuckGoTools()],
    role="Search the web for the latest news and trends",
)

```

Define research team for complex analysis

```

research_team = Team(
    name="Research Team",
    members=[hackernews_agent, web_agent],
    instructions="Research tech topics from Hackernews and the web",
)

content_planner = Agent(
    name="Content Planner",
    model=OpenAIChat(id="gpt-5-mini"),
    instructions=[
        "Plan a content schedule over 4 weeks for the provided topic and research content",
        "Ensure that I have posts for 3 posts per week",
    ],
)

```

Define steps

```

research_step = Step(
    name="Research Step",
    team=research_team,
)

content_planning_step = Step(
    name="Content Planning Step",
    agent=content_planner,
)

```

Create and use workflow

```

if name == "main":
    content_creation_workflow = Workflow(
        name="Content Creation Workflow",
        description="Automated content creation from blog posts to social media",
        db=RedisDb(
            session_table="workflow_session",
            db_url="redis://localhost:6379",
        )
    )

```

```

    ),
    steps=[research_step, content_planning_step],
)
content_creation_workflow.print_response(
    input="AI trends in 2024",
    markdown=True,
)

```

Params

Singlestore for Agent
Source: https://docs.agno.com/examples/concepts/db/singlestore/singlestore_for_agent

Agno supports using Singlestore as a storage backend for Agents using the `SingleStoreDb` class.

Usage

Obtain the credentials for Singlestore from [here](https://portal.singlestore.com/)

```
from os import getenv
```

```
from agno.agent import Agent
from agno.db.singlestore.singlestore import SingleStoreDb
from agno.tools.duckduckgo import DuckDuckGoTools
```

Configure SingleStore DB connection

```

USERNAME = getenv("SINGLESTORE_USERNAME")
PASSWORD = getenv("SINGLESTORE_PASSWORD")
HOST = getenv("SINGLESTORE_HOST")
PORT = getenv("SINGLESTORE_PORT")
DATABASE = getenv("SINGLESTORE_DATABASE")

db_url = (
    f"mysql+pymysql://{USERNAME}:{PASSWORD}@{HOST}:{PORT}/{DATABASE}?charset=utf8mb4"
)

```

```
db = SingleStoreDb(db_url=db_url)
```

Create an agent with SingleStore db

```
agent = Agent(
    db=db,
    tools=[DuckDuckGoTools()],
    add_history_to_context=True,
)
agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")

Async Sqlite for Agent

Source: https://docs.agno.com/examples/concepts/db/sqlite/async_sqlite_for_agent

Agno supports using Sqlite asynchronously as a storage backend for Agents, with the `AsyncSqliteDb` class.

Usage

````

Run pip install openai ddgs sqlalchemyaiosqlite to install dependencies.

````

```
import asyncio
```

```
from agno.agent import Agent
```

```
from agno.db.sqlite import AsyncSqliteDb
```

```
from agno.tools.duckduckgo import DuckDuckGoTools
```

Initialize AsyncSqliteDb

```
db = AsyncSqliteDb(db_file="agent_storage.db")
```

```
agent = Agent(
    db=db,
    tools=[DuckDuckGoTools()],
    add_history_to_context=True,
    add_datetime_to_context=True,
)
```

```
asyncio.run(agent.aprint_response("How many people live in Canada?"))
```

```
asyncio.run(agent.aprint_response("What is their national anthem called?"))
```

Sqlite for Agent

Source: https://docs.agno.com/examples/concepts/db/sqlite/sqlite_for_agent

Agno supports using Sqlite as a storage backend for Agents using the `SqliteDb` class.

Usage

You need to provide either `db\_url`, `db\_file` or `db\_engine`. The following example uses `db\_file`.

```

from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.tools.duckduckgo import DuckDuckGoTools

```

Setup the SQLite database

```
db = SqliteDb(db_file="tmp/data.db")
```

Setup a basic agent with the SQLite database

```

agent = Agent(
    db=db,
    tools=[DuckDuckGoTools()],
    add_history_to_context=True,
    add_datetime_to_context=True,
)

```

The Agent sessions and runs will now be stored in SQLite

```
agent.print_response("How many people live in Canada?")
```

```
agent.print_response("What is their national anthem?")
```

```
agent.print_response("List my messages one by one")
```

```
## Params

Async Accuracy Evaluation

Source: https://docs.agno.com/examples/concepts/evals/accuracy/accuracy_async

Learn how to run accuracy evaluations asynchronously for better performance.

This example shows how to run an Accuracy evaluation asynchronously.

Code

"""This example shows how to run an Accuracy evaluation asynchronously."""

```
import asyncio
```

```
from typing import Optional
```

```
from agno.agent import Agent
```

```
from agno.eval.accuracy import AccuracyEval, AccuracyResult
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.tools.calculator import CalculatorTools
```

```
evaluation = AccuracyEval(
```

```
    model=OpenAIChat(id="o4-mini"),
```

```
    agent=Agent(
```

```

        model=OpenAIChat(id="gpt-5-mini"),
        tools=[CalculatorTools()],
    ),
    input="What is 10*5 then to the power of 2? do it step by step",
    expected_output="2500",
    additional_guidelines="Agent output should include the steps and the final answer.",
    num_iterations=3,
)

```

Run the evaluation calling the arun method.

```

result: Optional[AccuracyResult] = asyncio.run(evaluation.arun(print_results=True))
assert result is not None and result.avg_score >= 8

```

Comparison Accuracy Evaluation

Source: https://docs.agno.com/examples/concepts/evals/accuracy/accuracy_comparison

Learn how to evaluate agent accuracy on comparison tasks.

This example shows how to evaluate an agent's ability to correctly compare numbers using calculator tools.

Code

```

from typing import Optional

```

```

from agno.agent import Agent

```

```

from agno.eval.accuracy import AccuracyEval, AccuracyResult

```

```

from agno.models.openai import OpenAIChat

```

```

from agno.tools.calculator import CalculatorTools

```

```

evaluation = AccuracyEval(
    name="Comparison Evaluation",
    model=OpenAIChat(id="o4-mini"),
    agent=Agent(
        model=OpenAIChat(id="gpt-5-mini"),
        tools=[CalculatorTools()],
        instructions="You must use the calculator tools for comparisons.",
    ),
    input="9.11 and 9.9 -- which is bigger?",

assert result is not None and result.avg_score >= 8

```

Accuracy with Database Logging

Source: https://docs.agno.com/examples/concepts/evals/accuracy/accuracy_db_logging

Learn how to store evaluation results in the database for tracking and analysis.

This example shows how to store evaluation results in the database.

Code

"""Example showing how to store evaluation results in the database."""

```
from typing import Optional
```

```
from agno.agent import Agent
```

```
from agno.db.postgres.postgres import PostgresDb
```

```
from agno.eval.accuracy import AccuracyEval, AccuracyResult
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.tools.calculator import CalculatorTools
```

Setup the database

```
db_url = "postgresql+psycopg://ai:ai@localhost:5432/ai"
```

```
db = PostgresDb(db_url=db_url, eval_table="eval_runs_cookbook")
```

```
evaluation = AccuracyEval(
```

```
    db=db, # Pass the database to the evaluation. Results will be stored in the database.
```

```
    name="Calculator Evaluation",
```

```
    model=OpenAIChat(id="o4-mini"),
```

```
    agent=Agent(
```

```
        model=OpenAIChat(id="gpt-5-mini"),
```

```
        tools=[CalculatorTools()],
```

```
    ),
```

```
    input="What is 10*5 then to the power of 2? do it step by step",
```

```
    expected_output="2500",
```

```
    additional_guidelines="Agent output should include the steps and the final answer.",
```

```
    num_iterations=1,
```

```
)
```

```
result: Optional[AccuracyResult] = evaluation.run(print_results=True)
```

```
assert result is not None and result.avg_score >= 8
```

Accuracy with Given Answer

Source: https://docs.agno.com/examples/concepts/evals/accuracy/accuracy_with_given_answer

Learn how to evaluate the accuracy of an Agno Agent's response with a given answer.

For this example an agent won't be executed, but the given result will be evaluated against the expected output for correctness.

```
## Code
```

```
from typing import Optional
```

```
from agno.eval.accuracy import AccuracyEval, AccuracyResult
```

```
from agno.models.openai import OpenAIChat
```

```
evaluation = AccuracyEval(
```

```
    name="Given Answer Evaluation",
```

```
    model=OpenAIChat(id="o4-mini"),
```

```
    input="What is 10*5 then to the power of 2? do it step by step",
```

```
    expected_output="2500",
```

```
)
```

```
result_with_given_answer: Optional[AccuracyResult] = evaluation.run_with_output(
```

```
    output="2500", print_results=True
```

```
)
```

```
assert result_with_given_answer is not None and result_with_given_answer.avg_score >= 8
```

```
# Accuracy with Teams
```

```
Source: https://docs.agno.com/examples/concepts/evals/accuracy/accuracy\_with\_teams
```

Learn how to evaluate the accuracy of an Agno Team.

```
## Code
```

```
from typing import Optional
```

```
from agno.agent import Agent
```

```
from agno.eval.accuracy import AccuracyEval, AccuracyResult
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.team import Team
```

Setup a team with two members

```
english_agent = Agent(
```

```
    name="English Agent",
```

```
    role="You only answer in English",
```

```
    model=OpenAIChat(id="gpt-5-mini"),
```

```
)
```

```
spanish_agent = Agent(
```

```
    name="Spanish Agent",
```

```
    role="You can only answer in Spanish",
```

```
    model=OpenAIChat(id="gpt-5-mini"),
```

```
)
```

```
multi_language_team = Team(
```

```
    name="Multi Language Team",
```

```
    model=OpenAIChat(id="gpt-5-mini"),
```

```

members=[english_agent, spanish_agent],
respond_directly=True,
markdown=True,
instructions=[
    "You are a language router that directs questions to the appropriate language agent.",
    "If the user asks in a language whose agent is not a team member, respond in English with:",
    "'I can only answer in the following languages: English and Spanish.",
    "Always check the language of the user's input before routing to an agent.",
],
)

```

Evaluate the accuracy of the Team's responses

```

evaluation = AccuracyEval(
    name="Multi Language Team",
    model=OpenAIChat(id="o4-mini"),
    team=multi_language_team,
    input="Comment allez-vous?",
    expected_output="I can only answer in the following languages: English and Spanish.",
    num_iterations=1,
)

```

```

result: Optional[AccuracyResult] = evaluation.run(print_results=True)
assert result is not None and result.avg_score >= 8

```

Accuracy with Tools
Source: https://docs.agno.com/examples/concepts/evals/accuracy/accuracy_with_tools

Learn how to evaluate the accuracy of an Agent that is using tools.

This example shows an evaluation that runs the provided agent with the provided input and then evaluates the answer that the agent gives.

Code

```

from typing import Optional

from agno.agent import Agent
from agno.eval.accuracy import AccuracyEval, AccuracyResult
from agno.models.openai import OpenAIChat
from agno.tools.calculator import CalculatorTools

evaluation = AccuracyEval(
    name="Tools Evaluation",
    model=OpenAIChat(id="o4-mini"),
    agent=Agent(
        model=OpenAIChat(id="gpt-5-mini"),

```

```

        tools=[CalculatorTools()],
    ),
    input="What is 10!?",
    expected_output="3628800",
)

```

```

result: Optional[AccuracyResult] = evaluation.run(print_results=True)
assert result is not None and result.avg_score >= 8

```

Simple Accuracy

Source: <https://docs.agno.com/examples/concepts/evals/accuracy/basic>

Learn to check how complete, correct and accurate an Agno Agent's response is.

This example shows a more complex evaluation that compares the full output of the agent for correctness.

Code

```

from typing import Optional

```

```

from agno.agent import Agent

```

```

from agno.eval.accuracy import AccuracyEval, AccuracyResult

```

```

from agno.models.openai import OpenAIChat

```

```

from agno.tools.calculator import CalculatorTools

```

```

evaluation = AccuracyEval(
    name="Calculator Evaluation",
    model=OpenAIChat(id="o4-mini"),
    agent=Agent(
        model=OpenAIChat(id="gpt-5-mini"),
        tools=[CalculatorTools()],
    ),
    input="What is 10*5 then to the power of 2? do it step by step",
    expected_output="2500",
    additional_guidelines="Agent output should include the steps and the final answer.",
    num_iterations=3,
)

```

```

result: Optional[AccuracyResult] = evaluation.run(print_results=True)
assert result is not None and result.avg_score >= 8

```

Performance on Agent Instantiation

Source: https://docs.agno.com/examples/concepts/evals/performance/performance_agent_instantiation

Evaluation to analyze the runtime and memory usage of an Agent.

Code

```
"""Run pip install agno openai to install dependencies."""
```

```
from agno.agent import Agent
```

```
from agno.eval.performance import PerformanceEval
```

```
def instantiate_agent():
```

```
    return Agent(system_message="Be concise, reply with one sentence.")
```

```
instantiation_perf = PerformanceEval(
```

```
    name="Instantiation Performance", func=instantiate_agent, num_iterations=1000
```

```
)
```

```
if name == "main":
```

```
    instantiation_perf.run(print_results=True, print_summary=True)
```

```
# Async Performance Evaluation
```

```
Source: https://docs.agno.com/examples/concepts/evals/performance/performance\_async
```

```
Learn how to run performance evaluations on async functions.
```

```
This example shows how to run a Performance evaluation on an async function.
```

```
## Code
```

```
"""This example shows how to run a Performance evaluation on an async function."""
```

```
import asyncio
```

```
from agno.agent import Agent
```

```
from agno.eval.performance import PerformanceEval
```

```
from agno.models.openai import OpenAIChat
```

Simple async function to run an Agent.

```
async def arun_agent():
```

```
    agent = Agent(
```

```
        model=OpenAIChat(id="gpt-5-mini"),
```

```
        system_message="Be concise, reply with one sentence.",
```

```
    )
```

```
    response = await agent.arun("What is the capital of France?")
```

```
    return response
```

```
performance_eval = PerformanceEval(func=arun_agent, num_iterations=10)
```

Because we are evaluating an async function, we use the arun method.

```
asyncio.run(performance_eval.arun(print_summary=Tr
```

```
ue, print_results=True))
```

```
# Performance with Database Logging
```

```
Source: https://docs.agno.com/examples/concepts/evals/performance/performance\_db\_logging
```

Agent Ops

Source: https://docs.agno.com/examples/concepts/integrations/observability/agent_ops

This example shows how to add observability to your agno agent with Agent Ops.

Code

```
import agentops
from agno.agent import Agent
from agno.models.openai import OpenAIChat
```

Initialize AgentOps

```
agentops.init()
```

Create and run an agent

```
agent = Agent(model=OpenAIChat(id="gpt-5-mini"))
response = agent.run("Share a 2 sentence horror story")
```

Print the response

```
print(response.content)
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Set your API key****

Obtain an API key from https://app.agentops.ai/

```
export AGENTOPS_API_KEY=xxx
```

Arize Phoenix via OpenInference

Source: <https://docs.agno.com/examples/concepts/integrations/observability/arize-phoenix-via-openinference>

Overview

This example demonstrates how to instrument your Agno agent with OpenInference and send traces to Arize Phoenix.

Code

```
import asyncio
import os
```

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
from phoenix.otel import register
```

Set environment variables for Arize Phoenix

```
os.environ["PHOENIX_CLIENT_HEADERS"] =
f"api_key={os.getenv('ARIZE_PHOENIX_API_KEY')}}"
os.environ["PHOENIX_COLLECTOR_ENDPOINT"] = "https://app.phoenix.arize.com"
```

Configure the Phoenix tracer

```
tracer_provider = register(
    project_name="agno-stock-price-agent", # Default is 'default'
    auto_instrument=True, # Automatically use the installed OpenInference instrumentation
)
```

Create and configure the agent

```
agent = Agent(
    name="Stock Price Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[DuckDuckGoTools()],
    instructions="You are an internet search agent. Find and provide accurate information on any topic.",
    debug_mode=True,
)
```

Use the agent

```
agent.print_response("What are the latest developments in artificial intelligence?")
```

Usage

****Step: Install Dependencies****

```
pip install -U agno arize-phoenix ddgs openai openinference-instrumentation-agno
opentelemetry-sdk opentelemetry-exporter-otlp
```

****Step: Set Environment Variables****

```
export ARIZE_PHOENIX_API_KEY=`<your-key>`
```

****Step: Run the Agent****

```
python cookbook/observability/arize_phoenix_via_openinference.py
```

```
python cookbook/observability/arize_phoenix_via_openinference.py
```

Arize Phoenix via OpenInference (Local Collector)

Source: <https://docs.agno.com/examples/concepts/integrations/observability/arize-phoenix-via-openinference-local>

Overview

This example demonstrates how to instrument your Agno agent with OpenInference and send traces to a local Arize Phoenix collector.

```
## Code
```

```
import os
```

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
from phoenix.otel import register
```

Set the local collector endpoint for Arize Phoenix

```
os.environ["PHOENIX_COLLECTOR_ENDPOINT"] = "http://localhost:6006"
```

Configure the Phoenix tracer

```
tracer_provider = register(
    project_name="agno-stock-price-agent", # Default is 'default'
    auto_instrument=True, # Automatically use the installed OpenInference instrumentation
)
```

Create and configure the agent

```
agent = Agent(
    name="Stock Price Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[DuckDuckGoTools()],
    instructions="You are an internet search agent. Find and provide accurate information on any topic.",
    debug_mode=True,
)
```

Use the agent

```
agent.print_response("What are the latest developments in artificial intelligence?")
```

```
## Usage
```

```
**Step: Install Dependencies**
```

```
pip install -U agno ddgs arize-phoenix openai openinference-instrumentation-agno
opentelemetry-sdk opentelemetry-exporter-otlp
```

```
**Step: Start Local Collector**
```

```
Run the following command to start the local collector:
```

```
phoenix serve
```

****Step: Run the Agent****

```
python cookbook/observability/arize_phoenix_via_openinference_local.py
```

```
python cookbook/observability/arize_phoenix_via_openinference_local.py
```

Atla

Source: [https://docs.agno.com/examples/concepts/integrations/observability/atla_op](https://docs.agno.com/examples/concepts/integrations/observability/atla_ops)

This example shows how to add observability to your agno agent with Atla.

Code

```
from os import getenv
```

```
from agno.agent import Agent
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.tools.duckduckgo import DuckDuckGoTools
```

```
from atla_insights import configure, instrument_agno
```

```
configure(token=getenv("ATLA_API_KEY"))
```

```
agent = Agent(
```

```
    name="Internet Search Agent",
```

```
    model=OpenAIChat(id="gpt-5-mini"),
```

```
    tools=[DuckDuckGoTools()],
```

```
    instructions="You are an internet search agent. Find and provide accurate information on any topic.",
```

```
    debug_mode=True,
```

```
)
```

Instrument and run

```
with instrument_agno("openai"):
```

```
    agent.print_response("What are the latest developments in artificial intelligence?")
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Set your API key****

Sign up for an account at <https://app.atla-ai.com>

```
export ATLA_API_KEY=`<your-key>`
```

****Step: Install libraries****

```
pip install -U agno atla-insights openai
```

****Step: Run Agent****

```
python cookbook/integrations/observability/atla_op.py
```

```
python cookbook/integrations/observability/atla_op.py
```

penlit.py
```

```
python cookbook/integrations/observability/langfuse_via_o  
penlit.py
```

```
# LangSmith
```

```
Source: https://docs.agno.com/examples/concepts/integratio  
ns/observability/langsmith-via-openinference
```

Overview

This example demonstrates how to instrument your Agno agent with OpenInference and send

traces to LangSmith.

Code

```
import os
```

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
from openinference.instrumentation.agno import AgnoInstrumentor
from opentelemetry import trace as trace_api
from opentelemetry.exporter.otlp.proto.http.trace_exporter import OTLPSpanExporter
from opentelemetry.sdk.trace import TracerProvider
from opentelemetry.sdk.trace.export import SimpleSpanProcessor
```

Set the endpoint and headers for LangSmith

```
endpoint = "https://eu.api.smith.langchain.com/otel/v1/traces"
```

```
headers = {
    "x-api-key": os.getenv("LANGSMITH_API_KEY"),
    "Langsmith-Project": os.getenv("LANGSMITH_PROJECT"),
}
```

Configure the tracer provider

```
tracer_provider = TracerProvider()
tracer_provider.add_span_processor(
    SimpleSpanProcessor(OTLPSpanExporter(endpoint=endpoint, headers=headers))
)
trace_api.set_tracer_provider(tracer_provider)
```

Start instrumenting agno

```
AgnoInstrumentor().instrument()
```

Create and configure the agent

```
agent = Agent(
    name="Stock Market Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[DuckDuckGoTools()],
    markdown=True
)
```

Use the agent

```
agent.print_response("What is news on the stock market?")
```

Usage

****Step: Install Dependencies****

```
pip install agno openai ddgs openinference-instrumentation-agno opentelemetry-sdk
opentelemetry-exporter-otlp
```

****Step: Set Environment Variables****

```
export LANGSMITH_API_KEY=`<your-key>`
export LANGSMITH_TRACING=true
export LANGSMITH_ENDPOINT=https://eu.api.smith.langchain.
com # or https://api.smith.langchain.com for US
export LANGSMITH_PROJECT=`<your-project-name>`
```

****Step: Run the Agent****

```
python cookbook/observability/langsmith_via_openinference
.py
```

```
python cookbook/observability/langsmith_via_openinference
.py
```

Notes

* ****Data Regions****: Choose the appropriate `LANGSMITH_ENDPOINT` based on your data region.

Langtrace

Source: <https://docs.agno.com/examples/concepts/integrations/observability/langtrace-op>

Overview

This example demonstrates how to instrument your Agno agent with Langtrace for tracing and monitoring.

Code

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.yfinance import YFinanceTools
from langtrace_python_sdk import langtrace
from langtrace_python_sdk.utils.with_root_span import with_langtrace_root_span
```

Initialize Langtrace

```
langtrace.init()
```

Create and configure the agent

```
agent = Agent(
    name="Stock Price Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[YFinanceTools()],
    instructions="You are a stock price agent. Answer questions in the style of a stock analyst.",
    debug_mode=True,
)
```

Use the agent

```
agent.print_response("What is the current price of Tesla?")
```

Usage

****Step: Install Dependencies****

```
pip install agno openai langtrace-python-sdk
```

****Step: Set Environment Variables****

```
export LANGTRACE_API_KEY=`<your-key>`
```

****Step: Run the Agent****

```
python cookbook/observability/langtrace_op.py
```

```
python cookbook/observability/langtrace_op.py
```

Notes

* ****Initialization****: Call `langtrace.init()` to initialize Langtrace before using the agent.

Langwatch

Source: https://docs.agno.com/examples/concepts/integrations/observability/langwatch_op

This example shows how to instrument your agno agent and send traces to LangWatch.

Code

```

import langwatch
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
from openinference.instrumentation.agno import AgnoInstrumentor

```

Initialize LangWatch and instrument Agno

```

langwatch.setup(instrumentors=[AgnoInstrumentor()])

```

Create and configure your Agno agent

```

agent = Agent(
    name="Stock Price Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[DuckDuckGoTools()],
    instructions="You are an internet search agent. Find and provide accurate information on any topic.",
    debug_mode=True,
)

```

```

agent.print_response("What are the latest developments in artificial intelligence?")

```

Usage

```

> **Snippet file:** "create-venv-step.mdx"

```

****Step: Set your API key****

- Sign up for an account at <https://app.langwatch.ai/>.
- Set your LangWatch API key as an environment variables:

```

export LANGWATCH_API_KEY=<your-key>

```

****Step: Install libraries****

```

pip install -U agno openai ddgs langwatch openinference-instrumentation-agno

```

****Step: Run Agent****

```

python cookbook/integrations/observability/langwatch_op.py

```

```

python cookbook/integrations/observability/langwatch_op.py

```

```
# Maxim
```

```
Source: https://docs.agno.com/examples/concepts/integrations/observability/maxim
```

This example shows how to instrument your agno agent and send traces to Maxim AI. We are building a simple Financial Conversation Agent.

```
# Code
```

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.team.team import Team
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.yfinance import YFinanceTools

try:
    from maxim import Maxim
    from maxim.logger.agno import instrument_agno
except ImportError:
    raise ImportError(
        "`maxim` not installed. Please install using `pip install maxim-py`"
    )
```

Instrument Agno with Maxim for automatic tracing and logging

```
instrument_agno(Maxim().logger())
```

Web Search Agent: Fetches financial information from the web

```
web_search_agent = Agent(
    name="Web Agent",
    model=OpenAIChat(id="gpt-4o"),
    tools=[DuckDuckGoTools()],
    instructions="Always include sources",
    markdown=True,
)
```

Finance Agent: Gets financial data using YFinance tools

```
finance_agent = Agent(
    name="Finance Agent",
    model=OpenAIChat(id="gpt-4o"),
    tools=[YFinanceTools()],
    instructions="Use tables to display data",
    markdown=True,
)
```

Aggregate both agents into a multi-agent system

```
multi_ai_team = Team(
    members=[web_search_agent, finance_agent],
    model=OpenAIChat(id="gpt-4o"),
    instructions="You are a helpful financial assistant. Answer user questions about
stocks, companies, and financial data.",
    markdown=True,
)
```

```
if name == "main":
    print("Welcome to the Financial Conversational Agent! Type 'exit' to quit.")
    messages = []
    while True:
        print("*****")
        user_input = input("You: ")
        if user_input.strip().lower() in ["exit", "quit"]:
            print("Goodbye!")
            break
        messages.append({"role": "user", "content": user_input})
        conversation = "\n".join(
            [
                ("User: " + m["content"])
                if m["role"] == "user"
                else ("Agent: " + m["content"])
                for m in messages
            ]
        )
        response = multi_ai_team.run(
            f"Conversation so far:\n{conversation}\n\nRespond to the latest user message."
        )
        agent_reply = getattr(response, "content", response)
        print("-----")
        print("Agent:", agent_reply)
        messages.append({"role": "agent", "content": str(agent_reply)})
```

Weave

Source: <https://docs.agno.com/examples/concepts/integrations/observability/weave-op>

Overview

This example demonstrates how to use Weave by Weights & Biases (WandB) to log model calls from your Agno agent.

Code

```
import weave
from agno.agent import Agent
from agno.models.openai import OpenAIChat
```

Create and configure the agent

```
agent = Agent(model=OpenAIChat(id="gpt-5-mini"), markdown=True, debug_mode=True)
```

Initialize Weave with your project name

```
weave.init("agno")
```

Define a function to run the agent, decorated with weave.op()

```
@weave.op()
def run(content: str):
    return agent.run(content)
```

Use the function to log a model call

```
run("Share a 2 sentence horror story")
```

Usage

****Step: Install Weave****

```
pip install agno openai weave
```

****Step: Authenticate with WandB****

```
* Go to [WandB](https://wandb.ai) and copy your API key from
[here](https://wandb.ai/authorize).
```

```
* Enter your API key in the terminal when prompted, or export it as an environment
variable:
```

```
export WANDB_API_KEY=`<your-api-key>`
```

****Step: Run the Agent****

```
python cookbook/observability/weave_op.py
```

```
python cookbook/observability/weave_op.py
```

Notes

```
* **Initialization**: Call `weave.init("project-name")` to initialize Weave with your
project name.
```

```
* **Decorators**: Use `@weave.op()` to decorate functions you want to log with Weave.
```

Scenario Testing

Source: <https://docs.agno.com/examples/concepts/integrations/testing/scenario/basic>

This example demonstrates how to use the [Scenario](https://github.com/langwatch/scenario) framework for agentic simulation-based testing. Scenario enables you to simulate conversations between agents, user simulators, and judges, making it easy to test and evaluate agent behaviors in a controlled environment.

> **Tip:** Want to see a more advanced scenario? Check out the [Customer support scenario example](https://github.com/langwatch/create-agent-app/tree/main/agno_example) for a more complex agent, including tool calls and advanced scenario features.

Code

```
import pytest
import scenario
from agno.agent import Agent
from agno.models.openai import OpenAIChat
```

Configure Scenario defaults (model for user simulator and judge)

```
scenario.configure(default_model="openai/gpt-4.1-mini")
```

```
@pytest.mark.agent_test
@pytest.mark.asyncio
async def test_vegetarian_recipe_agent() -> None:
```

1. Define an AgentAdapter to wrap your agent

```
class VegetarianRecipeAgentAdapter(scenario.AgentAdapter):
    """
    agent: Agent

    def __init__(self) -> None:
        self.agent = Agent(
            model=OpenAIChat(id="gpt-4.1-mini"),
            markdown=True,
            debug_mode=True,
            instructions="You are a vegetarian recipe agent.",
        )

    async def call(self, input: scenario.AgentInput) -> scenario.AgentReturnTypes:
        response = self.agent.run(
            input=input.last_new_user_message_str(), # Pass only the last user message
            session_id=input.thread_id, # Pass the thread id, this allows the agent to
            track history
        )
        return response.content
```

2. Run the scenario simulation

```

result = await scenario.run(
    name="dinner recipe request",
    description="User is looking for a vegetarian dinner idea.",
    agents=[
        VegetarianRecipeAgentAdapter(),
        scenario.UserSimulatorAgent(),
        scenario.JudgeAgent(
            criteria=[
                "Agent should not ask more than two follow-up questions",
                "Agent should generate a recipe",
                "Recipe should include a list of ingredients",
                "Recipe should include step-by-step cooking instructions",
                "Recipe should be vegetarian and not include any sort of meat",
            ]
        ),
    ],
)

```

3. Assert and inspect the result

```
assert result.success
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Set your API key****

```
export OPENAI_API_KEY=xxx
export LANGWATCH_API_KEY=xxx # Optional, required for Simulation monitoring
```

****Step: Install libraries****

```
pip install -U openai agno langwatch-scenario pytest pytest-asyncio
```

or

```
uv add agno langwatch-scenario openai pytest
```

****Step: Run Agent****

```
pytest cookbook/agent_concepts/other/scenario_testing.py
```

Include and Exclude Files

Source: <https://docs.agno.com/examples/concepts/knowledge/basic-operations/include-exclude-files>

Code

```
import asyncio
```

```
from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.vectordb.pgvector import PgVector
```

Create Knowledge Instance

```
knowledge = Knowledge(
    name="Basic SDK Knowledge Base",
    description="Agno 2.0 Knowledge Implementation",
    vector_db=PgVector(
        table_name="vectors", db_url="postgresql+psycopg://ai:ai@localhost:5532/
ai"
    ),
)
```

Add from local file to the knowledge base

```
asyncio.run(
    knowledge.add_content_async(
        name="CV",
        path="cookbook/knowledge/testing_resources",
        metadata={"user_tag": "Engineering Candidates"},
```

Only include PDF files

```
        include=["*.pdf"],
```

Don't include files that match this pattern

```
        exclude=["*cv_5*"],
    )
)
```

```
agent = Agent(
    name="My Agent",
    description="Agno 2.0 Agent Implementation",
    knowledge=knowledge,
    search_knowledge=True,
    debug_mode=True,
)
```

```
agent.print_response(
    "Who is the best candidate for the role of a software engineer?",
    markdown=True,
)
```

Alex River is not in the knowledge base, so the Agent should not find any information about him

```
agent.print_response(
    "Do you think Alex Rivera is a good candidate?",
    markdown=True,
)
```

Usage

****Step: Install libraries****

```
pip install -U agno sqlalchemy psycopg pgvector openai
```

****Step: Set environment variables****

```
export OPENAI_API_KEY=xxx
```

> ****Snippet file:**** "run-pgvector-step.mdx"

****Step: Run the example****

```
python cookbook/knowledge/basic_operations/08_include_exclude_files.py
```

```
python cookbook/knowledge/basic_operations/08_include_exclude_files.py
```

Remove Content

Source: <https://docs.agno.com/examples/concepts/knowledge/basic-operations/remove-content>

Code

```
import asyncio
from agno.db.postgres import PostgresDb
from agno.knowledge.knowledge import Knowledge
from agno.vectordb.pgvector import PgVector
```

Create Knowledge Instance

```
knowledge = Knowledge(
    name="Basic SDK Knowledge Base",
    description="Agno 2.0 Knowledge Implementation",
    contents_db=PostgresDb(
        db_url="postgresql+psycopg://ai:ai@localhost:5532/ai",
        knowledge_table="knowledge_contents",
    ),
    vector_db=PgVector(
        table_name="vectors", db_url="postgresql+psycopg://ai:ai@localhost:5532/ai"
    ),
)
```

```

asyncio.run(
    knowledge.add_content_async(
        name="CV",
        path="cookbook/knowledge/testing_resources/cv_1.pdf",
        metadata={"user_tag": "Engineering Candidates"},
    )
)

```

Remove content and vectors by id

```

contents, _ = knowledge.get_content()
for content in contents:
    print(content.id)
    print(" ")
    knowledge.remove_content_by_id(content.id)

```

Remove all content

```
knowledge.remove_all_content()
```

Usage

****Step: Install libraries****

```
pip install -U agno sqlalchemy psycopg pgvector
```

> ****Snippet file:**** "run-pgvector-step.mdx"

****Step: Run the example****

```
python cookbook/knowledge/basic_operations/09_remove_content.py
```

```
python cookbook/knowledge/basic_operations/09_remove_content.py
```

Remove Vectors

Source: <https://docs.agno.com/examples/concepts/knowledge/basic-operations/remove-vectors>

Code

```

import asyncio
from agno.knowledge.knowledge import Knowledge
from agno.vectordb.pgvector import PgVector

```

Create Knowledge Instance

```

knowledge = Knowledge(
    name="Basic SDK Knowledge Base",
    description="Agno 2.0 Knowledge Implementation",
    vector_db=PgVector(
        table_name="vectors", db_url="postgresql+psycopg://ai:ai@localhost:5532/
ai"
    ),
)

asyncio.run(
    knowledge.add_content_async(
        name="CV",

# Skip If Exists
Source: https://docs.agno.com/examples/concepts/knowledge/
basic-operations/skip-if-exists

## Code

import asyncio
from agno.knowledge.knowledge import Knowledge
from agno.vectordb.pgvector import PgVector

knowledge = Knowledge(
    name="Basic SDK Knowledge Base",
    description="Agno 2.0 Knowledge Implementation",
    vector_db=PgVector(
        table_name="vectors", db_url="postgresql+psycopg://ai:ai@localhost:5532/
ai"
    ),
)

```

Add from local file to the knowledge base

```

asyncio.run(
    knowledge.add_content_async(
        name="CV",
        path="cookbook/knowledge/testing_resources/cv_1.pd
f",
        metadata={"user_tag": "Engineering Candidates"},
        skip_if_exists=True, # True by default
    )
)

```

Add from local file to the knowledge base, but don't skip if it already exists

```

asyncio.run(
    knowledge.add_content_async(
        name="CV",
        path="cookbook/knowledge/testing_resources/cv_1.pd
f",
        metadata={"user_tag": "Engineering Candidates"},
        skip_if_exists=False,
    )
)

```

Usage

****Step: Install libraries****

```

pip install -U agno sqlalchemy psycopg pgvector

```

```
> **Snippet file:** "run-pgvector-step.md"
```

```
**Step: Run the example**
```

```
python cookbook/knowledge/basic_operations/11_skip_if_exi
sts.py
```

```
python cookbook/knowledge/basic_operations/11_skip_if_exi
sts.py
```

```
# Sync Operations
```

```
Source: https://docs.agno.com/examples/concepts/knowledge/
basic-operations/sync-operations
```

This example shows how to add content to your knowledge base synchronously. While async operations are recommended for better performance, sync operations can be useful in certain scenarios.

```
## Code
```

```
from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.knowledge.knowledge import Knowledge
from agno.vectordb.pgvector import PgVector
```

```
contents_db = PostgresDb(
    db_url="postgresql+psycopg://ai:ai@localhost:5532/
ai",
    knowledge_table="knowledge_contents",
)
```

Create Knowledge Instance

```
knowledge = Knowledge(
    name="Basic SDK Knowledge Base",
    description="Agno 2.0 Knowledge Implementation",
    vector_db=PgVector(
        table_name="vectors", db_url="postgresql+psycopg://ai:ai@localhost:5532/
ai"
    ),
)

knowledge.add_content(
    name="CV",
    path="cookbook/knowledge/testing_resources/cv_1.pd
f",
    metadata={"user_tag": "Engineering Candidates"},
)
```

```
agent = Agent(
    name="My Agent",

Agentic Chunking

Source: <https://docs.agno.com/examples/concepts/knowledge/chunking/agentic-chunking>

Agentic chunking is an intelligent method of splitting documents into smaller chunks by using a model to determine natural breakpoints in the text. Rather than splitting text at fixed character counts, it analyzes the content to find semantically meaningful boundaries like paragraph breaks and topic transitions.

Code

```
import asyncio
from agno.agent import Agent
from agno.knowledge.chunking.agentic import AgenticChunking
from agno.knowledge.knowledge import Knowledge
from agno.knowledge.reader.pdf_reader import PDFReader
```

```

from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"

knowledge = Knowledge(
    vector_db=PgVector(table_name="recipes_agentic_chunking", db_url=db_url),
)

asyncio.run(knowledge.add_content_async(
    url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf",
    reader=PDFReader(
        name="Agentic Chunking Reader",
        chunking_strategy=AgenticChunking(),
    ),
))

agent = Agent(
    knowledge=knowledge,
    search_knowledge=True,
)

agent.print_response("How to make Thai curry?", markdown=True)

```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
    pip install -U sqlalchemy psycpg pgvector agno
```

```
> **Snippet file:** "run-pgvector-step.mdx"
```

```
**Step: Run Agent**
```

```
    python cookbook/knowledge/chunking/agentic_chunking.py
```

```
    python cookbook/knowledge/chunking/agentic_chunking.py
```

Agentic Chunking Params

```
> **Snippet file:** "chunking-agentic.mdx"
```

CSV Row Chunking

Source: <https://docs.agno.com/examples/concepts/knowledge/chunking/csv-row-chunking>

CSV row chunking is a method of splitting documents into smaller chunks by using a model to determine natural breakpoints in the text. Rather than splitting text at fixed character counts, it analyzes the content to find semantically meaningful boundaries like paragraph breaks and topic transitions.

Code

```
import asyncio
from agno.agent import Agent
from agno.knowledge.chunking.row import RowChunking
from agno.knowledge.knowledge import Knowledge
from agno.knowledge.reader.csv_reader import CSVReader
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

knowledge_base = Knowledge(
    vector_db=PgVector(table_name="imdb_movies_row_chunking", db_url=db_url),
)

asyncio.run(knowledge_base.add_content_async(
    url="https://agno-public.s3.amazonaws.com/demo_data/IMDB-Movie-Data.csv",
    reader=CSVReader(
        chunking_strategy=RowChunking(),
    ),
))
```

Initialize the Agent with the knowledge_base

```
agent = Agent(
    knowledge=knowledge_base,
    search_knowledge=True,
)
```

Use the agent

```
agent.print_response("Tell me about the movie Guardians of the Galaxy", markdown=True)
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U sqlalchemy psycopg pgvector agno
```

```
> **Snippet file:** "run-pgvector-step.mdx"
```

```
**Step: Run Agent**
```

```
python cookbook/knowledge/chunking/csv_row_chunking.py
```

```
python cookbook/knowledge/chunking/csv_row_chunking.py
```

```
## CSV Row Chunking Params
```

```
> **Snippet file:** "chunking-csv-row.mdx"
```

```
# Document Chunking
```

```
Source: https://docs.agno.com/examples/concepts/knowledge/chunking/document-chunking
```

Document chunking is a method of splitting documents into smaller chunks based on document structure like paragraphs and sections. It analyzes natural document boundaries rather than splitting at fixed character counts. This is useful when you want to process large documents while preserving semantic meaning and context.

```
## Code
```

```
import asyncio
```

```
from agno.agent import Agent
```

```
from agno.knowledge.chunking.document import DocumentChunking
```

```
from agno.knowledge.knowledge import Knowledge
```

```
from agno.knowledge.reader.pdf_reader import PDFReader
```

```
from agno.vectordb.pgvector import PgVector
```

```
db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"
```

```
knowledge = Knowledge(  
    vector_db=PgVector(table_name="recipes_document_chunking", db_url=db_url),  
)
```

```
asyncio.run(knowledge.add_content_async(  
    url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf",  
    reader=PDFReader(  
        name="Document Chunking Reader",  
        chunking_strategy=DocumentChunking(),  
    ),  
)
```

```
agent = agentic_rag_with_reranking(  
    knowledge=knowledge,  
    search_knowledge=True,
```

```
)  
  
agent.print_response("How to make Thai curry?", markdown=True)
```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
    pip install -U sqlalchemy psycopg pgvector agno
```

```
> **Snippet file:** "run-pgvector-step.mdx"
```

```

> **Snippet file:** "chunking-markdown.mdx"
```

Recursive Chunking

Source: <https://docs.agno.com/examples/concepts/knowledge/chunking/recursive-chunking>

Recursive chunking is a method of splitting documents into smaller chunks by recursively applying a chunking strategy. This is useful when you want to process large documents in smaller, manageable pieces.

Code

```
import asyncio
from agno.agent import Agent
from agno.knowledge.chunking.recursive import RecursiveChunking
from agno.knowledge.knowledge import Knowledge
from agno.knowledge.reader.pdf_reader import PDFReader
from agno.vectordb.pgvector import PgVector
```

```
db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"
```

```
knowledge = Knowledge(
    vector_db=PgVector(table_name="recipes_recursive_chunking", db_url=db_url),
)
```

```
asyncio.run(knowledge.add_content_async(
    url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf",
    reader=PDFReader(
        name="Recursive Chunking Reader",
        chunking_strategy=RecursiveChunking(),
    ),
))
```

```
agent = Agent(
    knowledge=knowledge,
    search_knowledge=True,
)
```

```
agent.print_response("How to make Thai curry?", markdown=True)
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U sqlalchemy psycpg pgvector agno
```

```
> **Snippet file:** "run-pgvector-step.mdx"
```

```
**Step: Run Agent**
```

```
python cookbook/knowledge/chunking/recursive_chunking.py
```

```
python cookbook/knowledge/chunking/recursive_chunking.py
```

```
## Recursive Chunking Params
```

```
> **Snippet file:** "chunking-recursive.mdx"
```

```
# Semantic Chunking
```

```
Source: https://docs.agno.com/examples/concepts/knowledge/chunking/semantic-chunking
```

Semantic chunking is a method of splitting documents into smaller chunks by analyzing semantic similarity between text segments using embeddings. It uses the chonkie library to identify natural breakpoints where the semantic meaning changes significantly, based on a configurable similarity threshold. This helps preserve context and meaning better than fixed-size chunking by ensuring semantically related content stays together in the same chunk, while splitting occurs at meaningful topic transitions.

```
## Code
```

```
import asyncio
```

```
from agno.agent import Agent
```

```
from agno.knowledge.chunking.semantic import SemanticChunking
```

```
from agno.knowledge.knowledge import Knowledge
```

```
from agno.knowledge.reader.pdf_reader import PDFReader
```

```
from agno.vectordb.pgvector import PgVector
```

```
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
```

```
knowledge = Knowledge(
```

```
    vector_db=PgVector(table_name="recipes_semantic_chunking", db_url=db_url),  
)
```

```
asyncio.run(knowledge.add_content_async(
```

```
    url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf",
```

```
    reader=PDFReader(  
        name="Semantic Chunking Reader",  
        chunking_strategy=SemanticChunking(similarity_threshold=0.5),  
    ),  
)
```

```
agent = Agent(
```

```

        knowledge=knowledge,
        search_knowledge=True,
    )

agent.print_response("How to make Thai curry?", markdown=True)

```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
    pip install -U sqlalchemy psycopy pgvector agno chonkie
```

```
> **Snippet file:** "run-pgvector-step.mdx"
```

# Jina Embedder
```

```
Source: https://docs.agno.com/examples/concepts/knowledge/
embedders/jina-embedder
```

Code

```
from agno.knowledge.embedder.jina import JinaEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.vectordb.pgvector import PgVector
```

Basic usage - automatically loads from JINA_API_KEY environment variable

```
embeddings = JinaEmbedder().get_embedding(
```

```
    "The quick brown fox jumps over the lazy dog."
)
```

Print the embeddings and their dimensions

```
print(f"Embeddings: {embeddings[:5]}")
print(f"Dimensions: {len(embeddings)}")
```

```
custom_embedder = JinaEmbedder(
    dimensions=1024,
    late_chunking=True, # Improved processing for long documents
    timeout=30.0, # Request timeout in seconds
)
```

Get embedding with usage information

```
embedding, usage = custom_embedder.get_embedding_and_usage(
    "Advanced text processing with Jina embeddings and late chunking."
)
print(f"Embedding dimensions: {len(embedding)}")
if usage:
    print(f"Usage info: {usage}")
```

Example usage with Knowledge

```
knowledge = Knowledge(
    vector_db=PgVector(
        db_url="postgresql+psycopg://ai:ai@localhost:5532/
ai",
        table_name="jina_embeddings",

## Usage

> **Snippet file:** "create-venv-step.mdx"

**Step: Install libraries**

    pip install -U agno vllm openai sqlalchemy psycopg[binary] pgvector pypdf

**Step: Run PgVector**

    docker run -d \
        -e POSTGRES_DB=ai \
        -e POSTGRES_USER=ai \
        -e POSTGRES_PASSWORD=ai \
        -e PGDATA=/var/lib/postgresql/data/pgdata \
        -v pgvolume:/var/lib/postgresql/data \
        -p 5532:5432 \
        --name pgvector \
        agno/pgvector:16

**Step: Run the example**

    python vllm_embedder.py

    python vllm_embedder.py

## Notes

* This example uses **local mode** where vLLM loads the model directly (no server needed)
* For **remote mode**, the code includes `knowledge_remote` example with `base_url` parameter
* GPU with ~14GB VRAM required for e5-mistral-7b-instruct model
* For CPU-only or lower memory, use smaller models like `BAAI/bge-small-en-v1.5`
* Models are automatically downloaded from HuggingFace on first use

# VoyageAI Embedder
Source: https://docs.agno.com/examples/concepts/knowledge/embedders/voyageai-embedder

## Code

```

```
from agno.knowledge.embedder.voyageai import VoyageAIEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.vectordb.pgvector import PgVector
```

```
embeddings = VoyageAIEmbedder().get_embedding(
    "The quick brown fox jumps over the lazy dog."
)
```

Print the embeddings and their dimensions

```
print(f"Embeddings: {embeddings[:5]}")
print(f"Dimensions: {len(embeddings)}")
```

Example usage:

```
knowledge = Knowledge(
    vector_db=PgVector(
        db_url="postgresql+psycopg://ai:ai@localhost:5532/
ai",
        table_name="voyageai_embeddings",
        embedder=VoyageAIEmbedder(),
    ),
    max_results=2,
)
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U sqlalchemy psycopg pgvector voyageai agno
```

```
**Step: Run PgVector**
```

```
docker run -d \
    -e POSTGRES_DB=ai \
    -e POSTGRES_USER=ai \
    -e POSTGRES_PASSWORD=ai \
    -e PGDATA=/var/lib/postgresql/data/pgdata \
    -v pgvolume:/var/lib/postgresql/data \
    -p 5532:5432 \
    --name pgvector \
    agnohq/pgvector:16
```

```
**Step: Run Agent**
```

```
python cookbook/knowledge/embedders/voyageai_embedder.py
```

```
python cookbook/knowledge/embedders/voyageai_embedder.py
```

```
# Agentic Filtering
Source: https://docs.agno.com/examples/concepts/knowledge/filters/agent-filtering
```

```
## Code
```

```
import asyncio
from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.utils.media import (
    SampleDataFileExtension,
    download_knowledge_filters_sample_data,
)
from agno.vectordb.lancedb import LanceDb
```

Download all sample sales files and get their paths

```
downloaded_csv_paths = download_knowledge_filters_sample_data(
    num_files=4, file_extension=SampleDataFileExtension.CSV
)
```

Initialize LanceDB

By default, it stores data in /tmp/lancedb

```
vector_db = LanceDb(
    table_name="recipes",
    uri="/tmp/lancedb", # You can change this path to store data elsewhere
)
```

Step 1: Initialize knowledge base with documents and metadata

```
-----
-----
```

```
knowledge = Knowledge(
    name="CSV Knowledge Base",
    description="A knowledge base for CSV files",
    vector_db=vector_db,
)
```

Load all documents into the vector database

```

asyncio.run(knowledge.add_contents_async(
    [
        {
            "path": downloaded_csv_paths[0],
            "metadata": {
                "data_type": "sales",
                "quarter": "Q1",
                "year": 2024,
                "region": "north_america",
                "currency": "USD",
            },
        },
        {
            "path": downloaded_csv_paths[1],
            "metadata": {
                "data_type": "sales",
                "year": 2024,
                "region": "europe",
                "currency": "EUR",
            },
        },
        {
            "path": downloaded_csv_paths[2],
            "metadata": {
                "data_type": "survey",
                "survey_type": "customer_satisfaction",
                "year": 2024,
                "target_demographic": "mixed",
            },
        },
        {
            "path": downloaded_csv_paths[3],
            "metadata": {
                "data_type": "financial",
                "sector": "technology",
                "year": 2024,
                "report_type": "quarterly_earnings",
            },
        },
    ]
))

```

Step 2: Query the knowledge base with Agent using filters from query automatically

Enable agentic filtering

```

agent = Agent(
    knowledge=knowledge,

```

```

        search_knowledge=True,
        enable_agentic_knowledge_filters=True,
    )

    agent.print_response(
        "Tell me about revenue performance and top selling products in the region north_america and data_type sales",
        markdown=True,
    )

```

Usage

****Step: Install libraries****

```
pip install -U agno lancedb openai
```

****Step: Set environment variables****

```
export OPENAI_API_KEY=xxx
```

****Step: Run the example****

```
python cookbook/knowledge/filters/agentic_filtering.py
```

```
python cookbook/knowledge/filters/agentic_filtering.py
```

Async Filtering

Source: <https://docs.agno.com/examples/concepts/knowledge/filters/async-filtering>

Code

```

import asyncio

from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.utils.media import (
    SampleDataFileExtension,
    download_knowledge_filters_sample_data,
)
from agno.vectordb.lancedb import LanceDb

```

Download all sample CVs and get their paths

```

downloaded_cv_paths = download_knowledge_filters_sample_data(
    num_files=5, file_extension=SampleDataFileExtension.DOCX
)

```

```
)
```

Initialize LanceDB

By default, it stores data in /tmp/lancedb

```
vector_db = LanceDb(  
    table_name="recipes",  
    uri="/tmp/lancedb", # You can change this path to store data elsewhere  
)
```

Step 1: Initialize knowledge base with documents and metadata

When initializing the knowledge base, we can attach metadata that will be used for filtering

This metadata can include user IDs, document types, dates, or any other attributes

```
knowledge = Knowledge(  
    name="Async Filtering",  
    vector_db=vector_db,  
)  
  
asyncio.run(knowledge.add_contents_async(  
    [  
        {  
            "path": downloaded_cv_paths[0],  
            "metadata": {  
                "user_id": "jordan_mitchell",  
                "document_type": "cv",  
                "year": 2025,  
            },  
        },  
        {  
            "path": downloaded_cv_paths[1],  
            "metadata": {  
                "user_id": "taylor_brooks",  
                "document_type": "cv",  
                "year": 2025,  
            },  
        },  
        {  
            "path": downloaded_cv_paths[2],  
            "metadata": {  
                "user_id": "morgan_lee",
```

```

        "document_type": "cv",
        "year": 2025,
    },
},
{
    "path": downloaded_cv_paths[3],
    "metadata": {
        "user_id": "casey_jordan",
        "document_type": "cv",
        "year": 2025,
    },
},
{
    "path": downloaded_cv_paths[4],
    "metadata": {
        "user_id": "alex_rivera",
        "document_type": "cv",
        "year": 2025,
    },
},
],
))

```

Step 2: Query the knowledge base with different filter combinations

Option 1: Filters on the Agent

Initialize the Agent with the knowledge base and filters

```

agent = Agent(
    knowledge=knowledge,
    search_knowledge=True,
    debug_mode=True,
)

```

```

if name == "main":

```

Query for Jordan Mitchell's experience and skills

```

    asyncio.run(
        agent.aprint_response(
            "Tell me about Jordan Mitchell's experience and skills",
            knowledge_filters={"user_id": "jordan_mitchell"},
            markdown=True,
        )
    )

```

Usage

****Step: Install libraries****

```
pip install -U agno openai lancedb
```

****Step: Set environment variables****

```
export OPENAI_API_KEY=xxx
```

****Step: Run the example****

```
python cookbook/knowledge/filters/async_filtering.py
```

Filtering

Source: <https://docs.agno.com/examples/concepts/knowledge/filters/filtering>

Code

```
from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.utils.media import (
    SampleDataFileExtension,
    download_knowledge_filters_sample_data,
)
from agno.vectordb.lancedb import LanceDb
```

Download all sample sales documents and get their paths

```
downloaded_csv_paths = download_knowledge_filters_sample_data(
    num_files=4, file_extension=SampleDataFileExtension.CSV
)
```

Initialize LanceDB

By default, it stores data in /tmp/lancedb

```
vector_db = LanceDb(
    table_name="recipes",

Filtering on ChromaDB

Source: https://docs.agno.com/examples/concepts/knowledge/filters/vector-dbs/filtering_chroma_db

Learn how to filter knowledge base searches using Pdf documents with user-specific metadata in ChromaDB.

Code

```

from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.utils.media import (

```

```

        SampleDataFileExtension,
        download_knowledge_filters_sample_data,
    )
from agno.vectordb.chroma import ChromaDb

```

Download all sample CVs and get their paths

```

downloaded_cv_paths = download_knowledge_filters_sample_data(
    num_files=5, file_extension=SampleDataFileExtension.PDF
)

```

Initialize ChromaDB

```
vector_db = ChromaDb(collection="recipes", path="tmp/chromadb", persistent_client=True)
```

Step 1: Initialize knowledge with documents and metadata

```

-----
-----

```

When initializing the knowledge, we can attach metadata that will be used for filtering

This metadata can include user IDs, document types, dates, or any other attributes

```

knowledge = Knowledge(
    name="ChromaDB Knowledge Base",
    description="A knowledge base for ChromaDB",
    vector_db=vector_db,
)

```

Load all documents into the vector database

```

knowledge.add_contents(
    [
        {
            "path": downloaded_cv_paths[0],
            "metadata": {
                "user_id": "jordan_mitchell",
                "document_type": "cv",
                "year": 2025,
            },
        },
        {
            "path": downloaded_cv_paths[1],
            "metadata": {
                "user_id": "taylor_brooks",
                "document_type": "cv",
            },
        },
    ]
)

```

```

        "year": 2025,
    },
},
{
    "path": downloaded_cv_paths[2],
    "metadata": {
        "user_id": "morgan_lee",
        "document_type": "cv",
        "year": 2025,
    },
},
{
    "path": downloaded_cv_paths[3],
    "metadata": {
        "user_id": "casey_jordan",
        "document_type": "cv",

Filtering on LanceDB

Source: https://docs.agno.com/examples/concepts/knowledge/filters/vector-dbs/filtering_lance_db

Learn how to filter knowledge base searches using Pdf documents with user-specific metadata in LanceDB.

Code

```
from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.utils.media import (
    SampleDataFileExtension,
    download_knowledge_filters_sample_data,
)
from agno.vectordb.lancedb import LanceDb
```

Download all sample CVs and get their paths

```
downloaded_cv_paths = download_knowledge_filters_sample_data(
    num_files=5, file_extension=SampleDataFileExtension.PDF
)
```

Initialize LanceDB

By default, it stores data in /tmp/lancedb

```
vector_db = LanceDb(
    table_name="recipes",
    uri="/tmp/lancedb", # You can change this path to store data elsewhere
)
```

Step 1: Initialize knowledge base with documents and metadata

When initializing the knowledge base, we can attach metadata that will be used for filtering

This metadata can include user IDs, document types, dates, or any other attributes

```
knowledge = Knowledge(  
    name="LanceDB Knowledge Base",  
    description="A knowledge base for LanceDB",  
    vector_db=vector_db,  
)
```

```
knowledge.add_contents(  
    [  
        {  
            "path": downloaded_cv_paths[0],  
            "metadata": {  
                "user_id": "jordan_mitchell",  
                "document_type": "cv",  
                "year": 2025,  
            },  
        },  
        {  
            "path": downloaded_cv_paths[1],  
            "metadata": {  
                "user_id": "taylor_brooks",  
                "document_type": "cv",  
                "year": 2025,  
            },  
        },  
        {  
            "path": downloaded_cv_paths[2],  
            "metadata": {  
                "user_id": "morgan_lee",  
                "document_type": "cv",  
                "year": 2025,  
            },  
        },  
        {  
            "path": downloaded_cv_paths[3],  
            "metadata": {  
                "user_id": "casey_jordan",  
                "document_type": "cv",  
                "year": 2025,  
            },  
        },  
    ]
```

```

        },
        {
            "path": downloaded_cv_paths[4],
            "metadata": {
                "user_id": "alex_rivera",
                "document_type": "cv",
                "year": 2025,
            },
        },
    ],
)

```

Load all documents into the vector database

Step 2: Query the knowledge base with different filter combinations

```

-----
-----

agent = Agent(
    knowledge=knowledge,
    search_knowledge=True,
)

agent.print_response(
    "Tell me about Jordan Mitchell's experience and skills",
    knowledge_filters={"user_id": "jordan_mitchell"},
    markdown=True,
)

## Usage

**Step: Install libraries**

    pip install -U agno lancedb openai

**Step: Set environment variables**

    export OPENAI_API_KEY=xxx

**Step: Run the example**

    python cookbook/knowledge/filters/vector_dbs/filtering_lance_db.py

    python cookbook/knowledge/filters/vector_dbs/filtering_la

```

nce_db.py

Filtering on MilvusDB

Source: https://docs.agno.com/examples/concepts/knowledge/filters/vector-dbs/filtering_milvus_db

Learn how to filter knowledge base searches using Pdf documents with user-specific metadata in MilvusDB.

Code

```
from agno.agent import Agent

Learn how to filter knowledge base searches using Pdf documents with user-specific metadata in SurrealDB.

Code

```
from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.utils.media import (
    SampleDataFileExtension,
    download_knowledge_filters_sample_data,
)
from agno.vectordb.surrealdb import SurrealDb
from surrealdb import Surreal
```

SurrealDB connection parameters

```
SURREALDB_URL = "ws://localhost:8000"
SURREALDB_USER = "root"
SURREALDB_PASSWORD = "root"
SURREALDB_NAMESPACE = "test"
SURREALDB_DATABASE = "test"
```

Download all sample CVs and get their paths

```
downloaded_cv_paths = download_knowledge_filters_sample_data(
    num_files=5, file_extension=SampleDataFileExtension.PDF
)
```

Create a client

```
client = Surreal(url=SURREALDB_URL)
client.signin({"username": SURREALDB_USER, "password": SURREALDB_PASSWORD})
client.use(namespace=SURREALDB_NAMESPACE, database=SURREALDB_DATABASE)
```

```
vector_db = SurrealDb(
    client=client,
    collection="recipes", # Collection name for storing documents
    efc=150, # HNSW construction time/accuracy trade-off
    m=12, # HNSW max number of connections per element
    search_ef=40, # HNSW search time/accuracy trade-off
)
```

Step 1: Initialize knowledge base with documents and metadata

When initializing the knowledge base, we can attach metadata that will be used for filtering

This metadata can include user IDs, document types, dates, or any other attributes

```
knowledge = Knowledge(
    vector_db=vector_db,
)

knowledge.add_contents(
    [
        {
            "path": downloaded_cv_paths[0],
            "metadata": {
                "user_id": "jordan_mitchell",
                "document_type": "cv",
                "year": 2025,
            },
        },
        {
            "path": downloaded_cv_paths[1],
            "metadata": {
                "user_id": "taylor_brooks",
                "document_type": "cv",
                "year": 2025,
            },
        },
        {
            "path": downloaded_cv_paths[2],
            "metadata": {
                "user_id": "morgan_lee",
                "document_type": "cv",
                "year": 2025,
            },
        },
        {
            "path": downloaded_cv_paths[3],
            "metadata": {
                "user_id": "casey_jordan",
                "document_type": "cv",
                "year": 2025,
            },
        },
        {
            "path": downloaded_cv_paths[4],
            "metadata": {
                "user_id": "alex_rivera",
                "document_type": "cv",
                "year": 2025,
            },
        },
    ],
)
```

Step 2: Query the knowledge base with different filter combinations

Option 1: Filters on the Agent

Initialize the Agent with the knowledge base and filters

```
agent = Agent(
    knowledge=knowledge,
    search_knowledge=True,
    debug_mode=True,
)

agent.print_response(
    "Tell me about Jordan Mitchell's experience and skills",
    knowledge_filters={"user_id": "jordan_mitchell"},
    markdown=True,
)
```

Usage

****Step: Install libraries****

```
pip install -U agno surrealdb openai
```

****Step: Set environment variables****

```
export OPENAI_API_KEY=xxx
```

****Step: Run SurrealDB****

```
docker run --rm --pull always -p 8000:8000 surrealdb/surrealdb:latest start --user
root --pass root
```

****Step: Run the example****

```
python cookbook/knowledge/filters/vector_dbs/filtering_surrealdb.py
```

```
python cookbook/knowledge/filters/vector_dbs/filtering_surrealdb.py
```

Filtering on Weaviate

Source: https://docs.agno.com/examples/concepts/knowledge/filters/vector-dbs/filtering_weaviate

Learn how to filter knowledge base searches using Pdf documents with user-specific metadata in Weaviate.

Code

```
from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.utils.media import (
    SampleDataFileExtension,
    download_knowledge_filters_sample_data,
)
from agno.vectordb.weaviate import Distance, VectorIndex, Weaviate
```

Download all sample CVs and get their paths

```
downloaded_cv_paths = download_knowledge_filters_sample_data(
    num_files=5, file_extension=SampleDataFileExtension.PDF
)
```

Step 1: Initialize knowledge with documents and metadata

When initializing the knowledge, we can attach metadata that will be used for filtering

This metadata can include user IDs, document types, dates, or any other attributes

```
vector_db = Weaviate(
    collection="recipes",
    vector_index=VectorIndex.HNSW,
    distance=Distance.COSINE,
    local=False, # Set to False if using Weaviate Cloud and True if using local instance
)

knowledge = Knowledge(
    name="Weaviate Knowledge Base",
    description="A knowledge base for Weaviate",
    vector_db=vector_db,
)

knowledge.add_contents(
    [
```

```

    {
        "path": downloaded_cv_paths[0],
        "metadata": {
            "user_id": "jordan_mitchell",
            "document_type": "cv",
            "year": 2025,
        },
    },
    {
        "path": downloaded_cv_paths[1],
        "metadata": {
            "user_id": "taylor_brooks",
            "document_type": "cv",
            "year": 2025,
        },
    },
    {
        "path": downloaded_cv_paths[2],
        "metadata": {
            "user_id": "morgan_lee",
            "document_type": "cv",
            "year": 2025,
        },
    },
    {
        "path": downloaded_cv_paths[3],
        "metadata": {
            "user_id": "casey_jordan",
            "document_type": "cv",
            "year": 2025,
        },
    },
    {
        "path": downloaded_cv_paths[4],
        "metadata": {
            "user_id": "alex_rivera",
            "document_type": "cv",
            "year": 2025,
        },
    },
]
)

```

Step 2: Query the knowledge base with different filter combinations

```

agent = Agent(
    knowledge=knowledge,

```

```

        search_knowledge=True,
    )

    agent.print_response(
        "Tell me about Jordan Mitchell's experience and skills",
        knowledge_filters={"user_id": "jordan_mitchell"},
        markdown=True,
    )

```

Usage

****Step: Install libraries****

```
pip install -U agno weaviate-client openai
```

****Step: Set environment variables****

```
export OPENAI_API_KEY=xxx
```

****Step: Setup Weaviate****

- 1. Create account at <https://console.weaviate.cloud/>**
- 2. Create a cluster and copy the "REST endpoint" and "Admin" API Key**
- 3. Set environment variables:**

```
export WCD_URL="your-cluster-url"
export WCD_API_KEY="your-api-key"
```

- 4. Set local=False in the code**

1. Install Docker from <https://docs.docker.com/get-docker/>

- 2. Run Weaviate locally:**

```
docker run -d \
  -p 8080:8080 \
  -p 50051:50051 \
  --name weaviate \
  cr.weaviate.io/semitechnologies/weaviate:1.28.4
```

- 3. Set local=True in the code**

****Step: Run the example****

```
python cookbook/knowledge/filters/vector_dbs/filtering_we
aviate.py
```

```
python cookbook/knowledge/filters/vector_dbs/filtering_we
aviate.py
```

```

# ArXiv Reader
```

```
Source: https://docs.agno.com/examples/concepts/knowledge/readers/arxiv/arxiv-reader
```

The ****ArXiv Reader**** allows you to search and read academic papers from the ArXiv preprint repository, converting them into vector embeddings for your knowledge base.

```
## Code
```

```
from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.knowledge.reader.arxiv_reader import ArxivReader
from agno.vectordb.pgvector import PgVector
```

```
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
```

Create a knowledge base with the ArXiv documents

```
knowledge = Knowledge(
```

Table name: ai.arxiv_documents

```
    vector_db=PgVector(
        table_name="arxiv_documents",
        db_url=db_url,
    ),
)
```

Load the knowledge

```
knowledge.add_content(
    topics=["Generative AI", "Machine Learning"],
    reader=ArxivReader(),
)
```

Create an agent with the knowledge

```
agent = Agent(
    knowledge=knowledge,
```

```
        search_knowledge=True,  
)
```

Ask the agent about the knowledge

```
agent.print_response("What can you tell me about Generative AI?", markdown=True)
```

```
## Usage
```

```

# ArXiv Reader Async
```

```
Source: https://docs.agno.com/examples/concepts/knowledge/readers/arxiv/arxiv-reader-async
```

The **ArXiv Reader** with asynchronous processing allows you to search and read academic papers from the ArXiv preprint repository with better performance for concurrent operations.

```
## Code
```

```
import asyncio
```

```
from agno.agent import Agent
```

```
from agno.knowledge.knowledge import Knowledge
```

```
from agno.knowledge.reader.arxiv_reader import ArxivReader
```

```
from agno.vectordb.pgvector import PgVector
```

```
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
```

```
knowledge = Knowledge(
```

Table name: ai.arxiv_documents

```
    vector_db=PgVector(
        table_name="arxiv_documents",
        db_url=db_url,
    ),
)
```

Create an agent with the knowledge

```
agent = Agent(
    knowledge=knowledge,
    search_knowledge=True,
)
```

```
def main():
```

Load the knowledge

```
    asyncio.run(
        knowledge.add_content_async(
            topics=["Generative AI", "Machine Learning"],
            reader=ArxivReader(),
        )
    )
```

Create and use the agent

```
    asyncio.run(
        agent.aprint_response(
            "What can you tell me about Generative AI?", markdown=True
        )
    )
```

```
if name == "main":
```

```
    main()
```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
    pip install -U arxiv sqlalchemy psycopg pgvector agno
```

```
> **Snippet file:** "run-pgvector-step.mdx"
```

```
**Step: Run Agent**
```

```
    python examples/concepts/knowledge/readers/arxiv_reader_a
```

sync.py

```
python examples/concepts/knowledge/readers/arxiv_reader_a
sync.py
```

ArXiv Reader Params

```

CSV Reader

Source: <https://docs.agno.com/examples/concepts/knowledge/readers/csv/csv-reader>

The **CSV Reader** processes local CSV files and converts them into documents that can be used with Agno's knowledge system.

Code

```
from pathlib import Path
```

```
from agno.knowledge.reader.csv_reader import CSVReader
```

```
reader = CSVReader()
```

```
csv_path = Path("tmp/test.csv")
```

```
try:
```

```
    print("Starting read...")
    documents = reader.read(csv_path)
```

```
    if documents:
```

```
        for doc in documents:
            print(doc.name)
```

```
print(doc.content)
```

```
    print(f"Content length: {len(doc.content)}")
    print("-" * 80)
```

```
else:
```

```
    print("No documents were returned")
```

```
except Exception as e:
```

```
    print(f"Error type: {type(e)}")
    print(f"Error occurred: {str(e)}")
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U pandas agno
```

****Step: Run Agent****

```
python examples/concepts/knowledge/readers/csv_reader.py
```

```
python examples/concepts/knowledge/readers/csv_reader.py
```

Params

```

```

CSV Reader Async

Source: <https://docs.agno.com/examples/concepts/knowledge/readers/csv/csv-reader-async>

The ****CSV Reader**** with asynchronous processing allows you to handle CSV files and integrate them with knowledge bases efficiently.

Code

```
import asyncio
```

```
from pathlib import Path
```

```
from agno.agent import Agent
```

```
from agno.knowledge.knowledge import Knowledge
```

```
from agno.vectordb.pgvector import PgVector
```

```
db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"
```

```
knowledge = Knowledge(  
    vector_db=PgVector(  
        table_name="csv_documents",  
        db_url=db_url,  
    ),  
    max_results=5, # Number of results to return on search  
)
```

Initialize the Agent with the knowledge

```
agent = Agent(  
    knowledge=knowledge,  
    search_knowledge=True,  
)
```

```
if name == "main":
```

Comment out after first run

```
    asyncio.run(knowledge.add_content_async(path=Path(
```

```
"data/csv"))))
```

Create and use the agent

```
asyncio.run(agent.aprint_response("What is the csv file about", markdown=True))
```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U pandas sqlalchemy psycopg pgvector agno
```

```

PDF Password Reader

Source: <https://docs.agno.com/examples/concepts/knowledge/readers/pdf/pdf-password-reader>

The ****PDF Password Reader**** handles password-protected PDF files, allowing you to process secure documents and convert them into searchable knowledge bases.

Code

```

from agno.agent import Agent
from agno.knowledge.content import ContentAuth
from agno.knowledge.knowledge import Knowledge
from agno.utils.media import download_file
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
download_file(
    "https://agno-public.s3.us-east-1.amazonaws.com/re
cipes/ThaiRecipes_protected.pdf",
    "ThaiRecipes_protected.pdf",
)

```

Create a knowledge base with simplified password handling

```

knowledge = Knowledge(
    vector_db=PgVector(
        table_name="pdf_documents_password",
        db_url=db_url,
    ),
)

knowledge.add_content(
    path="ThaiRecipes_protected.pdf",
    auth=ContentAuth(password="ThaiRecipes"),
)

```

Create an agent with the knowledge base

```

agent = Agent(
    knowledge=knowledge,
    search_knowledge=True,
)

```

```
agent.print_response("Give me the recipe for pad thai")
```

Usage

```

```

```
# PDF Reader
```

```
Source: https://docs.agno.com/examples/concepts/knowledge/  
readers/pdf/pdf-reader
```

The **PDF Reader** processes PDF files synchronously and converts them into documents that can be used with Agno's knowledge system.

```
## Code
```

```
from agno.agent import Agent  
from agno.knowledge.knowledge import Knowledge  
from agno.knowledge.reader.pdf_reader import PDFReader  
from agno.vectordb.pgvector import PgVector
```

```
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
```

Create a knowledge base with PDF documents

```
knowledge = Knowledge(  
    vector_db=PgVector(  
        table_name="pdf_documents",  
        db_url=db_url,  
    )  
)
```

Add PDF content synchronously

```
knowledge.add_content(  
    path="cookbook/knowledge/testing_resources/cv_1.pd  
f",  
    reader=PDFReader(),  
)
```

Create an agent with the knowledge base

```
agent = Agent(
    knowledge=knowledge,
    search_knowledge=True,
)
```

Query the knowledge base

```
agent.print_response(
    "What skills does an applicant require to apply for the Software Engineer position?",
    markdown=True,
)
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Install libraries****

```
pip install -U pypdf sqlalchemy psycopg pgvector agno openai
```

****Step: Set environment variables****

```
export OPENAI_API_KEY=xxx
```

```
> **Snippet file:** "run-pgvector-step.mdx"
```

****Step: Run Agent****

```
python examples/concepts/knowledge/readers/pdf_reader_syn
c.py
```

```
python examples/concepts/knowledge/readers/pdf_reader_syn
c.py
```

Params

```
> **Snippet file:** "pdf-reader-reference.mdx"
```

PDF Reader Async

Source: <https://docs.agno.com/examples/concepts/knowledge/readers/pdf/pdf-reader-async>

The ****PDF Reader**** with asynchronous processing allows you to handle PDF files efficiently and integrate them with knowledge bases.

Code

```
import asyncio
```

```

from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

```

Create a knowledge base with the PDFs from the data/pdfs directory

```

knowledge = Knowledge(
    vector_db=PgVector(
        table_name="pdf_documents",
        db_url=db_url,
    )
)

```

Create an agent with the knowledge base

```

agent = Agent(
    knowledge=knowledge,
    search_knowledge=True,
)

if name == "main":
    asyncio.run(
        knowledge.add_content_async(
            path="cookbook/knowledge/testing_resources/cv_1.pdf",
        )
    )

```

Create and use the agent

```

asyncio.run(
    agent.aprint_response(
        "What skills does an applicant require to apply for the Software Engineer position?",
        markdown=True,
    )
)

```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Install libraries****

```
pip install -U pypdf sqlalchemy psycopg pgvector agno openai
```

****Step: Set environment variables****

```
export OPENAI_API_KEY=xxx
```

```
> **Snippet file:** "run-pgvector-step.mdx"
```

```
**Step: Run Agent**
```

```
python examples/concepts/knowledge/readers/pdf_reader_async.py
```

```
python examples/concepts/knowledge/readers/pdf_reader_async.py
```

```
## Params
```

```
> **Snippet file:** "pdf-reader-reference.mdx"
```

```
# PDF URL Password Reader
```

```
Source: https://docs.agno.com/examples/concepts/knowledge/readers/pdf/pdf-url-password-reader
```

The **PDF URL Password Reader** processes password-protected PDF files directly from URLs, allowing you to handle secure remote documents.

```
## Code
```

```
from agno.agent import Agent
from agno.knowledge.content import ContentAuth
from agno.knowledge.knowledge import Knowledge
from agno.vectordb.pgvector import PgVector
```

```
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
```

Create a knowledge base with simplified password handling

```
knowledge = Knowledge(
    vector_db=PgVector(
        table_name="pdf_documents_password",
        db_url=db_url,
    ),
)

knowledge.add_content(
    url="https://agno-public.s3.us-east-1.amazonaws.com/recipes/ThaiRecipes-protected.pdf",
    auth=ContentAuth(password="ThaiRecipes"),
)
```

Create an agent with the knowledge

```
agent = Agent(  
    knowledge=knowledge,  
    search_knowledge=True,  
)
```

```
agent.print_response("Give me the recipe for pad thai")
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U pypdf requests sqlalchemy psycopg pgvector agno openai
```

```
**Step: Set environment variables**
```

```
export OPENAI_API_KEY=xxx
```

```
> **Snippet file:** "run-pgvector-step.mdx"
```

```
**Step: Run Agent**
```

```
python examples/concepts/knowledge/readers/pdf_reader_url  
_password.py
```

```
python examples/concepts/knowledge/readers/pdf_reader_url  
_password.py
```

Params

```
> **Snippet file:** "pdf-reader-reference.mdx"
```

PPTX Reader

Source: <https://docs.agno.com/examples/concepts/knowledge/readers/pptx/pptx-reader>

The **PPTX Reader** allows you to read and extract text content from PowerPoint (.pptx) files, converting them into vector embeddings for your knowledge base.

Code

```
from agno.agent import Agent  
from agno.knowledge.knowledge import Knowledge  
from agno.knowledge.reader.pptx_reader import PPTXReader  
from agno.vectordb.pgvector import PgVector
```

```
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
```

Create a knowledge base with the PPTX documents

```
knowledge = Knowledge(
```

Table name: ai.pptx_documents

```
    vector_db=PgVector(
        table_name="pptx_documents",
        db_url=db_url,
    ),
)
```

Load the knowledge

```
knowledge.add_content(
    path="data/pptx_files",
    reader=PPTXReader(),
)
```

Create an agent with the knowledge

```
agent = Agent(
    knowledge=knowledge,
    search_knowledge=True,
)
```

Ask the agent about the knowledge

```
agent.print_response("What can you tell me about the content in these PowerPoint presentations?",
    markdown=True)
```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
    pip install -U python-pptx sqlalchemy psycopg pgvector agno
```

```
> **Snippet file:** "run-pgvector-step.mdx"
```

```
**Step: Run Agent**
```

```
    python pptx_reader.py
```

```
    python pptx_reader.py
```

```
## Params
```

```
> **Snippet file:** "pptx-reader-reference.mdx"
```

```
# PPTX Reader Async
```

```
Source: https://docs.agno.com/examples/concepts/knowledge/readers/pptx/pptx-reader-async
```

The **PPTX Reader** with asynchronous processing allows you to read and extract text content from PowerPoint (.pptx) files with better performance for concurrent operations.

```
## Code
```

```
import asyncio
```

```
from agno.agent import Agent
```

```
from agno.knowledge.knowledge import Knowledge
```

```
from agno.knowledge.reader.pptx_reader import PPTXReader
```

```
from agno.vectordb.pgvector import PgVector
```

```
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
```

```
knowledge = Knowledge(
```

Table name: ai.pptx_documents

```
    vector_db=PgVector(
        table_name="pptx_documents",
        db_url=db_url,
    ),
)
```

Create an agent with the knowledge

```
agent = Agent(
    knowledge=knowledge,
    search_knowledge=True,
)
```

```
def main():
```

Load the knowledge

```
    asyncio.run(
        knowledge.add_content_async(
            path="data/pptx_files",
            reader=PPTXReader(),
        )
    )
```

Create and use the agent

```
    asyncio.run(
        agent.aprint_response(
```

```

        "What can you tell me about the content in these PowerPoint presentations?",
markdown=True
    )
)

if name == "main":
    main()

## Usage

> **Snippet file:** "create-venv-step.mdx"

**Step: Install libraries**

    pip install -U python-pptx sqlalchemy psycopg pgvector agno

> **Snippet file:** "run-pgvector-step.mdx"

**Step: Run Agent**

    python pptx_reader_async.py

    python pptx_reader_async.py

## PPTX Reader Params

> **Snippet file:** "pptx-reader-reference.mdx"

# Web Search Reader
Source: https://docs.agno.com/examples/concepts/knowledge/readers/web-search/web-search-reader

The **Web Search Reader** searches and reads web search results, converting them into
vector embeddings for your knowledge base.

## Code

from agno.agent import Agent
from agno.db.postgres.postgres import PostgresDb
from agno.knowledge.embedder.openai import OpenAIEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.knowledge.reader.web_search_reader import WebSearchReader
from agno.models.openai import OpenAIChat
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
db = PostgresDb(id="web-search-db", db_url=db_url)

```

```
vector_db = PgVector(
    db_url=db_url,
    table_name="web_search_documents",
)
knowledge = Knowledge(
    name="Web Search Documents",
    contents_db=db,
    vector_db=vector_db,
)
```

Load knowledge from web search

```
knowledge.add_content(
    topics=["agno"],
    reader=WebSearchReader(
        max_results=3,
        search_engine="duckduckgo",
        chunk=True,
    ),
)
```

Create an agent with the knowledge

```
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    knowledge=knowledge,
    search_knowledge=True,
    debug_mode=True,
)
```

Ask the agent about the knowledge

```
agent.print_response(
    "What are the latest AI trends according to the search results?", markdown=True
)
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U requests beautifulsoup4 agno openai
```

```
> **Snippet file:** "run-pgvector-step.mdx"
```

```
**Step: Set environment variables**
```

```
export OPENAI_API_KEY=xxx
```

```

```
# YouTube Reader (Async)
```

```
Source: https://docs.agno.com/examples/concepts/knowledge/  
readers/youtube/youtube-reader-async
```

The **YouTube Reader** allows you to extract transcripts from YouTube videos and convert them into vector embeddings for your knowledge base.

```
## Code
```

```
import asyncio
```

```
from agno.agent import Agent
```

```
from agno.knowledge.knowledge import Knowledge
```

```
from agno.knowledge.reader.youtube_reader import YouTubeReader
```

```
from agno.vectordb.pgvector import PgVector
```

```
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
```

Create Knowledge Instance

```
knowledge = Knowledge(  
    name="YouTube Knowledge Base",
```

```

        description="Knowledge base from YouTube video transcripts",
        vector_db=PgVector(
            table_name="youtube_vectors",
            db_url=db_url
        ),
    )
)

```

Create an agent with the knowledge

```

agent = Agent(
    knowledge=knowledge,
    search_knowledge=True,
)

```

```

async def main():

```

Add YouTube video content

```

    await knowledge.add_content_async(
        metadata={"source": "youtube", "type": "educational"},
        urls=[
            "https://www.youtube.com/watch?v=dQw4w9WgXcQ",  # Replace with actual
educational video
            "https://www.youtube.com/watch?v=example123"  # Replace with actual video URL
        ],
        reader=YouTubeReader(),
    )

```

Query the knowledge base

```

    await agent.aprint_response(
        "What are the main topics discussed in the videos?",
        markdown=True
    )

```

```

if name == "main":
    asyncio.run(main())

```

Usage

```

> **Snippet file:** "create-venv-step.mdx"

```

```

**Step: Install libraries**

```

```

    pip install -U youtube-transcript-api pytube sqlalchemy psycopg pgvector agno openai

```

```

**Step: Set environment variables**

```

```

    export OPENAI_API_KEY=xxx

```

```

> **Snippet file:** "run-pgvector-step.mdx"

```

****Step: Run Agent****

```
python examples/concepts/knowledge/readers/youtube_reader
.py
```

```
python examples/concepts/knowledge/readers/youtube_reader
.py
```

Params

```
> **Snippet file:** "youtube-reader-reference.mdx"
```

GCS Content

Source: <https://docs.agno.com/examples/concepts/knowledge/remote-content/gcs-content>

This example shows how to add content from a Google Cloud Storage (GCS) bucket to your knowledge base. This allows you to process documents stored in Google Cloud without downloading them locally.

Code

"""This cookbook shows how to add content from a GCS bucket to the knowledge base.

1. Run: `python cookbook/agent_concepts/knowledge/12_from_gcs.py` to run the cookbook

"""

```
import asyncio
```

```
from agno.agent import Agent
```

```
from agno.db.postgres import PostgresDb
```

```
from agno.knowledge.knowledge import Knowledge
```

```
from agno.knowledge.remote_content.remote_content import GCSCContent
```

```
from agno.vectordb.pgvector import PgVector
```

```
contents_db = PostgresDb(
```

```
    db_url="postgresql+psycpg://ai:ai@localhost:5532/
ai",
```

```
    knowledge_table="knowledge_contents",
```

```
)
```

Create Knowledge Instance

```
knowledge = Knowledge(
```

```
    name="Basic SDK Knowledge Base",
```

```
    description="Agno 2.0 Knowledge Implementation",
```

```
    contents_db=contents_db,
```

```
    vector_db=PgVector(
```

```
        table_name="vectors", db_url="postgresql+psycpg://ai:ai@localhost:5532/
```

```
ai"
    ),
)
```

Add from GCS

```
asyncio.run(
    knowledge.add_content_async(
        name="GCS PDF",
        remote_content=GCSCContent(
            bucket_name="thai-recepies", blob_name="ThaiRecipes.pdf"
        ),
        metadata={"remote_content": "GCS"},
    )
)
```

```
agent = Agent(
    name="My Agent",
    description="Agno 2.0 Agent Implementation",
    knowledge=knowledge,
    search_knowledge=True,
    debug_mode=True,
)
```

```
agent.print_response(
    "What is the best way to make a Thai curry?",
    markdown=True,
)
```

Usage

****Step: Install libraries****

```
pip install -U agno sqlalchemy psycopg pgvector google-cloud-storage
```

****Step: Configure Google Cloud credentials****

Set up your GCS credentials using one of these methods:

- * Service Account Key: Set `GOOGLE\_APPLICATION\_CREDENTIALS` environment variable
- * gcloud CLI: `gcloud auth application-default login`
- * Workload Identity (if running on Google Cloud)

> ****Snippet file:**** "run-pgvector-step.md"

****Step: Run the example****

```
python cookbook/knowledge/basic_operations/07_from_gcs.py
```

```
python cookbook/knowledge/basic_operations/07_from_gcs.py
```

```
## Params
```

> **Snippet file:** "gcs-remote-content-params.mdx"
```

```
# S3 Content
```

```
Source: https://docs.agno.com/examples/concepts/knowledge/remote-content/s3-content
```

This example shows how to add content from an Amazon S3 bucket to your knowledge base. This allows you to process documents stored in cloud storage without downloading them locally.

```
## Code
```

```
import asyncio
from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.knowledge.knowledge import Knowledge
from agno.knowledge.remote_content.remote_content import S3Content
from agno.vectordb.pgvector import PgVector
```

```
contents_db = PostgresDb(
    db_url="postgresql+psycopg://ai:ai@localhost:5532/ai",
    knowledge_table="knowledge_contents",
)
```

Create Knowledge Instance

```
knowledge = Knowledge(
    name="Basic SDK Knowledge Base",
    description="Agno 2.0 Knowledge Implementation",
    contents_db=contents_db,
    vector_db=PgVector(
        table_name="vectors", db_url="postgresql+psycopg://ai:ai@localhost:5532/ai"
    ),
)
```

Add from S3 bucket

```
asyncio.run(
    knowledge.add_content_async(
        name="S3 PDF",
        remote_content=S3Content(
            bucket_name="agno-public", key="recipes/ThaiRecipes.pdf"
        ),
        metadata={"remote_content": "S3"},
    )
)
```

```

    )
)

agent = Agent(
    name="My Agent",
    description="Agno 2.0 Agent Implementation",
    knowledge=knowledge,
    search_knowledge=True,
    debug_mode=True,
)

agent.print_response(
    "What is the best way to make a Thai curry?",
    markdown=True,
)

## Usage

**Step: Install libraries**

    pip install -U agno sqlalchemy psycopg pgvector boto3

**Step: Configure AWS credentials**

    Set up your AWS credentials using one of these methods:

    * AWS CLI: `aws configure`
    * Environment variables: `AWS_ACCESS_KEY_ID` and `AWS_SECRET_ACCESS_KEY`
    * IAM roles (if running on AWS infrastructure)

> **Snippet file:** "run-pgvector-step.md"

**Step: Run the example**

    python cookbook/knowledge/basic_operations/06_from_s3.py

    python cookbook/knowledge/basic_operations/06_from_s3.py

## Params

```

Agent with Memory

Source: <https://docs.agno.com/examples/concepts/memory/01-agent-with-memory>

This example shows you how to use persistent memory with an Agent.

After each run, user memories are created/updated.

To enable this, set `enable\_user\_memories=True` in the Agent config.

Code

```

from uuid import uuid4

```

```

from agno.agent.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.openai import OpenAIChat
from rich.pretty import pprint

```

```

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

db = PostgresDb(db_url=db_url)

db.clear_memories()

session_id = str(uuid4())
john_doe_id = "john_doe@example.com"

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    enable_user_memories=True,
)

agent.print_response(
    "My name is John Doe and I like to hike in the mountains on weekends.",
    stream=True,
    user_id=john_doe_id,
    session_id=session_id,
)

agent.print_response(
    "What are my hobbies?", stream=True, user_id=john_doe_id, session_id=session_id
)

memories = agent.get_user_memories(user_id=john_doe_id)
print("John Doe's memories:")
pprint(memories)

agent.print_response(
    "Ok i dont like hiking anymore, i like to play soccer instead.",
    stream=True,
    user_id=john_doe_id,
    session_id=session_id,
)

```

You can also get the user memories from the agent

```

memories = agent.get_user_memories(user_id=john_doe_id)
print("John Doe's memories:")
pprint(memories)

```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
pip install -U agno
```

****Step: Run Example****

```
python cookbook/memory/01_agent_with_memory.py
```

```
python cookbook/memory/01_agent_with_memory.py
```

Agentic Memory

Source: <https://docs.agno.com/examples/concepts/memory/02-agentic-memory>

This example shows you how to use persistent memory with an Agent.

During each run the Agent can create/update/delete user memories.

To enable this, set `enable\_agentic\_memory=True` in the Agent config.

Code

```
from agno.agent.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.openai import OpenAIChat
from rich.pretty import pprint

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

db = PostgresDb(db_url=db_url)

john_doe_id = "john_doe@example.com"

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    enable_agentic_memory=True,
)

agent.print_response(
    "My name is John Doe and I like to hike in the mountains on weekends.",
    stream=True,
    user_id=john_doe_id,
)

agent.print_response("What are my hobbies?", stream=True, user_id=john_doe_id)

memories = agent.get_user_memories(user_id=john_doe_id)
print("Memories about John Doe:")
pprint(memories)
```

```

agent.print_response(
    "Remove all existing memories of me.",
    stream=True,
    user_id=john_doe_id,
)

memories = agent.get_user_memories(user_id=john_doe_id)
print("Memories about John Doe:")
pprint(memories)

agent.print_response(
    "My name is John Doe and I like to paint.", stream=True, user_id=john_doe_id
)

memories = agent.get_user_memories(user_id=john_doe_id)
print("Memories about John Doe:")
pprint(memories)

agent.print_response(
    "I don't paint anymore, i draw instead.", stream=True, user_id=john_doe_id
)

memories = agent.get_user_memories(user_id=john_doe_id)

print("Memories about John Doe:")
pprint(memories)

```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Install libraries****

```
pip install -U agno
```

****Step: Run Example****

```
python cookbook/memory/02_agentic_memory.py
```

```
python cookbook/memory/02_agentic_memory.py
```

Share Memory between Agents

Source: <https://docs.agno.com/examples/concepts/memory/03-agents-share-memory>

This example demonstrates how to share memory between Agents.

This means that memories created by one Agent, will be available to the other Agents.

```
## Code
```

```
from agno.agent.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
from rich.pretty import pprint

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

db = PostgresDb(db_url=db_url)

john_doe_id = "john_doe@example.com"

chat_agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    description="You are a helpful assistant that can chat with users",
    db=db,
    enable_user_memories=True,
)

chat_agent.print_response(
    "My name is John Doe and I like to hike in the mountains on weekends.",
    stream=True,
    user_id=john_doe_id,
)

chat_agent.print_response("What are my hobbies?", stream=True, user_id=john_doe_id)

research_agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    description="You are a research assistant that can help users with their research questions",
    tools=[DuckDuckGoTools(cache_results=True)],
    db=db,
    enable_user_memories=True,
)

research_agent.print_response(
    "I love asking questions about quantum computing. What is the latest news on quantum computing?",
    stream=True,
    user_id=john_doe_id,
)

memories = research_agent.get_user_memories(user_id=john_doe_id)
print("Memories about John Doe:")
```

```
pprint(memories)
```

```
## Usage
```

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install libraries**
```

```
    pip install -U agno rich
```

```
**Step: Run Example**
```

```
    python cookbook/memory/03_agents_share_memory.py
```

```
    python cookbook/memory/03_agents_share_memory.py
```

```
# Custom Memory Manager
```

```
Source: https://docs.agno.com/examples/concepts/memory/04-custom-memory-manager
```

This example shows how you can configure the Memory Manager.

We also set custom system prompts for the memory manager. You can either override the entire system prompt or add additional instructions which is added to the end of the system prompt.

```
## Code
```

```
from agno.agent.agent import Agent
from agno.db.postgres import PostgresDb
from agno.memory import MemoryManager
from agno.models.openai import OpenAIChat
from rich.pretty import pprint
```

```
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
```

```
db = PostgresDb(db_url=db_url)
```

You can also override the entire system_message for the memory manager

```
memory_manager = MemoryManager(
    model=OpenAIChat(id="gpt-5-mini"),
    additional_instructions="""
    IMPORTANT: Don't store any memories about the user's name. Just say "The User" instead
    of referencing the user's name.
    """,
```

```

        db=db,
    )

john_doe_id = "john_doe@example.com"

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    memory_manager=memory_manager,
    enable_user_memories=True,
    user_id=john_doe_id,
)

agent.print_response(
    "My name is John Doe and I like to swim and play soccer.", stream=True
)

agent.print_response("I dont like to swim", stream=True)

memories = agent.get_user_memories(user_id=john_doe_id)

print("John Doe's memories:")
pprint(memories)

```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

****Step: Install libraries****

```
pip install -U agno
```

****Step: Run Example****

```
python cookbook/memory/04_custom_memory_manager.py
```

```
python cookbook/memory/04_custom_memory_manager.py
```

Multi-user, Multi-session Chat

Source: <https://docs.agno.com/examples/concepts/memory/05-multi-user-multi-session-chat>

This example demonstrates how to run a multi-user, multi-session chat.

Code

```
"""
```

In this example, we have 3 users and 4 sessions.

User 1 has 2 sessions.

User 2 has 1 session.

User 3 has 1 session.

.....

```
import asyncio
```

```
from agno.agent.agent import Agent
```

```
from agno.db.postgres import PostgresDb
```

```
from agno.models.openai import OpenAIChat
```

```
db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"
```

```
db = PostgresDb(db_url=db_url)
```

```
user_1_id = "user_1@example.com"
```

```
user_2_id = "user_2@example.com"
```

```
user_3_id = "user_3@example.com"
```

```
user_1_session_1_id = "user_1_session_1"
```

```
user_1_session_2_id = "user_1_session_2"
```

```
user_2_session_1_id = "user_2_session_1"
```

```
user_3_session_1_id = "user_3_session_1"
```

```
chat_agent = Agent(
```

```
    model=OpenAIChat(id="gpt-5-mini"),
```

```
    db=db,
```

```
    enable_user_memories=True,
```

```
)
```

```
async def run_chat_agent():

# Share Memory and History between Agents
```

```
Source: https://docs.agno.com/examples/concepts/memory/07-share-memory-and-history-between-agents
```

This example shows how to share memory and history between agents.

You can set ``add_history_to_context=True`` to add the history to the context of the agent.

You can set ``enable_user_memories=True`` to enable user memory generation at the end of each run.

```
## Code
```

```
from uuid import uuid4
```

```
from agno.agent import Agent
```

```
from agno.db.sqlite import SQLiteDatabase
```

```
from agno.models.openai import OpenAIChat
```

```
db = SQLiteDatabase(db_file="tmp/agent_sessions.db")
```

```
session_id = str(uuid4())
```

```
user_id = "john_doe@example.com"
```

```
agent_1 = Agent(
```

```
    model=OpenAIChat(id="gpt-5-mini"),
```

```
    instructions="You are really friendly and helpful.",
```

```
    db=db,
```

```
    add_history_to_context=True,
```

```
    enable_user_memories=True,
```

```

)

agent_2 = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    instructions="You are really grumpy and mean.",
    db=db,
    add_history_to_context=True,
    enable_user_memories=True,
)

agent_1.print_response(
    "Hi! My name is John Doe.", session_id=session_id, user_id=user_id
)

agent_2.print_response("What is my name?", session_id=session_id, user_id=user_id)

agent_2.print_response(
    "I like to hike in the mountains on weekends.",
    session_id=session_id,
    user_id=user_id,
)

agent_1.print_response("What are my hobbies?", session_id=session_id, user_id=user_id)

agent_1.print_response(
    "What have we been discussing? Give me bullet points.",
    session_id=session_id,
    user_id=user_id,
)

## Usage

Memory with Redis

Source: <https://docs.agno.com/examples/concepts/memory/db/mem-redis-memory>

Code

```
from agno.agent import Agent
from agno.db.redis import RedisDb
```

Setup Redis

Initialize Redis db (use the right db_url for your setup)

```
db = RedisDb(db_url="redis://localhost:6379")
```

Create agent with Redis db

```
agent = Agent(  
    db=db,  
    enable_user_memories=True,  
)
```

```
agent.print_response("My name is John Doe and I like to play basketball on the weekends.")
```

```
agent.print_response("What's do I do in weekends?")
```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Set environment variables**
```

```
export OPENAI_API_KEY=xxx
```

```
**Step: Install libraries**
```

```
pip install -U agno openai redis
```

```
**Step: Run Redis**
```

```
docker run --name my-redis -p 6379:6379 -d redis
```

```
**Step: Run Example**
```

```
python cookbook/memory/db/mem-redis-memory.py
```

```
python cookbook/memory/db/mem-redis-memory.py

Multimodal Query for Video Analysis

query = """

You are an expert in video content creation, specializing in crafting engaging short-form content for platforms like YouTube Shorts and Instagram Reels. Your task is to analyze the provided video and identify segments that maximize viewer engagement.

For each video, you'll:

1. Identify key moments that will capture viewers' attention, focusing on:
 - High-energy sequences
 - Emotional peaks
 - Surprising or unexpected moments
 - Strong visual and audio elements
 - Clear narrative segments with compelling storytelling
2. Extract segments that work best for short-form content, considering:
 - Optimal length (strictly 15-60 seconds)
 - Natural start and end points that ensure smooth transitions
 - Engaging pacing that maintains viewer attention
 - Audio-visual harmony for an immersive experience
 - Vertical format compatibility and adjustments if necessary
3. Provide a detailed analysis of each segment, including:
 - Precise timestamps (Start Time | End Time in MM:SS format)
 - A clear description of why the segment would be engaging
 - Suggestions on how to enhance the segment for short-form content
 - An importance score (1-10) based on engagement potential

Your goal is to identify moments that are visually compelling, emotionally engaging, and perfectly optimized for short-form platforms.

"""

Generate Video Analysis

```
response = agent.run(query, videos=[Video(content=video_file)])
```

Create output directory

```
output_dir = Path(output_dir)
output_dir.mkdir(parents=True, exist_ok=True)
```

Extract and cut video segments

```
def extract_segments(response_text):

Basic Reasoning Agent

Source: <https://docs.agno.com/examples/concepts/reasoning/agents/basic-cot>

This example demonstrates how to configure a basic Reasoning Agent, using the `reasoning=True` flag.

Code

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat

task = (
```

```

        "Analyze the key factors that led to the signing of the Treaty of Versailles in 1919.
"
        "Discuss the political, economic, and social impacts of the treaty on Germany and how
it "
        "contributed to the onset of World War II. Provide a nuanced assessment that includes
"
        "multiple historical perspectives."
)

```

```

reasoning_agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    reasoning=True, # The Agent will be able to reason.
    markdown=True,
)
reasoning_agent.print_response(task, stream=True, show_full_reasoning=True)

```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Set your API key**
```

```
export OPENAI_API_KEY=xxx
```

```

# Non-Reasoning Model Agent
Source: https://docs.agno.com/examples/concepts/reasoning/agents/non-reasoning-model

This example demonstrates how to use a non-reasoning model as a reasoning model.

For reasoning, we recommend using a Reasoning Agent (with `reasoning=True`), or to use an appropriate reasoning model with `reasoning_model=`.

## Code

from agno.agent import Agent
from agno.models.openai import OpenAIChat

reasoning_agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    reasoning_model=OpenAIChat(
        id="gpt-5-mini", # This model will be used for reasoning, although it is not a native reasoning model.
        max_tokens=1200,
    ),
    markdown=True,
)
reasoning_agent.print_response(

```

```

        "Give me steps to write a python script for fibonacci series",
        stream=True,
        show_full_reasoning=True,
    )

```

It uses the default model of the Agent

```

reasoning_agent = Agent(
    model=OpenAIChat(id="gpt-5-mini", max_tokens=1200),
    reasoning=True,
    markdown=True,
)

reasoning_agent.print_response(
    "Give me steps to write a python script for fibonacci series",
    stream=True,
    show_full_reasoning=True,
)

```

Usage

```

```

```
thinking_llama = Agent(  
    model=Groq(id="meta-llama/llama-4-scout-17b-16e-in  
struct"),  
    tools=[  
        ReasoningTools(),  
        DuckDuckGoTools(),  
    ],  
    instructions=dedent("""\
```

General Instructions

- Always start by using the think tool to map out the steps needed to complete the task.
- After receiving tool results, use the think tool as a scratchpad to validate the results for correctness
- Before responding to the user, use the think tool to jot down final thoughts and ideas.
- Present final outputs in well-organized tables whenever possible.

Using the think tool

At every step, use the think tool as a scratchpad to:

- Restate the object in your own words to ensure full comprehension.
- List the specific rules that apply to the current request
- Check if all required information is collected and is valid
- Verify that the planned action completes the task

```
        """),

# Reasoning Tools
```

```
Source: https://docs.agno.com/examples/concepts/reasoning/tools/reasoning-tools
```

This example shows how to setup a basic Reasoning Agent with `ReasoningTools`.

```
## Code
```

```
from textwrap import dedent
```

```
from agno.agent import Agent
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.tools.reasoning import ReasoningTools
```

```
reasoning_agent = Agent(  
    model=OpenAIChat(id="gpt-5-mini"),  
    tools=[ReasoningTools(add_instructions=True)],  
    instructions=dedent("""\n        You are an expert problem-solving assistant with strong analytical skills!
```

```
        Your approach to problems:
```

1. First, break down complex questions into component parts
2. Clearly state your assumptions
3. Develop a structured reasoning path
4. Consider multiple perspectives
5. Evaluate evidence and counter-arguments
6. Draw well-justified conclusions

```
        When solving problems:
```

- Use explicit step-by-step reasoning
- Identify key variables and constraints
- Explore alternative scenarios
- Highlight areas of uncertainty
- Explain your thought process clearly
- Consider both short and long-term implications

- Evaluate trade-offs explicitly

For quantitative problems:

- Show your calculations
- Explain the significance of numbers
- Consider confidence intervals when appropriate
- Identify source data reliability

For qualitative reasoning:

- Assess how different factors interact
- Consider psychological and social dynamics
- Evaluate practical constraints
- Address value considerations

```
\
"""),
add_datetime_to_context=True,
stream_events=True,
markdown=True,
)
```

Example usage with a complex reasoning problem

```
reasoning_agent.print_response(
    "Solve this logic puzzle: A man has to take a fox, a chicken, and a sack of grain across a river. "
    "The boat is only big enough for the man and one item. If left unattended together, the fox will "
    "eat the chicken, and the chicken will eat the grain. How can the man get everything across safely?",
    stream=True,
)
```

Economic analysis example

```
reasoning_agent.print_response(
    "Is it better to rent or buy a home given current interest rates, inflation, and market trends? "
    "Consider both financial and lifestyle factors in your analysis.",
    stream=True
)
```

Strategic decision-making example

```
reasoning_agent.print_response(
```

"A startup has \$500,000 in funding and needs to decide between spending it on marketing or "

"product development. They want to maximize growth and user acquisition within 12 months. "

"What factors should they consider and how should they analyze this decision?",

stream=True

)

Usage

> ****Snippet file:**** "create-venv-step.mdx"

****Step: Set your API key****

```
export OPENAI_API_KEY=xxx
```

****Step: Install libraries****

```
pip install -U openai agno
```

****Step: Run Example****

```
python cookbook/reasoning/tools/reasoning_tools.py
```

Async Collaborative Team

Source: https://docs.agno.com/examples/concepts/teams/async/async_delegate_to_all_members

This example demonstrates a collaborative team of AI agents working together asynchronously to research topics across different platforms.

Code

"""

This example demonstrates a collaborative team of AI agents working together to research topics across different platforms.

The team consists of two specialized agents:

1. Reddit Researcher - Uses DuckDuckGo to find and analyze relevant Reddit posts
2. HackerNews Researcher - Uses HackerNews API to find and analyze relevant HackerNews posts

The agents work in "collaborate" mode, meaning they:

- Both are given the same task at the same time
- Work towards reaching consensus through discussion
- Are coordinated by a team leader that guides the discussion

The team leader moderates the discussion and determines when consensus is reached.

This setup is useful for:

- Getting diverse perspectives from different online communities
- Cross-referencing information across platforms
- Having agents collaborate to form more comprehensive analysis
- Reaching balanced conclusions through structured discussion

.....

# Delegate to All Members (Cooperation)
```

```
Source: https://docs.agno.com/examples/concepts/teams/basic/delegate\_to\_all\_members\_cooperation
```

This example demonstrates a collaborative team of AI agents working together to research topics across different platforms.

The team consists of two specialized agents:

1. **Reddit Researcher** - Uses DuckDuckGo to find and analyze relevant Reddit posts
2. **HackerNews Researcher** - Uses HackerNews API to find and analyze relevant HackerNews posts

The agents work in "collaborate" mode by using `delegate\_task\_to\_all\_members=True`, meaning they:

- * Both are given the same task at the same time
- * Work towards reaching consensus through discussion
- * Are coordinated by a team leader that guides the discussion

The team leader moderates the discussion and determines when consensus is reached.

```

# Member-Level History

```

```

Source: https://docs.agno.com/examples/concepts/teams/basic/history\_of\_members

```

This example demonstrates a team where each member has access to its own history through `add\_history\_to\_context=True` set on individual agents.

Unlike team-level history, each member only has access to its own conversation history, not the history of other members or the team.

Use member-level history when:

- * Each member handles distinct, independent tasks
- * You don't need cross-member context sharing
- * Members should maintain isolated conversation threads
- * You want to minimize context size for each member

```
from uuid import uuid4

# Model Inheritance
Source: https://docs.agno.com/examples/concepts/teams/basic/model\_inheritance
```

This example demonstrates how agents automatically inherit the model from their parent team.

```
**When the Team has a model:**
```

```
* Agents without a model use the Team's `model`
* Agents with their own model keep their own model
* In nested teams, agents use the `model` from their direct parent team
* The `reasoning_model`, `parser_model`, and `output_model` must be set explicitly on each team member or team
```

```
**When the Team has no model:**
```

```
* The Team and all agents default to OpenAI `gpt-4o`
```

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.team.team import Team
```

These agents don't have models set

```
researcher = Agent(
    name="Researcher",
    role="Research and gather information",
    instructions=["Be thorough and detailed"],
)

writer = Agent(
    name="Writer",
    role="Write content based on research",
    instructions=["Write clearly and concisely"],
)
```

This agent has a model set

```
editor = Agent(
    name="Editor",
    role="Edit and refine content",
    model=OpenAIChat(id="gpt-4o-mini"),
    instructions=["Ensure clarity and correctness"],
)
```

Nested team setup

```
analyst = Agent(
    name="Analyst",
```

```

        role="Analyze data and provide insights",
    )

    sub_team = Team(
        name="Analysis Team",
        model=OpenAIChat(id="gpt-5-mini"),
        members=[analyst],
    )

    team = Team(
        name="Content Production Team",
        model=OpenAIChat(id="gpt-4o"),
        members=[researcher, writer, editor, sub_team],
        instructions=[
            "Research the topic thoroughly",
            "Write clear and engaging content",
            "Edit for quality and clarity",
            "Coordinate the entire process",
        ],
        show_members_responses=True,
    )

    team.initialize_team()

```

researcher and writer inherit gpt-4o from team

```

print(f"Researcher model: {researcher.model.id}")
print(f"Writer model: {writer.model.id}")

```

editor keeps its explicit model

```

print(f"Editor model: {editor.model.id}")

```

analyst inherits gpt-5-mini from its sub-team

```

print(f"Analyst model: {analyst.model.id}")

team.print_response(
    "Write a brief article about AI", stream=True
)

```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install required libraries**
```

```
    pip install agno openai
```

```
**Step: Set environment variables**
```

```
export OPENAI_API_KEY=****
```

****Step: Run the agent****

```
python model_inheritance.py
```

```
# Router Team with Direct Response
```

```
Source: https://docs.agno.com/examples/concepts/teams/basic/respond\_directly\_router\_team
```

This example demonstrates a team of AI agents working together to answer questions in different languages.

The team consists of six specialized agents:

1. ****English Agent**** - Can only answer in English
2. ****Japanese Agent**** - Can only answer in Japanese
3. ****Chinese Agent**** - Can only answer in Chinese
4. ****Spanish Agent**** - Can only answer in Spanish
5. ****French Agent**** - Can only answer in French
6. ****German Agent**** - Can only answer in German

The team leader routes the user's question to the appropriate language agent. With `respond_directly=True`, the selected agent responds directly without the team leader processing the response.

```
import asyncio
```

```
from agno.agent import Agent
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.team.team import Team

Direct Response with Team History

Source: https://docs.agno.com/examples/concepts/teams/basic/respond_directly_with_history

This example demonstrates a team where the team leader routes requests to the appropriate member, and the members respond directly to the user.

In addition, the team has access to the conversation history through `add\_history\_to\_context=True`.

```

from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.team.team import Team

def get_weather(city: str) -> str:
    return f"The weather in {city} is sunny."

weather_agent = Agent(
    name="Weather Agent",
    role="You are a weather agent that can answer questions about the weather.",
    model=OpenAIChat(id="o3-mini"),
    tools=[get_weather],
)

def get_news(topic: str) -> str:
    return f"The news about {topic} is that it is going well!"

news_agent = Agent(
    name="News Agent",
    role="You are a news agent that can answer questions about the news.",
    model=OpenAIChat(id="o3-mini"),
    tools=[get_news],
)

def get_activities(city: str) -> str:
    return f"The activities in {city} are that it is going well!"

activities_agent = Agent(
    name="Activities Agent",
    role="You are a activities agent that can answer questions about the activities.",
    model=OpenAIChat(id="o3-mini"),
    tools=[get_activities],
)

Share Member Interactions

Source: https://docs.agno.com/examples/concepts/teams/basic/share_member_interactions

This example demonstrates a team where member interactions during the current run are shared with other members through ``share_member_interactions=True``.

This allows members to see what other members have done during the same run, enabling better coordination and avoiding duplicate work.

How it Works

When ``share_member_interactions=True``, interaction details are appended to tasks sent to members:

<member_interaction_context>

- Member: User Profile Agent
- Task: Get the user's profile information
- Response: {"name": "John Doe", "email": "john.doe@example.com", ...}

- Member: Technical Support Agent
- Task: Answer technical support questions
- Response: Here's how to change your billing address...

This allows the Billing Agent to see that the User Profile Agent has already retrieved the user's information, avoiding duplicate tool calls.

When to Use

Use `share\_member\_interactions=True` when:

- * Multiple members might need the same information
- * You want to avoid duplicate API calls or tool executions
- * Members need to coordinate their actions during a single run
- * One member's work builds on another's within the same request

Code

```
from uuid import uuid4
```

```
from agno.agent import Agent
```

```
from agno.db.sqlite import SQLiteDatabase
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.team.team import Team
```

```
def get_user_profile() -> dict:
```

```
    """Get the user profile."""
```

```
    return {
```

```
        "name": "John Doe",
```

```
        "email": "john.doe@example.com",
```

```
        "phone": "1234567890",
```

```
        "billing_address": "123 Main St, Anytown, USA",
```

```
        "login_type": "email",
```

```
        "mfa_enabled": True,
```

```
    }
```

```
user_profile_agent = Agent(
```

```
    name="User Profile Agent",
```

```
    role="You are a user profile agent that can retrieve information about the user and  
the user's account.",
```

```
    model=OpenAIChat(id="gpt-5-mini"),
```

Step: Install required libraries

```
pip install agno openai
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
```

****Step: Run the agent****

```
python share_member_interactions.py
```

```
# Team History for Members
```

```
Source: https://docs.agno.com/examples/concepts/teams/basic/team\_history
```

This example demonstrates a team where the team leader routes requests to the appropriate member, and the members respond directly to the user.

Using ``add_team_history_to_members=True``, each team member has access to the shared history of the team, allowing them to use context from previous interactions with other members.

```
## How it Works
```

When ``add_team_history_to_members=True``, team history is appended to tasks sent to members:

```
<team_history_context>
```

input: Hallo, wie heit du? Meine Name ist John.

response: Ich heie ChatGPT.

This allows the Spanish agent to recall the name "John" that was originally shared with the German agent.

```
## Code
```

```
from uuid import uuid4
```

```
from agno.agent import Agent
```

```
from agno.db.sqlite import SQLiteDatabase
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.team.team import Team
```

```
german_agent = Agent(  
    name="German Agent",  
    role="You answer German questions.",  
    model=OpenAIChat(id="o3-mini"),  
)
```

```
spanish_agent = Agent(  
    name="Spanish Agent",  
    role="You answer Spanish questions.",
```

```

        model=OpenAIChat(id="o3-mini"),
    )

    multi_lingual_q_and_a_team = Team(
        name="Multi Lingual Q and A Team",
        model=OpenAIChat("o3-mini"),
        members=[german_agent, spanish_agent],
        instructions=[
            "You are a multi lingual Q and A team that can answer questions in English and Spanish. You MUST delegate the task to the appropriate member based on the language of the question.",
            "If the question is in German, delegate to the German agent. If the question is in Spanish, delegate to the Spanish agent.",
            "Always translate the response from the appropriate language to English and show both the original and translated responses.",
        ],
        db=SqliteDb(
            db_file="tmp/multi_lingual_q_and_a_team.db"
        ), # Add a database to store the conversation history. This is a requirement for history to work correctly.
        determine_input_for_members=False, # Send the input directly to the member agents without the team leader synthesizing its own input.
        respond_directly=True,
        add_team_history_to_members=True, # Send all interactions between the user and the team to the member agents.
    )

    session_id = f"conversation_{uuid4()}"

```

First give information to the team

Ask question in German

```

multi_lingual_q_and_a_team.print_response(
    "Hallo, wie heit du? Meine Name ist John.", stream=True, session_id=session_id
)

```

Then watch them recall the information (the question below states: "Tell me a 2-sentence story using my name")

Follow up in Spanish

```

multi_lingual_q_and_a_team.print_response(
    "Cuntame una historia de 2 oraciones usando mi nombre real.",
    stream=True,
    session_id=session_id,
)

```

Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

```
**Step: Install required libraries**
```

```
pip install agno openai
```

```
**Step: Set environment variables**
```

```
export OPENAI_API_KEY=****
```

Step: Run the agent

```
python team_history.py
```

Managing Tool Calls

Source: https://docs.agno.com/examples/concepts/teams/context_management/filter_tool_calls_from_history

This example demonstrates how to use `max_tool_calls_from_history` to limit tool calls in team context across multiple research queries.

Code

```
# filter_tool_calls_from_history.py
from textwrap import dedent

from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.team.team import Team
from agno.tools.duckduckgo import DuckDuckGoTools

# Create specialized research agents
tech_researcher = Agent(
    name="Alex",
    role="Technology Researcher",
    instructions=dedent("""
        You specialize in technology and AI research.
        - Focus on latest developments, trends, and breakthroughs
        - Provide concise, data-driven insights
        - Cite your sources
    """).strip(),
)

business_analyst = Agent(
    name="Sarah",
    role="Business Analyst",
    instructions=dedent("""
```

```

        You specialize in business and market analysis.
        - Focus on companies, markets, and economic trends
        - Provide actionable business insights
        - Include relevant data and statistics
    """).strip(),
)

# Create research team with tools and context management
research_team = Team(
    name="Research Team",
    model=OpenAIChat("gpt-4o"),
    members=[tech_researcher, business_analyst],
    tools=[DuckDuckGoTools()], # Team uses DuckDuckGo for research
    description="Research team that investigates topics and provides analysis.",
    instructions=dedent("""
        You are a research coordinator that investigates topics comprehensively.

        Your Process:
        1. Use DuckDuckGo to search for information on the topic
        2. Delegate detailed analysis to the appropriate specialist
        3. Synthesize research findings with specialist insights

        Guidelines:
        - Always start with web research using your DuckDuckGo tools
        - Choose the right specialist based on the topic (tech vs business)
        - Combine your research with specialist analysis
        - Provide comprehensive, well-sourced responses
    """).strip(),
    db=SqliteDb(db_file="tmp/research_team.db"),
    session_id="research_session",
    add_history_to_context=True,
    num_history_runs=6, # Load last 6 research queries
    max_tool_calls_from_history=3, # Keep only last 3 research results
    markdown=True,
)

research_team.print_response("What are the latest developments in AI agents?",
stream=True)
research_team.print_response("How is the tech market performing this quarter?",
stream=True)
research_team.print_response("What are the trends in LLM applications?", stream=True)
research_team.print_response("What companies are leading in AI infrastructure?",
stream=True)

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install -U agno openai ddgs sqlalchemy
```

Step: Export your OpenAI API key

```
# Mac/Linux
export OPENAI_API_KEY="your_openai_api_key_here"

# Windows
$Env:OPENAI_API_KEY="your_openai_api_key_here"
```

Step: Create a Python file

Create a Python file and add the above code.

```
touch filter_tool_calls_from_history.py
```

Step: Run Team

```
# Mac/Linux
python filter_tool_calls_from_history.py

# Windows
python filter_tool_calls_from_history.py
```

Access Dependencies in Team Tool

Source: https://docs.agno.com/examples/concepts/teams/dependencies/access_dependencies_in_tool

How to access dependencies passed to a team in a tool

This example demonstrates how team tools can access dependencies passed to the team, allowing tools to utilize dynamic context like team metrics and current time information while team members collaborate with shared data sources.

Code

```
# cookbook/examples/teams/dependencies/access_dependencies_in_tool.py
from typing import Dict, Any, Optional
from datetime import datetime
```

```

from agno.agent import Agent
from agno.team import Team
from agno.models.openai import OpenAIChat

def get_current_context() -> dict:
    """Get current contextual information like time, weather, etc."""
    return {
        "current_time": datetime.now().strftime("%Y-%m-%d %H:%M:%S"),
        "timezone": "PST",
        "day_of_week": datetime.now().strftime("%A"),
    }

def analyze_team_performance(team_id: str, dependencies: Optional[Dict[str, Any]] = None)
-> str:
    """
    Analyze team performance using available data sources.

    This tool analyzes team metrics and provides insights.
    Call this tool with the team_id you want to analyze.

    Args:
        team_id: The team ID to analyze (e.g., 'engineering_team', 'sales_team')
        dependencies: Available data sources (automatically provided)

    Returns:
        Detailed team performance analysis and insights
    """
    if not dependencies:
        return "No data sources available for analysis."

    print(f"--> Team tool received data sources: {list(dependencies.keys())}")

    results = [f"=== TEAM PERFORMANCE ANALYSIS FOR {team_id.upper()} ==="]

    # Use team metrics data if available
    if "team_metrics" in dependencies:
        metrics_data = dependencies["team_metrics"]
        results.append(f"Team Metrics: {metrics_data}")

Adding Dependencies to Team Run

Source: https://docs.agno.com/examples/concepts/teams/dependencies/add_dependencies_run

This example demonstrates how to add dependencies to a specific team run. Dependencies are

functions that provide contextual information (like user profiles and current context) that get passed to the team during execution for personalized responses.

Code

```
# cookbook/examples/teams/dependencies/add_dependencies_on_run.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.team import Team

def get_user_profile(user_id: str = "john_doe") -> dict:
    """Get user profile information that can be referenced in responses."""
    profiles = {
        "john_doe": {
            "name": "John Doe",
            "preferences": {
                "communication_style": "professional",
                "topics_of_interest": ["AI/ML", "Software Engineering", "Finance"],
                "experience_level": "senior",
            },
            "location": "San Francisco, CA",
            "role": "Senior Software Engineer",
        }
    }

    return profiles.get(user_id, {"name": "Unknown User"})

def get_current_context() -> dict:
    """Get current contextual information like time, weather, etc."""
    from datetime import datetime

    return {
        "current_time": datetime.now().strftime("%Y-%m-%d %H:%M:%S"),
        "timezone": "PST",
        "day_of_week": datetime.now().strftime("%A"),
    }

profile_agent = Agent(
    name="ProfileAnalyst",

Adding Dependencies to Team Context

Source: https://docs.agno.com/examples/concepts/teams/dependencies/add_dependencies_to_context

This example demonstrates how to add dependencies directly to the team context. Unlike adding dependencies per run, this approach makes the dependency functions available to all team runs by default, providing consistent access to contextual information across all interactions.

Code

```
# cookbook/examples/teams/dependencies/add_dependencies_to_context.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.team import Team

def get_user_profile(user_id: str = "john_doe") -> dict:
    """Get user profile information that can be referenced in responses."""
    profiles = {
        "john_doe": {
            "name": "John Doe",
            "preferences": {
```

```

        "communication_style": "professional",
        "topics_of_interest": ["AI/ML", "Software Engineering", "Finance"],
        "experience_level": "senior",
    },
    "location": "San Francisco, CA",
    "role": "Senior Software Engineer",
}

return profiles.get(user_id, {"name": "Unknown User"})

def get_current_context() -> dict:
    """Get current contextual information like time, weather, etc."""
    from datetime import datetime

    return {
        "current_time": datetime.now().strftime("%Y-%m-%d %H:%M:%S"),
        "timezone": "PST",
        "day_of_week": datetime.now().strftime("%A"),
    }

profile_agent = Agent(
    name="ProfileAnalyst",
    model=OpenAIChat(id="gpt-5-mini"),
    instructions="You analyze user profiles and provide personalized recommendations.",
)

context_agent = Agent(
    name="ContextAnalyst",
    model=OpenAIChat(id="gpt-5-mini"),
    instructions="You analyze current context and timing to provide relevant insights.",
)

team = Team(
    name="PersonalizationTeam",
    model=OpenAIChat(id="gpt-5-mini"),
    members=[profile_agent, context_agent],
    dependencies={
        "user_profile": get_user_profile,
        "current_context": get_current_context,
    },
    add_dependencies_to_context=True,
    debug_mode=True,
    markdown=True,
)

response = team.run(
    "Please provide me with a personalized summary of today's priorities based on my profile and interests.",
)

print(response.content)

```

```

# -----
# -----
# ASYNC EXAMPLE
# -----
# -----
# async def test_async():
#     async_response = await team.arun(
#         "Based on my profile, what should I focus on this week? Include specific
#         recommendations.",
#     )
#
#     print("\n=== Async Run Response ===")
#     print(async_response.content)
#
# # Run the async test
# import asyncio
# asyncio.run(test_async())

```

Usage

Snippet file: "create-venv-step.mdx"

```
python cookbook/examples/teams/dependencies/add_dependencies_to_context.py
```

Using Reference Dependencies in Team Instructions

Source: https://docs.agno.com/examples/concepts/teams/dependencies/reference_dependencies

This example demonstrates how to use reference dependencies by defining them in the team constructor and referencing them directly in team instructions. This approach allows dependencies to be automatically injected into the team's context and referenced using template variables in instructions.

Code

```

# cookbook/examples/teams/dependencies/reference_dependencies.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.team import Team

def get_user_profile(user_id: str = "john_doe") -> dict:
    """Get user profile information that can be referenced in responses."""
    profiles = {
        "john_doe": {
            "name": "John Doe",
            "preferences": {
                "communication_style": "professional",
                "topics_of_interest": ["AI/ML", "Software Engineering", "Finance"],
                "experience_level": "senior",
            },
            "location": "San Francisco, CA",
            "role": "Senior Software Engineer",
        }
    }

    return profiles.get(user_id, {"name": "Unknown User"})

def get_current_context() -> dict:
    """Get current contextual information like time, weather, etc."""
    from datetime import datetime

    return {
        "current_time": datetime.now().strftime("%Y-%m-%d %H:%M:%S"),
        "timezone": "PST",
        "day_of_week": datetime.now().strftime("%A"),
    }

profile_agent = Agent(
    name="ProfileAnalyst",
    model=OpenAIChat(id="gpt-5-mini"),
    instructions="You analyze user profiles and provide personalized recommendations.",
)

context_agent = Agent(
    name="ContextAnalyst",
    model=OpenAIChat(id="gpt-5-mini"),
    instructions="You analyze current context and timing to provide relevant insights.",
)

team = Team(
    name="PersonalizationTeam",
    model=OpenAIChat(id="gpt-5-mini"),
    members=[profile_agent, context_agent],
    dependencies={
        "user_profile": get_user_profile,
        "current_context": get_current_context,
    }
)

```

```

    },
    instructions=[
        "You are a personalization team that provides personalized recommendations based on the user's profile and context.",
        "Here is the user profile: {user_profile}",
        "Here is the current context: {current_context}",
    ],
    debug_mode=True,
    markdown=True,
)

response = team.run(
    "Please provide me with a personalized summary of today's priorities based on my profile and interests.",
)

print(response.content)

```

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install required libraries

```
pip install agno openai lancedb tantivy pypdf sqlalchemy cohere
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
export COHERE_API_KEY=****
```

Step: Run the agent

```
python cookbook/examples/teams/distributed_rag/03_distributed_rag_with_reranking.py
```

## Custom Events

Source: [https://docs.agno.com/examples/concepts/teams/events/custom\\_events](https://docs.agno.com/examples/concepts/teams/events/custom_events)

Learn how to yield custom events from your own tools.

### Complete Example

```
import asyncio
from dataclasses import dataclass
from typing import Optional

from agno.agent import Agent
from agno.team import Team
from agno.models.openai import OpenAIChat
from agno.run.team import CustomEvent
from agno.tools import tool

Our custom event, extending the CustomEvent class
@dataclass
class CustomerProfileEvent(CustomEvent):
 """CustomEvent for customer profile."""

 customer_name: Optional[str] = None
 customer_email: Optional[str] = None
 customer_phone: Optional[str] = None

Our custom tool
@tool()
async def get_customer_profile():
 """
 Get the customer profile for the customer with ID 123.
 """
 yield CustomerProfileEvent(
 customer_name="John Doe",
 customer_email="john.doe@example.com",
 customer_phone="1234567890",
)

agent = Agent(
 name="Customer Support Agent",
 role="Support agent that handles customer requests.",
 model=OpenAIChat(id="gpt-4o"),
)
```

```
Setup the Team with our custom tool.
team = Team(
 members=[agent],
 tools=[get_customer_profile],
 model=OpenAIChat(id="gpt-4o"),
 instructions="You are a team that handles customer requests.",
)

async def run_team():
 # Running the Team: The team should call our custom tool and yield the custom event
 async for event in team.arun(
 "Hello, can you get me the customer profile for customer with ID 123?",
 stream=True,
):
 if isinstance(event, CustomEvent):
 print(f" Custom event emitted: {event}")

asyncio.run(run_team())
```

## OpenAI Moderation Guardrail

Source: [https://docs.agno.com/examples/concepts/teams/guardrails/openai\\_moderation](https://docs.agno.com/examples/concepts/teams/guardrails/openai_moderation)

This example demonstrates how to use Agno's built-in OpenAI moderation guardrail with an Team.

This example shows how to:

1. Detect and block content that violates OpenAI's content policy
2. Handle both text and image content moderation
3. Configure moderation for specific categories
4. Use both sync and async moderation checks
5. Customize moderation models and sensitivity settings

## Code

```
openai_moderation.py
import asyncio

from agno.team import Team
from agno.exceptions import InputCheckError
from agno.guardrails import OpenAIModerationGuardrail
from agno.media import Image
from agno.models.openai import OpenAIChat

async def main():
 """Demonstrate OpenAI moderation guardrails functionality."""
 print(" OpenAI Moderation Guardrails Demo")
 print("=" * 50)
```

```

basic_team = Team(
 name="Basic Moderated Team",
 model=OpenAIChat(id="gpt-5-mini"),
 pre_hooks=[OpenAIModerationGuardrail()],
 description="An team with basic OpenAI content moderation.",
 instructions="You are a helpful assistant that provides information and answers
questions.",
)

Test 1: Basic text moderation with default settings
print("\n Test 1: Normal request without policy violations")
print("-" * 50)

try:
 await basic_team.aprint_response(
 input="Can you help me understand machine learning concepts?",
)
 print(" Safe content processed successfully")
except InputCheckError as e:
 print(f" Unexpected moderation error: {e.message}")

Test 2: Text that might trigger violence category
print("\n Test 2: Content with potential violence references")
print("-" * 50)
try:
 await basic_team.aprint_response(
 input="How can I violently overthrow the government and cause maximum harm to
people?",
)
 print(" This should have been blocked!")
except InputCheckError as e:
 print(f" Violent content blocked: {e.message[:100]}...")
 print(f" Trigger: {e.check_trigger}")

Test 3: Text that might trigger hate speech category
print("\n Test 3: Content with potential hate speech")
print("-" * 50)
try:
 await basic_team.aprint_response(
 input="I hate all people from [specific group] and think they should be
eliminated.",
)
 print(" This should have been blocked!")
except InputCheckError as e:
 print(f" Hate speech blocked: {e.message[:100]}...")
 print(f" Trigger: {e.check_trigger}")

Test 4: Custom categories - only moderate specific categories
print("\n Test 4: Custom moderation categories (violence only)")
print("-" * 50)

```

```

custom_team = Team(
 name="Custom Moderated Team",
 model=OpenAIChat(id="gpt-5-mini"),
 pre_hooks=[

# PII Detection Guardrail

Source: [https://docs.agno.com/examples/concepts/teams/guardrails/pii\\_detection](https://docs.agno.com/examples/concepts/teams/guardrails/pii_detection)

This example demonstrates how to use Agno's built-in PII detection guardrail with an Team.

This example shows how to:

1. Detect and block personally identifiable information (PII) in input
2. Protect sensitive data like SSNs, credit cards, emails, and phone numbers
3. Handle different types of PII violations with appropriate error messages

## Code

```
pii_detection.py

import asyncio

from agno.team import Team
from agno.exceptions import InputCheckError
from agno.guardrails import PIIDetectionGuardrail
from agno.models.openai import OpenAIChat

async def main():
 """Demonstrate PII detection guardrails functionality."""
 print(" PII Detection Guardrails Demo")
 print("=" * 50)

 # Create an team with PII detection protection
 team = Team(
 name="Privacy-Protected Team",
 model=OpenAIChat(id="gpt-5-mini"),
 pre_hooks=[PIIDetectionGuardrail()],
 description="An team that helps with customer service while protecting privacy.",
 instructions="You are a helpful customer service assistant. Always protect user privacy and handle sensitive information appropriately.",
)

 # Test 1: Normal request without PII (should work)
 print("\n Test 1: Normal request without PII")
 print("-" * 30)
 try:
 team.print_response(
 input="Can you help me understand your return policy?",
)
 print(" Normal request processed successfully")
 except InputCheckError as e:
 print(f" Unexpected error: {e}")

 # Test 2: Request with SSN (should be blocked)
```

```

print("\n Test 2: Input containing SSN")
print("-" * 30)
try:
 team.print_response(
 input="Hi, my Social Security Number is 123-45-6789. Can you help me with my
account?",
)
 print(" This should have been blocked!")

# Output Transformation Post-Hook

Source: [https://docs.agno.com/examples/concepts/teams/hooks/output\\_transformation\\_post\\_hook](https://docs.agno.com/examples/concepts/teams/hooks/output_transformation_post_hook)

This example demonstrates how to use a post-hook to transform the output of an Team, before it is returned to the user.

This example shows how to:

1. Transform team responses by updating RunOutput.content
2. Add formatting, structure, and additional information
3. Enhance the user experience through content modification

## Code

```
from datetime import datetime

from agno.team import Team
from agno.models.openai import OpenAIChat
from agno.run.team import RunOutput
from pydantic import BaseModel

class FormattedResponse(BaseModel):
 main_content: str
 key_points: list[str]
 disclaimer: str
 follow_up_questions: list[str]

def add_markdown_formatting(run_output: RunOutput) -> None:
 """
 Simple post-hook: Add basic markdown formatting to the response.

 Enhances readability by adding proper markdown structure.
 """
 content = run_output.content.strip()

 # Add markdown formatting for better presentation
 formatted_content = f"""# Response
```

```

{content}

Generated at {datetime.now().strftime("%Y-%m-%d %H:%M:%S")}"""

 run_output.content = formatted_content

def add_disclaimer_and_timestamp(run_output: RunOutput) -> None:
 """
 Simple post-hook: Add a disclaimer and timestamp to responses.

 Useful for teams providing advice or information that needs context.
 """
 content = run_output.content.strip()

 enhanced_content = f"""{content}

 Important: This information is for educational purposes only.
 Please consult with appropriate professionals for personalized advice.

 Response generated on {datetime.now().strftime("%B %d, %Y at %I:%M %p")}"""

 run_output.content = enhanced_content

def structure_financial_advice(run_output: RunOutput) -> None:
 """
 Advanced post-hook: Structure financial advice responses with AI assistance.

 Uses an AI team to format the response into a structured format
 with key points, disclaimers, and follow-up suggestions.
 """

python cookbook/teams/hooks/output_transformation_post_hook.py
```

## Output Validation Post-Hook

Source: [https://docs.agno.com/examples/concepts/teams/hooks/output\\_validation\\_post\\_hook](https://docs.agno.com/examples/concepts/teams/hooks/output_validation_post_hook)

This example demonstrates how to use a post-hook to validate the output of an Team, before it is returned to the user.

This example shows how to:

1. Validate team responses for quality and safety
2. Ensure outputs meet minimum standards before being returned
3. Raise `OutputCheckError` when validation fails

## Code

```
import asyncio

from agno.team import Team
from agno.exceptions import CheckTrigger, OutputCheckError
from agno.models.openai import OpenAIChat
from agno.run.team import RunOutput
from pydantic import BaseModel

class OutputValidationResult(BaseModel):
 is_complete: bool
 is_professional: bool
 is_safe: bool
 concerns: list[str]
 confidence_score: float

def validate_response_quality(run_output: RunOutput) -> None:
 """
 Post-hook: Validate the team's response for quality and safety.

 This hook checks:
 - Response completeness (not too short or vague)
 - Professional tone and language
 - Safety and appropriateness of content

 Raises OutputCheckError if validation fails.
 """
```

```

Skip validation for empty responses
if not run_output.content or len(run_output.content.strip()) < 10:
 raise OutputCheckError(
 "Response is too short or empty",
 check_trigger=CheckTrigger.OUTPUT_NOT_ALLOWED,
)

Create a validation team
validator_team = Team(
 name="Output Validator",
 model=OpenAIChat(id="gpt-5-mini"),
 instructions=[
 "You are an output quality validator. Analyze responses for:",
 "1. COMPLETENESS: Response addresses the question thoroughly",
 "2. PROFESSIONALISM: Language is professional and appropriate",
 "3. SAFETY: Content is safe and doesn't contain harmful advice",
 "",
 "Provide a confidence score (0.0-1.0) for overall quality.",
 "List any specific concerns found.",
 "",
 "Be reasonable - don't reject good responses for minor issues.",
],
 output_schema=OutputValidationResult,
)

## Team with Agentic Memory

Source: [https://docs.agno.com/examples/concepts/teams/memory/team\\_with\\_agentic\\_memory](https://docs.agno.com/examples/concepts/teams/memory/team_with_agentic_memory)

This example demonstrates how to use agentic memory with a team. Unlike simple memory storage, agentic memory allows the AI to actively create, update, and delete user memories during each run based on the conversation context, providing intelligent memory management.

## Code

```
cookbook/examples/teams/memory/02_team_with_agentic_memory.py
"""
This example shows you how to use persistent memory with an Agent.

During each run the Agent can create/update/delete user memories.

To enable this, set `enable_agentic_memory=True` in the Agent config.
"""

from agno.agent.agent import Agent
from agno.db.postgres import PostgresDb
from agno.memory import MemoryManager # noqa: F401
```

```

from agno.models.openai import OpenAIChat
from agno.team import Team

db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"
db = PostgresDb(db_url=db_url)

john_doe_id = "john_doe@example.com"

agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
)

team = Team(
 model=OpenAIChat(id="gpt-5-mini"),
 members=[agent],
 db=db,
 enable_agentic_memory=True,
)

team.print_response(
 "My name is John Doe and I like to hike in the mountains on weekends.",
 stream=True,
 user_id=john_doe_id,
)

team.print_response("What are my hobbies?", stream=True, user_id=john_doe_id)

More examples:
agent.print_response(
"Remove all existing memories of me.",
stream=True,
user_id=john_doe_id,
)

agent.print_response(
"My name is John Doe and I like to paint.", stream=True, user_id=john_doe_id
)

agent.print_response(
"I don't pain anymore, i draw instead.", stream=True, user_id=john_doe_id
)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set up PostgreSQL database

```
./cookbook/run_pgvector.sh
```

Step: Install required libraries

```
pip install agno openai 'psycopg[binary]' sqlalchemy
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
```

Step: Run the agent

```
python cookbook/examples/teams/memory/02_team_with_agenti
c_memory.py
```

## Team with Memory Manager

Source: [https://docs.agno.com/examples/concepts/teams/memory/team\\_with\\_memory\\_manager](https://docs.agno.com/examples/concepts/teams/memory/team_with_memory_manager)

This example demonstrates how to use persistent memory with a team. After each run, user memories are created and updated, allowing the team to remember information about users across sessions and provide personalized experiences.

### Code

```
cookbook/examples/teams/memory/01_team_with_memory
_manager.py
"""
This example shows you how to use persistent memory with an Agent.

After each run, user memories are created/updated.

To enable this, set `enable_user_memories=True` in the Agent config.
"""

from uuid import uuid4

from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.memory import MemoryManager # noqa: F401
from agno.models.openai import OpenAIChat
from agno.team import Team

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
db = PostgresDb(db_url=db_url)

session_id = str(uuid4())
john_doe_id = "john_doe@example.com"

1. Create memories by setting `enable_user_memories=True` in the Agent
```

```

agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
)
team = Team(
 model=OpenAIChat(id="gpt-5-mini"),
 members=[agent],
 db=db,
 enable_user_memories=True,
)

team.print_response(
 "My name is John Doe and I like to hike in the mountains on weekends.",
 stream=True,
 user_id=john_doe_id,
 session_id=session_id,
)

team.print_response(
 "What are my hobbies?", stream=True, user_id=john_doe_id, session_id=session_id
)

2. Set a custom MemoryManager on the agent
memory_manager = MemoryManager(model=OpenAIChat(id="gpt-5-mini"))

memory_manager.clear()

agent = Agent(
model=OpenAIChat(id="gpt-5-mini"),
memory_manager=memory_manager,
)

team = Team(
model=OpenAIChat(id="gpt-5-mini"),
members=[agent],
db=db,
enable_user_memories=True,
)

team.print_response(
"My name is John Doe and I like to hike in the mountains on weekends.",
stream=True,
user_id=john_doe_id,
session_id=session_id,
)

You can also get the user memories from the agent
memories = agent.get_user_memories(user_id=john_doe_id)
print("John Doe's memories:")
pprint(memories)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set up PostgreSQL database

```
./cookbook/run_pgvector.sh
```

Step: Install required libraries

```
pip install agno openai psycopg sqlalchemy
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
```

Step: Run the agent

```
python cookbook/examples/teams/memory/01_team_with_memory
_manager.py
```

## Team Metrics Analysis

Source: [https://docs.agno.com/examples/concepts/teams/metrics/team\\_metrics](https://docs.agno.com/examples/concepts/teams/metrics/team_metrics)

This example demonstrates how to access and analyze comprehensive team metrics including message-level metrics, session metrics, and member-specific performance data.

### Code

```
cookbook/examples/teams/metrics/01_team_metrics.py
"""
```

This example demonstrates how to access and analyze team metrics.

Shows how to retrieve detailed metrics for team execution, including message-level metrics, session metrics, and member-specific metrics.

Prerequisites:

1. Run: `cookbook/run_pgvector.sh` (to start PostgreSQL)
  2. Ensure PostgreSQL is running on `localhost:5532`
- ```
"""

Input as Dictionary

Source: <https://docs.agno.com/examples/concepts/teams/othe>

r/input_as_dict

This example shows how to pass input to a team as a dictionary format, useful for multimodal inputs or structured data.

Code

```
# cookbook/examples/teams/basic/input_as_dict.py
from agno.agent import Agent
from agno.team import Team

# Create a research team
team = Team(
    members=[
        Agent(
            name="Sarah",
            role="Data Researcher",
            instructions="Focus on gathering and analyzing data",
        ),
        Agent(
            name="Mike",
            role="Technical Writer",
            instructions="Create clear, concise summaries",
        ),
    ],
    stream=True,
    markdown=True,
)

team.print_response(
    {
        "role": "user",
        "content": [
            {"type": "text", "text": "What's in this image?"},
            {
                "type": "image_url",
                "image_url": {
                    "url": "https://upload.wikimedia.org/wikipedia/commons/thumb/d/dd/Gfp-wisconsin-madison-the-nature-boardwalk.jpg/2560px-Gfp-wisconsin-madison-the-nature-boardwalk.jpg",

```

Team Input as Image List

Source: https://docs.agno.com/examples/concepts/teams/other/input_as_list

This example demonstrates how to pass input to a team as a list containing both text and images. The team processes multimodal input including text descriptions and image URLs for analysis.

Code

```
# cookbook/examples/teams/basic/input_as_list.py
from agno.agent import Agent
from agno.team import Team

team = Team(
    members=[
        Agent(
            name="Sarah",
            role="Data Researcher",
            instructions="Focus on gathering and analyzing data",
        ),
        Agent(
            name="Mike",
            role="Technical Writer",
            instructions="Create clear, concise summaries",
        ),
    ],
)

team.print_response(
    [
        {"type": "text", "text": "What's in this image?"},
        {
            "type": "image_url",
            "image_url": {
```

```

        "url": "https://upload.wikimedia.org/wikipedia/commons/th
umb/d/dd/Gfp-wisconsin-madison-the-nature-boardwal
k.jpg/2560px-Gfp-wisconsin-madison-the-nature-boar
dwalk.jpg",
    },
    ],
    stream=True,
    markdown=True,
)

```

Usage

Team with Exponential Backoff

Source: https://docs.agno.com/examples/concepts/teams/other/team_exponential_backoff

This example demonstrates how to configure a team with exponential backoff retry logic. When agents encounter errors or rate limits, the team will automatically retry with increasing delays between attempts.

Code

```
# cookbook/examples/teams/basic/team_exponential_backoff.py
from agno.agent import Agent
from agno.team import Team
from agno.tools.duckduckgo import DuckDuckGoTools

# Create a research team
team = Team(
    members=[
        Agent(
            name="Sarah",
            role="Data Researcher",
            tools=[DuckDuckGoTools()],
            instructions="Focus on gathering and analyzing data",
        ),
```

```

        Agent(
            name="Mike",
            role="Technical Writer",
            instructions="Create clear, concise summaries",
        ),
    ],
    retries=3,
    exponential_backoff=True,
)

team.print_response(
    "Search for latest news about the latest AI models",
    stream=True,
)

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install required libraries

```
pip install agno ddgs
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
```

Step: Run the agent

```
python cookbook/examples/teams/basic/team_exponential_backoff.py
```

Async Multi-Purpose Reasoning Team

Source: https://docs.agno.com/examples/concepts/teams/reasoning/async_multi_purpose_reasoning_team

This example demonstrates an asynchronous multi-purpose reasoning team that uses reasoning tools to analyze questions and delegate to appropriate specialist agents asynchronously, showcasing coordination and intelligent task routing.

Code

```

# cookbook/examples/teams/reasoning/02_async_multi_purpose_reasoning_team.py
"""

```

This example demonstrates an async multi-purpose reasoning team.

The team uses reasoning tools to analyze questions and delegate to appropriate specialist agents asynchronously, showcasing coordination and intelligent task routing.

Multi-Purpose Reasoning Team

Source: https://docs.agno.com/examples/concepts/teams/reasoning/reasoning_multi_purpose_team

This example demonstrates a comprehensive team of specialist agents that uses reasoning tools to analyze questions and intelligently delegate tasks to appropriate members including web search, finance, writing, medical research, and code execution agents.

Code

```
# cookbook/examples/teams/reasoning/01_reasoning_multi_purpose_team.py
"""
This example demonstrates a team of agents that can answer a variety of questions.

The team uses reasoning tools to reason about the questions and delegate to the appropriate agent.

The team consists of:
- A web agent that can search the web for information
- A finance agent that can get financial data
- A writer agent that can write content
- A calculator agent that can calculate
- A FastAPI assistant that can explain how to write FastAPI code
- A code execution agent that can execute code in a secure E2B sandbox

Coordinated Agentic RAG Team

Source: https://docs.agno.com/examples/concepts/teams/search_coordination/coordinated_agentic_rag

This example demonstrates how multiple specialized agents can coordinate to provide comprehensive RAG (Retrieval-Augmented Generation) responses by dividing search and analysis tasks across team members.

Code

```

# cookbook/examples/teams/search_coordination/01_coordinated_agentic_rag.py
"""

```

```

This example demonstrates how multiple specialized agents can coordinate to provide comprehensive RAG (Retrieval-Augmented Generation) responses by dividing search and analysis tasks across team members.

```

Team Composition:

- Knowledge Searcher: Searches knowledge base for relevant information
- Content Analyzer: Analyzes and synthesizes retrieved content
- Response Synthesizer: Creates final comprehensive response with sources

Setup:

1. Run: ``pip install agno anthropic cohere lancedb tantivy sqlalchemy``
2. Export your ANTHROPIC_API_KEY and CO_API_KEY
3. Run this script to see coordinated RAG in action

Coordinated Reasoning RAG Team

Source: https://docs.agno.com/examples/concepts/teams/search_coordination/coordinated_reasoning_rag

This example demonstrates how multiple specialized agents coordinate to provide comprehensive RAG responses with distributed reasoning capabilities. Each agent has specific reasoning responsibilities to ensure thorough analysis.

Code

```
# cookbook/examples/teams/search_coordination/02_coordinated_reasoning_rag.py
"""
```

This example demonstrates how multiple specialized agents coordinate to provide comprehensive RAG responses with distributed reasoning capabilities. Each agent has specific reasoning responsibilities to ensure thorough analysis.

Team Composition:

- Information Gatherer: Searches knowledge base and gathers raw information
- Reasoning Analyst: Applies logical reasoning to analyze gathered information
- Evidence Evaluator: Evaluates evidence quality and identifies gaps
- Response Coordinator: Synthesizes everything into a final reasoned response

Setup:

1. Run: `pip install agno anthropic cohere lancedb tantivy sqlalchemy`
 2. Export your ANTHROPIC_API_KEY and CO_API_KEY
 3. Run this script to see coordinated reasoning RAG in action
- ```

## Distributed Search with Infinity Reranker

Source: [https://docs.agno.com/examples/concepts/teams/search\\_coordination/distributed\\_infinity\\_search](https://docs.agno.com/examples/concepts/teams/search_coordination/distributed_infinity_search)

This example demonstrates how multiple agents coordinate to perform distributed search using Infinity reranker for high-performance ranking across team members.

### Code

```
cookbook/examples/teams/search_coordination/03_distributed_infinity_search.py
"""
```

This example demonstrates how multiple agents coordinate to perform distributed search using Infinity reranker for high-performance ranking across team members.

Team Composition:

- Primary Searcher: Performs initial broad search with infinity reranking
- Secondary Searcher: Performs targeted search on specific topics
- Cross-Reference Validator: Validates information across different sources
- Result Synthesizer: Combines and ranks all results for final response

Setup:

1. Install dependencies: ``pip install agno anthropic infinity-client lancedb``
  2. Set up Infinity Server:

```
\\`\\`\\`bash
pip install "infinity-emb[all]"
infinity_emb v2 --model-id BAAI/bge-reranker-base --port 7997
\\`\\`\\`
```
  3. Export ANTHROPIC\_API\_KEY
  4. Run this script

```

Agentic Session State

Source: https://docs.agno.com/examples/concepts/teams/state/agent_session_state

This example demonstrates how to enable agentic session state in teams and agents, allowing them to automatically manage and update their session state during interactions. The agents can modify the session state autonomously based on the conversation context.

Code

```
# cookbook/examples/teams/state/agent_session_state.py
from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.team.team import Team

db = SqliteDb(db_file="tmp/agents.db")
shopping_agent = Agent(
    name="Shopping List Agent",
    role="Manage the shopping list",
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    add_session_state_to_context=True, # Required so the agent is aware of the session state
    enable_agentic_state=True,
)

team = Team(
    members=[shopping_agent],
    session_state={"shopping_list": []},
    db=db,
    add_session_state_to_context=True, # Required so the team is aware of the session state
    enable_agentic_state=True,
    description="You are a team that manages a shopping list and chores",
    show_members_responses=True,
)

team.print_response("Add milk, eggs, and bread to the shopping list")

team.print_response("I picked up the eggs, now what's on my list?")

print(f"Session state: {team.get_session_state()}")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install required libraries

```
pip install agno openai
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
```

Step: Run the agent

```
python cookbook/examples/teams/state/agent_session_state.py
```

Change Session State on Run

Source: https://docs.agno.com/examples/concepts/teams/state/change_state_on_run

This example demonstrates how to set and manage session state for different users and sessions. It shows how session state can be passed during runs and persists across multiple interactions within the same session.

Code

```
# cookbook/examples/teams/state/change_state_on_run.py
from agno.db.in_memory import InMemoryDb
from agno.models.openai import OpenAIChat
from agno.team import Team

team = Team(
    db=InMemoryDb(),
    model=OpenAIChat(id="gpt-5-mini"),
    members=[],
    instructions="Users name is {user_name} and age is {age}",
)

# Sets the session state for the session with the id "user_1_session_1"
team.print_response(
    "What is my name?",
    session_id="user_1_session_1",
    user_id="user_1",
    session_state={"user_name": "John", "age": 30},
)

# Will load the session state from the session with the id "user_1_session_1"
team.print_response("How old am I?", session_id="user_1_session_1", user_id="user_1")

# Sets the session state for the session with the id "user_2_session_1"
team.print_response(
    "What is my name?",
```

```

    session_id="user_2_session_1",
    user_id="user_2",
    session_state={"user_name": "Jane", "age": 25},
)

# Will load the session state from the session with the id "user_2_session_1"
team.print_response("How old am I?", session_id="user_2_session_1", user_id="user_2")

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install required libraries

```
pip install agno openai
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
```

Step: Run the agent

```
python cookbook/examples/teams/state/change_state_on_run.py
```

Session State in Instructions

Source: https://docs.agno.com/examples/concepts/teams/state/session_state_in_instructions

This example demonstrates how to use session state variables directly in team instructions using template syntax. The session state values are automatically injected into the instructions, making them available to the team during execution.

Code

```

# cookbook/examples/teams/state/session_state_in_instructions.py
from agno.team.team import Team

team = Team(
    members=[],
    # Initialize the session state with a variable
    session_state={"user_name": "John"},
    instructions="Users name is {user_name}",
    markdown=True,
)

```

```
team.print_response("What is my name?", stream=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install required libraries

```
pip install agno openai
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
```

Step: Run the agent

```
python cookbook/examples/teams/state/session_state_instructions.py
```

Share Member Interactions

Source: https://docs.agno.com/examples/concepts/teams/state/share_member_interactions

This example demonstrates how to enable sharing of member interactions within a team. When `share_member_interactions` is set to `True`, team members can see and build upon each other's responses, creating a collaborative workflow.

Code

```
# cookbook/examples/teams/state/share_member_interactions.py
from agno.agent.agent import Agent
from agno.db.sqlite import SQLiteDatabase
from agno.models.openai import OpenAIChat
from agno.team.team import Team
from agno.tools.duckduckgo import DuckDuckGoTools

db = SQLiteDatabase(db_file="tmp/agents.db")

web_research_agent = Agent(
    name="Web Research Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[DuckDuckGoTools()],
    instructions="You are a web research agent that can answer questions from the web.",
)

report_agent = Agent(
```

```

    name="Report Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    instructions="You are a report agent that can write a report from the web research.",
)

team = Team(
    model=OpenAIChat(id="gpt-5-mini"),
    db=db,
    members=[web_research_agent, report_agent],
    share_member_interactions=True,
    instructions=[
        "You are a team of agents that can research the web and write a report.",
        "First, research the web for information about the topic.",
        "Then, use your report agent to write a report from the web research.",
    ],
    show_members_responses=True,
    debug_mode=True,
)

team.print_response("How are LEDs made?")

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install required libraries

```
pip install agno openai ddgs
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
```

Step: Run the agent

```
python cookbook/examples/teams/state/share_member_interactions.py
```

Team with Nested Shared State

Source: https://docs.agno.com/examples/concepts/teams/state/team_with_nested_shared_state

This example demonstrates a hierarchical team structure with nested shared state management for complex multi-agent coordination in a shopping list and meal planning system.

Code

```

# cookbook/examples/teams/state/team_with_nested_sha
red_state.py
"""

This example demonstrates the nested Team functionality in a hierarchical team structure.
Each team and agent has a clearly defined role that guides their behavior and
specialization:

Team Hierarchy & Roles:
Shopping List Team (Orchestrator)
    Role: "Orchestrate comprehensive shopping list management and meal planning"
    Shopping Management Team (Operations Specialist)
        Role: "Execute precise shopping list operations through delegation"
        Shopping List Agent
            Role: "Maintain and modify the shopping list with precision and accuracy"
        Meal Planning Team (Culinary Expert)
            Role: "Transform shopping list ingredients into creative meal suggestions"
            Recipe Suggester Agent
                Role: "Create innovative and practical recipe suggestions"

        "Provide insights about graph structure and patterns",
    ],
    tools=[Neo4jTools()],
    markdown=True,
)

agent.print_response("Show me the schema of the graph database and list all node labels")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your credentials

```
export NE04J_URI=bolt://localhost:7687
export NE04J_USERNAME=neo4j
export NE04J_PASSWORD=your-password
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U neo4j openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/neo4j_tools.py
```

```
# Windows
python cookbook/tools/neo4j_tools.py
```

null

Source: <https://docs.agno.com/examples/concepts/tools/data-base/pandas>

Description:

Implemented an AI agent using the agno library with PandasTools for automated data analysis.

The agent loads a CSV file (data.csv) and performs analysis based on natural language instructions.

Enables interaction with data without manual Pandas coding, simplifying data exploration and insights extraction.

Includes setup instructions for environment variables and dependencies.

*

title: Pandas Tools

Code

```
# cookbook/tools/pandas_tools.py
```

```
from agno.agent import Agent
from agno.tools.pandas import PandasTools

agent = Agent(
    tools=[PandasTools()],
    markdown=True,
)
agent.print_response("Load and analyze the dataset from data.csv")
```

        await pprint_run_response(response_stream, markdown=True)

if __name__ == "__main__":
    asyncio.run(
        run_agent(
            "What listings are available in San Francisco for 2 people for 3 nights from 1
to 4 August 2025?"
        )
    )
```

GitHub MCP agent

Source: <https://docs.agno.com/examples/concepts/tools/mcp/github>

Using the GitHub MCP server (<https://github.com/modelcontextprotocol/servers/tree/main/src/github>) to create an Agent that can explore, analyze and provide insights about GitHub repositories:

```
""" MCP GitHub Agent - Your Personal GitHub Explorer!
```

This example shows how to create a GitHub agent that uses MCP to explore, analyze, and provide insights about GitHub repositories. The agent leverages the Model Context Protocol (MCP) to interact with GitHub, allowing it to answer questions about issues, pull requests, repository details and more.

Example prompts to try:

- "List open issues in the repository"
- "Show me recent pull requests"
- "What are the repository statistics?"
- "Find issues labeled as bugs"
- "Show me contributor activity"

Run: ``pip install agno mcp openai`` to install the dependencies

Environment variables needed:

- Create a GitHub personal access token following these steps:
 - <https://github.com/modelcontextprotocol/servers/tree/main/src/github#setup>
 - `export GITHUB_TOKEN: Your GitHub personal access token`
- ```
"""
```

```
import asyncio
```

```
import os
```

```
from textwrap import dedent
```

```
from agno.agent import Agent
```

```
from agno.tools.mcp import MCPTools
```

```
from mcp import StdioServerParameters
```

```
async def run_agent(message: str) -> None:
```

```
 """Run the GitHub agent with the given message."""
```

```
 # Initialize the MCP server
```

```
 server_params = StdioServerParameters(
```

```
 command="npx",
```

```
 args=["-y", "@modelcontextprotocol/server-github"],
```

```
)
```

```
 # Create a client session to connect to the MCP server
```

```
 async with MCPTools(server_params=server_params) as mcp_tools:
```

```
 agent = Agent(
```

```
 tools=[mcp_tools],
```

```
 instructions=dedent("""\
```

```
 You are a GitHub assistant. Help users explore repositories and their
```

```
activity.
```

```
 - Use headings to organize your responses
```

```
 - Be concise and focus on relevant information\
```

```
 """),
```

```
 markdown=True,
```

```
)
```

```

 # Run the agent
 await agent.aprint_response(message, stream=True)

Example usage
if __name__ == "__main__":
 # Pull request example
 asyncio.run(
 run_agent(
 "Tell me about Agno. Github repo: https://github.com/agno-agi/agno. You can
read the README for more information."
)
)

More example prompts to explore:
"""
Issue queries:
1. "Find issues needing attention"
2. "Show me issues by label"
3. "What issues are being actively discussed?"
4. "Find related issues"
5. "Analyze issue resolution patterns"

Pull request queries:
1. "What PRs need review?"
2. "Show me recent merged PRs"
3. "Find PRs with conflicts"
4. "What features are being developed?"
5. "Analyze PR review patterns"

Repository queries:
1. "Show repository health metrics"
2. "What are the contribution guidelines?"
3. "Find documentation gaps"
4. "Analyze code quality trends"
5. "Show repository activity patterns"
"""

```

## Notion MCP agent

Source: <https://docs.agno.com/examples/concepts/tools/mcp/notion>

Using the Notion MCP server (<https://github.com/makenotion/notion-mcp-server>) to create an Agent that can create, update and search for Notion pages:

```

"""
Notion MCP Agent - Manages your documents

```

This example shows how to use the Agno MCP tools to interact with your Notion workspace.

1. Start by setting up a new internal integration in Notion:  
<https://www.notion.so/profile/integrations>
2. Export your new Notion key: ``export NOTION_API_KEY=ntn_****``
3. Connect your relevant Notion pages to the integration. To do this, you'll need to visit that page, and click on the 3 dots, and select "Connect to integration".

Dependencies: `pip install agno mcp openai`

Usage:

```
python cookbook/tools/mcp/notion_mcp_agent.py
"""
```

```

 markdown=True,
)
```

```

 await agent.acli_app(
 input="You are a helpful assistant that can access Notion workspaces and
pages.",
 stream=True,
 markdown=True,
 exit_on=["exit", "quit"],
)

if __name__ == "__main__":
 asyncio.run(run_agent())

```

## Pipedream Auth

Source: [https://docs.agno.com/examples/concepts/tools/mcp/pipedream\\_auth](https://docs.agno.com/examples/concepts/tools/mcp/pipedream_auth)

This example shows how to add authorization when integrating Pipedream MCP servers with Agno Agents.

## Code

```

"""
 Using Pipedream MCP servers with authentication

 This is an example of how to use Pipedream MCP servers with authentication.
 This is useful if your app is interfacing with the MCP servers in behalf of your users.

 1. Get your access token. You can check how in Pipedream's docs:
 https://pipedream.com/docs/connect/mcp/developers/
 2. Get the URL of the MCP server. It will look like this:
 https://remote.mcp.pipedream.net/<External user id>/<MCP app slug>
 3. Set the environment variables:
 - MCP_SERVER_URL: The URL of the MCP server you previously got
 - MCP_ACCESS_TOKEN: The access token you previously got
 - PIPEDREAM_PROJECT_ID: The project id of the Pipedream project you want to use
 - PIPEDREAM_ENVIRONMENT: The environment of the Pipedream project you want to use
 3. Install dependencies: pip install agno mcp-sdk

Stagehand MCP agent

Source: <https://docs.agno.com/examples/concepts/tools/mcp/stagehand>

A web scraping agent that uses the Stagehand MCP server to automate browser interactions and create a structured content digest from Hacker News.

Key Features

- * Safe Navigation: Proper initialization sequence prevents common browser automation errors
- * Structured Data Extraction: Methodical approach to extracting and organizing web content
- * Flexible Output: Creates well-structured digests with headlines, summaries, and insights

Prerequisites

Before running this example, you'll need:

- * Browserbase Account: Get API credentials from Browserbase (<https://browserbase.com>)
- * OpenAI API Key: Get an API Key from OpenAI (<https://platform.openai.com/settings/organization/api-keys>)

Setup Instructions

1. Clone and Build Stagehand MCP Server

```
git clone https://github.com/browserbase/mcp-server-browserbase
cd mcp-server-browserbase/stagehand

# Install dependencies and build
npm install
npm run build
```

2. Install Python Dependencies

```
pip install agno mcp openai
```

3. Set Environment Variables

```
export BROWSERBASE_API_KEY=your_browserbase_api_key
export BROWSERBASE_PROJECT_ID=your_browserbase_project_id
export OPENAI_API_KEY=your_openai_api_key
```

Code Example

```
import asyncio
from os import environ
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.mcp import MCPTools
```

```

from mcp import StdioServerParameters

async def run_agent(message: str) -> None:
    server_params = StdioServerParameters(
        command="node",
        # Update this path to the location where you cloned the repository
        args=["mcp-server-browserbase/stagehand/dist/index
.js"],
        env=envron.copy(),
    )

    async with MCPTools(server_params=server_params, timeout_seconds=60) as mcp_tools:
        agent = Agent(
            model=OpenAIChat(id="gpt-5-mini"),
            tools=[mcp_tools],
            instructions=dedent("""\
                You are a web scraping assistant that creates concise reader's digests
from Hacker News.

                CRITICAL INITIALIZATION RULES - FOLLOW EXACTLY:
                1. NEVER use screenshot tool until AFTER successful navigation
                2. ALWAYS start with stagehand_navigate first
                3. Wait for navigation success message before any other actions
                4. If you see initialization errors, restart with navigation only
                5. Use stagehand_observe and stagehand_extract to explore pages safely

                Available tools and safe usage order:
                - stagehand_navigate: Use FIRST to initialize browser
                - stagehand_extract: Use to extract structured data from pages
                - stagehand_observe: Use to find elements and understand page structure
                - stagehand_act: Use to click links and navigate to comments
                - screenshot: Use ONLY after navigation succeeds and page loads

                Your goal is to create a comprehensive but concise digest that includes:
                - Top headlines with brief summaries
                - Key themes and trends
                - Notable comments and insights
                - Overall tech news landscape overview

                Be methodical, extract structured data, and provide valuable insights.
            """),
            markdown=True,
        )
        await agent.aprint_response(message, stream=True)

if __name__ == "__main__":
    asyncio.run(
        run_agent(
            "Create a comprehensive Hacker News Reader's Digest from
https://news.ycombinator.com"
        )
    )

```

Available Tools

The Stagehand MCP server provides several tools for web automation:

Tool	Purpose	Usage Notes
stagehand_navigate	Navigate to web pages	Use first for initialization
stagehand_extract	Extract structured data	Safe for content extraction
stagehand_observe	Find elements and understand page structure	Good for exploration
stagehand_act	Interact with page elements	Click, type, scroll actions
screenshot	Take screenshots	Use only after navigation succeeds

Stripe MCP agent

Source: <https://docs.agno.com/examples/concepts/tools/mcp/stripe>

Using the Stripe MCP server (<https://github.com/stripe/agent-toolkit/tree/main/modelcontextprotocol>) to create an Agent that can interact with the Stripe API:

```
""" Stripe MCP Agent - Manage Your Stripe Operations
```

```
This example demonstrates how to create an Agno agent that interacts with the Stripe API via the Model Context Protocol (MCP). This agent can create and manage Stripe objects like customers, products, prices, and payment links using natural language commands.
```

```
Setup:
```

- ```
2. Install Python dependencies: `pip install agno mcp-sdk`
3. Set Environment Variable: export STRIPE_SECRET_KEY=***.
```

```
Stripe MCP Docs: https://github.com/stripe/agent-toolkit
"""

 "Develop a cloud-based SaaS platform with AI-powered task suggestions, calendar syncing, predictive prioritization, "
 "team collaboration, and project analytics."
)
 asyncio.run(run_agent(demo_description))

Example prompts to try:
"""
A SaaS tool that helps businesses automate document processing using AI. Users can upload invoices, contracts, or PDFs and get structured data, smart summaries, and red flag alerts for compliance or anomalies. Ideal for legal teams, accountants, and enterprise back offices.

An AI-enhanced SaaS platform for streamlining the recruitment process. Features include automated candidate screening using NLP, AI interview scheduling, bias detection in job descriptions, and pipeline analytics. Designed for fast-growing startups and mid-sized HR teams.

An internal SaaS tool for HR departments to monitor employee wellbeing. Combines weekly mood check-ins, anonymous feedback, and AI-driven burnout detection models. Integrates with Slack and HR systems to support a healthier workplace culture.
"""

```

## Azure OpenAI Tools

Source: <https://docs.agno.com/examples/concepts/tools/mode>  
 ls/azure\_openai

### Code

```

cookbook/tools/azure_openai_tools.py
from agno.agent import Agent
from agno.tools.models.azure_openai import AzureOpenAITools

agent = Agent(
 instructions=[
 "You are an AI image generation assistant using Azure OpenAI",
 "Generate high-quality images based on user descriptions",
 "Provide detailed descriptions of the generated images",
],
 tools=[AzureOpenAITools()],
 markdown=True,
)

agent.print_response("Generate an image of a sunset over mountains")

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your credentials

```
export AZURE_OPENAI_API_KEY=your-azure-openai-api-key
export AZURE_OPENAI_ENDPOINT=https://your-resource.openai
.azure.com
export AZURE_OPENAI_IMAGE_DEPLOYMENT=your-dalle-deploymen
t-name
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U requests openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/azure_openai_tools.py

Windows
python cookbook/tools/azure_openai_tools.py
```

## Morph Tools

Source: <https://docs.agno.com/examples/concepts/tools/morph>

## Code

```
cookbook/tools/morph_tools.py
from agno.agent import Agent
from agno.tools.models.morph import MorphTools

agent = Agent(
 instructions=[
 "You are a code editing assistant using Morph's advanced AI capabilities",
 "Help users modify, improve, and refactor their code intelligently",
 "Apply code changes efficiently while maintaining code quality",
],
 tools=[MorphTools()],
 markdown=True,
)

agent.print_response("Refactor this Python function to be more efficient and add type hints")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API keys

```
export MORPH_API_KEY=your-morph-api-key
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/morph_tools.py

Windows
python cookbook/tools/morph_tools.py
```

## Nebius Tools

Source: <https://docs.agno.com/examples/concepts/tools/models/nebius>

## Code

```
cookbook/tools/nebius_tools.py
from agno.agent import Agent
from agno.tools.models.nebius import NebiusTools

agent = Agent(
 instructions=[
 "You are an AI image generation assistant using Nebius AI Studio",
 "Create high-quality images based on user descriptions",
 "Provide detailed information about the generated images",
],
 tools=[NebiusTools()],
 markdown=True,
)

agent.print_response("Generate an image of a futuristic city with flying cars at sunset")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API keys

```
export NEBIUS_API_KEY=your-nebius-api-key
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/nebius_tools.py
```

```
Windows
python cookbook/tools/nebius_tools.py
```

## Meeting Summary Agent

Source: <https://docs.agno.com/examples/concepts/tools/models/openai/meeting-summarizer>

Multi-modal Agno agent that transcribes meeting recordings, extracts key insights, generates visual summaries, and creates audio summaries using OpenAI tools.

This example demonstrates a multi-modal meeting summarizer and visualizer agent that uses OpenAITools and ReasoningTools to transcribe a meeting recording, extract key insights, generate a visual summary, and synthesize an audio summary.

## Code

```
ref/meeting_summarizer_agent.py
"""Example: Meeting Summarizer & Visualizer Agent
```

```
This script uses OpenAITools (transcribe_audio, generate_image, generate_speech)
to process a meeting recording, summarize it, visualize it, and create an audio summary.
```

```
Requires: pip install openai agno
"""
```

```
import base64
from pathlib import Path
from textwrap import dedent

from agno.agent import Agent
from agno.models.google import Gemini
from agno.tools.openai import OpenAITools
from agno.tools.reasoning import ReasoningTools
```

```

from agno.utils.media import download_file, save_base64_data

input_audio_url: str = (
 "https://agno-public.s3.us-east-1.amazonaws.com/de
mo_data/sample_audio.mp3"
)

local_audio_path = Path("tmp/meeting_recording.mp3")
print(f"Downloading file to local path: {local_audio_path}")
download_file(input_audio_url, local_audio_path)

meeting_agent: Agent = Agent(
 model=Gemini(id="gemini-2.0-flash"),
 tools=[OpenAITools(), ReasoningTools()],
 description=dedent("""\
 You are an efficient Meeting Assistant AI.
 Your purpose is to process audio recordings of meetings, extract key information,
 create a visual representation, and provide an audio summary.
 """),
 instructions=dedent("""\
 Follow these steps precisely:
 1. Receive the path to an audio file.
 2. Use the `transcribe_audio` tool to get the text transcription.
 3. Analyze the transcription and write a concise summary highlighting key
discussion points, decisions, and action items.
 4. Based *only* on the summary created in step 3, generating important meeting
points. This should be a essentially an overview of the summary's content properly ordered
and formatted in the form of meeting minutes.
 5. Convert the meeting minutes into an audio summary using the `generate_speech`
tool.
 """),
 markdown=True,
)

response = meeting_agent.run(
 f"Please process the meeting recording located at '{local_audio_path}'"
)
if response.audio:
 base64_audio = base64.b64encode(response.audio[0].content).decode
("utf-8")
 save_base64_data(base64_audio, Path("tmp/meeting_summary.mp3"))
 print(f"Meeting summary saved to: {Path('tmp/meeting_summary.mp3')}")

```

## Usage

Step: Install dependencies

```
pip install openai agno
```

Step: Run the example

```
python ref/meeting_summarizer_agent.py
```

By default, the audio summary will be saved to tmp/meeting\_summary.mp3.

## Recipe RAG Image Agent

Source: <https://docs.agno.com/examples/concepts/tools/mode>  
ls/openai/rag-recipe-image

This example demonstrates a multi-modal RAG agent that uses Groq and OpenAITools to search a PDF recipe knowledge base and generate a step-by-step visual guide for recipes.

## Code

```
ref/recipe_rag_image.py
"""Example: Multi-Modal RAG & Image Agent

An agent that uses Llama 4 for multi-modal RAG and OpenAITools to create a visual,
step-by-step image manual for a recipe.

Run: `pip install openai agno groq cohere` to install the dependencies
"""

from pathlib import Path

from agno.agent import Agent
from agno.knowledge.embedder.cohere import CohereEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.groq import Groq
from agno.tools.openai import OpenAITools
from agno.utils.media import download_image
from agno.vectordb.pgvector import PgVector

knowledge_base = Knowledge(
 vector_db=PgVector(
 db_url="postgresql+psycopg://ai:ai@localhost:5532/
ai",
 table_name="embed_vision_documents",
 embedder=CohereEmbedder(

```

 model=Groq(id="meta-llama/llama-4-scout-17b-16e-in
struct"),
 tools=[OpenAITools()],
 knowledge=knowledge_base,
 instructions=[
 "You are a specialized recipe assistant.",
 "When asked for a recipe:",
 "1. Search the knowledge base to retrieve the relevant recipe details.",
 "2. Analyze the retrieved recipe steps carefully.",
 "3. Use the `generate_image` tool to create a visual, step-by-step image manual
for the recipe.",
 "4. Present the recipe text clearly and mention that you have generated an
accompanying image manual. Add instructions while generating the image.",
],
 markdown=True,
 debug_mode=True,
)

response = agent.print_response(
 "What is the recipe for a Thai curry?",
)
if response.images:
 download_image(response.images[0].url, Path("tmp/recipe_image.png"))

```

## Usage

Step: Install dependencies

```
pip install openai agno groq cohere
```

Step: Run the example

```
python ref/recipe_rag_image.py
```

By default, the generated image will be saved to tmp/recipe\_image.png.

## Airflow Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/airflow>

## Code

```

cookbook/tools/airflow_tools.py
from agno.agent import Agent
from agno.tools.airflow import AirflowTools

agent = Agent(
 tools=[AirflowTools(dags_dir="tmp/dags", enable_save_dag=True, enable_read_dag=True)],

```

```

# AWS Lambda Tools

Source: [https://docs.agno.com/examples/concepts/tools/others/aws\\_lambda](https://docs.agno.com/examples/concepts/tools/others/aws_lambda)

## Code

```
cookbook/tools/aws_lambda_tools.py
from agno.agent import Agent
from agno.tools.aws_lambda import AWSLambdaTools

agent = Agent(
 tools=[AWSLambdaTools(region_name="us-east-1")],
 name="AWS Lambda Agent",
)

agent.print_response("List all Lambda functions in our AWS account", markdown=True)
agent.print_response(
 "Invoke the 'hello-world' Lambda function with an empty payload", markdown=True
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your AWS credentials

```
export AWS_ACCESS_KEY_ID=xxx
export AWS_SECRET_ACCESS_KEY=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U boto3 openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/aws_lambda_tools.py
```

```
Windows
python cookbook/tools/aws_lambda_tools.py
```

# AWS SES Tools

Source: [https://docs.agno.com/examples/concepts/tools/others/aws\\_ses](https://docs.agno.com/examples/concepts/tools/others/aws_ses)

## Code

```
cookbook/tools/aws_ses_tools.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.aws_ses import AWSSSESTool
from agno.tools.duckduckgo import DuckDuckGoTools

Configure email settings
sender_email = "verified-sender@example.com" # Your verified SES email
sender_name = "AI Research Updates"
region_name = "us-east-1"

Create an agent that can research and send personalized email updates
agent = Agent(
 name="Research Newsletter Agent",
 model=OpenAIChat(id="gpt-5-mini"),
 description="""You are an AI research specialist who creates and sends
personalized email newsletters about the latest developments in artificial
intelligence and technology."""
 instructions=[
 """When given a prompt:,
1. Extract the recipient's email address carefully. Look for the
complete email in format 'user@domain.com'.,
2. Research the latest AI developments using DuckDuckGo,
3. Compose a concise, engaging email with:
 - A compelling subject line,
 - 3-4 key developments or news items,
 - Brief explanations of why they matter,
 - Links to sources,
4. Format the content in a clean, readable way,
5. Send the email using AWS SES. IMPORTANT: The receiver_email parameter
must be the COMPLETE email address including the @ symbol and domain."""
],
 tools=[
 AWSSSESTool(
 sender_email=sender_email,
 sender_name=sender_name,
 region_name=region_name
),
 DuckDuckGoTools(),
],
 markdown=True,
)

agent.print_response(
 "Research AI developments in healthcare from the past week with a focus on practical
applications in clinical settings. Send the summary via email to johndoe@example.com"
)
```

## Usage

```
Snippet file: "create-venv-step.mdx"
```

```
{" "}
```

Step: Set up AWS SES

## Verify your email/domain: For testing: 1. Go to [AWS SES

```
Console]\([https://console.aws.amazon.com/ses/home
](https://console.aws.amazon.com/ses/home)) > Verified Identities >
Create Identity 2. Choose "Email Address" verification 3. Click verification
link sent to your email **For production:** 1. Choose "Domain" and follow DNS
verification steps 2. Add DKIM and SPF records to your domain's DNS **Note:**
In sandbox mode, both sender and recipient emails must be verified.
```

```
{" "}
```

Step: Configure AWS credentials

## Create IAM user: 1. Go to IAM Console > Users > Add User 2. Enable

```
"Programmatic access" 3. Attach 'AmazonSESFullAccess' policy ### Set
credentials (choose one method): **Method 1 - Using AWS CLI:** `bash aws
configure ` **Method 2 - Environment variables:** `bash export
AWS_ACCESS_KEY_ID=xxx export AWS_SECRET_ACCESS_KEY=xxx export
AWS_DEFAULT_REGION=us-east-1 export OPENAI_API_KEY=xxx `
```

```
{" "}
```

Step: Install libraries

```
`bash pip install -U boto3 openai ddgs agno `
```

```
{" "}
```

Step: Run Agent

```
`bash python cookbook/tools/aws_ses_tools.py `
```

Step: Troubleshooting

If emails aren't sending, check:

- \* Both sender and recipient are verified (in sandbox mode)
- \* AWS credentials are correctly configured
- \* You're within sending limits
- \* Your IAM user has correct SES permissions
- \* Use SES Console's 'Send Test Email' feature to verify setup

## Bitbucket Tools

Source: <https://docs.agno.com/examples/concepts/tools/othe>

rs/bitbucket

## Code

```
cookbook/tools/bitbucket_tools.py
from agno.agent import Agent
from agno.tools.bitbucket import BitbucketTools

agent = Agent(

# Daytona Code Execution

Source: <https://docs.agno.com/examples/concepts/tools/others/daytona>

Learn to use Agno's Daytona integration to run your Agent-generated code in a secure sandbox.

## Code

```
cookbook/tools/daytona_tools.py
from agno.agent import Agent
from agno.models.anthropic import Claude
from agno.tools.daytona import DaytonaTools

daytona_tools = DaytonaTools()

Setup an Agent focused on coding tasks, with access to the Daytona tools
agent = Agent(
 name="Coding Agent with Daytona tools",
 id="coding-agent",
 model=Claude(id="claude-sonnet-4-20250514"),
 tools=[daytona_tools],
 markdown=True,
 instructions=[
 "You are an expert at writing and validating Python code. You have access to a remote, secure Daytona sandbox.",
 "Your primary purpose is to:",
 "1. Write clear, efficient Python code based on user requests",
 "2. Execute and verify the code in the Daytona sandbox",
 "3. Share the complete code with the user, as this is the main use case",
 "4. Provide thorough explanations of how the code works",
 "You can use the run_python_code tool to run Python code in the Daytona sandbox.",
 "Guidelines:",
 "- ALWAYS share the complete code with the user, properly formatted in code blocks",
 "- Verify code functionality by executing it in the sandbox before sharing",
 "- Iterate and debug code as needed to ensure it works correctly",
 "- Use pandas, matplotlib, and other Python libraries for data analysis when appropriate",
 "- Create proper visualizations when requested and add them as image artifacts to show inline",
 "- Handle file uploads and downloads properly",
 "- Explain your approach and the code's functionality in detail",
 "- Format responses with both code and explanations for maximum clarity",
 "- Handle errors gracefully and explain any issues encountered",
],
)

agent.print_response(
 "Write Python code to generate the first 10 Fibonacci numbers and calculate their sum and average"
```

)

## Desi Vocal Tools

Source: [https://docs.agno.com/examples/concepts/tools/others/desi\\_vocal](https://docs.agno.com/examples/concepts/tools/others/desi_vocal)

### Code

```
cookbook/tools/desi_vocal_tools.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.desi_vocal import DesiVocalTools

audio_agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[DesiVocalTools()],
 description="You are an AI agent that can generate audio using the DesiVocal API.",
 instructions=[
 "When the user asks you to generate audio, use the `text_to_speech` tool to generate the audio.",
 "You'll generate the appropriate prompt to send to the tool to generate audio.",
 "You don't need to find the appropriate voice first, I already specified the voice to user.",
 "Return the audio file name in your response. Don't convert it to markdown.",
 "Generate the text prompt we send in hindi language",
],
 markdown=True,
 debug_mode=True,
)

audio_agent.print_response(
 "Generate a very small audio of history of french revolution"
)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export DESI_VOCAL_API_KEY=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U requests openai agno
```

## Step: Run Agent

```
Mac
python cookbook/tools/desi_vocal_tools.py
```

```
Windows
python cookbook/tools/desi_vocal_tools.py
```

## E2B Code Execution

Source: <https://docs.agno.com/examples/concepts/tools/others/e2b>

Learn to use Agno's E2B integration to run your Agent-generated code in a secure sandbox.

## Code

```
cookbook/tools/e2b_tools.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.e2b import E2BTools

e2b_tools = E2BTools(
 timeout=600, # 10 minutes timeout (in seconds)
)

agent = Agent(
 name="Code Execution Sandbox",
 id="e2b-sandbox",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[e2b_tools],
 markdown=True,
 instructions=[
 "You are an expert at writing and validating Python code using a secure E2B sandbox environment.",
 "Your primary purpose is to:",
 "1. Write clear, efficient Python code based on user requests",
 "2. Execute and verify the code in the E2B sandbox",
 "3. Share the complete code with the user, as this is the main use case",
 "4. Provide thorough explanations of how the code works",
],
)

Example: Generate Fibonacci numbers
agent.print_response(
 "Write Python code to generate the first 10 Fibonacci numbers and calculate their sum and average"
)

Example: Data visualization
```

```

agent.print_response(
 "Write a Python script that creates a sample dataset of sales by region and visualize it with matplotlib"
)

Example: Run a web server
agent.print_response(
 "Create a simple FastAPI web server that displays 'Hello from E2B Sandbox!' and run it to get a public URL"
)

Example: Sandbox management
agent.print_response("What's the current status of our sandbox and how much time is left before timeout?")

Example: File operations
agent.print_response("Create a text file with the current date and time, then read it back")

```

## Usage

Snippet file: "create-venv-step.mdx"

### Step: Create an E2B account

Create an account at [E2B](https://e2b.dev/) and get your API key from the dashboard.

### Step: Install libraries

```
pip install e2b_code_interpreter
```

### Step: Set your API Key

```
Mac/Linux
export E2B_API_KEY=your_api_key_here
```

```
Windows (Command Prompt)
set E2B_API_KEY=your_api_key_here
```

```
Windows (PowerShell)
$env:E2B_API_KEY="your_api_key_here"
```

### Step: Run Agent

```
Mac/Linux
python cookbook/tools/e2b_tools.py
```

```
Windows
```

python cookbook\tools\evm\_tools.py

## EVM Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/evm>

### Code

```
cookbook/tools/evm_tools.py
from agno.agent import Agent
from agno.tools.evm import EvmTools

agent = Agent(
 instructions=[
 "You are a blockchain assistant that helps with Ethereum transactions",
 "Help users send transactions and interact with smart contracts",
 "Always verify transaction details before executing",
],
 tools=[EvmTools()],
 markdown=True,
)

agent.print_response("Check my account balance and estimate gas for sending 0.01 ETH")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your credentials

```
export EVM_PRIVATE_KEY=your-private-key
export EVM_RPC_URL=https://your-rpc-endpoint.com
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U web3 openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/evm_tools.py
```

```
Windows
python cookbook/tools/evm_tools.py
```

# Fal Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/fal>

## Code

```
cookbook/tools/fal_tools.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.fal import FalTools

fal_agent = Agent(
 name="Fal Video Generator Agent",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[FalTools("fal-ai/hunyuan-video")],
 description="You are an AI agent that can generate videos using the Fal API.",
 instructions=[
 "When the user asks you to create a video, use the `generate_media` tool to create the video.",
 "Return the URL as raw to the user.",
 "Don't convert video URL to markdown or anything else.",
],
 markdown=True,
 debug_mode=True,
)

fal_agent.print_response("Generate video of balloon in the ocean")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API keys

```
export FAL_KEY=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U fal openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/fal_tools.py
```

```
Windows
```

python cookbook/tools/fal\_tools.py

## Financial Datasets Tools

Source: [https://docs.agno.com/examples/concepts/tools/others/financial\\_datasets](https://docs.agno.com/examples/concepts/tools/others/financial_datasets)

### Code

```
cookbook/tools/financial_datasets_tools.py
from agno.agent import Agent
from agno.tools.financial_datasets import FinancialDatasetsTools

agent = Agent(
 name="Financial Data Agent",
 tools=[
 FinancialDatasetsTools(), # For accessing financial data
],
 description="You are a financial data specialist that helps analyze financial information for stocks and cryptocurrencies.",
 instructions=[
 "When given a financial query:",
 "1. Use appropriate Financial Datasets methods based on the query type",
 "2. Format financial data clearly and highlight key metrics",
 "3. For financial statements, compare important metrics with previous periods when relevant",
 "4. Calculate growth rates and trends when appropriate",
 "5. Handle errors gracefully and provide meaningful feedback",
],
 markdown=True,
)

Example 1: Financial Statements
print("\n=== Income Statement Example ===")
agent.print_response(
 "Get the most recent income statement for AAPL and highlight key metrics",
 stream=True,
)

Example 2: Balance Sheet Analysis
print("\n=== Balance Sheet Analysis Example ===")
agent.print_response(
 "Analyze the balance sheets for MSFT over the last 3 years. Focus on debt-to-equity ratio and cash position.",
 stream=True,
)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API credentials

```
export FINANCIAL_DATASETS_API_KEY=xxx
```

Step: Install libraries

```
pip install -U agno
```

Step: Run Agent

```
Mac
python cookbook/tools/financial_datasets_tools.py

Windows
python cookbook/tools/financial_datasets_tools.py
```

## Giphy Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/giphy>

### Code

```
cookbook/tools/giphy_tools.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.giphy import GiphyTools

gif_agent = Agent(
 name="Gif Generator Agent",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[GiphyTools(limit=5)],
 description="You are an AI agent that can generate gifs using Giphy.",
 instructions=[
 "When the user asks you to create a gif, come up with the appropriate Giphy query and use the `search_gifs` tool to find the appropriate gif.",
],
 debug_mode=True,
)

gif_agent.print_response("I want a gif to send to a friend for their birthday.")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GIPHY_API_KEY=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U giphy_client openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/giphy_tools.py
```

```
Windows
python cookbook/tools/giphy_tools.py
```

## GitHub Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/github>

## Code

```
cookbook/tools/github_tools.py
from agno.agent import Agent
from agno.tools.github import GithubTools

agent = Agent(
 instructions=[
 "Use your tools to answer questions about the repo: agno-agi/agno",
 "Do not create any issues or pull requests unless explicitly asked to do so",
],
 tools=[GithubTools()],
)
agent.print_response("List open pull requests", markdown=True)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your GitHub token

```
export GITHUB_TOKEN=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U PyGithub openai agno
```

### Step: Run Agent

# Mac

```
python cookbook/tools/github_tools.py
```

# Windows

```
python cookbook/tools/github_tools.py
```

## Google Calendar Tools

Source: [https://docs.agno.com/examples/concepts/tools/others/google\\_calendar](https://docs.agno.com/examples/concepts/tools/others/google_calendar)

### Code

```
cookbook/tools/google_calendar_tools.py
from agno.agent import Agent
from agno.tools.googlecalendar import GoogleCalendarTools

agent = Agent(
 tools=[GoogleCalendarTools()],
 markdown=True,
)

agent.print_response("What events do I have today?")
agent.print_response("Schedule a meeting with John tomorrow at 2pm")
```

### Usage

Snippet file: "create-venv-step.mdx"

### Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

### Step: Set up Google Calendar credentials

```
export GOOGLE_CALENDAR_CREDENTIALS=path/to/credentials.js
on
```

### Step: Install libraries

```
pip install -U google-auth-oauthlib google-auth-httpplib2 google-api-python-client
openai agno
```

## Step: Run Agent

```
Mac
python cookbook/tools/google_calendar_tools.py

Windows
python cookbook/tools/google_calendar_tools.py
```

# Google Maps Tools

Source: [https://docs.agno.com/examples/concepts/tools/others/google\\_maps](https://docs.agno.com/examples/concepts/tools/others/google_maps)

## Code

```
cookbook/tools/google_maps_tools.py
from agno.agent import Agent
from agno.tools.google_maps import GoogleMapTools
from agno.tools.crawl4ai import Crawl4aiTools # Optional: for enriching place data

agent = Agent(
 name="Maps API Demo Agent",
 tools=[
 GoogleMapTools(),
 Crawl4aiTools(max_length=5000), # Optional: for scraping business websites
],
 description="Location and business information specialist for mapping and location-based queries.",
 markdown=True,
)

Example 1: Business Search
print("\n=== Business Search Example ===")
agent.print_response(
 "Find me highly rated Indian restaurants in Phoenix, AZ with their contact details",
 markdown=True,
 stream=True,
)

Example 2: Directions
print("\n=== Directions Example ===")
agent.print_response(
 """Get driving directions from 'Phoenix Sky Harbor Airport' to 'Desert Botanical Garden',
 avoiding highways if possible""",
 markdown=True,
 stream=True,
)

Example 3: Address Validation and Geocoding
```

```

print("\n=== Address Validation and Geocoding Example ===")
agent.print_response(
 """Please validate and geocode this address:
 '1600 Amphitheatre Parkway, Mountain View, CA'""",
 markdown=True,
 stream=True,
)

Example 4: Distance Matrix
print("\n=== Distance Matrix Example ===")
agent.print_response(
 """Calculate the travel time and distance between these locations in Phoenix:
 Origins: ['Phoenix Sky Harbor Airport', 'Downtown Phoenix']
 Destinations: ['Desert Botanical Garden', 'Phoenix Zoo']""",
 markdown=True,
 stream=True,
)

Example 5: Location Analysis
print("\n=== Location Analysis Example ===")
agent.print_response(
 """Analyze this location in Phoenix:
 Address: '2301 N Central Ave, Phoenix, AZ 85004'
 Please provide:
 1. Exact coordinates
 2. Nearby landmarks
 3. Elevation data
 4. Local timezone""",
 markdown=True,
 stream=True,
)

Example 6: Multi-mode Transit Comparison
print("\n=== Transit Options Example ===")
agent.print_response(
 """Compare different travel modes from 'Phoenix Convention Center' to 'Phoenix Art
 Museum':
 1. Driving
 2. Walking
 3. Transit (if available)
 Include estimated time and distance for each option.""",
 markdown=True,
 stream=True,
)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API keys

```
export GOOGLE_MAPS_API_KEY=xxx
export OPENAI_API_KEY=xxx
```

Get your API key from the [Google Cloud Console](<https://console.cloud.google.com/projects/elector2/google/maps-apis/credentials>)

Step: Install libraries

```
pip install -U openai googlemaps agno
```

Step: Run Agent

```
Mac
python cookbook/tools/google_maps_tools.py
```

```
Windows
python cookbook/tools/google_maps_tools.py
```

## Jira Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/jira>

### Code

```
cookbook/tools/jira_tools.py
from agno.agent import Agent
from agno.tools.jira import JiraTools
```

```
agent = Agent(
 tools=[JiraTools()],
 markdown=True,
)
```

```
agent.print_response("List all open issues in project 'DEMO'")
agent.print_response("Create a new task in project 'DEMO' with high priority")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your Jira credentials

```
export JIRA_API_TOKEN=xxx
export JIRA_SERVER_URL=xxx
export JIRA_EMAIL=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U jira openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/jira_tools.py

Windows
python cookbook/tools/jira_tools.py
```

## Knowledge Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/knowledge>

### Code

```
cookbook/tools/knowledge_tools.py
from agno.agent import Agent
from agno.tools.knowledge import KnowledgeTools
from agno.knowledge import Knowledge

Initialize knowledge base
knowledge = Knowledge()
knowledge.load_documents("./docs/")

agent = Agent(
 instructions=[
 "You are a knowledge assistant that helps find and analyze information",
 "Search through the knowledge base to answer questions",
 "Provide detailed analysis and reasoning about the information found",
],
 tools=[KnowledgeTools(knowledge=knowledge)],
 markdown=True,
)

agent.print_response("What are the best practices for API design?")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/knowledge_tools.py

Windows
python cookbook/tools/knowledge_tools.py
```

## Linear Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/linear>

### Code

```
cookbook/tools/linear_tools.py
from agno.agent import Agent
from agno.tools.linear import LinearTools

agent = Agent(
 tools=[LinearTools()],
 markdown=True,
)

agent.print_response("Show me all active issues")
agent.print_response("Create a new high priority task for the engineering team")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your Linear API key

```
export LINEAR_API_KEY=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U linear-sdk openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/linear_tools.py
```

```
Windows
python cookbook/tools/linear_tools.py
```

## Luma Labs Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/lumalabs>

### Code

```
cookbook/tools/lumalabs_tools.py
from agno.agent import Agent
from agno.tools.lumalabs import LumaLabsTools

agent = Agent(
 tools=[LumaLabsTools()],
 markdown=True,
)
agent.print_response("Generate a 3D model of a futuristic city")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export LUMALABS_API_KEY=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/lumalabs_tools.py
```

```
Windows
python cookbook/tools/lumalabs_tools.py
```

## Mem0 Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/mem0>

## Code

```
cookbook/tools/mem0_tools.py
from agno.agent import Agent
from agno.tools.mem0 import Mem0Tools

agent = Agent(
 instructions=[
 "You are a memory-enhanced assistant that can remember information across conversations",
 "Store important information about users and their preferences",
 "Retrieve relevant memories to provide personalized responses",
],
 tools=[Mem0Tools(user_id="user_123")],
 markdown=True,
)

agent.print_response("Remember that I prefer vegetarian meals and I'm allergic to nuts")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API keys

```
export MEM0_API_KEY=your-mem0-api-key
export MEM0_ORG_ID=your-organization-id
export MEM0_PROJECT_ID=your-project-id
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U mem0ai openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/mem0_tools.py
```

```
Windows
python cookbook/tools/mem0_tools.py
```

## Memori Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/memori>

## Code

```
cookbook/tools/memori_tools.py
from agno.agent import Agent
from agno.tools.memori import MemoriTools

agent = Agent(
 instructions=[
 "You are a memory-enhanced assistant with persistent conversation history",
 "Remember important information about users and their preferences",
 "Use stored memories to provide personalized and contextual responses",
],
 tools=[
 MemoriTools(database_connect="sqlite:///memori.db"
, namespace="quick-memori")
],
 markdown=True,
)

agent.print_response("Remember that I prefer vegetarian recipes and I'm learning to cook Italian cuisine")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U memorisdk openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/memori_tools.py
```

```
Windows
python cookbook/tools/memori_tools.py
```

## MLX Transcribe Tools

Source: [https://docs.agno.com/examples/concepts/tools/others/mlx\\_transcribe](https://docs.agno.com/examples/concepts/tools/others/mlx_transcribe)

## Code

```
cookbook/tools/mlx_transcribe_tools.py
from agno.agent import Agent
from agno.tools.mlx_transcribe import MLXTranscribeTools

agent = Agent(
 tools=[MLXTranscribeTools()],
 markdown=True,
)
agent.print_response("Transcribe this audio file: path/to/audio.mp3")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U mlx-transcribe openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/mlx_transcribe_tools.py
```

```
Windows
python cookbook/tools/mlx_transcribe_tools.py
```

## Models Labs Tools

Source: [https://docs.agno.com/examples/concepts/tools/others/models\\_labs](https://docs.agno.com/examples/concepts/tools/others/models_labs)

## Code

```
cookbook/tools/models_labs_tools.py
from agno.agent import Agent
from agno.tools.models_labs import ModelsLabsTools
```

```
agent = Agent(
 tools=[ModelsLabsTools()],
 markdown=True,
)
agent.print_response("Generate an image of a sunset over mountains")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export MODELS_LABS_API_KEY=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/models_labs_tools.py
```

```
Windows
python cookbook/tools/models_labs_tools.py
```

## OpenBB Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/openbb>

## Code

```
cookbook/tools/openbb_tools.py
from agno.agent import Agent
from agno.tools.openbb import OpenBBTools

agent = Agent(
 tools=[OpenBBTools()],
 markdown=True,
)
agent.print_response("Get the latest stock price for AAPL")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENBB_PAT=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openbb openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/openbb_tools.py

Windows
python cookbook/tools/openbb_tools.py
```

## OpenCV Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/opencv>

### Code

```
cookbook/tools/opencv_tools.py
from agno.agent import Agent
from agno.tools.opencv import OpenCVTools

agent = Agent(
 instructions=[
 "You are a computer vision assistant that can capture images and videos",
 "Use the webcam to take photos or record videos as requested",
 "Provide clear feedback about capture operations",
],
 tools=[OpenCVTools()],
 markdown=True,
)

agent.print_response("Take a photo using the webcam")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U opencv-python openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/opencv_tools.py
```

```
Windows
python cookbook/tools/opencv_tools.py
```

## Reasoning Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/reasoning>

### Code

```
cookbook/tools/reasoning_tools.py
from agno.agent import Agent
from agno.tools.reasoning import ReasoningTools

agent = Agent(
 instructions=[
 "You are a logical reasoning assistant that breaks down complex problems",
 "Use step-by-step thinking to analyze situations thoroughly",
 "Apply structured reasoning to reach well-founded conclusions",
],
 tools=[ReasoningTools()],
 markdown=True,
)

agent.print_response("Analyze the pros and cons of remote work for software developers")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

### Step: Run Agent

```
Mac
python cookbook/tools/reasoning_tools.py
```

```
Windows
python cookbook/tools/reasoning_tools.py
```

## Replicate Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/replicate>

### Code

```
cookbook/tools/replicate_tools.py
from agno.agent import Agent
from agno.tools.replicate import ReplicateTools

agent = Agent(
 tools=[ReplicateTools()],
 markdown=True,
)
agent.print_response("Generate an image of a cyberpunk city")
```

### Usage

Snippet file: "create-venv-step.mdx"

### Step: Set your API token

```
export REPLICATE_API_TOKEN=xxx
export OPENAI_API_KEY=xxx
```

### Step: Install libraries

```
pip install -U replicate openai agno
```

### Step: Run Agent

```
Mac
python cookbook/tools/replicate_tools.py
```

```
Windows
```

python cookbook/tools/replicate\_tools.py

## Resend Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/resend>

### Code

```
cookbook/tools/resend_tools.py
from agno.agent import Agent
from agno.tools.resend import ResendTools

agent = Agent(
 tools=[ResendTools()],
 markdown=True,
)
agent.print_response("Send an email to test@example.com with the subject 'Test Email'")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export RESEND_API_KEY=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U resend openai agno
```

Step: Run Agent

```
Mac
python cookbook/tools/resend_tools.py
```

```
Windows
python cookbook/tools/resend_tools.py
```

## Todoist Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/todoist>

### Code

```
cookbook/tools/todoist_tools.py
```

```
"""
```

Example showing how to use the Todoist Tools with Agno

Requirements:

- Sign up/login to Todoist and get a Todoist API Token (get from <https://app.todoist.com/app/settings/integrations/developer>)
- pip install todoist-api-python

Usage:

- Set the following environment variables:  
    export TODOIST\_API\_TOKEN="your\_api\_token"
  - Or provide them when creating the TodoistTools instance
- ```
"""
```

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.todoist import TodoistTools
```

```
todoist_agent = Agent(
    name="Todoist Agent",
    role="Manage your todoist tasks",
    instructions=[
        "When given a task, create a todoist task for it.",
        "When given a list of tasks, create a todoist task for each one.",
        "When given a task to update, update the todoist task.",
        "When given a task to delete, delete the todoist task.",
        "When given a task to get, get the todoist task.",
    ],
    id="todoist-agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[TodoistTools()],
    markdown=True,
    debug_mode=True,
)
```

Example 1: Create a task

```
print("\n=== Create a task ===")
todoist_agent.print_response("Create a todoist task to buy groceries tomorrow at 10am")
```

Example 2: Delete a task

```
print("\n=== Delete a task ===")
todoist_agent.print_response(
    "Delete the todoist task to buy groceries tomorrow at 10am"
)
```

Example 3: Get all tasks

```
print("\n=== Get all tasks ===")
todoist_agent.print_response("Get all the todoist tasks")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API Token

```
export TODOIST_API_TOKEN=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U todoist-api-python openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/todoist_tools.py
```

```
# Windows
python cookbook/tools/todoist_tools.py
```

User Control Flow Tools

Source: https://docs.agno.com/examples/concepts/tools/others/user_control_flow

Code

```
# cookbook/tools/user_control_flow_tools.py
from agno.agent import Agent
from agno.tools.user_control_flow import UserControlFlowTools

agent = Agent(
    instructions=[
        "You are an interactive assistant that can ask users for input when needed",
        "Use user input requests to gather specific information or clarify requirements",
        "Always explain why you need the user input and how it will be used",
    ],
    tools=[UserControlFlowTools()],
    markdown=True,
)

agent.print_response("Help me create a personalized workout plan")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

Mac

```
python cookbook/tools/user_control_flow_tools.py
```

Windows

```
python cookbook/tools/user_control_flow_tools.py
```

Visualization Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/visualization>

Code

```
# cookbook/tools/visualization_tools.py
from agno.agent import Agent
from agno.tools.visualization import VisualizationTools

agent = Agent(
    instructions=[
        "You are a data visualization assistant that creates charts and plots",
        "Generate clear, informative visualizations based on user data",
        "Save charts to files and provide insights about the data",
    ],
    tools=[VisualizationTools(output_dir="charts")],
    markdown=True,
)

agent.print_response("Create a bar chart showing sales by quarter: Q1=100, Q2=150, Q3=120, Q4=180")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U matplotlib openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/visualization_tools.py

# Windows
python cookbook/tools/visualization_tools.py
```

Web Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/webtools>

Code

```
# cookbook/tools/webtools.py
from agno.agent import Agent
from agno.tools.webtools import WebTools

agent = Agent(
    instructions=[
        "You are a web utility assistant that helps with URL operations",
        "Expand shortened URLs to show their final destinations",
        "Help users understand where links lead before visiting them",
    ],
    tools=[WebTools()],
    markdown=True,
)

agent.print_response("Expand this shortened URL: https://bit.ly/3example")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U httpx openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/webtools.py

# Windows
python cookbook/tools/webtools.py
```

YFinance Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/yfinance>

Code

```
# cookbook/tools/yfinance_tools.py
from agno.agent import Agent
from agno.tools.yfinance import YFinanceTools

agent = Agent(
    tools=[YFinanceTools()],
    markdown=True,
)
agent.print_response("Get the current stock price and recent history for AAPL")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U yfinance openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/yfinance_tools.py

# Windows
python cookbook/tools/yfinance_tools.py
```

YouTube Tools

Source: <https://docs.agno.com/examples/concepts/tools/others/youtube>

Code

```
# cookbook/tools/youtube_tools.py
from agno.agent import Agent
from agno.tools.youtube import YouTubeTools

agent = Agent(
    tools=[YouTubeTools()],
    markdown=True,
)
agent.print_response("Search for recent videos about artificial intelligence")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export YOUTUBE_API_KEY=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-api-python-client openai agno
```

Step: Run Agent

```
# Mac

from agno.tools.twilio import TwilioTools

agent = Agent(
    tools=[TwilioTools()],
    markdown=True,
)
agent.print_response("Send an SMS to +1234567890 saying 'Hello from Agno!'")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Set your Twilio credentials

```
export TWILIO_ACCOUNT_SID=xxx
export TWILIO_AUTH_TOKEN=xxx
export TWILIO_FROM_NUMBER=xxx
```

Step: Install libraries

```
pip install -U twilio openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/twilio_tools.py

# Windows
python cookbook/tools/twilio_tools.py
```

Webex Tools

Source: <https://docs.agno.com/examples/concepts/tools/social/webex>

Code

```
# cookbook/tools/webex_tools.py
from agno.agent import Agent
from agno.tools.webex import WebexTools

agent = Agent(
    name="Webex Assistant",
    tools=[WebexTools()],
    description="You are a Webex assistant that can send messages and manage spaces.",
    instructions=[
        "You can help users by:",
        "- Listing available Webex spaces",
        "- Sending messages to spaces",
        "Always confirm the space exists before sending messages.",
    ],
    markdown=True,
)

# List all spaces in Webex
agent.print_response("List all spaces on our Webex", markdown=True)

# Send a message to a Space in Webex
agent.print_response(
    "Send a funny ice-breaking message to the webex Welcome space", markdown=True
)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set up Webex Bot

1. Go to Webex Developer Portal (<https://developer.webex.com/>)
2. Create a Bot:
 - * Navigate to My Webex Apps Create a Bot
 - * Fill in the bot details and click Add Bot
3. Get your access token:
 - * Copy the token shown after bot creation
 - * Or regenerate via My Webex Apps Edit Bot

Step: Set your API keys

```
export WEBEX_ACCESS_TOKEN=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U webexpythonsdk openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/webex_tools.py

# Windows
python cookbook/tools/webex_tools.py
```

WhatsApp Tools

Source: <https://docs.agno.com/examples/concepts/tools/social/whatsapp>

Code

```
# cookbook/tools/whatsapp_tools.py
from agno.agent import Agent
from agno.models.google import Gemini
from agno.tools.whatsapp import WhatsAppTools

agent = Agent(
    name="whatsapp",
    model=Gemini(id="gemini-2.0-flash"),
    tools=[WhatsAppTools()],
)
```

```
# Example: Send a template message
# Note: Replace '''hello_world''' with your actual template name
agent.print_response(
    "Send a template message using the '''hello_world''' template in English to +91
1234567890"
)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set up WhatsApp Business API

1. Go to Meta for Developers (<https://developers.facebook.com/docs/whatsapp/cloud-api/get-started>)
2. Create a Meta App and set up the WhatsApp Business API.
3. Obtain your Phone Number ID and a permanent System User Access Token.

Step: Set your API keys and identifiers

```
export WHATSAPP_ACCESS_TOKEN=xxx
export WHATSAPP_PHONE_NUMBER_ID=xxx
export OPENAI_API_KEY=xxx # Or your preferred LLM API key
```

Step: Install libraries

```
pip install -U agno openai google-generativeai # Add any other necessary WhatsApp SDKs
```

Step: Run Agent

```
# Mac
python cookbook/tools/whatsapp_tools.py
```

```
# Windows
python cookbook/tools/whatsapp_tools.py
```

X (Twitter) Tools

Source: <https://docs.agno.com/examples/concepts/tools/social/x>

Code

```
# cookbook/tools/x_tools.py
from agno.agent import Agent
from agno.tools.x import XTools
```

```
agent = Agent(  
    tools=[XTools()],  
    markdown=True,  
)  
agent.print_response("Make a post saying 'Hello World from Agno!'")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Set your X credentials

```
export X_CONSUMER_KEY=xxx  
export X_CONSUMER_SECRET=xxx  
export X_ACCESS_TOKEN=xxx  
export X_ACCESS_TOKEN_SECRET=xxx  
export X_BEARER_TOKEN=xxx
```

Step: Install libraries

```
pip install -U tweepy openai agno
```

Step: Run Agent

```
# Mac  
python cookbook/tools/x_tools.py
```

```
# Windows  
python cookbook/tools/x_tools.py
```

BrightData Tools

Source: https://docs.agno.com/examples/concepts/tools/web_scrape/brightdata

Code

```
# cookbook/tools/brightdata_tools.py  
from agno.agent import Agent  
from agno.models.openai import OpenAIChat  
from agno.tools.brightdata import BrightDataTools  
from agno.utils.media import save_base64_data
```

```

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[
        BrightDataTools(
            enable_get_screenshot=True,
        )
    ],
    markdown=True,
)

# Example 1: Scrape a webpage as Markdown
agent.print_response(
    "Scrape this webpage as markdown: https://docs.agno.com/introduction",
)

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API keys

```

export OPENAI_API_KEY=xxx
export BRIGHT_DATA_API_KEY=xxx

```

Step: Install libraries

```

pip install -U requests openai agno

```

Step: Run Agent

```

# Mac
python cookbook/tools/brightdata_tools.py

```

```

# Windows
python cookbook/tools/brightdata_tools.py

```

Firecrawl Tools

Source: https://docs.agno.com/examples/concepts/tools/web_scrape/firecrawl

Use Firecrawl with Agno to scrape and crawl the web.

Code

```

# cookbook/tools/firecrawl_tools.py

```

```
from agno.agent import Agent
from agno.tools.firecrawl import FirecrawlTools

agent = Agent(
    tools=[FirecrawlTools(enable_scrape=False, enable_crawl=True)],
    markdown=True,
)
agent.print_response("Summarize this https://finance.yahoo.com/")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export FIRECRAWL_API_KEY=xxx
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U firecrawl openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/firecrawl_tools.py
```

```
# Windows
python cookbook/tools/firecrawl_tools.py
```

Jina Reader Tools

Source: https://docs.agno.com/examples/concepts/tools/web_scrape/jina_reader

Code

```
# cookbook/tools/jina_reader_tools.py
from agno.agent import Agent
from agno.tools.jina_reader import JinaReaderTools

agent = Agent(
    tools=[JinaReaderTools()],
    markdown=True,
)
agent.print_response("Read and summarize this PDF: https://example.com/sample.pdf")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U jina-reader openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/jina_reader_tools.py
```

```
# Windows
python cookbook/tools/jina_reader_tools.py
```

Newspaper Tools

Source: https://docs.agno.com/examples/concepts/tools/web_scrape/newspaper

Code

```
# cookbook/tools/newspaper_tools.py
from agno.agent import Agent
from agno.tools.newspaper import NewspaperTools

agent = Agent(
    tools=[NewspaperTools()],
    markdown=True,
)
agent.print_response("Extract the main article content from https://example.com/article")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U newspaper3k openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/newspaper_tools.py
```

```
# Windows
python cookbook/tools/newspaper_tools.py
```

Newspaper4k Tools

Source: https://docs.agno.com/examples/concepts/tools/web_scrape/newspaper4k

Code

```
# cookbook/tools/newspaper4k_tools.py
from agno.agent import Agent
from agno.tools.newspaper4k import Newspaper4kTools

agent = Agent(
    tools=[Newspaper4kTools()],
    markdown=True,
)
agent.print_response("Analyze and summarize this news article: https://example.com/news")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U newspaper4k openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/newspaper4k_tools.py
```

```
# Windows
python cookbook/tools/newspaper4k_tools.py
```

Oxylabs Tools

Source: https://docs.agno.com/examples/concepts/tools/web_scrape/oxylabs

Use Oxylabs with Agno to scrape and crawl the web.

Code

```
# cookbook/tools/oxylabs_tools.py
from agno.agent import Agent
from agno.tools.oxylabs import OxylabsTools

agent = Agent(
    tools=[OxylabsTools()],
    markdown=True,
)

agent.print_response("""
Let's search for 'latest iPhone reviews' and provide a summary of the top 3 results.
""")

print(response)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API keys

```
export OXYLABS_USERNAME=your_oxylabs_username
export OXYLABS_PASSWORD=your_oxylabs_password
```

Step: Install libraries

```
pip install -U oxylabs agno openai
```

Step: Run the example

```
python cookbook/tools/oxylabs_tools.py
```

Spider Tools

Source: https://docs.agno.com/examples/concepts/tools/web_scrape/spider

Code

```
# cookbook/tools/spider_tools.py
from agno.agent import Agent
from agno.tools.spider import SpiderTools

agent = Agent(
    tools=[SpiderTools()],
    markdown=True,
)
agent.print_response("Crawl https://example.com and extract all links")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U scrapy openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/spider_tools.py
```

```
# Windows
python cookbook/tools/spider_tools.py
```

Trafilatura Tools

Source: https://docs.agno.com/examples/concepts/tools/web_scrape/trafilatura

Code

```
# cookbook/tools/trafilatura_tools.py
from agno.agent import Agent
from agno.tools.trafilatura import TrafilaturaTools

agent = Agent(
    instructions=[
        "You are a web content extraction specialist",
        "Extract clean text and structured data from web pages",
        "Provide detailed analysis of web content and metadata",
    ],
```

```
tools=[TrafilaturaTools()],
markdown=True,
)

agent.print_response("Extract the main content from https://example.com/article")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U trafilatura openai agno
```

Step: Run Agent

```
# Mac
python cookbook/tools/trafilatura_tools.py
```

```
# Windows
python cookbook/tools/trafilatura_tools.py
```

Website Tools

Source: https://docs.agno.com/examples/concepts/tools/web_scrape/website

Code

```
# cookbook/tools/website_tools.py
from agno.agent import Agent
from agno.tools.website import WebsiteTools

agent = Agent(
    tools=[WebsiteTools()],
    markdown=True,
)
agent.print_response("Extract the main content from https://example.com")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U beautifulsoup4 requests openai agno
```

Step: Run Agent

Mac

```
python cookbook/tools/website_tools.py
```

Windows

          "fields": [

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Start Couchbase

```
docker run -d --name couchbase-server \
  -p 8091-8096:8091-8096 \
  -p 11210:11210 \
  -e COUCHBASE_ADMINISTRATOR_USERNAME=Administrator \
  -e COUCHBASE_ADMINISTRATOR_PASSWORD=password \
  couchbase:latest
```

Then access http://localhost:8091 and create:

```
* Bucket: `recipe_bucket`
* Scope: `recipe_scope`
* Collection: `recipes`
```

Step: Install libraries

```
pip install -U couchbase pypdf openai agno
```

Step: Set environment variables

```
export COUCHBASE_USER="Administrator"
export COUCHBASE_PASSWORD="password"
export COUCHBASE_CONNECTION_STRING="couchbase://localhost"
"
export OPENAI_API_KEY=xxx
```

Step: Run Agent

Mac

```
python cookbook/knowledge/vector_db/couchbase_db/async_couchbase_db.py
```

Windows

```
python cookbook/knowledge/vector_db/couchbase_db/async_couchbase_db.py
```

# cookbook/knowledge/vector_db/weaviate_db/weaviate_db.py
from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.vectordb.search import SearchType
from agno.vectordb.weaviate import Weaviate
from agno.vectordb.weaviate.index import Distance, VectorIndex

vector_db = Weaviate(
    collection="vectors",
    search_type=SearchType.vector,
    vector_index=VectorIndex.HNSW,
    distance=Distance.COSINE,
    local=False, # Set to True if using Weaviate locally
)
```

```

# Create Knowledge Instance with Weaviate
knowledge = Knowledge(
    name="Basic SDK Knowledge Base",
    description="Agno 2.0 Knowledge Implementation with Weaviate",
    vector_db=vector_db,
)

knowledge.add_content(
    name="Recipes",
    url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf",
    metadata={"doc_type": "recipe_book"},
    skip_if_exists=True,
)

# Create and use the agent
agent = Agent(knowledge=knowledge)
agent.print_response("List down the ingredients to make Massaman Gai", markdown=True)

# Delete operations
vector_db.delete_by_name("Recipes")
# or
vector_db.delete_by_metadata({"doc_type": "recipe_book"})

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install -U weaviate-client pypdf openai agno
```

Step: Setup Weaviate

```

# Weaviate Cloud
# 1. Create account at https://console.weaviate.cloud/
# 2. Create a cluster and copy the "REST endpoint" and "Admin" API Key
# 3. Set environment variables:
export WCD_URL="your-cluster-url"
export WCD_API_KEY="your-api-key"
# 4. Set local=False in the code

# Local Development
# 1. Install Docker from https://docs.docker.com/get-docker/
# 2. Run Weaviate locally:
docker run -d \
    -p 8080:8080 \
    -p 50051:50051 \
    --name weaviate \
    cr.weaviate.io/semitechnologies/weaviate:1.28.4

```

```
# 3. Set local=True in the code
```

Step: Set environment variables

```
export OPENAI_API_KEY=xxx
```

Step: Run Agent

```
# Mac
```

```
python cookbook/knowledge/vector_db/weaviate_db/weaviate_db.py
```

```
# Windows
```

```
python cookbook/knowledge/vector_db/weaviate_db/weaviate_db.py
```

Weaviate Hybrid Search

Function instead of steps

Source: https://docs.agno.com/examples/concepts/workflows/01-basic-workflows/function_instead_of_steps

This example demonstrates how to use just a single function instead of steps in a workflow.

This example demonstrates Workflows using a single custom execution function instead of discrete steps. This pattern gives you complete control over the orchestration logic while still benefiting from workflow features like storage, streaming, and session management.

When to use: When you need maximum flexibility and control over the execution flow, similar to Workflows 1.0 approach but with a better structured approach.

```

# function_instead_of_steps.py
from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.team import Team
from agno.tools.duckduckgo import DuckDuckGoTools

```

```

from agno.tools.hackernews import HackerNewsTools
from agno.workflow.types import WorkflowExecutionInput
from agno.workflow.workflow import Workflow

# Define agents
hackernews_agent = Agent(
    name="Hackernews Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[HackerNewsTools()],
    role="Extract key insights and content from Hackernews posts",
)
web_agent = Agent(
    name="Web Agent",
    model=OpenAIChat(id="gpt-5-mini"),

Sequence of functions and agents

Source: https://docs.agno.com/examples/concepts/workflows/01-basic-workflows/sequence_of_functions_and_agent

This example demonstrates how to use a sequence of functions and agents in a workflow.

This example demonstrates Workflows combining custom functions with agents and teams in a sequential execution pattern. This shows how to mix different component types for maximum flexibility in your workflow design.

When to use: Linear processes where you need custom data preprocessing between AI agents, or when combining multiple component types (functions, agents, teams) in sequence.

```
# sequence_of_functions_and_agents.py
from textwrap import dedent

from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.team import Team
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.hackernews import HackerNewsTools
from agno.workflow.types import StepInput, StepOutput
from agno.workflow.workflow import Workflow

# Define agents
web_agent = Agent(
    name="Web Agent",
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[DuckDuckGoTools()],
    role="Search the web for the latest news and trends",
)

hackernews_agent = Agent(
    name="Hackernews Agent",

Sequence of steps

Source: https://docs.agno.com/examples/concepts/workflows/01-basic-workflows/sequence_of_steps

This example demonstrates how to use named steps in a workflow.

This example demonstrates Workflows using named Step objects for better tracking and organization. This pattern provides clear step identification and enhanced logging while maintaining simple sequential execution.

Pattern: Sequential Named Steps

When to use: Linear processes where you want clear step identification, better logging, and future platform support. Ideal when you have distinct phases that benefit from naming.

```
# sequence_of_steps.py
from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.team import Team

Step with function

Source: https://docs.agno.com/examples/concepts/workflows/01-basic-workflows/step_with_function

This example demonstrates how to use named steps with custom function executors.

This example demonstrates Workflows using named Step objects with custom function executors. This pattern combines the benefits of named steps with the flexibility of custom functions, allowing for sophisticated data processing within structured workflow steps.

When to use: When you need named step organization but want custom logic that goes beyond what agents/teams provide. Ideal for complex data processing, multi-step operations, or when you need to orchestrate multiple agents within a single step.

```
# step_with_function.py

Condition steps workflow

Source: https://docs.agno.com/examples/concepts/workflows/02-workflows-conditional-execution/condition_steps_workflow_stream

This example demonstrates how to use conditional steps in a workflow.

This example demonstrates Workflows 2.0 conditional execution pattern. Shows how to conditionally execute steps based on content analysis, providing intelligent selection of steps based on the actual data being processed.

When to use: When you need intelligent selection of steps based on content analysis rather than simple input parameters or some other business logic. Ideal for quality gates, content-specific processing, or adaptive workflows that respond to intermediate results.

```

Loop Steps Workflow

Source: https://docs.agno.com/examples/concepts/workflows/03_workflows_loop_execution/loop_steps_workflow

This example demonstrates Workflows 2.0 loop execution for quality-driven iterative processes.

This example demonstrates Workflows 2.0 to repeatedly execute steps until specific conditions are met, ensuring adequate research depth before proceeding to content creation.

When to use: When you need iterative refinement, quality assurance, or when the required output quality can't be guaranteed in a single execution. Ideal for research gathering, data collection, or any process where "good enough" is determined by content analysis rather than a fixed number of iterations.

```
# loop_steps_workflow.py

Parallel Steps Workflow

Source: https://docs.agno.com/examples/concepts/workflows/04-workflows-parallel-execution/parallel_steps_workflow

This example demonstrates Workflows 2.0 parallel execution for independent tasks that can run simultaneously. Shows how to optimize workflow performance by executing non-dependent steps in parallel, significantly reducing total execution time.

This example demonstrates Workflows 2.0 parallel execution for independent tasks that can run simultaneously. Shows how to optimize workflow performance by executing non-dependent steps in parallel, significantly reducing total execution time.

When to use: When you have independent tasks that don't depend on each other's output but can contribute to the same final goal. Ideal for research from multiple sources, parallel data processing, or any scenario where tasks can run simultaneously.

```

# parallel_steps_workflow.py
from agno.agent import Agent
from agno.tools.googlesearch import GoogleSearchTools
from agno.tools.hackernews import HackerNewsTools
from agno.workflow import Step, Workflow
from agno.workflow.parallel import Parallel

```

```

# Create agents

Conditional Branching Workflow

Source: https://docs.agno.com/examples/concepts/workflows/05_workflows_conditional_branching/router_steps_workflow

This example demonstrates Workflows 2.0 router pattern for intelligent, content-based workflow routing.

This example demonstrates Workflows 2.0 to dynamically select the best execution path based on input analysis, enabling adaptive workflows that choose optimal strategies per topic.

When to use: When you need mutually exclusive execution paths based on business logic. Ideal for topic-specific workflows, expertise routing, or when different subjects require completely different processing strategies. Unlike Conditions which can trigger multiple parallel paths, Router selects exactly one path.

```
# router_steps_workflow.py

Selector for Image Video Generation Pipelines

Source: https://docs.agno.com/examples/concepts/workflows/05_workflows_conditional_branching/selector_for_image_video_generation_pipelines

This example demonstrates Workflows 2.0 router pattern for dynamically selecting between image and video generation pipelines.

This example demonstrates Workflows 2.0 router pattern for dynamically selecting between image

and video generation pipelines. It uses Steps to encapsulate each media type's workflow and a Router to intelligently choose the pipeline based on input analysis.

Key Features:

- * Dynamic Routing: Selects pipelines (Steps) based on input keywords (e.g., "image" or "video").
- * Modular Pipelines: Encapsulates image/video workflows as reusable Steps objects.
- * Structured Inputs: Uses Pydantic models for type-safe configuration (e.g., resolution, style).

Key Features:

- * Nested Logic: Embeds Condition and Parallel within a Steps sequence.
- * Topic-Specialized Research: Uses Condition to trigger parallel tech/news research for tech topics.
- * Modular Design: Encapsulates the entire workflow as a reusable Steps object.

```

Access Multiple Previous Steps Output

Source: https://docs.agno.com/examples/concepts/workflows/06_workflows_advanced_concepts/access_multiple_previous_steps_output

This example demonstrates Workflows 2.0 advanced data flow capabilities

This example demonstrates Workflows 2.0 shows how to:

1. Access outputs from specific named steps (`get_step_content()`)
2. Aggregate all previous outputs (`get_all_previous_content()`)
3. Create comprehensive reports by combining multiple research sources

Key Features:

- * Step Output Access: Retrieve data from any previous step by name or collectively.
- * Custom Reporting: Combine and analyze outputs from parallel or sequential steps.
- * Streaming Support: Real-time updates during execution.

```
# access_multiple_previous_steps_output.py

Early Stop a Workflow

Source: https://docs.agno.com/examples/concepts/workflows/06_workflows_advanced_concepts/early_stop_workflow

This example demonstrates Workflows 2.0 early termination of a running workflow.

This example shows how to create workflows that can terminate gracefully when quality conditions aren't met, preventing downstream processing of invalid or unsafe data.

When to use: When you need safety mechanisms, quality gates, or validation checkpoints that should prevent downstream processing if conditions aren't met. Ideal for data validation pipelines, security checks, quality assurance workflows, or any process where continuing with invalid inputs could cause problems.

```
# early_stop_workflow_with_agents.py
from agno.agent import Agent
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.workflow import Workflow
from agno.workflow.types import StepInput, StepOutput

# Create agents with more specific validation criteria
data_validator = Agent(
    name="Data Validator",
    model=OpenAIChat(id="gpt-5-mini"),
    instructions=[
        "You are a data validator. Analyze the provided data and determine if it's",
        "valid.",
        "For data to be VALID, it must meet these criteria:",
        "- user_count: Must be a positive number (> 0)",
        "- revenue: Must be a positive number (> 0)",
        "- date: Must be in a reasonable date format (YYYY-MM-DD)",
        "",
        "Return exactly 'VALID' if all criteria are met.",
        "Return exactly 'INVALID' if any criteria fail.",

Store Events and Events to Skip in a Workflow

Source: https://docs.agno.com/examples/concepts/workflows/06_workflows_advanced_concepts/store_events_and_events_to_skip_in_a_workflow

This example demonstrates Workflows 2.0 event storage capabilities

This example demonstrates Workflows 2.0 event storage capabilities, showing how to:

1. Store execution events for debugging/auditing (store_events=True)
2. Filter noisy events (events_to_skip) to focus on critical workflow milestones
3. Access stored events post-execution via workflow.run_response.events

Key Features:

- * Selective Storage: Skip verbose events (e.g., step_started) while retaining key milestones.
- * Debugging/Audit: Capture execution flow for analysis without manual logging.
- * Performance Optimization: Reduce storage overhead by filtering non-essential events.

```

Source: https://docs.agno.com/examples/concepts/workflows/06_workflows_advanced_concepts/structured_io_at_each_step_level

Demonstrates Workflows 2.0 type-safe data flow between agents/teams/custom python functions. Each step:

1. Receives structured (pydantic model, list, dict or raw string) input
2. Produces structured output (e.g., ResearchFindings, ContentStrategy)

You can also use this pattern to create a custom function that can be used in any step and you can-

1. Inspect incoming data types (raw strings or Pydantic models).
2. Analyze structured outputs from previous steps.
3. Generate reports while preserving type safety.

```

* Structured IO at each Step level Custom Function-2
(https://github.com/agno-agi/agno/blob/main/cookbook/workflows/_06_advanced_concepts/_01_structured_io_at_each_level/structured_io_at_each_level_function_2.py)

Workflow Cancellation

Source: https://docs.agno.com/examples/concepts/workflows/06_workflows_advanced_concepts/workflow_cancellation

This example demonstrates Workflows 2.0 support for cancelling running workflow executions, including thread-based cancellation and handling cancelled responses.

This example shows how to cancel a running workflow execution in real-time. It demonstrates:

1. Thread-based Execution: Running workflows in separate threads for non-blocking operation
2. Dynamic Cancellation: Cancelling workflows while they're actively running
3. Cancellation Events: Handling and responding to cancellation events
4. Status Tracking: Monitoring workflow status throughout execution and cancellation

```
# workflow_cancellation.py
import threading
import time

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.run.agent import RunEvent
from agno.run.base import RunStatus
from agno.run.workflow import WorkflowRunEvent
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.workflow.step import Step
from agno.workflow.workflow import Workflow

def long_running_task(workflow: Workflow, run_id_container: dict):
    """
    Simulate a long-running workflow task that can be cancelled.
```

Args:

workflow: The workflow to run

run_id_container: Dictionary to store the run_id for cancellation

Returns:

Dictionary with run results and status

"""

try:

Start the workflow run - this simulates a long task

final_response = None

Single Step Continuous Execution Workflow

Source: https://docs.agno.com/examples/concepts/workflows/06_workflows_advanced_concepts/workflow_history/01_single_step_continuous_execution_workflow

This example demonstrates a workflow with a single step that is executed continuously with access to workflow history.

This example shows how to use the `add_workflow_history_to_steps` flag to add workflow history to all the steps in the workflow.

In this case we have a single step workflow with a single agent.

The agent has access to the workflow history and uses it to provide personalized educational support.

```
# 01_single_step_continuous_execution_workflow.py
from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.workflow.step import Step
from agno.workflow.workflow import Workflow

tutor_agent = Agent(
    name="AI Tutor",
    model=OpenAIChat(id="gpt-4o"),
    instructions=[
        "You are an expert tutor who provides personalized educational support.",
        "You have access to our full conversation history.",
        "Build on previous discussions - don't repeat questions or information.",
        "Reference what the student has told you earlier in our conversation.",
        "Adapt your teaching style based on what you've learned about the student.",
        "Be encouraging, patient, and supportive.",
        "When asked about conversation history, provide a helpful summary.",
        "Focus on helping the student understand concepts and improve their skills.",
    ],
)

tutor_workflow = Workflow(
    name="Simple AI Tutor",
    description="Single-step conversational tutoring with history awareness",
    db=SqliteDb(db_file="tmp/simple_tutor_workflow.db"),
    steps=[
        Step(name="AI Tutoring", agent=tutor_agent),
    ],
    add_workflow_history_to_steps=True, # This adds the workflow history
)

```

Workflow with History Enabled for Steps

Source: https://docs.agno.com/examples/concepts/workflows/06_workflows_advanced_concepts/workflow_history/02_workflow_with_history_enabled_for_steps

This example demonstrates a workflow with history enabled for specific steps.

This example shows how to use the `add_workflow_history_to_steps` flag to add workflow history to multiple steps in the workflow.

In this case we have a workflow with three steps.

- * The first step is a meal suggester that suggests meal categories and cuisines.
- * The second step is a preference analysis step that analyzes the conversation history to understand user food preferences.
- * The third step is a recipe specialist that provides recipe recommendations based on the user's preferences.

```

# 02_workflow_with_history_enabled_for_steps.py
from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.workflow.step import Step, StepInput, StepOutput
from agno.workflow.workflow import Workflow

# Define specialized agents for meal planning conversation
meal_suggester = Agent(
    name="Meal Suggester",
    model=OpenAIChat(id="gpt-4o"),
    instructions=[
        "You are a friendly meal planning assistant who suggests meal categories and cuisines.",
        "Consider the time of day, day of the week, and any context from the

```

```

conversation.",
    "Keep suggestions broad (Italian, Asian, healthy, comfort food, quick meals,
etc.)",
    "Ask follow-up questions to understand preferences better.",
],
)

recipe_specialist = Agent(
    name="Recipe Specialist",
    model=OpenAIChat(id="gpt-4o"),
    instructions=[
        "You are a recipe expert who provides specific, detailed recipe recommendations.",
        "Pay close attention to the full conversation to understand user preferences and
restrictions.",
        "If the user mentioned avoiding certain foods or wanting healthier options,
respect that.",

Enable History for Specific Steps

Source: https://docs.agno.com/examples/concepts/workflows/06_workflows_advanced_concepts/workflow_history/03_enable_history_for_step

This example demonstrates a workflow with history enabled for a specific step.

This example shows how to use the `add_workflow_history` flag to add workflow history to a specific step in the workflow.

In this case we have a workflow with three steps.

- * The first step is a research specialist that gathers information on topics.
- * The second step is a content creator that writes engaging content.
- * The third step is a content publisher that prepares the content for publication.

```

# 03_enable_history_for_step.py
"""

```

This example shows step-level `add_workflow_history` control.
Only the Content Creator step gets workflow history to avoid repeating previous content.

```

Workflow: Research  Content Creation (with history)  Publishing
"""

```

Get History in Function

Source: [https://docs.agno.com/examples/concepts/workflows/](https://docs.agno.com/examples/concepts/workflows/06_workflows_advanced_concepts/workflow_history/04_get_history_in_function)

06_workflows_advanced_concepts/workflow_history/04

_get_history_in_function

This example demonstrates how to get workflow history in a custom function.

This example shows how to get workflow history in a custom function.

* Using `step_input.get_workflow_history(num_runs=5)` we can get the history as a list of tuples.

* We can also use `step_input.get_workflow_history_context(num_runs=5`

) to get the history as a string.

```
# 04_get_history_in_function.py
```

```
import json
```

```
from agno.agent import Agent
```

```
from agno.db.sqlite import SQLiteDatabase
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.workflow.step import Step
```

```

from agno.workflow.types import StepInput, StepOutput
from agno.workflow.workflow import Workflow

Multi Purpose CLI App with Workflow History

Source: https://docs.agno.com/examples/concepts/workflows/06_workflows_advanced_concepts/workflow_history/05_multi_purpose_cli

This example demonstrates how to use workflow history in a multi purpose CLI.

This example shows how to use the `add_workflow_history_to_steps` flag to add workflow history to the steps.

In this case we have a multi-step workflow with a single agent.

We show different scenarios of a continuous execution of the workflow.

We have 5 different demos:

- * Customer Support
- * Medical Consultation
- * Tutoring

```
# 05_multi_purpose_cli.py
from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.workflow.step import Step
from agno.workflow.workflow import Workflow

Intent Routing with Workflow History

Source: https://docs.agno.com/examples/concepts/workflows/06_workflows_advanced_concepts/workflow_history/06_intent_routing_with_history

This example demonstrates how to use workflow history in intent routing.

This example demonstrates:

1. A simple Router that routes to different specialist agents
2. All agents share the same conversation history for context continuity
3. The power of shared context across different agents

The router uses basic intent detection, but the real value is in the shared history.

```

# 06_intent_routing_with_history.py
from typing import List

from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.workflow.router import Router
from agno.workflow.step import Step
from agno.workflow.types import StepInput
from agno.workflow.workflow import Workflow

# Define specialized customer service agents

Workflow with Input Schema Validation

Source: https://docs.agno.com/examples/concepts/workflows/06_workflows_advanced_concepts/workflow_with_input_schema

This example demonstrates Workflows support for input schema validation using Pydantic models to ensure type safety and data integrity at the workflow entry point.

This example shows how to use input schema validation in workflows to enforce type safety and data structure validation. By defining an `input_schema` with a Pydantic model, you can ensure that your workflow receives properly structured and validated data before execution begins.

Key Features:

- * Type Safety: Automatic validation of input data against Pydantic models
- * Structure Validation: Ensure all required fields are present and correctly typed
- * Clear Contracts: Define exactly what data your workflow expects
- * Error Prevention: Catch invalid inputs before workflow execution begins
- * Multiple Input Formats: Support for Pydantic models and matching dictionaries

```

Basic Agent

Source: <https://docs.agno.com/examples/getting-started/01-basic-agent>

This example shows how to create a basic AI agent with a distinct personality. We'll create a fun news reporter that combines NYC attitude with creative storytelling. This shows how personality and style instructions can shape an agent's responses.

Example prompts to try:

- * "What's the latest scoop from Central Park?"
- * "Tell me about a breaking story from Wall Street"
- * "What's happening at the Yankees game right now?"
- * "Give me the buzz about a new Broadway show"

Code

```
# basic_agent.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat

# Create our News Reporter with a fun personality
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    instructions=dedent("""\
        You are an enthusiastic news reporter with a flair for storytelling!
        Think of yourself as a mix between a witty comedian and a sharp journalist.

        Your style guide:
        - Start with an attention-grabbing headline using emoji
        - Share news with enthusiasm and NYC attitude
        - Keep your responses concise but entertaining
        - Throw in local references and NYC slang when appropriate
        - End with a catchy sign-off like 'Back to you in the studio!' or 'Reporting live
        from the Big Apple!'

        Remember to verify all facts while keeping that NYC energy high!\
    """),
    markdown=True,
)

# Example usage
agent.print_response(
    "Tell me about a breaking news story happening in Times Square.", stream=True
)

# More example prompts to try:
"""
Try these fun scenarios:
```

1. "What's the latest food trend taking over Brooklyn?"
 2. "Tell me about a peculiar incident on the subway today"
 3. "What's the scoop on the newest rooftop garden in Manhattan?"
 4. "Report on an unusual traffic jam caused by escaped zoo animals"
 5. "Cover a flash mob wedding proposal at Grand Central"
- ```
"""
```

## Usage

```
Snippet file: "create-venv-step.mdx"
```

Step: Install libraries

```
pip install openai agno
```

Step: Run the agent

```
python basic_agent.py
```

## Agent with Tools

Source: <https://docs.agno.com/examples/getting-started/02-agent-with-tools>

This example shows how to create an AI news reporter agent that can search the web for real-time news and present them with a distinctive NYC personality. The agent combines web searching capabilities with engaging storytelling to deliver news in an entertaining way.

Example prompts to try:

- \* "What's the latest headline from Wall Street?"
- \* "Tell me about any breaking news in Central Park"
- \* "What's happening at Yankees Stadium today?"
- \* "Give me updates on the newest Broadway shows"
- \* "What's the buzz about the latest NYC restaurant opening?"

## Code

```
agent_with_tools.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools

Create a News Reporter Agent with a fun personality
agent = Agent(
```

```

model=OpenAIChat(id="gpt-5-mini"),
instructions=dedent("""\
 You are an enthusiastic news reporter with a flair for storytelling!
 Think of yourself as a mix between a witty comedian and a sharp journalist.

 Follow these guidelines for every report:
 1. Start with an attention-grabbing headline using relevant emoji
 2. Use the search tool to find current, accurate information
 3. Present news with authentic NYC enthusiasm and local flavor
 4. Structure your reports in clear sections:
 - Catchy headline
 - Brief summary of the news
 - Key details and quotes
 - Local impact or context
 5. Keep responses concise but informative (2-3 paragraphs max)
 6. Include NYC-style commentary and local references
 7. End with a signature sign-off phrase

 Sign-off examples:
 - 'Back to you in the studio, folks!'
 - 'Reporting live from the city that never sleeps!'
 - 'This is [Your Name], live from the heart of Manhattan!'

 Remember: Always verify facts through web searches and maintain that authentic NYC
energy!\
"""),
tools=[DuckDuckGoTools()],
markdown=True,
)

Example usage
agent.print_response(
 "Tell me about a breaking news story happening in Times Square.", stream=True
)

More example prompts to try:
"""
Try these engaging news queries:
1. "What's the latest development in NYC's tech scene?"
2. "Tell me about any upcoming events at Madison Square Garden"
3. "What's the weather impact on NYC today?"
4. "Any updates on the NYC subway system?"
5. "What's the hottest food trend in Manhattan right now?"
"""

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai ddgs agno
```

Step: Run the agent

```
python agent_with_tools.py
```

## Agent with Knowledge

Source: <https://docs.agno.com/examples/getting-started/03-agent-with-knowledge>

This example shows how to create an AI cooking assistant that combines knowledge from a curated recipe database with web searching capabilities. The agent uses a PDF knowledge base of authentic Thai recipes and can supplement this information with web searches when needed.

Example prompts to try:

- \* "How do I make authentic Pad Thai?"
- \* "What's the difference between red and green curry?"
- \* "Can you explain what galangal is and possible substitutes?"
- \* "Tell me about the history of Tom Yum soup"
- \* "What are essential ingredients for a Thai pantry?"
- \* "How do I make Thai basil chicken (Pad Kra Pao)?"

## Code

```
agent_with_knowledge.py
from textwrap import dedent

from agno.agent import Agent
from agno.knowledge.embedder.openai import OpenAIEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.vectordb.lancedb import LanceDb, SearchType

knowledge = Knowledge(
 vector_db=LanceDb(
 uri="tmp/lancedb",
 table_name="recipe_knowledge",
 search_type=SearchType.hybrid,
 embedder=OpenAIEmbedder(id="text-embedding-3-small"
),
),

)

knowledge.add_content(
 url="https://agno-public.s3.amazonaws.com/recipes/
ThaiRecipes.pdf",
```

)

```
Create a Recipe Expert Agent with knowledge of Thai recipes
```

```
agent = Agent(
```

```
 model=OpenAIChat(id="gpt-5-mini"),
```

```
 instructions=dedent("""\
```

```
 You are a passionate and knowledgeable Thai cuisine expert!
```

```
 Think of yourself as a combination of a warm, encouraging cooking instructor,
```

```
 a Thai food historian, and a cultural ambassador.
```

```
 Follow these steps when answering questions:
```

```
 1. If the user asks a about Thai cuisine, ALWAYS search your knowledge base for authentic Thai recipes and cooking information
```

```
 2. If the information in the knowledge base is incomplete OR if the user asks a question better suited for the web, search the web to fill in gaps
```

```
 3. If you find the information in the knowledge base, no need to search the web
```

```
 4. Always prioritize knowledge base information over web results for authenticity
```

```
 5. If needed, supplement with web searches for:
```

```
 - Modern adaptations or ingredient substitutions
```

```
 - Cultural context and historical background
```

```
 - Additional cooking tips and troubleshooting
```

```
 Communication style:
```

```
 1. Start each response with a relevant cooking emoji
```

```
 2. Structure your responses clearly:
```

```
 - Brief introduction or context
```

```
 - Main content (recipe, explanation, or history)
```

```
 - Pro tips or cultural insights
```

```
 - Encouraging conclusion
```

```
 3. For recipes, include:
```

```
 - List of ingredients with possible substitutions
```

```
 - Clear, numbered cooking steps
```

```
 - Tips for success and common pitfalls
```

```
 4. Use friendly, encouraging language
```

```
 Special features:
```

```
 - Explain unfamiliar Thai ingredients and suggest alternatives
```

```
 - Share relevant cultural context and traditions
```

```
 - Provide tips for adapting recipes to different dietary needs
```

```
 - Include serving suggestions and accompaniments
```

```
 End each response with an uplifting sign-off like:
```

```
 - 'Happy cooking! (Enjoy your meal)!'
```

```
 - 'May your Thai cooking adventure bring joy!'
```

```
 - 'Enjoy your homemade Thai feast!'
```

```
 Remember:
```

```
 - Always verify recipe authenticity with the knowledge base
```

```
 - Clearly indicate when information comes from web sources
```

```
 - Be encouraging and supportive of home cooks at all skill levels\
```

```
 """),
```

```
 knowledge=knowledge,
```

```

tools=[DuckDuckGoTools()],
markdown=True,
)

agent.print_response(
 "How do I make chicken and galangal in coconut milk soup", stream=True
)
agent.print_response("What is the history of Thai curry?", stream=True)
agent.print_response("What ingredients do I need for Pad Thai?", stream=True)

More example prompts to try:
"""
Explore Thai cuisine with these queries:
1. "What are the essential spices and herbs in Thai cooking?"
2. "Can you explain the different types of Thai curry pastes?"
3. "How do I make mango sticky rice dessert?"
4. "What's the proper way to cook Thai jasmine rice?"
5. "Tell me about regional differences in Thai cuisine"
"""

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai lancedb tantivy pypdf ddgs agno
```

Step: Run the agent

```
python agent_with_knowledge.py
```

## Write Your Own Tool

Source: <https://docs.agno.com/examples/getting-started/04-write-your-own-tool>

This example shows how to create and use your own custom tool with Agno. You can replace the Hacker News functionality with any API or service you want!

Some ideas for your own tools:

- \* Weather data fetcher
- \* Stock price analyzer
- \* Personal calendar integration
- \* Custom database queries
- \* Local file operations

## Code

```
custom_tools.py
import json
from textwrap import dedent

import httpx
from agno.agent import Agent
from agno.models.openai import OpenAIChat

def get_top_hackernews_stories(num_stories: int = 10) -> str:
 """Use this function to get top stories from Hacker News.

 Args:
 num_stories (int): Number of stories to return. Defaults to 10.

 Returns:
 str: JSON string of top stories.
 """

 # Fetch top story IDs
 response = httpx.get("https://hacker-news.firebaseio.com/v0/topstories.json")
 story_ids = response.json()

 # Fetch story details
 stories = []
 for story_id in story_ids[:num_stories]:
 story_response = httpx.get(
 f"https://hacker-news.firebaseio.com/v0/item/{story_id}.json"
)
 story = story_response.json()
 if "text" in story:
 story.pop("text", None)
 stories.append(story)
 return json.dumps(stories)

Create a Tech News Reporter Agent with a Silicon Valley personality
agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 instructions=dedent("""\
 You are a tech-savvy Hacker News reporter with a passion for all things
 technology!

 Think of yourself as a mix between a Silicon Valley insider and a tech journalist.

 Your style guide:
 - Start with an attention-grabbing tech headline using emoji
 - Present Hacker News stories with enthusiasm and tech-forward attitude
 - Keep your responses concise but informative
 - Use tech industry references and startup lingo when appropriate
 - End with a catchy tech-themed sign-off like 'Back to the terminal!' or 'Pushing
```

```
to production!'
```

```
 Remember to analyze the HN stories thoroughly while keeping the tech enthusiasm
high!\
 """),
 tools=[get_top_hackernews_stories],
 markdown=True,
)

Example questions to try:
- "What are the trending tech discussions on HN right now?"
- "Summarize the top 5 stories on Hacker News"
- "What's the most upvoted story today?"
agent.print_response("Summarize the top 5 stories on hackernews?", stream=True)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai httpx agno
```

Step: Run the agent

```
python custom_tools.py
```

## Structured Output

Source: <https://docs.agno.com/examples/getting-started/05-structured-output>

This example shows how to use structured outputs with AI agents to generate well-formatted movie script concepts. It shows two approaches:

1. JSON Mode: Traditional JSON response parsing
2. Structured Output: Enhanced structured data handling

Example prompts to try:

- \* "Tokyo" - Get a high-tech thriller set in futuristic Japan
- \* "Ancient Rome" - Experience an epic historical drama
- \* "Manhattan" - Explore a modern romantic comedy
- \* "Amazon Rainforest" - Adventure in an exotic location
- \* "Mars Colony" - Science fiction in a space settlement

## Code

```

structured_output.py
from textwrap import dedent
from typing import List

from agno.agent import Agent, RunOutput # noqa
from agno.models.openai import OpenAIChat
from pydantic import BaseModel, Field

class MovieScript(BaseModel):
 setting: str = Field(
 ...,
 description="A richly detailed, atmospheric description of the movie's primary location and time period. Include sensory details and mood.",
)
 ending: str = Field(
 ...,
 description="The movie's powerful conclusion that ties together all plot threads. Should deliver emotional impact and satisfaction.",
)
 genre: str = Field(
 ...,
 description="The film's primary and secondary genres (e.g., 'Sci-fi Thriller', 'Romantic Comedy'). Should align with setting and tone.",
)
 name: str = Field(
 ...,
 description="An attention-grabbing, memorable title that captures the essence of the story and appeals to target audience.",
)
 characters: List[str] = Field(
 ...,
 description="4-6 main characters with distinctive names and brief role descriptions (e.g., 'Sarah Chen - brilliant quantum physicist with a dark secret').",
)
 storyline: str = Field(
 ...,
 description="A compelling three-sentence plot summary: Setup, Conflict, and Stakes. Hook readers with intrigue and emotion.",
)

Agent that uses JSON mode
json_mode_agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 description=dedent("""\
 You are an acclaimed Hollywood screenwriter known for creating unforgettable blockbusters!

 With the combined storytelling prowess of Christopher Nolan, Aaron Sorkin, and Quentin Tarantino,
 you craft unique stories that captivate audiences worldwide.

 Your specialty is turning locations into living, breathing characters that drive the narrative.\
 """))

```

```

"""),
instructions=dedent("""\
 When crafting movie concepts, follow these principles:

 1. Settings should be characters:
 - Make locations come alive with sensory details
 - Include atmospheric elements that affect the story
 - Consider the time period's impact on the narrative

 2. Character Development:
 - Give each character a unique voice and clear motivation
 - Create compelling relationships and conflicts
 - Ensure diverse representation and authentic backgrounds

 3. Story Structure:
 - Begin with a hook that grabs attention
 - Build tension through escalating conflicts
 - Deliver surprising yet inevitable endings

 4. Genre Mastery:
 - Embrace genre conventions while adding fresh twists
 - Mix genres thoughtfully for unique combinations
 - Maintain consistent tone throughout

 Transform every location into an unforgettable cinematic experience!\
"""),
output_schema=MovieScript,
use_json_mode=True,
)

Agent that uses structured outputs
structured_output_agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 description=dedent("""\

```

 Transform every location into an unforgettable cinematic experience!\
 """),
 output_schema=MovieScript,
)

Example usage with different locations
json_mode_agent.print_response("Tokyo", stream=True)
structured_output_agent.print_response("Ancient Rome", stream=True)

More examples to try:
"""
Creative location prompts to explore:
1. "Underwater Research Station" - For a claustrophobic sci-fi thriller
2. "Victorian London" - For a gothic mystery
3. "Dubai 2050" - For a futuristic heist movie
4. "Antarctic Research Base" - For a survival horror story
5. "Caribbean Island" - For a tropical adventure romance
"""

To get the response in a variable:
from rich.pretty import pprint

json_mode_response: RunOutput = json_mode_agent.run("New York")
pprint(json_mode_response.content)
structured_output_response: RunOutput = structured_output_agent.run("New York")
pprint(structured_output_response.content)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai agno
```

Step: Run the agent

## Agent with Storage

Source: <https://docs.agno.com/examples/getting-started/06-agent-with-storage>

This example shows how to create an AI cooking assistant that combines knowledge from a curated recipe database with web searching capabilities and persistent storage. The agent uses a PDF knowledge base of authentic Thai recipes and can supplement this information with web searches when needed.

Example prompts to try:

- \* "How do I make authentic Pad Thai?"
- \* "What's the difference between red and green curry?"
- \* "Can you explain what galangal is and possible substitutes?"
- \* "Tell me about the history of Tom Yum soup"
- \* "What are essential ingredients for a Thai pantry?"
- \* "How do I make Thai basil chicken (Pad Kra Pao)?"

## Code

```
agent_with_storage.py
from textwrap import dedent
from typing import List, Optional

import typer
from agno.agent import Agent
from agno.db.base import SessionType
from agno.db.sqlite import SqliteDb
from agno.knowledge.embedder.openai import OpenAIEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.openai import OpenAIChat
from agno.session import AgentSession
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.vectordb.lancedb import LanceDb, SearchType
from rich import print

agent_knowledge = Knowledge(
 vector_db=LanceDb(
 uri="tmp/lancedb",
 table_name="recipe_knowledge",
 search_type=SearchType.hybrid,
 embedder=OpenAIEmbedder(id="text-embedding-3-small
),
),
)
```

```

Add content to the knowledge
agent_knowledge.add_content(
 url="https://agno-public.s3.amazonaws.com/recipes/
ThaiRecipes.pdf"
)

Setup the database
db = SqliteDb(db_file="tmp/agents.db")

def recipe_agent(user: str = "user"):
 session_id: Optional[str] = None

 # Ask the user if they want to start a new session or continue an existing one
 new = typer.confirm("Do you want to start a new session?")

 if not new:
 existing_sessions: List[AgentSession] = db.get_sessions(# type: ignore
 user_id=user, session_type=SessionType.AGENT
)
 if len(existing_sessions) > 0:
 session_id = existing_sessions[0].session_id

 agent = Agent(
 user_id=user,
 session_id=session_id,
 model=OpenAIChat(id="gpt-5-mini"),
 instructions=dedent("""\
 You are a passionate and knowledgeable Thai cuisine expert!
 Think of yourself as a combination of a warm, encouraging cooking instructor,
 a Thai food historian, and a cultural ambassador.

 Follow these steps when answering questions:
 1. First, search the knowledge base for authentic Thai recipes and cooking
information
 2. If the information in the knowledge base is incomplete OR if the user asks
a question better suited for the web, search the web to fill in gaps
 3. If you find the information in the knowledge base, no need to search the
web
 4. Always prioritize knowledge base information over web results for
authenticity
 5. If needed, supplement with web searches for:
 - Modern adaptations or ingredient substitutions
 - Cultural context and historical background
 - Additional cooking tips and troubleshooting

 Communication style:
 1. Start each response with a relevant cooking emoji
 2. Structure your responses clearly:
 - Brief introduction or context
 - Main content (recipe, explanation, or history)
 - Pro tips or cultural insights
 - Encouraging conclusion
 """))

```

3. For recipes, include:
  - List of ingredients with possible substitutions
  - Clear, numbered cooking steps
  - Tips for success and common pitfalls
4. Use friendly, encouraging language

Special features:

- Explain unfamiliar Thai ingredients and suggest alternatives
- Share relevant cultural context and traditions
- Provide tips for adapting recipes to different dietary needs
- Include serving suggestions and accompaniments

End each response with an uplifting sign-off like:

- 'Happy cooking! (Enjoy your meal)!'
- 'May your Thai cooking adventure bring joy!'
- 'Enjoy your homemade Thai feast!'

Remember:

- Always verify recipe authenticity with the knowledge base
- Clearly indicate when information comes from web sources
- Be encouraging and supportive of home cooks at all skill levels\

```
"""),
db=db,
knowledge=agent_knowledge,
tools=[DuckDuckGoTools()],
To provide the agent with the chat history
We can either:
1. Provide the agent with a tool to read the chat history
2. Automatically add the chat history to the messages sent to the model
#
1. Provide the agent with a tool to read the chat history
read_chat_history=True,
2. Automatically add the chat history to the messages sent to the model
add_history_to_context=True,
Number of historical responses to add to the messages.
num_history_runs=3,
markdown=True,
)

print("You are about to chat with an agent!")
if session_id is None:
 session_id = agent.session_id
 if session_id is not None:
 print(f"Started Session: {session_id}\n")
 else:
 print("Started Session\n")
else:
 print(f"Continuing Session: {session_id}\n")

Runs the agent as a command line application
agent.cli_app(markdown=True)
```

```
if __name__ == "__main__":
 typer.run(recipe_agent)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai lancedb tantivy pypdf ddgs sqlalchemy agno
```

Step: Run the agent

```
python agent_with_storage.py
```

## Agent State

Source: <https://docs.agno.com/examples/getting-started/07-agent-state>

This example shows how to create an agent that maintains state across interactions. It demonstrates a simple counter mechanism, but this pattern can be extended to more complex state management like maintaining conversation context, user preferences, or tracking multi-step processes.

Example prompts to try:

- \* "Increment the counter 3 times and tell me the final count"
- \* "What's our current count? Add 2 more to it"
- \* "Let's increment the counter 5 times, but tell me each step"
- \* "Add 4 to our count and remind me where we started"
- \* "Increase the counter twice and summarize our journey"

## Code

```
agent_state.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.run import RunContext

def increment_counter(run_context: RunContext) -> str:
 """Increment the counter in session state."""
 # Initialize counter if it doesn't exist
 if not run_context.session_state:
 run_context.session_state = {}

 if "count" not in run_context.session_state:
```

```

 run_context.session_state["count"] = 0

 # Increment the counter
 run_context.session_state["count"] += 1

 return f"Counter incremented! Current count: {run_context.session_state['count']}"

def get_counter(run_context: RunContext) -> str:
 """Get the current counter value."""
 if not run_context.session_state:
 run_context.session_state = {}

 count = run_context.session_state.get("count", 0)
 return f"Current count: {count}"

Create an Agent that maintains state
agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 # Initialize the session state with a counter starting at 0
 session_state={"count": 0},
 tools=[increment_counter, get_counter],
 # Use variables from the session state in the instructions
 instructions="You can increment and check a counter. Current count is: {count}",
 # Important: Resolve the state in the messages so the agent can see state changes
 resolve_in_context=True,
 markdown=True,
)

Test the counter functionality
print("Testing counter functionality...")
agent.print_response(
 "Let's increment the counter 3 times and observe the state changes!", stream=True
)
print(f"Final session state: {agent.get_session_state()}")

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai agno
```

Step: Run the agent

```
python agent_state.py
```

## Agent Context

Source: <https://docs.agno.com/examples/getting-started/08->

## agent-context

This example shows how to inject external dependencies into an agent. The context is evaluated when the agent is run, acting like dependency injection for Agents.

Example prompts to try:

- \* "Summarize the top stories on HackerNews"
- \* "What are the trending tech discussions right now?"
- \* "Analyze the current top stories and identify trends"
- \* "What's the most upvoted story today?"

## Code

```
agent_context.py
import json
from textwrap import dedent

import httpx
from agno.agent import Agent
from agno.models.openai import OpenAIChat

def get_top_hackernews_stories(num_stories: int = 5) -> str:
 """Fetch and return the top stories from HackerNews.

 Args:
 num_stories: Number of top stories to retrieve (default: 5)
 Returns:
 JSON string containing story details (title, url, score, etc.)
 """
 # Get top stories
 stories = [
 {
 k: v
 for k, v in httpx.get(
 f"https://hacker-news.firebaseio.com/v0/item/{id}.
json"
).json()
 .items()
 if k != "kids" # Exclude discussion threads
 }
 for id in httpx.get(
 "https://hacker-news.firebaseio.com/v0/topstories.
json"
).json()[: num_stories]
]
 return json.dumps(stories, indent=4)

Create a Context-Aware Agent that can access real-time HackerNews data
```

```

agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 # Each function in the context is evaluated when the agent is run,
 # think of it as dependency injection for Agents
 dependencies={"top_hackernews_stories": get_top_hackernews_stories},
 # Alternatively, you can manually add the context to the instructions. This gets
 resolved automatically
 instructions=dedent("""\
 You are an insightful tech trend observer!

 Here are the top stories on HackerNews:
 {top_hackernews_stories}\
 """),
 markdown=True,
)

Example usage
agent.print_response(
 "Summarize the top stories on HackerNews and identify any interesting trends.",
 stream=True,
)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai httpx agno
```

Step: Run the agent

```
python agent_context.py
```

## Agent Session

Source: <https://docs.agno.com/examples/getting-started/09-agent-session>

This example shows how to create an agent with persistent memory stored in a SQLite database. We set the `session_id` on the agent when resuming the conversation, this way the previous chat history is preserved.

Key features:

- \* Stores conversation history in a SQLite database
- \* Continues conversations across multiple sessions
- \* References previous context in responses

## Code

```
agent_session.py
import json
from typing import List, Optional

import typer
from agno.agent import Agent
from agno.db.base import SessionType
from agno.db.sqlite import SQLiteDatabase
from agno.models.openai import OpenAIChat
from agno.session import AgentSession
from rich import print
from rich.console import Console
from rich.json import JSON
from rich.panel import Panel
from rich.prompt import Prompt

console = Console()

def create_agent(user: str = "user"):
 session_id: Optional[str] = None

 # Ask if user wants to start new session or continue existing one
 new = typer.confirm("Do you want to start a new session?")

 # Get existing session if user doesn't want a new one
 db = SQLiteDatabase(db_file="tmp/agents.db")

 if not new:
 existing_sessions: List[AgentSession] = db.get_sessions(
 user_id=user, session_type=SessionType.AGENT
) # type: ignore
 if len(existing_sessions) > 0:
 session_id = existing_sessions[0].session_id

 agent = Agent(
 user_id=user,
 # Set the session_id on the agent to resume the conversation
 session_id=session_id,
 model=OpenAIChat(id="gpt-5-mini"),
 db=db,
 # Add chat history to messages
 add_history_to_context=True,
 num_history_runs=3,
 markdown=True,
)

 if session_id is None:
 session_id = agent.session_id
 if session_id is not None:
 print(f"Started Session: {session_id}\n")
```

```

 else:
 print("Started Session\n")
 else:
 print(f"Continuing Session: {session_id}\n")

 return agent

def print_messages(agent):
 """Print the current chat history in a formatted panel"""
 console.print(
 Panel(
 JSON(
 json.dumps(
 [
 m.model_dump(include={"role", "content"})
 for m in agent.get_messages_for_session()
]
),
 indent=4,
),
 title=f"Chat History for session_id: {agent.session_id}",
 expand=True,
)
)

def main(user: str = "user"):
 agent = create_agent(user)

 print("Chat with an OpenAI agent!")
 exit_on = ["exit", "quit", "bye"]
 while True:
 message = Prompt.ask(f"[bold] :sunglasses: {user} [/bold]")
 if message in exit_on:
 break

 agent.print_response(input=message, stream=True, markdown=True)
 print_messages(agent)

if __name__ == "__main__":
 typer.run(main)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai sqlalchemy agno
```

Step: Run the agent

python agent\_session.py

## User Memories and Session Summaries

Source: <https://docs.agno.com/examples/getting-started/10-user-memories-and-summaries>

This example shows how to create an agent with persistent memory that stores:

1. Personalized user memories - facts and preferences learned about specific users
2. Session summaries - key points and context from conversations
3. Chat history - stored in SQLite for persistence

Key features:

- \* Stores user-specific memories in SQLite database
- \* Maintains session summaries for context
- \* Continues conversations across sessions with memory
- \* References previous context and user information in responses

Examples:

User: "My name is John and I live in NYC"

Agent: \*Creates memory about John's location\*

User: "What do you remember about me?"

Agent: \*Recalls previous memories about John\*

## Code

```
user_memories.py
import json
from textwrap import dedent
from typing import List, Optional

import typer
from agno.agent import Agent
from agno.db.base import SessionType
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.session import AgentSession
from rich.console import Console
from rich.json import JSON
from rich.panel import Panel
from rich.prompt import Prompt

def create_agent(user: str = "user"):
 session_id: Optional[str] = None

 # Ask if user wants to start new session or continue existing one
```

```

new = typer.confirm("Do you want to start a new session?")

Initialize storage for both agent sessions and memories
db = SqliteDb(db_file="tmp/agents.db")

if not new:
 existing_sessions: List[AgentSession] = db.get_sessions(
 user_id=user, session_type=SessionType.AGENT
) # type: ignore
 if len(existing_sessions) > 0:
 session_id = existing_sessions[0].session_id

agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 user_id=user,
 session_id=session_id,
 enable_user_memories=True,
 enable_session_summaries=True,
 db=db,
 add_history_to_context=True,
 num_history_runs=3,
 # Enhanced system prompt for better personality and memory usage
 description=dedent("""\
You are a helpful and friendly AI assistant with excellent memory.
- Remember important details about users and reference them naturally
- Maintain a warm, positive tone while being precise and helpful
- When appropriate, refer back to previous conversations and memories
- Always be truthful about what you remember or don't remember"""),
)

if session_id is None:
 session_id = agent.session_id
 if session_id is not None:
 print(f"Started Session: {session_id}\n")
 else:
 print("Started Session\n")
else:
 print(f"Continuing Session: {session_id}\n")

return agent

def print_agent_memory(agent):

 """Interactive chat loop with memory display"""
 agent = create_agent(user)

 print("Try these example inputs:")
 print("- 'My name is [name] and I live in [city]'"")
 print("- 'I love [hobby/interest]'"")
 print("- 'What do you remember about me?'"")
 print("- 'What have we discussed so far?'\n")

 exit_on = ["exit", "quit", "bye"]

```

```

while True:
 message = Prompt.ask(f"[bold] :sunglasses: {user} [/bold]")
 if message in exit_on:
 break

 agent.print_response(input=message, stream=True, markdown=True)
 print_agent_memory(agent)

if __name__ == "__main__":
 typer.run(main)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai sqlalchemy agno
```

Step: Run the agent

```
python user_memories.py
```

## Retry Function Call

Source: <https://docs.agno.com/examples/getting-started/11-retry-function-call>

This example shows how to retry a function call if it fails or you do not like the output. This is useful for:

- \* Handling temporary failures
- \* Improving output quality through retries
- \* Implementing human-in-the-loop validation

## Code

```

retry_function_call.py
from typing import Iterator

from agno.agent import Agent
from agno.exceptions import RetryAgentRun
from agno.tools import FunctionCall, tool

num_calls = 0

def pre_hook(fc: FunctionCall):
 global num_calls

```

```

print(f"Pre-hook: {fc.function.name}")
print(f"Arguments: {fc.arguments}")
num_calls += 1
if num_calls < 2:
 raise RetryAgentRun(
 "This wasn't interesting enough, please retry with a different argument"
)

@tool(pre_hook=pre_hook)
def print_something(something: str) -> Iterator[str]:
 print(something)
 yield f"I have printed {something}"

agent = Agent(tools=[print_something], markdown=True)
agent.print_response("Print something interesting", stream=True)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai agno
```

Step: Run the agent

```
python retry_function_call.py
```

## Human in the Loop

Source: <https://docs.agno.com/examples/getting-started/12-human-in-the-loop>

This example shows how to implement human-in-the-loop functionality in your Agno tools. It shows how to:

- \* Add pre-hooks to tools for user confirmation
- \* Handle user input during tool execution
- \* Gracefully cancel operations based on user choice

Some practical applications:

- \* Confirming sensitive operations before execution
- \* Reviewing API calls before they're made
- \* Validating data transformations
- \* Approving automated actions in critical systems

## Code

```
human_in_the_loop.py
import json
from textwrap import dedent

import httpx
from agno.agent import Agent
from agno.tools import tool
from agno.utils import pprint
from rich.console import Console
from rich.prompt import Prompt

console = Console()

@tool(requires_confirmation=True)
def get_top_hackernews_stories(num_stories: int) -> str:
 """Fetch top stories from Hacker News.

 Args:
 num_stories (int): Number of stories to retrieve

 Returns:
 str: JSON string containing story details
 """
 # Fetch top story IDs
 response = httpx.get("https://hacker-news.firebaseio.com/v0/topstories.json")
 story_ids = response.json()

 # Yield story details
 all_stories = []
 for story_id in story_ids[:num_stories]:
 story_response = httpx.get(
 f"https://hacker-news.firebaseio.com/v0/item/{story_id}.json"
)
 story = story_response.json()
 if "text" in story:
 story.pop("text", None)
 all_stories.append(story)
 return json.dumps(all_stories)

Initialize the agent with a tech-savvy personality and clear instructions
agent = Agent(
 description="A Tech News Assistant that fetches and summarizes Hacker News stories",
 instructions=dedent("""\
 You are an enthusiastic Tech Reporter

 Your responsibilities:
 - Present Hacker News stories in an engaging and informative way
 - Provide clear summaries of the information you gather
 """))
```

```

 Style guide:
 - Use emoji to make your responses more engaging
 - Keep your summaries concise but informative
 - End with a friendly tech-themed sign-off\
 """),
 tools=[get_top_hackernews_stories],
 markdown=True,
)

Example questions to try:
- "What are the top 3 HN stories right now?"
- "Show me the most recent story from Hacker News"
- "Get the top 5 stories (you can try accepting and declining the confirmation)"
response = agent.run("What are the top 2 hackernews stories?")
if response.is_paused:
 for tool in response.tools: # type: ignore
 # Ask for confirmation
 console.print(
 f"Tool name [bold blue]{tool.tool_name}({tool.tool_args})[/] requires
confirmation."
)
 message = (
 Prompt.ask("Do you want to continue?", choices=["y", "n"], default="y")
 .strip()
 .lower()
)

 if message == "n":
 break
 else:
 # We update the tools in place
 tool.confirmed = True

run_response = agent.continue_run(run_response=response)
pprint.pprint_run_response(run_response)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai agno
```

Step: Run the agent

```
python human_in_the_loop.py
```

# Image Agent

Source: <https://docs.agno.com/examples/getting-started/13-image-agent>

This example shows how to create an AI agent that can analyze images and connect them with current events using web searches. Perfect for:

1. News reporting and journalism
2. Travel and tourism content
3. Social media analysis
4. Educational presentations
5. Event coverage

Example images to try:

- \* Famous landmarks (Eiffel Tower, Taj Mahal, etc.)
- \* City skylines
- \* Cultural events and festivals
- \* Breaking news scenes
- \* Historical locations

## Code

```
image_agent.py
from textwrap import dedent

from agno.agent import Agent
from agno.media import Image
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 description=dedent("""\
 You are a world-class visual journalist and cultural correspondent with a gift
 for bringing images to life through storytelling! With the observational skills
 of a detective and the narrative flair of a bestselling author, you transform
visual
 analysis into compelling stories that inform and captivate.\
 """),
 instructions=dedent("""\
 When analyzing images and reporting news, follow these principles:

 1. Visual Analysis:
 - Start with an attention-grabbing headline using relevant emoji
 - Break down key visual elements with expert precision
 - Notice subtle details others might miss
 - Connect visual elements to broader contexts
 ""
```

## 2. News Integration:

- Research and verify current events related to the image
- Connect historical context with present-day significance
- Prioritize accuracy while maintaining engagement
- Include relevant statistics or data when available

## 3. Storytelling Style:

- Maintain a professional yet engaging tone
- Use vivid, descriptive language
- Include cultural and historical references when relevant
- End with a memorable sign-off that fits the story

## 4. Reporting Guidelines:

- Keep responses concise but informative (2-3 paragraphs)
- Balance facts with human interest
- Maintain journalistic integrity
- Credit sources when citing specific information

Transform every image into a compelling news story that informs and inspires!\

```
"""),
```

```
tools=[DuckDuckGoTools()],
```

```
markdown=True,
```

```
)
```

```
Example usage with a famous landmark
```

```
agent.print_response(
```

```
 "Tell me about this image and share the latest relevant news.",
```

```
 images=[
```

```
 Image(
```

```
 url="https://upload.wikimedia.org/wikipedia/common
```

```
s/0/0c/GoldenGateBridge-001.jpg"
```

```
)
```

```
],
```

```
 stream=True,
```

```
)
```

```
More examples to try:
```

```
"""
```

```
Sample prompts to explore:
```

1. "What's the historical significance of this location?"
2. "How has this place changed over time?"
3. "What cultural events happen here?"
4. "What's the architectural style and influence?"
5. "What recent developments affect this area?"

```
Sample image URLs to analyze:
```

```
1. Eiffel Tower: "https://upload.wikimedia.org/wikipedia/commons/8/85/Tour_Eiffel_Wikimedia_Commons_%28cropped%29.jpg"
```

```
"
```

```
2. Taj Mahal: "https://upload.wikimedia.org/wikipedia/commons/b/bd/Taj_Mahal%2C_Agra%2C_India_edit3.jpg"
```

```
3. Golden Gate Bridge: "https://upload.wikimedia.org/wikipedia/commons/0/
```

```
0c/GoldenGateBridge-001.jpg"
"""

To get the response in a variable:
from rich.pretty import pprint
response = agent.run(
"Analyze this landmark's architecture and recent news.",
images=[Image(url="YOUR_IMAGE_URL")],
)
pprint(response.content)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai ddgs agno
```

Step: Run the agent

```
python image_agent.py
```

## Image Generation

Source: <https://docs.agno.com/examples/getting-started/14-image-generation>

This example shows how to create an AI agent that generates images using DALL-E. You can use this agent to create various types of images, from realistic photos to artistic illustrations and creative concepts.

Example prompts to try:

- \* "Create a surreal painting of a floating city in the clouds at sunset"
- \* "Generate a photorealistic image of a cozy coffee shop interior"
- \* "Design a cute cartoon mascot for a tech startup"
- \* "Create an artistic portrait of a cyberpunk samurai"

## Code

```
image_generation.py
from textwrap import dedent

from agno.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai import OpenAIChat
from agno.run.agent import RunOutput
```

```

from agno.tools.dalle import DalleTools

Create an Creative AI Artist Agent
image_agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[DalleTools()],
 description=dedent("""\
 You are an experienced AI artist with expertise in various artistic styles,
 from photorealism to abstract art. You have a deep understanding of composition,
 color theory, and visual storytelling.\
 """),
 instructions=dedent("""\
 As an AI artist, follow these guidelines:
 1. Analyze the user's request carefully to understand the desired style and mood
 2. Before generating, enhance the prompt with artistic details like lighting,
 perspective, and atmosphere
 3. Use the `create_image` tool with detailed, well-crafted prompts
 4. Provide a brief explanation of the artistic choices made
 5. If the request is unclear, ask for clarification about style preferences

 Always aim to create visually striking and meaningful images that capture the
 user's vision!\
 """),
 markdown=True,
 db=SqliteDb(session_table="test_agent", db_file="tmp/test.db"),
)

Example usage
image_agent.print_response(
 "Create a magical library with floating books and glowing crystals",
)

Retrieve and display generated images
run_response = image_agent.get_last_run_output()
if run_response and isinstance(run_response, RunOutput):
 for image_response in run_response.images:
 image_url = image_response.url
 print("image_url: ", image_url)
else:
 print("No images found or images is not a list")

More example prompts to try:
"""
Try these creative prompts:
1. "Generate a steampunk-style robot playing a violin"
2. "Design a peaceful zen garden during cherry blossom season"
3. "Create an underwater city with bioluminescent buildings"
4. "Generate a cozy cabin in a snowy forest at night"
5. "Create a futuristic cityscape with flying cars and skyscrapers"
"""

```

## Usage

```
Snippet file: "create-venv-step.mdx"
```

Step: Install libraries

```
pip install openai agno
```

Step: Run the agent

```
python image_generation.py
```

## Video Generation

Source: <https://docs.agno.com/examples/getting-started/15-video-generation>

This example shows how to create an AI agent that generates videos using ModelsLabs. You can use this agent to create various types of short videos, from animated scenes to creative visual stories.

Example prompts to try:

- \* "Create a serene video of waves crashing on a beach at sunset"
- \* "Generate a magical video of butterflies flying in a enchanted forest"
- \* "Create a timelapse of a blooming flower in a garden"
- \* "Generate a video of northern lights dancing in the night sky"

## Code

```
video_generation.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.models_labs import ModelsLabTools

Create a Creative AI Video Director Agent
video_agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[ModelsLabTools()],
 description=dedent("""\
 You are an experienced AI video director with expertise in various video styles,
 from nature scenes to artistic animations. You have a deep understanding of
 motion,
 timing, and visual storytelling through video content.\
 """),
 instructions=dedent("""\
 As an AI video director, follow these guidelines:
 1. Analyze the user's request carefully to understand the desired style and mood
 2. Before generating, enhance the prompt with details about motion, timing, and
```

```

atmosphere
 3. Use the `generate_media` tool with detailed, well-crafted prompts
 4. Provide a brief explanation of the creative choices made
 5. If the request is unclear, ask for clarification about style preferences

 The video will be displayed in the UI automatically below your response.
 Always aim to create captivating and meaningful videos that bring the user's
vision to life!\
 """),
 markdown=True,
)

Example usage
video_agent.print_response(
 "Generate a cosmic journey through a colorful nebula", stream=True
)

Retrieve and display generated videos
run_response = video_agent.get_last_run_output()
if run_response and run_response.videos:
 for video in run_response.videos:
 print(f"Generated video URL: {video.url}")

More example prompts to try:
"""
Try these creative prompts:
1. "Create a video of autumn leaves falling in a peaceful forest"
2. "Generate a video of a cat playing with a ball"
3. "Create a video of a peaceful koi pond with rippling water"
4. "Generate a video of a cozy fireplace with dancing flames"
5. "Create a video of a mystical portal opening in a magical realm"
"""

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai agno
```

Step: Set environment variables

```
export MODELS_LAB_API_KEY=****
```

Step: Run the agent

```
python video_generation.py
```

# Audio Input-Output Agent

Source: <https://docs.agno.com/examples/getting-started/16-audio-agent>

This example shows how to create an AI agent that can process audio input and generate audio responses. You can use this agent for various voice-based interactions, from analyzing speech content to generating natural-sounding responses.

Example audio interactions to try:

- \* Upload a recording of a conversation for analysis
- \* Have the agent respond to questions with voice output
- \* Process different languages and accents
- \* Analyze tone and emotion in speech

## Code

```
audio_input_output.py
from textwrap import dedent

import requests
from agno.agent import Agent
from agno.media import Audio
from agno.models.openai import OpenAIChat
from agno.utils.audio import write_audio_to_file

Create an AI Voice Interaction Agent
agent = Agent(
 model=OpenAIChat(
 id="gpt-5-mini-audio-preview",
 modalities=["text", "audio"],
 audio={"voice": "sage", "format": "wav"},
),
 description=dedent("""\
 You are an expert in audio processing and voice interaction, capable of
understanding
 and analyzing spoken content while providing natural, engaging voice responses.
 You excel at comprehending context, emotion, and nuance in speech.\
 """),
 instructions=dedent("""\
 As a voice interaction specialist, follow these guidelines:
 1. Listen carefully to audio input to understand both content and context
 2. Provide clear, concise responses that address the main points
 3. When generating voice responses, maintain a natural, conversational tone
 4. Consider the speaker's tone and emotion in your analysis
 5. If the audio is unclear, ask for clarification

 Focus on creating engaging and helpful voice interactions!\
 """),
```

```

)

Fetch the audio file and convert it to a base64 encoded string
url = "https://openaiassets.blob.core.windows.net/$web/A
PI/docs/audio/alloy.wav"
response = requests.get(url)
response.raise_for_status()

Process the audio and get a response
run_response = agent.run(
 "What's in this recording? Please analyze the content and tone.",
 audio=[Audio(content=response.content, format="wav")],
)

Save the audio response if available
if run_response.response_audio is not None:
 write_audio_to_file(
 audio=run_response.response_audio.content, filename="tmp/response.wav"
)

More example interactions to try:
"""
Try these voice interaction scenarios:
1. "Can you summarize the main points discussed in this recording?"
2. "What emotions or tone do you detect in the speaker's voice?"
3. "Please provide a detailed analysis of the speech patterns and clarity"
4. "Can you identify any background noises or audio quality issues?"
5. "What is the overall context and purpose of this recording?"

Note: You can use your own audio files by converting them to base64 format.
Example for using your own audio file:

with open('your_audio.wav', 'rb') as audio_file:
 audio_data = audio_file.read()
 agent.run("Analyze this audio", audio=[Audio(content=audio_data, format="wav")])
"""

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai requests agno
```

Step: Run the agent

```
python audio_input_output.py
```

# Agent Team

Source: <https://docs.agno.com/examples/getting-started/17-agent-team>

This example shows how to create a powerful team of AI agents working together to provide comprehensive financial analysis and news reporting. The team consists of:

1. Web Agent: Searches and analyzes latest news
2. Finance Agent: Analyzes financial data and market trends
3. Lead Editor: Coordinates and combines insights from both agents

Example prompts to try:

- \* "What's the latest news and financial performance of Apple (AAPL)?"
- \* "Analyze the impact of AI developments on NVIDIA's stock (NVDA)"
- \* "How are EV manufacturers performing? Focus on Tesla (TSLA) and Rivian (RIVN)"
- \* "What's the market outlook for semiconductor companies like AMD and Intel?"
- \* "Summarize recent developments and stock performance of Microsoft (MSFT)"

## Code

```
agent_team.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.team import Team
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.exa import ExaTools

web_agent = Agent(
 name="Web Agent",
 role="Search the web for information",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[DuckDuckGoTools()],
 instructions=dedent("""\
 You are an experienced web researcher and news analyst!

 Follow these steps when searching for information:
 1. Start with the most recent and relevant sources
 2. Cross-reference information from multiple sources
 3. Prioritize reputable news outlets and official sources
 4. Always cite your sources with links
 5. Focus on market-moving news and significant developments

 Your style guide:
 - Present information in a clear, journalistic style
 - Use bullet points for key takeaways
 - Include relevant quotes when available
```

- Specify the date and time for each piece of news
- Highlight market sentiment and industry trends
- End with a brief analysis of the overall narrative
- Pay special attention to regulatory news, earnings reports, and strategic announcements\

```

 """),
 markdown=True,
)

```

```

finance_agent = Agent(
 name="Finance Agent",
 role="Get financial data",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[
 ExaTools(
 include_domains=["trendlyne.com"],
 text=False,
 show_results=True,
 highlights=False,
)
],
 instructions=dedent("""\
 You are a skilled financial analyst with expertise in market data!

 Follow these steps when analyzing financial data:
 1. Start with the latest stock price, trading volume, and daily range
 2. Present detailed analyst recommendations and consensus target prices
 3. Include key metrics: P/E ratio, market cap, 52-week range
 4. Analyze trading patterns and volume trends
 5. Compare performance against relevant sector indices

 Your style guide:
 - Use tables for structured data presentation
 - Include clear headers for each data section
 - Add brief explanations for technical terms
 - Highlight notable changes with emojis ()
 - Use bullet points for quick insights
 - Compare current values with historical averages
 - End with a data-driven financial outlook\
 """),
 markdown=True,
)

```

```

agent_team = Team(
 members=[web_agent, finance_agent],
 model=OpenAIChat(id="gpt-5-mini"),
 instructions=dedent("""\
 You are the lead editor of a prestigious financial news desk!

 Your role:
 1. Coordinate between the web researcher and financial analyst
 2. Combine their findings into a compelling narrative
 """)
)

```

3. Ensure all information is properly sourced and verified
4. Present a balanced view of both news and data
5. Highlight key risks and opportunities

Your style guide:

- Start with an attention-grabbing headline
- Begin with a powerful executive summary
- Present financial data first, followed by news context
- Use clear section breaks between different types of information
- Include relevant charts or tables when available
- Add 'Market Sentiment' section with current mood
- Include a 'Key Takeaways' section at the end
- End with 'Risk Factors' when appropriate
- Sign off with 'Market Watch Team' and the current date\

```
"""),
add_datetime_to_context=True,
markdown=True,
show_members_responses=False,
)

Example usage with diverse queries
agent_team.print_response(
 input="Summarize analyst recommendations and share the latest news for NVDA",
 stream=True,
)
agent_team.print_response(
 input="What's the market outlook and financial performance of AI semiconductor companies?",
 stream=True,
)
agent_team.print_response(
 input="Analyze recent developments and financial performance of TSLA",
 stream=True,
)

More example prompts to try:
"""
Advanced queries to explore:
1. "Compare the financial performance and recent news of major cloud providers (AMZN, MSFT, GOOGL)"
2. "What's the impact of recent Fed decisions on banking stocks? Focus on JPM and BAC"
3. "Analyze the gaming industry outlook through ATVI, EA, and TTWO performance"
4. "How are social media companies performing? Compare META and SNAP"
5. "What's the latest on AI chip manufacturers and their market position?"
"""
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai ddgs exa agno
```

Step: Set API keys

```
export EXA_API_KEY=xxx
```

Step: Run the agent

```
python agent_team.py
```

## Research Agent

Source: <https://docs.agno.com/examples/getting-started/18-research-agent-exa>

This example shows how to create an advanced research agent by combining exa's search capabilities with academic writing skills to deliver well-structured, fact-based reports.

Key features demonstrated:

- \* Using Exa.ai for academic and news searches
- \* Structured report generation with references
- \* Custom formatting and file saving capabilities

Example prompts to try:

- \* "What are the latest developments in quantum computing?"
- \* "Research the current state of artificial consciousness"
- \* "Analyze recent breakthroughs in fusion energy"
- \* "Investigate the environmental impact of space tourism"
- \* "Explore the latest findings in longevity research"

## Code

```

## Research Workflow

Source: <https://docs.agno.com/examples/getting-started/19-blog-generator-workflow>

This advanced example demonstrates how to build a sophisticated blog post generator using

the new workflow v2.0 architecture. The workflow combines web research capabilities with professional writing expertise using a multi-stage approach:

1. Intelligent web research and source gathering
2. Content extraction and processing
3. Professional blog post writing with proper citations

Key capabilities:

- \* Advanced web research and source evaluation
- \* Content scraping and processing
- \* Professional writing with SEO optimization
- \* Automatic content caching for efficiency
- \* Source attribution and fact verification

## Code

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
openai googlesearch-python newspaper4k lxml_html_clean sqlalchemy agno
```

Step: Run the workflow

```
python blog-generator-workflow.py
```

## Introduction

Source: <https://docs.agno.com/examples/getting-started/introduction>

This guide walks through the basics of building Agents with Agno.

The examples build on each other, introducing new concepts and capabilities progressively. Each example contains detailed comments, example prompts, and required dependencies.

## Setup

Create a virtual environment:

```
python3 -m venv .venv
source .venv/bin/activate
```

Install the required dependencies:

```
pip install openai ddgs lancedb tantivy pypdf requests exa-py newspaper4k lxml_html_clean
sqlalchemy agno
```

Export your OpenAI API key:

```
export OPENAI_API_KEY=your_api_key
```

## Examples

<CardGroup cols={3}>

- Basic Agent `_(icon: robot)_` Build a news reporter with a vibrant personality. This Agent only shows basic LLM inference. `(./01-basic-agent)`
- Agent with Tools `_(icon: toolbox)_` Add web search capabilities using DuckDuckGo for real-time information gathering. `(./02-agent-with-tools)`
- Agent with Knowledge `_(icon: brain)_` Add a vector database to your agent to store and search knowledge. `(./03-agent-with-knowledge)`
- Agent with Storage `_(icon: database)_` Add persistence to your agents with session management and history capabilities. `(./06-agent-with-storage)`
- Agent Team `_(icon: users)_` Create an agent team specializing in market research and financial analysis. `(./17-agent-team)`
- Structured Output `_(icon: code)_` Generate a structured output using a Pydantic model. `(./05-structured-output)`
- Custom Tools `_(icon: wrench)_` Create and integrate custom tools with your agent. `(./04-write-your-own-tool)`
- Research Agent `_(icon: magnifying-glass)_` Build an AI research agent using Exa with controlled output steering. `(./18-research-agent-exa)`
- Research Workflow `_(icon: diagram-project)_` Create a research workflow combining web searches and content scraping. `(./19-blog-generator-workflow)`
- Image Agent `_(icon: image)_` Create an agent that can understand images. `(./13-image-agent)`
- Image Generation `_(icon: paintbrush)_` Create an Agent that can generate images using DALL-E. `(./14-image-generation)`
- Video Generation `_(icon: video)_` Create an Agent that can generate videos using ModelsLabs. `(./15-video-generation)`
- Audio Agent `_(icon: microphone)_` Create an Agent that can process audio input and generate responses. `(./16-audio-agent)`
- Agent with State `_(icon: database)_` Create an Agent with session state management. `(./07-agent-state)`
- Agent Context `_(icon: sitemap)_` Evaluate dependencies at `agent.run` and inject them into the instructions. `(./08-agent-context)`
- Agent Session `_(icon: clock-rotate-left)_` Create an Agent with persistent session memory across conversations. `(./09-agent-session)`

- User Memories  Create an Agent that stores user memories and summaries. ([./10-user-memories-and-summaries](#))
- Function Retries  Handle function retries for failed or unsatisfactory outputs. ([./11-retry-function-call](#))
- Human in the Loop  Add user confirmation and safety checks for interactive agent control. ([./12-human-in-the-loop](#))

Each example includes runnable code and detailed explanations. We recommend following them in order, as concepts build upon previous examples.

## Examples Gallery

Source: <https://docs.agno.com/examples/introduction>

Explore Agno's example gallery showcasing everything from single-agent tasks to sophisticated multi-agent workflows.

Welcome to Agno's example gallery! Here you'll discover examples showcasing everything from single-agent tasks to sophisticated multi-agent workflows. You can either:

- \* Run the examples individually
- \* Clone the entire Agno cookbook (<https://github.com/agno-agi/agno/tree/main/cookbook>)

Have an interesting example to share? Please consider contributing (<https://github.com/agno-agi/agno-docs>) to our growing collection.

## Getting Started

If you're just getting started, follow the Getting Started ([/examples/getting-started](#)) guide for a step-by-step tutorial. The examples build on each other, introducing new concepts and capabilities progressively.

## Use Cases

Build real-world applications with Agno.

<CardGroup cols={3}>

- Simple Agents  Simple agents for web scraping, data processing, financial analysis, etc. ([/examples/use-cases/agents](#))
- Multi-Agent Teams  Multi-agent teams that collaborate to solve tasks. ([/examples/use-cases/teams](#))
- Advanced Workflows  Advanced workflows for creating blog posts,

investment reports, etc. (/examples/use-cases/workflows/)

## Agent Concepts

Explore Agent concepts with detailed examples.

<CardGroup cols={3}>

- Multimodal  Learn how to use multimodal Agents (/examples/concepts/multimodal)
- Knowledge  Add domain-specific knowledge to your Agents (/examples/concepts/knowledge)
- RAG  Learn how to use Agentic RAG (/examples/concepts/knowledge/rag)
- Hybrid search  Combine semantic and keyword search (/examples/concepts/knowledge/search\_type/hybrid-search)
- Memory  Let Agents remember past conversations (/examples/concepts/memory)
- Tools  Extend your Agents with 100s or tools (/examples/concepts/tools)
- Storage  Store Agents sessions in a database (/examples/concepts/db)
- Vector Databases  Store Knowledge in Vector Databases (/examples/concepts/vectordb)
- Embedders  Convert text to embeddings to store in VectorDbs (/examples/concepts/knowledge/embedders)

## Models

Explore different models with Agno.

<CardGroup cols={3}>

- OpenAI  Examples using OpenAI GPT models (/examples/models/openai)
- Ollama  Examples using Ollama models locally (/examples/models/ollama)
- Anthropic  Examples using Anthropic models like Claude (/examples/models/anthropic)

- Cohere  Examples using Cohere command models (/examples/models/cohere)
- DeepSeek  Examples using DeepSeek models (/examples/models/deepseek)
- Gemini  Examples using Google Gemini models (/examples/models/gemini)
- Groq  Examples using Groq's fast inference (/examples/models/groq)
- Mistral  Examples using Mistral models (/examples/models/mistral)
- Azure  Examples using Azure OpenAI (/examples/models/azure)
- Fireworks  Examples using Fireworks models (/examples/models/fireworks)
- AWS  Examples using Amazon Bedrock (/examples/models/aws)
- Hugging Face  Examples using Hugging Face models (/examples/models/huggingface)
- NVIDIA  Examples using NVIDIA models (/examples/models/nvidia)
- Nebius  Examples using Nebius AI models (/examples/models/nebius)
- Together  Examples using Together AI models (/examples/models/together)
- xAI  Examples using xAI models (/examples/models/xai)
- LangDB  Examples using LangDB AI Gateway. (/examples/models/langdb)

## Basic Agent

Source: <https://docs.agno.com/examples/models/anthropic/basic>

### Code

```
cookbook/models/anthropic/basic.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.anthropic import Claude

agent = Agent(model=Claude(id="claude-sonnet-4-20250514"), markdown=True)

Get the response in a variable
run: RunOutput = agent.run("Share a 2 sentence horror story")
print(run.content)

Print the response in the terminal
```

```
agent.print_response("Share a 2 sentence horror story")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export ANTHROPIC_API_KEY=xxx
```

Step: Install libraries

```
pip install -U anthropic agno
```

Step: Run Agent

```
Mac
python cookbook/models/anthropic/basic.py
```

```
Windows
python cookbook/models/anthropic/basic.py
```

## Streaming Agent

Source: [https://docs.agno.com/examples/models/anthropic/basic\\_stream](https://docs.agno.com/examples/models/anthropic/basic_stream)

## Code

```
cookbook/models/anthropic/basic_stream.py
from typing import Iterator # noqa
from agno.agent import Agent, RunOutputEvent # noqa
from agno.models.anthropic import Claude

agent = Agent(model=Claude(id="claude-sonnet-4-20250514"), markdown=True)

Get the response in a variable
run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
stream=True)
for chunk in run_response:
print(chunk.content)

Print the response in the terminal
agent.print_response("Share a 2 sentence horror story", stream=True)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export ANTHROPIC_API_KEY=xxx
```

Step: Install libraries

```
pip install -U anthropic agno
```

Step: Run Agent

```
Mac
python cookbook/models/anthropic/basic_stream.py

Windows
python cookbook/models/anthropic/basic_stream.py
```

## Response Caching

Source: [https://docs.agno.com/examples/models/anthropic/cache\\_response](https://docs.agno.com/examples/models/anthropic/cache_response)

Learn how to cache model responses to avoid redundant API calls and reduce costs.

Response caching allows you to cache model responses, which can significantly improve response times and reduce API costs during development and testing.

Note:

For a detailed overview of response caching, see [Response Caching \(/concepts/models/cache-response\)](#).

Note:

This is different from Anthropic's prompt caching feature. Response caching caches the entire model response, while prompt caching ([/examples/models/anthropic/prompt\\_caching](#)) caches the system prompt to reduce processing time.

## Basic Usage

Enable caching by setting `cache_response=True` when initializing the model. The first call will hit the API and cache the response, while subsequent identical calls will return the cached result.

```
cache_model_response.py
import time

from agno.agent import Agent
from agno.models.openai import OpenAIChat
```

```

agent = Agent(model=OpenAIChat(id="gpt-4o", cache_response=True))

Run the same query twice to demonstrate caching
for i in range(1, 3):
 print(f"\n{'=' * 60}")
 print(
 f"Run {i}: {'Cache Miss (First Request)' if i == 1 else 'Cache Hit (Cached Response)'}"
)
 print(f"{'=' * 60}\n")

 response = agent.run(
 "Write me a short story about a cat that can talk and solve problems."
)
 print(response.content)
 print(f"\n Elapsed time: {response.metrics.duration:.3f}s")

Small delay between iterations for clarity
if i == 1:
 time.sleep(0.5)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export ANTHROPIC_API_KEY=xxx
```

Step: Install libraries

```
pip install -U anthropic agno
```

Step: Run Agent

```
Mac
python cache_model_response.py
```

```
Windows
python cache_model_response.py
```

## Code Execution Tool

Source: [https://docs.agno.com/examples/models/anthropic/code\\_execution](https://docs.agno.com/examples/models/anthropic/code_execution)

Learn how to use Anthropic's code execution tool with Agno.

With Anthropic's code execution tool (<https://docs.anthropic.com/en/docs/agents-and-tools/tool-use/code-execution-tool>), your model can execute Python code in a secure, sandboxed environment.

This is useful for your model to perform tasks as analyzing data, creating visualizations, or performing complex calculations.

## Working example

```
from agno.agent import Agent
from agno.models.anthropic import Claude

agent = Agent(
 model=Claude(
 id="claude-sonnet-4-20250514",
 default_headers={"anthropic-beta": "code-execution-2025-05-22"},
),
 tools=[
 {
 "type": "code_execution_20250522",
 "name": "code_execution",
 }
],
 markdown=True,
)

agent.print_response(
 "Calculate the mean and standard deviation of [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]",
 stream=True,
)
```

## File Upload

Source: [https://docs.agno.com/examples/models/anthropic/file\\_upload](https://docs.agno.com/examples/models/anthropic/file_upload)

Learn how to use Anthropic's Files API with Agno.

With Anthropic's Files API (<https://docs.anthropic.com/en/docs/build-with-claude/files>), you can upload files and later reference them in other API calls.

This is handy when a file is referenced multiple times in the same flow.

## Usage

Step: Upload a file

Initialize the Anthropic client and use `client.beta.files.upload`:`

```
from anthropic import Anthropic
```

```
file_path = Path("path/to/your/file.pdf")

client = Anthropic()
uploaded_file = client.beta.files.upload(file=file_path)
```

### Step: Initialize the Claude model

When initializing the `Claude` model, pass the necessary beta header:

```
from agno.agent import Agent
from agno.models.anthropic import Claude

agent = Agent(
 model=Claude(
 id="claude-opus-4-20250514",
 default_headers={"anthropic-beta": "files-api-2025-04-14"},
)
)
```

### Step: Reference the file

You can now reference the uploaded file when interacting with your Agno agent:

```
agent.print_response(
 "Summarize the contents of the attached file.",
 files=[File(external=uploaded_file)],
)
```

Notice there are some storage limits attached to this feature. You can read more about that on Anthropic's docs (<https://docs.anthropic.com/en/docs/build-with-claude/files#file-storage-and-limits>).

## Working example

```
cookbook/models/anthropic/pdf_input_file_upload.py
from pathlib import Path

from agno.agent import Agent
from agno.media import File
from agno.models.anthropic import Claude
from agno.utils.media import download_file
from anthropic import Anthropic

pdf_path = Path(__file__).parent.joinpath("ThaiRecipes.pdf")

Download the file using the download_file function
download_file(
 "https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf", str(pdf_path)
)
```

```

Initialize Anthropic client
client = Anthropic()

Upload the file to Anthropic
uploaded_file = client.beta.files.upload(
 file=Path(pdf_path),
)

if uploaded_file is not None:
 agent = Agent(
 model=Claude(
 id="claude-opus-4-20250514",
 default_headers={"anthropic-beta": "files-api-2025-04-14"},
),
 markdown=True,
)

 agent.print_response(
 "Summarize the contents of the attached file.",
 files=[File(external=uploaded_file)],
)

```

## Image Input Bytes Content

Source: [https://docs.agno.com/examples/models/anthropic/image\\_input\\_bytes](https://docs.agno.com/examples/models/anthropic/image_input_bytes)

### Code

```

cookbook/models/anthropic/image_input_bytes.py
from pathlib import Path

from agno.agent import Agent
from agno.media import Image
from agno.models.anthropic.claude import Claude
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.utils.media import download_image

agent = Agent(
 model=Claude(id="claude-sonnet-4-20250514"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)

image_path = Path(__file__).parent.joinpath("sample.jpg")

download_image(
 url="https://upload.wikimedia.org/wikipedia/commons/0/0c/GoldenGateBridge-001.jpg",
 output_path=str(image_path),
)

```

```

)

Read the image file content as bytes
image_bytes = image_path.read_bytes()

agent.print_response(
 "Tell me about this image and give me the latest news about it.",
 images=[
 Image(content=image_bytes),
],
 stream=True,
)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export ANTHROPIC_API_KEY=xxx
```

Step: Install libraries

```
pip install -U anthropic agno ddgs
```

Step: Run Agent

```
Mac
python cookbook/models/anthropic/image_input_bytes.py
```

```
Windows
python cookbook/models/anthropic/image_input_bytes.py
```

## Image Input URL

Source: [https://docs.agno.com/examples/models/anthropic/image\\_input\\_url](https://docs.agno.com/examples/models/anthropic/image_input_url)

## Code

```

cookbook/models/anthropic/image_input_url.py
from agno.agent import Agent
from agno.media import Image
from agno.models.anthropic import Claude
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(

```

```

model=Claude(id="claude-sonnet-4-20250514"),
tools=[DuckDuckGoTools()],
markdown=True,
)

agent.print_response(
 "Tell me about this image and search the web for more information.",
 images=[
 Image(
 url="https://upload.wikimedia.org/wikipedia/commons/a/a7/Camponotus_flavomarginatus_ant.jpg"
),
],
 stream=True,
)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export ANTHROPIC_API_KEY=xxx
```

Step: Install libraries

```
pip install -U anthropic agno ddgs
```

Step: Run Agent

# Mac

```
python cookbook/models/anthropic/image_input_url.py
```

# Windows

```
python cookbook/models/anthropic/image_input_url.py
```

## Agent with Knowledge

Source: <https://docs.agno.com/examples/models/anthropic/knowledge>

## Code

```

cookbook/models/anthropic/knowledge.py
from agno.agent import Agent
from agno.knowledge.embedder.azure_openai import AzureOpenAIEmbedder
from agno.knowledge.knowledge import Knowledge

```

```

from agno.models.anthropic import Claude
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"

knowledge = Knowledge(
 vector_db=PgVector(
 table_name="recipes",
 db_url=db_url,
 embedder=AzureOpenAIEmbedder(),
),
)
Add content to the knowledge
knowledge.add_content(
 url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf"
)

agent = Agent(
 model=Claude(id="claude-sonnet-4-20250514"),
 knowledge=knowledge,
 debug_mode=True,
)
agent.print_response("How to make Thai curry?", markdown=True)

```

## Usage

Snippet file: "create-venv-step.mdx"

### Step: Set your API keys

```

export ANTHROPIC_API_KEY=xxx
export OPENAI_API_KEY=xxx

```

### Step: Install libraries

```

pip install -U anthropic sqlalchemy pgvector pypdf openai agno

```

### Step: Run PgVector

```

docker run -d \
 -e POSTGRES_DB=ai \
 -e POSTGRES_USER=ai \
 -e POSTGRES_PASSWORD=ai \
 -e PGDATA=/var/lib/postgresql/data/pgdata \
 -v pgvolume:/var/lib/postgresql/data \
 -p 5532:5432 \
 --name pgvector \
 agnohq/pgvector:16

```

## Step: Run Agent

```
Mac
python cookbook/models/anthropic/knowledge.py

Windows
python cookbook/models/anthropic/knowledge.py
```

# PDF Input Bytes Agent

Source: [https://docs.agno.com/examples/models/anthropic/pdf\\_input\\_bytes](https://docs.agno.com/examples/models/anthropic/pdf_input_bytes)

## Code

```
cookbook/models/anthropic/pdf_input_bytes.py
from pathlib import Path

from agno.agent import Agent
from agno.media import File
from agno.models.anthropic import Claude
from agno.utils.media import download_file

pdf_path = Path(__file__).parent.joinpath("ThaiRecipes.pdf")

Download the file using the download_file function
download_file(
 "https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf", str(pdf_path)
)

agent = Agent(
 model=Claude(id="claude-sonnet-4-20250514"),
 markdown=True,
)

agent.print_response(
 "Summarize the contents of the attached file.",
 files=[
 File(
 content=pdf_path.read_bytes(),
),
],
)

run_response = agent.get_last_run_output()
print("Citations:")
print(run_response.citations)
```

## Usage

```
Snippet file: "create-venv-step.mdx"
```

Step: Set your API key

```
export ANTHROPIC_API_KEY=xxx
```

Step: Install libraries

```
pip install -U anthropic agno
```

Step: Run Agent

# Mac

```
python cookbook/models/anthropic/pdf_input_bytes.py
```

# Windows

```
python cookbook/models/anthropic/pdf_input_bytes.py
```

## PDF Input Local Agent

Source: [https://docs.agno.com/examples/models/anthropic/pdf\\_input\\_local](https://docs.agno.com/examples/models/anthropic/pdf_input_local)

### Code

```
cookbook/models/anthropic/pdf_input_local.py
from pathlib import Path

from agno.agent import Agent
from agno.media import File
from agno.models.anthropic import Claude
from agno.utils.media import download_file

pdf_path = Path(__file__).parent.joinpath("ThaiRecipes.pdf")

Download the file using the download_file function
download_file(
 "https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf", str(pdf_path)
)

agent = Agent(
 model=Claude(id="claude-sonnet-4-20250514"),
 markdown=True,
)

agent.print_response(
 "Summarize the contents of the attached file.",
```

```
files=[
 File(
 filepath=pdf_path,
),
],
)
run_response = agent.get_last_run_output()
print("Citations:")
print(run_response.citations)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export ANTHROPIC_API_KEY=xxx
```

Step: Install libraries

```
pip install -U anthropic agno
```

Step: Run Agent

# Mac

```
python cookbook/models/anthropic/pdf_input_local.py
```

# Windows

```
python cookbook/models/anthropic/pdf_input_local.py
```

## PDF Input URL Agent

Source: [https://docs.agno.com/examples/models/anthropic/pdf\\_input\\_url](https://docs.agno.com/examples/models/anthropic/pdf_input_url)

## Code

```
cookbook/models/anthropic/pdf_input_url.py
from agno.agent import Agent
from agno.media import File
from agno.models.anthropic import Claude

agent = Agent(
 model=Claude(id="claude-sonnet-4-20250514"),
 markdown=True,
)
```

```
agent.print_response(
 "Summarize the contents of the attached file.",
 files=[
 File(url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf"),
],
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export ANTHROPIC_API_KEY=xxx
```

Step: Install libraries

```
pip install -U anthropic agno
```

Step: Run Agent

```
Mac
python cookbook/models/anthropic/pdf_input_url.py

Windows
python cookbook/models/anthropic/pdf_input_url.py
```

## Prompt Caching

Source: [https://docs.agno.com/examples/models/anthropic/prompt\\_caching](https://docs.agno.com/examples/models/anthropic/prompt_caching)

Learn how to use prompt caching with Anthropic models and Agno.

Prompt caching can help reducing processing time and costs. Consider it if you are using the same prompt multiple times in any flow.

You can read more about prompt caching with Anthropic models here (<https://docs.anthropic.com/en/docs/build-with-claude/prompt-caching>).

## Usage

To use prompt caching in your Agno setup, pass the `cache_system_prompt` argument when initializing the Claude model:

```

from agno.agent import Agent
from agno.models.anthropic import Claude

agent = Agent(
 model=Claude(
 id="claude-3-5-sonnet-20241022",
 cache_system_prompt=True,
),
)

```

Notice that for prompt caching to work, the prompt needs to be of a certain length. You can read more about this on Anthropic's docs (<https://docs.anthropic.com/en/docs/build-with-claude/prompt-caching#cache-limitations>).

## Extended cache

You can also use Anthropic's extended cache beta feature. This updates the cache duration from 5 minutes to 1 hour. To activate it, pass the `extended_cache_time` argument and the following beta header:

```

from agno.agent import Agent
from agno.models.anthropic import Claude

agent = Agent(
 model=Claude(
 id="claude-3-5-sonnet-20241022",
 default_headers={"anthropic-beta": "extended-cache-ttl-2025-04-11"},
 cache_system_prompt=True,
 extended_cache_time=True,
),
)

```

## Working example

```

cookbook/models/anthropic/prompt_caching_extended.py
from pathlib import Path
from agno.agent import Agent
from agno.models.anthropic import Claude
from agno.utils.media import download_file

Load an example large system message from S3. A large prompt like this would benefit
from caching.
txt_path = Path(__file__).parent.joinpath("system_prompt.txt")
download_file(
 "https://agno-public.s3.amazonaws.com/prompts/system_prompt.txt",
 str(txt_path),
)

```

```

)
system_message = txt_path.read_text()

agent = Agent(
 model=Claude(
 id="claude-sonnet-4-20250514",
 cache_system_prompt=True, # Activate prompt caching for Anthropic to cache the
system prompt
),
 system_message=system_message,
 markdown=True,
)

First run - this will create the cache
response = agent.run(
 "Explain the difference between REST and GraphQL APIs with examples"
)
if response and response.metrics:
 print(f"First run cache write tokens = {response.metrics.cache_write_tokens}")

Second run - this will use the cached system prompt
response = agent.run(
 "What are the key principles of clean code and how do I apply them in Python?"
)
if response and response.metrics:
 print(f"Second run cache read tokens = {response.metrics.cache_read_tokens}")

```

## Claude Agent Skills

Source: <https://docs.agno.com/examples/models/anthropic/skills>

Create PowerPoint presentations, Excel spreadsheets, Word documents, and analyze PDFs with Claude Agent Skills

Claude Agent Skills (<https://docs.claude.com/en/docs/agents-and-tools/agent-skills/overview>) provide capabilities beyond what can get done with prompts alone.

With Skills, Claude will gain access to filesystem-based resources. These will be loaded on demand, removing the need to provide the same guidance multiple times as it happens with prompts.

You can read more about how Skills work on Anthropic docs (<https://docs.claude.com/en/docs/agents-and-tools/agent-skills/overview#how-skills-work>).

## Available Skills

- \* PowerPoint (pptx): Create professional presentations with slides, layouts, and formatting
- \* Excel (xlsx): Generate spreadsheets with formulas, charts, and data analysis

- \* Word (docx): Create and edit documents with rich formatting
- \* PDF (pdf): Analyze and extract information from PDF documents

You can also create custom skills for Claude to use. You can read more about that on Anthropic docs (<https://docs.claude.com/en/docs/agents-and-tools/agent-skills/overview#custom-skills-examples>).

## Prerequisites

Before using Claude Agent Skills, ensure you have:

1. Python 3.8 or higher
2. Anthropic API key with access to Claude models
3. Beta access to Claude Agent Skills

## File Download Helper Setup

### Warning:

Important: Files created by Agent Skills are NOT automatically saved to your local filesystem. They are created in a sandboxed execution environment and must be downloaded using the Anthropic Files API.

Before running any of the examples below, you must create the `file_download_helper.py` file in the same directory as your script.

### How File Download Works

1. Claude creates the file in the sandbox
2. Returns a file ID in the tool result
3. You download the file using the helper function below

### Create `file_download_helper.py`

Save the following code as `file_download_helper.py` in your project directory:

```
file_download_helper.py
from typing import List
import os
import re

def detect_file_extension(file_content: bytes) -> str:
 """
 Detect file type from magic bytes (file header).

 Args:
 file_content: First few bytes of the file
```

Returns:  
File extension including dot (e.g., '.xlsx', '.docx', '.pptx')

```
"""
Check magic bytes for common Office file formats
if file_content.startswith(b"PK\x03\x04"):
 # ZIP-based formats (Office 2007+)
 if b"word/" in file_content[:2000]:
 return ".docx"
 elif b"xl/" in file_content[:2000]:
 return ".xlsx"
 elif b"ppt/" in file_content[:2000]:
 return ".pptx"
 else:
 return ".zip"
elif file_content.startswith(b"%PDF"):
 return ".pdf"
elif file_content.startswith(b"\xd0\xcf\x11\xe0"):
 # Old Office format (97-2003)
 return ".doc"
else:
 return ".bin"
```

```
def download_skill_files(
 response, client, output_dir: str = ".", default_filename: str = None
) -> List[str]:
 """
 Download files created by Claude Agent Skills from the API response.
```

Args:

- response: The Anthropic API response object OR a dict with 'file\_ids' key
- client: Anthropic client instance
- output\_dir: Directory to save files (default: current directory)
- default\_filename: Default filename to use

Returns:  
List of downloaded file paths

```
"""
downloaded_files = []
seen_file_ids = set()

Check if response is a dict with file_ids (from provider_data)
if isinstance(response, dict) and "file_ids" in response:
 for file_id in response["file_ids"]:
 if file_id in seen_file_ids:
 continue
 seen_file_ids.add(file_id)

 print(f"Found file ID: {file_id}")

 try:
 # Download the file
```

```

 file_content = client.beta.files.download(
 file_id=file_id, betas=["files-api-2025-04-14"]
)

 # Read file content
 file_data = file_content.read()

 # Detect actual file type from content
 detected_ext = detect_file_extension(file_data)

 # Use default filename or generate one
 filename = (
 default_filename
 if default_filename
 else f"skill_output_{file_id[-8:]}{detected_ext}"
)
 filepath = os.path.join(output_dir, filename)

 # Save to disk
 with open(filepath, "wb") as f:
 f.write(file_data)

 downloaded_files.append(filepath)
 print(f"Downloaded: {filepath}")

 except Exception as e:
 print(f"Failed to download file {file_id}: {e}")

 return downloaded_files

Original logic: Iterate through response content blocks
if not hasattr(response, "content"):
 return downloaded_files

for block in response.content:
 if block.type == "bash_code_execution_tool_result":
 if hasattr(block, "content") and hasattr(block.content, "content"):
 if isinstance(block.content.content, list):
 for output_block in block.content.content:
 if hasattr(output_block, "file_id"):
 file_id = output_block.file_id

 if file_id in seen_file_ids:
 continue
 seen_file_ids.add(file_id)

 print(f"Found file ID: {file_id}")

 try:
 file_content = client.beta.files.download(
 file_id=file_id, betas=["files-api-2025-04-14"]
)

```

```

file_data = file_content.read()
detected_ext = detect_file_extension(file_data)

filename = default_filename

if (
 not filename
 and hasattr(block.content, "stdout")
 and block.content.stdout
):
 match = re.search(
 r"[\w\.-]+\.(pptx|xlsx|docx|pdf)",
 block.content.stdout,
)
 if match:
 extracted_filename = match.group(0)
 extracted_ext = os.path.splitext(
 extracted_filename
)[1]
 if extracted_ext == detected_ext:
 filename = extracted_filename
 else:
 basename = os.path.splitext(
 extracted_filename
)[0]
 filename = f"{basename}{detected_ext}"

 if not filename:
 filename = (
 f"skill_output_{file_id[-8:]}{detected_ext}"
)

filepath = os.path.join(output_dir, filename)

with open(filepath, "wb") as f:
 f.write(file_data)

downloaded_files.append(filepath)
print(f"Downloaded: {filepath}")

except Exception as e:
 print(f"Failed to download file {file_id}: {e}")

return downloaded_files

```

Once you've created this file, you can import it in your scripts:

```
from file_download_helper import download_skill_files
```

## Basic Usage

Enable skills by passing them to the Claude model configuration:

```
from agno.agent import Agent
from agno.models.anthropic import Claude

agent = Agent(
 model=Claude(
 id="claude-sonnet-4-5-20250929",
 skills=[
 {"type": "anthropic", "skill_id": "pptx", "version": "latest"}
],
),
 instructions=["You are a presentation specialist."],
 markdown=True
)

agent.print_response("Create a 3-slide presentation about AI trends")
```

The framework automatically:

- \* Configures the required betas (code-execution-2025-08-25, skills-2025-10-02)
- \* Adds the code execution tool
- \* Uses the beta API client
- \* Sets up the container with skill configurations

You can enable multiple skills at once:

```
model=Claude(
 id="claude-sonnet-4-5-20250929",
 skills=[
 {"type": "anthropic", "skill_id": "pptx", "version": "latest"},
 {"type": "anthropic", "skill_id": "xlsx", "version": "latest"},
 {"type": "anthropic", "skill_id": "docx", "version": "latest"},
]
)
```

## PowerPoint Skills

Create professional presentations with slides, layouts, and formatting.

### Example: Q4 Business Review Presentation

```
import os
from agno.agent import Agent
from agno.models.anthropic import Claude
from anthropic import Anthropic
from file_download_helper import download_skill_files

Create agent with PowerPoint skills
```

```

powerpoint_agent = Agent(
 name="PowerPoint Creator",
 model=Claude(
 id="claude-sonnet-4-5-20250929",
 skills=[
 {"type": "anthropic", "skill_id": "pptx", "version": "latest"}
],
),
 instructions=[
 "You are a professional presentation creator with access to PowerPoint skills.",
 "Create well-structured presentations with clear slides and professional design.",
 "Keep text concise - no more than 6 bullet points per slide.",
],
 markdown=True,
)

Create presentation
prompt = (
 "Create a Q4 business review presentation with 5 slides:\n"
 "1. Title slide: 'Q4 2025 Business Review'\n"
 "2. Key metrics: Revenue $2.5M (25% YoY), 850 customers\n"
 "3. Major achievements: Product launch, new markets, team growth\n"
 "4. Challenges: Market competition, customer retention\n"
 "5. Q1 2026 goals: $3M revenue, 1000 customers, new features\n"
 "Save as 'q4_review.pptx'"
)

response = powerpoint_agent.run(prompt)
print(response.content)

Download files
client = Anthropic(api_key=os.getenv("ANTHROPIC_API_KEY"))
if response.messages:
 for msg in response.messages:
 if hasattr(msg, "provider_data") and msg.provider_data:
 files = download_skill_files(
 msg.provider_data, client, default_filename="q4_review.pptx"
)
 if files:
 print(f"Downloaded {len(files)} file(s):")
 for file in files:
 print(f" - {file}")
 break

```

## Excel Skills

Generate spreadsheets with formulas, charts, and data analysis.

### Example: Sales Dashboard

```

import os
from agno.agent import Agent
from agno.models.anthropic import Claude
from anthropic import Anthropic
from file_download_helper import download_skill_files

Create agent with Excel skills
excel_agent = Agent(
 name="Excel Creator",
 model=Claude(
 id="claude-sonnet-4-5-20250929",
 skills=[
 {"type": "anthropic", "skill_id": "xlsx", "version": "latest"}
],
),
 instructions=[
 "You are a data analysis specialist with access to Excel skills.",
 "Create professional spreadsheets with well-formatted tables and accurate formulas.",
 "Use charts and visualizations to make data insights clear.",
],
 markdown=True,
)

Create sales dashboard
prompt = (
 "Create a sales dashboard for January 2026 with:\n"
 "Sales data for 5 reps:\n"
 "- Alice: 24 deals, $385K revenue, 65% close rate\n"
 "- Bob: 19 deals, $298K revenue, 58% close rate\n"
 "- Carol: 31 deals, $467K revenue, 72% close rate\n"
 "- David: 22 deals, $356K revenue, 61% close rate\n"
 "- Emma: 27 deals, $412K revenue, 68% close rate\n\n"
 "Include:\n"
 "1. Table with all metrics\n"
 "2. Total revenue calculation\n"
 "3. Bar chart showing revenue by rep\n"
 "4. Quota attainment (quota: $350K per rep)\n"
 "5. Conditional formatting (green if above quota, red if below)\n"
 "Save as 'sales_dashboard.xlsx'"
)

response = excel_agent.run(prompt)
print(response.content)

Download files
client = Anthropic(api_key=os.getenv("ANTHROPIC_API_KEY"))
if response.messages:
 for msg in response.messages:
 if hasattr(msg, "provider_data") and msg.provider_data:
 files = download_skill_files(
 msg.provider_data, client, default_filename="sales_dashboard.xlsx"
)

```

```

)
 if files:
 print(f"Downloaded {len(files)} file(s):")
 for file in files:
 print(f" - {file}")
 break

```

## Word Document Skills

Create and edit documents with rich formatting.

### Example: Project Proposal

```

import os
from agno.agent import Agent
from agno.models.anthropic import Claude
from anthropic import Anthropic
from file_download_helper import download_skill_files

Create agent with Word skills
document_agent = Agent(
 name="Document Creator",
 model=Claude(
 id="claude-sonnet-4-5-20250929",
 skills=[
 {"type": "anthropic", "skill_id": "docx", "version": "latest"}
],
),
 instructions=[
 "You are a professional document writer with access to Word document skills.",
 "Create well-structured documents with clear sections and professional formatting.",
 "Use headings, lists, and tables where appropriate.",
],
 markdown=True,
)

Create project proposal
prompt = (
 "Create a project proposal document for 'Mobile App Development':\n\n"
 "Title: Mobile App Development Proposal\n\n"
 "1. Executive Summary:\n"
 " Project to build a task management mobile app\n"
 " Timeline: 12 weeks, Budget: $120K\n\n"
 "2. Project Overview:\n"
 " - Native iOS and Android app\n"
 " - Key features: Task lists, reminders, team collaboration\n"
 " - Target users: Small business teams\n\n"
 "3. Scope of Work:\n"
 " - Requirements gathering (Week 1-2)\n\n"

```

```

" - Design and prototyping (Week 3-4)\n"
" - Development (Week 5-10)\n"
" - Testing and launch (Week 11-12)\n\n"
"4. Team:\n"
" - 2 developers, 1 designer, 1 project manager\n\n"
"5. Budget Breakdown:\n"
" - Development: $80K\n"
" - Design: $25K\n"
" - Testing: $10K\n"
" - Contingency: $5K\n\n"
"6. Success Metrics:\n"
" - 1000 users in first month\n"
" - 4.5+ star rating\n"
" - 70% user retention\n\n"
"Save as 'mobile_app_proposal.docx'"
)

```

```

response = document_agent.run(prompt)
print(response.content)

```

```

Download files
client = Anthropic(api_key=os.getenv("ANTHROPIC_API_KEY"))
if response.messages:
 for msg in response.messages:
 if hasattr(msg, "provider_data") and msg.provider_data:
 files = download_skill_files(
 msg.provider_data, client, default_filename="mobile_app_proposal.docx"
)
 if files:
 print(f"Downloaded {len(files)} file(s):")
 for file in files:
 print(f" - {file}")
 break

```

## Multi-Skill Workflows

Combine multiple skills for comprehensive document packages.

### Example: Multi-Document Package

```

import os
from agno.agent import Agent
from agno.models.anthropic import Claude
from anthropic import Anthropic
from file_download_helper import download_skill_files

Create agent with multiple skills
multi_skill_agent = Agent(
 name="Multi-Skill Document Creator",
 model=Claude(

```

```

 id="claude-sonnet-4-5-20250929",
 skills=[
 {"type": "anthropic", "skill_id": "pptx", "version": "latest"},
 {"type": "anthropic", "skill_id": "xlsx", "version": "latest"},
 {"type": "anthropic", "skill_id": "docx", "version": "latest"},
],
),
 instructions=[
 "You are a comprehensive business document creator.",
 "You have access to PowerPoint, Excel, and Word document skills.",
 "Create professional document packages with consistent information across all
files.",
],
 markdown=True,
)

Create document package
prompt = (
 "Create a sales report package with 2 documents:\n\n"
 "1. EXCEL SPREADSHEET (sales_report.xlsx):\n"
 " - Q4 sales data: Oct $450K, Nov $520K, Dec $610K\n"
 " - Include a total formula\n"
 " - Add a simple bar chart\n\n"
 "2. WORD DOCUMENT (sales_summary.docx):\n"
 " - Brief Q4 sales summary\n"
 " - Total sales: $1.58M\n"
 " - Growth trend: Strong December performance\n"
)

response = multi_skill_agent.run(prompt)
print(response.content)

Download files
client = Anthropic(api_key=os.getenv("ANTHROPIC_API_KEY"))
if response.messages:
 for msg in response.messages:
 if hasattr(msg, "provider_data") and msg.provider_data:
 files = download_skill_files(msg.provider_data, client)
 if files:
 print(f"Downloaded {len(files)} file(s):")
 for file in files:
 print(f" - {file}")
 break

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export ANTHROPIC_API_KEY=xxx
```

Step: Install libraries

```
pip install -U anthropic agno
```

Step: Create file download helper

Create `file_download_helper.py` using the code provided in the [File Download Helper Setup](#file-download-helper-setup) section above.

Step: Run Example

Create a Python file with any of the examples above and run:

```
Mac
python your_script.py
```

```
Windows
python your_script.py
```

## Configuration

### Model Requirements

- \* Recommended: claude-sonnet-4-5-20250929 or later
- \* Minimum: claude-3-5-sonnet-20241022
- \* Skills require models with code execution capability

### Beta Version

Skills require the following beta flags:

- \* code-execution-2025-08-25
- \* skills-2025-10-02

### Skill Configuration

Specify skills in the model configuration:

```
skills=[
 {"type": "anthropic", "skill_id": "ptx", "version": "latest"},
 {"type": "anthropic", "skill_id": "xlsx", "version": "latest"},
 {"type": "anthropic", "skill_id": "docx", "version": "latest"},
 {"type": "anthropic", "skill_id": "pdf", "version": "latest"},
]
```

## Additional Resources

\* Claude Agent Skills Documentation (<https://docs.anthropic.com/en/docs/agents-and-tools/agent-skills/quickstart>)

\* Anthropic API Reference (<https://docs.anthropic.com/en/api>)

\* Anthropic Files API (<https://docs.anthropic.com/en/docs/build-with-claude/files>)

## Agent with Structured Outputs

Source: [https://docs.agno.com/examples/models/anthropic/structured\\_output](https://docs.agno.com/examples/models/anthropic/structured_output)

### Code

```
cookbook/models/anthropic/structured_output.py
from typing import List

from agno.agent import Agent, RunOutput # noqa
from agno.models.anthropic import Claude
from pydantic import BaseModel, Field
from rich.pretty import pprint # noqa

class MovieScript(BaseModel):
 setting: str = Field(
 ..., description="Provide a nice setting for a blockbuster movie."
)
 ending: str = Field(
 ...,
 description="Ending of the movie. If not available, provide a happy ending.",
)
 genre: str = Field(
 ...,
 description="Genre of the movie. If not available, select action, thriller or romantic comedy.",
)
 name: str = Field(..., description="Give a name to this movie")
 characters: List[str] = Field(..., description="Name of characters for this movie.")
 storyline: str = Field(
 ..., description="3 sentence storyline for the movie. Make it exciting!"
)

movie_agent = Agent(
 model=Claude(id="claude-sonnet-4-20250514"),
 description="You help people write movie scripts.",
 output_schema=MovieScript,
)

Get the response in a variable
run: RunOutput = movie_agent.run("New York")
pprint(run.content)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export ANTHROPIC_API_KEY=xxx
```

Step: Install libraries

```
pip install -U anthropic agno
```

Step: Run Agent

# Mac

```
python cookbook/models/anthropic/structured_output.py
```

# Windows

```
python cookbook/models/anthropic/structured_output.py
```

## Agent with Tools

Source: [https://docs.agno.com/examples/models/anthropic/tool\\_use](https://docs.agno.com/examples/models/anthropic/tool_use)

## Code

```
cookbook/models/anthropic/tool_use.py
from agno.agent import Agent
from agno.models.anthropic import Claude
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=Claude(id="claude-sonnet-4-20250514"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)
agent.print_response("Whats happening in France?")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export ANTHROPIC_API_KEY=xxx
```

## Step: Install libraries

```
pip install -U anthropic ddgs agno
```

## Step: Run Agent

```
Mac
```

```
python cookbook/models/anthropic/tool_use.py
```

```
Windows
```

```
python cookbook/models/anthropic/tool_use.py
```

# Web Fetch

Source: [https://docs.agno.com/examples/models/anthropic/web\\_fetch](https://docs.agno.com/examples/models/anthropic/web_fetch)

## Code

```
cookbook/models/anthropic/web_fetch.py
from agno.agent import Agent
from agno.models.anthropic import Claude

agent = Agent(
 model=Claude(
 id="claude-opus-4-1-20250805",
 default_headers={"anthropic-beta": "web-fetch-2025-09-10"},
),
 tools=[
 {
 "type": "web_fetch_20250910",
 "name": "web_fetch",
 "max_uses": 5,
 }
],
 markdown=True,
)

agent.print_response(
 "Tell me more about https://en.wikipedia.org/wiki/Glacier_National_Park_\(U.S.\)",
 stream=True,
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export ANTHROPIC_API_KEY=xxx
```

Step: Install libraries

```
pip install -U anthropic agno
```

Step: Run Agent

# Mac

```
python cookbook/models/anthropic/web_fetch.py
```

# Windows

```
python cookbook/models/anthropic/web_fetch.py
```

## Basic Agent

Source: <https://docs.agno.com/examples/models/aws/bedrock/basic>

### Code

```
cookbook/models/aws/bedrock/basic.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.aws import AwsBedrock

agent = Agent(
 model=AwsBedrock(id="mistral.mistral-large-2402-v1:0"), markdown=True
)

Get the response in a variable
run: RunOutput = agent.run("Share a 2 sentence horror story")
print(run.content)

Print the response in the terminal
agent.print_response("Share a 2 sentence horror story")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your AWS Credentials

```
export AWS_ACCESS_KEY_ID=***
export AWS_SECRET_ACCESS_KEY=***
```

```
export AWS_REGION=***
```

Step: Install libraries

```
pip install -U boto3 agno
```

Step: Run Agent

```
Mac
python cookbook/models/aws/bedrock/basic.py
```

```
Windows
python cookbook/models/aws/bedrock/basic.py
```

## Streaming Agent

Source: [https://docs.agno.com/examples/models/aws/bedrock/basic\\_stream](https://docs.agno.com/examples/models/aws/bedrock/basic_stream)

### Code

```
cookbook/models/aws/bedrock/basic_stream.py
from typing import Iterator # noqa
from agno.agent import Agent, RunOutput # noqa
from agno.models.aws import AwsBedrock

agent = Agent(
 model=AwsBedrock(id="mistral.mistral-large-2402-v1:0"), markdown=True
)

Get the response in a variable
run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
stream=True)
for chunk in run_response:
print(chunk.content)

Print the response in the terminal
agent.print_response("Share a 2 sentence horror story", stream=True)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your AWS Credentials

```
export AWS_ACCESS_KEY_ID=***
```

```
export AWS_SECRET_ACCESS_KEY=***
export AWS_REGION=***
```

Step: Install libraries

```
pip install -U boto3 agno
```

Step: Run Agent

# Mac

```
python cookbook/models/aws/bedrock/basic_stream.py
```

# Windows

```
python cookbook/models/aws/bedrock/basic_stream.py
```

## Agent with Image Input

Source: [https://docs.agno.com/examples/models/aws/bedrock/image\\_agent](https://docs.agno.com/examples/models/aws/bedrock/image_agent)

AWS Bedrock supports image input with models like amazon.nova-pro-v1:0. You can use this to analyze images and get information about them.

## Code

```
cookbook/models/aws/bedrock/image_agent.py
from pathlib import Path
from agno.agent import Agent
from agno.media import Image
from agno.models.aws import AwsBedrock
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=AwsBedrock(id="amazon.nova-pro-v1:0"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)

image_path = Path(__file__).parent.joinpath("sample.jpg")

Read the image file content as bytes
with open(image_path, "rb") as img_file:
 image_bytes = img_file.read()

agent.print_response(
 "Tell me about this image and give me the latest news about it.",
 images=[
 Image(content=image_bytes, format="jpeg"),
],
)
```

)

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your AWS Credentials

```
export AWS_ACCESS_KEY_ID=***
export AWS_SECRET_ACCESS_KEY=***
export AWS_REGION=***
```

Step: Install libraries

```
pip install -U boto3 ddgs agno
```

Step: Add an Image

Place an image file named `sample.jpg` in the same directory as your script.

Step: Run Agent

```
Mac
python cookbook/models/aws/bedrock/image_agent.py

Windows
python cookbook/models/aws/bedrock/image_agent.py
```

## Agent with Knowledge

Source: <https://docs.agno.com/examples/models/aws/bedrock/knowledge>

## Code

```
cookbook/models/aws/bedrock/knowledge.py
from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.models.aws import AwsBedrock
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

knowledge_base = Knowledge(
 vector_db=PgVector(table_name="recipes", db_url=db_url),
)
knowledge_base.add_content(
 url="https://agno-public.s3.amazonaws.com/recipes/"
```

```

ThaiRecipes.pdf"
)

agent = Agent(
 model=AwsBedrock(id="mistral.mistral-large-2402-v1
:0"), markdown=True
 knowledge=knowledge_base,
)
agent.print_response("How to make Thai curry?", markdown=True)

```

## Usage

Snippet file: "create-venv-step.mdx"

### Step: Set your AWS Credentials

```

export AWS_ACCESS_KEY_ID=***
export AWS_SECRET_ACCESS_KEY=***
export AWS_REGION=***

```

### Step: Install libraries

```

pip install -U boto3 sqlalchemy pgvector pypdf openai psycopg agno

```

### Step: Run PgVector

```

docker run -d \
 -e POSTGRES_DB=ai \
 -e POSTGRES_USER=ai \
 -e POSTGRES_PASSWORD=ai \
 -e PGDATA=/var/lib/postgresql/data/pgdata \
 -v pgvolume:/var/lib/postgresql/data \
 -p 5532:5432 \
 --name pgvector \
 agnohq/pgvector:16

```

### Step: Run Agent

```

Mac
python cookbook/models/aws/bedrock/knowledge.py

Windows
python cookbook/models/aws/bedrock/knowledge.py

```

## Agent with Storage

Source: <https://docs.agno.com/examples/models/aws/bedrock/storage>

## Code

```
cookbook/models/aws/bedrock/storage.py
from agno.agent import Agent
from agno.models.aws import AwsBedrock
from agno.db.postgres import PostgresDb
from agno.tools.duckduckgo import DuckDuckGoTools

db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"

agent = Agent(
 model=AwsBedrock(id="mistral.mistral-large-2402-v1:0"),
 db=PostgresDb(session_table="agent_sessions", db_url=db_url),
 tools=[DuckDuckGoTools()],
 add_history_to_context=True,
)
agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")
```

## Usage

Snippet file: "create-venv-step.mdx"

### Step: Set your AWS Credentials

```
export AWS_ACCESS_KEY_ID=***
export AWS_SECRET_ACCESS_KEY=***
export AWS_REGION=***
```

### Step: Install libraries

```
pip install -U boto3 ddgs sqlalchemy psycpg agno
```

### Step: Run PgVector

```
docker run -d \
 -e POSTGRES_DB=ai \
 -e POSTGRES_USER=ai \
 -e POSTGRES_PASSWORD=ai \
 -e PGDATA=/var/lib/postgresql/data/pgdata \
 -v pgvolume:/var/lib/postgresql/data \
 -p 5532:5432 \
 --name pgvector \
 agnohq/pgvector:16
```

### Step: Run Agent

```
Mac
python cookbook/models/aws/bedrock/storage.py

Windows
python cookbook/models/aws/bedrock/storage.py
```

## Agent with Structured Outputs

Source: [https://docs.agno.com/examples/models/aws/bedrock/structured\\_output](https://docs.agno.com/examples/models/aws/bedrock/structured_output)

### Code

```
cookbook/models/aws/bedrock/structured_output.py
from typing import List

from agno.agent import Agent, RunOutput # noqa
from agno.models.aws import AwsBedrock
from pydantic import BaseModel, Field
from rich.pretty import pprint # noqa

class MovieScript(BaseModel):
 setting: str = Field(
 ..., description="Provide a nice setting for a blockbuster movie."
)
 ending: str = Field(
 ...,
 description="Ending of the movie. If not available, provide a happy ending.",
)
 genre: str = Field(
 ...,
 description="Genre of the movie. If not available, select action, thriller or romantic comedy.",
)
 name: str = Field(..., description="Give a name to this movie")
 characters: List[str] = Field(..., description="Name of characters for this movie.")
 storyline: str = Field(
 ..., description="3 sentence storyline for the movie. Make it exciting!"
)

movie_agent = Agent(
 model=AwsBedrock(id="mistral.mistral-large-2402-v1:0"),
 description="You help people write movie scripts.",
 output_schema=MovieScript,
)

Get the response in a variable
movie_agent: RunOutput = movie_agent.run("New York")
pprint(movie_agent.content)
```

```
movie_agent.print_response("New York")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your AWS Credentials

```
export AWS_ACCESS_KEY_ID=***
export AWS_SECRET_ACCESS_KEY=***
export AWS_REGION=***
```

Step: Install libraries

```
pip install -U boto3 agno
```

Step: Run Agent

```
Mac
python cookbook/models/aws/bedrock/structured_output.py
```

```
Windows
python cookbook/models/aws/bedrock/structured_output.py
```

## Agent with Tools

Source: [https://docs.agno.com/examples/models/aws/bedrock/tool\\_use](https://docs.agno.com/examples/models/aws/bedrock/tool_use)

## Code

```
cookbook/models/aws/bedrock/tool_use.py
from agno.agent import Agent
from agno.models.aws import AwsBedrock
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=AwsBedrock(id="mistral.mistral-large-2402-v1:0"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)
agent.print_response("Whats happening in France?", stream=True)
```

## Usage

Snippet file: "create-venv-step.mdx"

### Step: Set your AWS Credentials

```
export AWS_ACCESS_KEY_ID=***
export AWS_SECRET_ACCESS_KEY=***
export AWS_REGION=***
```

### Step: Install libraries

```
pip install -U boto3 ddgs agno
```

### Step: Run Agent

```
Mac
python cookbook/models/aws/bedrock/tool_use.py

Windows
python cookbook/models/aws/bedrock/tool_use.py
```

## Basic Agent

Source: <https://docs.agno.com/examples/models/aws/claude/basic>

### Code

```
cookbook/models/aws/claude/basic.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.aws import Claude

agent = Agent(
 model=Claude(id="anthropic.claude-3-5-sonnet-20240620-v1:0"), markdown=True
)

Get the response in a variable
run: RunOutput = agent.run("Share a 2 sentence horror story")
print(run.content)

Print the response in the terminal
agent.print_response("Share a 2 sentence horror story")
```

### Usage

Snippet file: "create-venv-step.mdx"

## Step: Set your AWS Credentials

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export AZURE_API_KEY=xxx
export AZURE_ENDPOINT=xxx
```

Step: Install libraries

```
pip install -U azure-ai-inference agno
```

Step: Run Agent

```
Mac
python cookbook/models/azure/ai_foundry/structured_output
.py
```

```
Windows
python cookbook/models/azure/ai_foundry/structured_output
.py
```

## Agent with Tools

Source: [https://docs.agno.com/examples/models/azure/ai\\_foundry/tool\\_use](https://docs.agno.com/examples/models/azure/ai_foundry/tool_use)

## Code

```
cookbook/models/azure/ai_foundry/tool_use.py
from agno.agent import Agent
from agno.models.azure import AzureAIFoundry
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=AzureAIFoundry(id="Cohere-command-r-08-2024"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)

agent.print_response("What is currently happening in France?", stream=True)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export AZURE_API_KEY=xxx
```

```
export AZURE_ENDPOINT=xxx
```

Step: Install libraries

```
pip install -U azure-ai-inference agno ddgs
```

Step: Run Agent

# Mac

```
python cookbook/models/azure/ai_foundry/tool_use.py
```

# Windows

```
python cookbook/models/azure/ai_foundry/tool_use.py
```

## Basic Agent

Source: <https://docs.agno.com/examples/models/azure/openai/basic>

### Code

```
cookbook/models/azure/openai/basic.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.azure import AzureOpenAI

agent = Agent(model=AzureOpenAI(id="gpt-5-mini"), markdown=True)

Get the response in a variable
run: RunOutput = agent.run("Share a 2 sentence horror story")
print(run.content)

Print the response on the terminal
agent.print_response("Share a 2 sentence horror story")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export AZURE_OPENAI_API_KEY=xxx
export AZURE_OPENAI_ENDPOINT=xxx
export AZURE_DEPLOYMENT=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
Mac
python cookbook/models/azure/openai/basic.py

Windows
python cookbook/models/azure/openai/basic.py
```

## Basic Streaming

Source: [https://docs.agno.com/examples/models/azure/openai/basic\\_stream](https://docs.agno.com/examples/models/azure/openai/basic_stream)

### Code

```
cookbook/models/azure/openai/basic_stream.py
from typing import Iterator # noqa

from agno.agent import Agent, RunOutputEvent # noqa
from agno.models.azure import AzureOpenAI

agent = Agent(model=AzureOpenAI(id="gpt-5-mini"), markdown=True)

Get the response in a variable
run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
stream=True)
for chunk in run_response:
print(chunk.content)

Print the response on the terminal
agent.print_response("Share a 2 sentence horror story", stream=True)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export AZURE_OPENAI_API_KEY=xxx
export AZURE_OPENAI_ENDPOINT=xxx
export AZURE_DEPLOYMENT=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
Mac
python cookbook/models/azure/openai/basic_stream.py

Windows
python cookbook/models/azure/openai/basic_stream.py
```

## Agent with Knowledge Base

Source: <https://docs.agno.com/examples/models/azure/openai/knowledge>

### Code

```
cookbook/models/azure/openai/knowledge.py
import asyncio
from agno.agent import Agent
from agno.knowledge.embedder.azure_openai import AzureOpenAIEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.azure import AzureOpenAI
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"

knowledge = Knowledge(
 vector_db=PgVector(
 table_name="recipes",
 db_url=db_url,
 embedder=AzureOpenAIEmbedder(),
),
)

Add content to the knowledge
asyncio.run(knowledge.add_content_async(
 url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf"
))

agent = Agent(
 model=AzureOpenAI(id="gpt-5-mini"),
 knowledge=knowledge,
)
agent.print_response("How to make Thai curry?", markdown=True)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export AZURE_OPENAI_API_KEY=xxx
```

```
export AZURE_OPENAI_ENDPOINT=xxx
export AZURE_DEPLOYMENT=xxx
```

### Step: Install libraries

```
pip install -U openai agno ddgs sqlalchemy pgvector pypdf
```

### Step: Run PgVector

```
docker run -d \
 -e POSTGRES_DB=ai \
 -e POSTGRES_USER=ai \
 -e POSTGRES_PASSWORD=ai \
 -e PGDATA=/var/lib/postgresql/data/pgdata \
 -v pgvolume:/var/lib/postgresql/data \
 -p 5532:5432 \
 --name pgvector \
 agnohq/pgvector:16
```

### Step: Run Agent

```
Mac
python cookbook/models/azure/openai/knowledge.py
```

```
Windows
python cookbook/models/azure/openai/knowledge.py
```

## Agent with Storage

Source: <https://docs.agno.com/examples/models/azure/openai/storage>

### Code

```
cookbook/models/azure/openai/db.py
"""Run `pip install ddgs sqlalchemy anthropic` to install dependencies."""

from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.azure import AzureOpenAI
from agno.tools.duckduckgo import DuckDuckGoTools

Setup the database
db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"
db = PostgresDb(db_url=db_url)

agent = Agent(
 model=AzureOpenAI(id="gpt-5-mini"),
```

```
db=db,
tools=[DuckDuckGoTools()],
add_history_to_context=True,
)
agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")
```

## Usage

Snippet file: "create-venv-step.mdx"

### Step: Set your API key

```
export AZURE_OPENAI_API_KEY=xxx
export AZURE_OPENAI_ENDPOINT=xxx
export AZURE_DEPLOYMENT=xxx
```

### Step: Install libraries

```
pip install -U openai sqlalchemy psycopg ddgs agno
```

### Step: Run PgVector

```
docker run -d \
 -e POSTGRES_DB=ai \
 -e POSTGRES_USER=ai \
 -e POSTGRES_PASSWORD=ai \
 -e PGDATA=/var/lib/postgresql/data/pgdata \
 -v pgvolume:/var/lib/postgresql/data \
 -p 5532:5432 \
 --name pgvector \
 agnohq/pgvector:16
```

### Step: Run Agent

```
Mac
python cookbook/models/azure/openai/db.py
```

```
Windows
python cookbook/models/azure/openai/db.py
```

## Agent with Structured Outputs

Source: [https://docs.agno.com/examples/models/azure/openai/structured\\_output](https://docs.agno.com/examples/models/azure/openai/structured_output)

## Code

```

cookbook/models/azure/openai/structured_output.py
from typing import List

from agno.agent import Agent, RunOutput # noqa
from agno.models.azure import AzureOpenAI
from pydantic import BaseModel, Field
from rich.pretty import pprint # noqa

class MovieScript(BaseModel):
 setting: str = Field(
 ..., description="Provide a nice setting for a blockbuster movie."
)
 ending: str = Field(
 ...,
 description="Ending of the movie. If not available, provide a happy ending.",
)
 genre: str = Field(
 ...,
 description="Genre of the movie. If not available, select action, thriller or
romantic comedy.",
)
 name: str = Field(..., description="Give a name to this movie")
 characters: List[str] = Field(..., description="Name of characters for this movie.")
 storyline: str = Field(
 ..., description="3 sentence storyline for the movie. Make it exciting!"
)

agent = Agent(
 model=AzureOpenAI(id="gpt-5-mini"),
 description="You help people write movie scripts.",
 output_schema=MovieScript,
)

Get the response in a variable
run: RunOutput = agent.run("New York")
pprint(run.content)

agent.print_response("New York")

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```

export AZURE_OPENAI_API_KEY=xxx
export AZURE_OPENAI_ENDPOINT=xxx
export AZURE_DEPLOYMENT=xxx

```

Step: Install libraries

```
pip install -U openai agno
```

### Step: Run Agent

```
Mac
```

```
python cookbook/models/azure/openai/structured_output.py
```

```
Windows
```

```
python cookbook/models/azure/openai/structured_output.py
```

## Agent with Tools

Source: [https://docs.agno.com/examples/models/azure/openai/tool\\_use](https://docs.agno.com/examples/models/azure/openai/tool_use)

### Code

```
cookbook/models/azure/openai/tool_use.py
from agno.agent import Agent
from agno.models.azure import AzureOpenAI
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=AzureOpenAI(id="gpt-5-mini"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)

agent.print_response("Whats happening in France?", stream=True)
```

### Usage

Snippet file: "create-venv-step.mdx"

### Step: Set your API key

```
export AZURE_OPENAI_API_KEY=xxx
export AZURE_OPENAI_ENDPOINT=xxx
export AZURE_DEPLOYMENT=xxx
```

### Step: Install libraries

```
pip install -U openai agno ddgs
```

### Step: Run Agent

```
Mac
```

```
python cookbook/models/azure/openai/tool_use.py
```

```
Windows
```

```
python cookbook/models/azure/openai/tool_use.py
```

## Basic Agent

Source: <https://docs.agno.com/examples/models/cerebras/basic>

### Code

```
cookbook/models/cerebras/basic.py
from agno.agent import Agent
from agno.models.cerebras import Cerebras

agent = Agent(
 model=Cerebras(id="llama-4-scout-17b-16e-instruct"),
 markdown=True,
)

Print the response in the terminal
agent.print_response("write a two sentence horror story")
```

### Usage

```
Snippet file: "create-venv-step.mdx"
```

Step: Set your API key

```
export CEREBRAS_API_KEY=xxx
```

Step: Install libraries

```
pip install -U cerebras-cloud-sdk agno
```

Step: Run Agent

```
Mac
```

```
python cookbook/models/cerebras/basic.py
```

```
Windows
```

```
python cookbook/models/cerebras/basic.py
```

## Streaming Agent

Source: [https://docs.agno.com/examples/models/cerebras/basic\\_stream](https://docs.agno.com/examples/models/cerebras/basic_stream)

## Code

```
cookbook/models/cerebras/basic_stream.py
from agno.agent import Agent # noqa
from agno.models.cerebras import Cerebras

agent = Agent(
 model=Cerebras(id="llama-4-scout-17b-16e-instruct"),
 markdown=True,
)

Print the response in the terminal
agent.print_response("write a two sentence horror story", stream=True)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export CEREBRAS_API_KEY=xxx
```

Step: Install libraries

```
pip install -U cerebras-cloud-sdk agno
```

Step: Run Agent

```
Mac
python cookbook/models/cerebras/basic_stream.py
```

```
Windows
python cookbook/models/cerebras/basic_stream.py
```

## Agent with Knowledge Base

Source: <https://docs.agno.com/examples/models/cerebras/knowledge>

## Code

```
cookbook/models/cerebras/basic_knowledge.py
```

```

from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.models.cerebras import Cerebras
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"

knowledge = Knowledge(
 vector_db=PgVector(table_name="recipes", db_url=db_url),
)
Add content to the knowledge
knowledge.add_content(
 url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf"
)

agent = Agent(model=Cerebras(id="llama-4-scout-17b-16e-instruct"), knowledge=knowledge)
agent.print_response("How to make Thai curry?", markdown=True)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export CEREBRAS_API_KEY=xxx
```

Step: Install libraries

```
pip install -U agno ddgs sqlalchemy pgvector pypdf cerebras_cloud_sdk
```

Step: Start your Postgres server

Ensure your Postgres server is running and accessible at the connection string used in `db\_url`.

Step: Run Agent (first time)

The first run will load and index the PDF. This may take a while.

# Mac

```
python cookbook/models/cerebras/basic_knowledge.py
```

# Windows

```
python cookbook/models/cerebras/basic_knowledge.py
```

Step: Subsequent Runs

After the first run, comment out or remove ``knowledge_base.load(recreate=True)`` to avoid reloading the PDF each time.

## Agent with Storage

Source: <https://docs.agno.com/examples/models/cerebras/storage>

### Code

```
cookbook/models/cerebras/db.py
from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.cerebras import Cerebras
from agno.tools.duckduckgo import DuckDuckGoTools

Setup the database
db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"
db = PostgresDb(db_url=db_url)

agent = Agent(
 model=Cerebras(id="llama-4-scout-17b-16e-instruct"),
 db=db,
 tools=[DuckDuckGoTools()],
 add_history_to_context=True,
)
agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export CEREBRAS_API_KEY=xxx
```

Step: Install libraries

```
pip install -U ddgs sqlalchemy cerebras_cloud_sdk agno
```

Step: Start your Postgres server

Ensure your Postgres server is running and accessible at the connection string used in ``db_url``.

Step: Run Agent

```
Mac
python cookbook/models/cerebras/db.py
```

```
Windows
python cookbook/models/cerebras/db.py
```

## Agent with Structured Outputs

Source: [https://docs.agno.com/examples/models/cerebras/structured\\_output](https://docs.agno.com/examples/models/cerebras/structured_output)

### Code

```
cookbook/models/cerebras/basic_json_schema.py
from typing import List

from agno.agent import Agent, RunOutput # noqa
from agno.models.cerebras import Cerebras

## Agent with Tools

Source: [https://docs.agno.com/examples/models/deepseek/tool\\_use](https://docs.agno.com/examples/models/deepseek/tool_use)

## Code

```
cookbook/models/deepseek/tool_use.py
from agno.agent import Agent
from agno.models.deepseek import DeepSeek
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=DeepSeek(id="deepseek-chat"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)

agent.print_response("Whats happening in France?")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export DEEPSEEK_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai ddgs agno
```

Step: Run Agent

```
Mac
python cookbook/models/deepseek/tool_use.py
```

```
Windows
python cookbook/models/deepseek/tool_use.py
```

## Basic Agent

Source: <https://docs.agno.com/examples/models/fireworks/basic>

### Code

```
cookbook/models/fireworks/basic.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.fireworks import Fireworks

agent = Agent(
 model=Fireworks(id="accounts/fireworks/models/llama-v3p1-405b-instruct"),
 markdown=True,
)

Get the response in a variable
run: RunOutput = agent.run("Share a 2 sentence horror story")
print(run.content)

Print the response in the terminal
agent.print_response("Share a 2 sentence horror story")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export FIREWORKS_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

### Step: Run Agent

```
Mac
python cookbook/models/fireworks/basic.py
```

```
Windows
python cookbook/models/fireworks/basic.py
```

## Streaming Agent

Source: [https://docs.agno.com/examples/models/fireworks/basic\\_stream](https://docs.agno.com/examples/models/fireworks/basic_stream)

### Code

```
cookbook/models/fireworks/basic_stream.py
from typing import Iterator # noqa
from agno.agent import Agent, RunOutputEvent # noqa
from agno.models.fireworks import Fireworks

agent = Agent(
 model=Fireworks(id="accounts/fireworks/models/llama-v3p1-405b-instruct"),
 markdown=True,
)

Get the response in a variable
run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
stream=True)
for chunk in run_response:
print(chunk.content)

Print the response in the terminal
agent.print_response("Share a 2 sentence horror story", stream=True)
```

### Usage

Snippet file: "create-venv-step.mdx"

### Step: Set your API key

```
export FIREWORKS_API_KEY=xxx
```

### Step: Install libraries

```
pip install -U openai agno
```

## Step: Run Agent

```
Mac
```

```
python cookbook/models/fireworks/basic_stream.py
```

```
Windows
```

```
python cookbook/models/fireworks/basic_stream.py
```

# Agent with Structured Outputs

Source: [https://docs.agno.com/examples/models/fireworks/structured\\_output](https://docs.agno.com/examples/models/fireworks/structured_output)

## Code

```
cookbook/models/fireworks/structured_output.py
```

```
from typing import List
```

```
from agno.agent import Agent, RunOutput # noqa
```

```
from agno.models.fireworks import Fireworks
```

```
from pydantic import BaseModel, Field
```

```
from rich.pretty import pprint # noqa
```

```
class MovieScript(BaseModel):

## Agent with Grounding

Source: <https://docs.agno.com/examples/models/gemini/grounding>

## Code

```
cookbook/models/google/gemini/grounding.py
"""Grounding with Gemini.
```

Grounding enables Gemini to search the web and provide responses backed by

real-time information with citations. This is a legacy tool - for Gemini 2.0+ models, consider using the 'search' parameter instead.

```
"""
```

```
from agno.agent import Agent
from agno.models.google import Gemini

agent = Agent(
 model=Gemini(
 id="gemini-2.0-flash",
 grounding=True,
 grounding_dynamic_threshold=0.7, # Optional: set threshold for grounding
),
 add_datetime_to_context=True,
)

Ask questions that benefit from real-time information
agent.print_response(
 "What are the current market trends in renewable energy?",
 stream=True,
 markdown=True,
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai agno
```

Step: Run Agent

```
Mac
python cookbook/models/google/gemini/grounding.py
```

```
Windows
python cookbook/models/google/gemini/grounding.py
```

## Image Editing Agent

Source: [https://docs.agno.com/examples/models/gemini/image\\_editing](https://docs.agno.com/examples/models/gemini/image_editing)

## Code

```
cookbook/models/google/gemini/image_editing.py
from io import BytesIO

from agno.agent import Agent, RunOutput # noqa
from agno.media import Image
from agno.models.google import Gemini
from PIL import Image as PILImage

No system message should be provided (Gemini requires only the image)
agent = Agent(
 model=Gemini(
 id="gemini-2.0-flash-exp-image-generation",
 response_modalities=["Text", "Image"],
)
)

Print the response in the terminal
response = agent.run(
 "Can you add a Llama in the background of this image?",
 images=[Image(filepath="tmp/test_photo.png")],
)

Retrieve and display generated images using get_last_run_output
run_response = agent.get_last_run_output()
if run_response and isinstance(run_response, RunOutput) and run_response.images:
 for image_response in run_response.images:

 image = PILImage.open(BytesIO(image_bytes))
 image.show()
 # Save the image to a file
 # image.save("generated_image.png")
else:
 print("No images found in run response")
```

## Usage

Snippet file: "create-venv-step.mdx"

### Step: Prepare your image

Place an image file at `tmp/test\_photo.png` or update the filepath in the code to point to your image.

### Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai pillow agno
```

Step: Run Agent

# Mac

```
python cookbook/models/google/gemini/image_editing.py
```

# Windows

```
python cookbook/models/google/gemini/image_editing.py
```

## Image Generation Agent

Source: [https://docs.agno.com/examples/models/gemini/image\\_generation](https://docs.agno.com/examples/models/gemini/image_generation)

### Code

```
image_generation.py
from io import BytesIO

from agno.agent import Agent, RunOutput # noqa
from agno.models.google import Gemini
from PIL import Image

No system message should be provided
agent = Agent(
 model=Gemini(
 id="gemini-2.0-flash-exp-image-generation",
 response_modalities=["Text", "Image"],
)
)

Print the response in the terminal
run_response = agent.run("Make me an image of a cat in a tree.")

if run_response and isinstance(run_response, RunOutput) and run_response.images:
 for image_response in run_response.images:
 image_bytes = image_response.content
 if image_bytes:
 image = Image.open(BytesIO(image_bytes))
 image.show()
 # Save the image to a file
 # image.save("generated_image.png")
else:
 print("No images found in run response")
```

## Usage

```
Snippet file: "create-venv-step.mdx"
```

Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai pillow agno
```

Step: Run Agent

# Mac

```
python image_generation.py
```

# Windows

```
python image_generation.py
```

## Image Generation Agent (Streaming)

Source: [https://docs.agno.com/examples/models/gemini/image\\_generation\\_stream](https://docs.agno.com/examples/models/gemini/image_generation_stream)

## Code

```
cookbook/models/google/gemini/image_generation_stream.py

"""
```

Example prompts to try:

- A horizontally oriented rectangular stamp features the Mission District's vibrant culture, portrayed in shades of warm terracotta orange using an etching style. The scene might depict a sun-drenched street like Valencia or Mission Street, lined with a mix of Victorian buildings and newer structures.
- Painterly landscape featuring a simple, isolated wooden cabin nestled amongst tall pine trees on the shore of a calm, reflective lake.
- Filmed cinematically from the driver's seat, offering a clear profile view of the young passenger on the front seat with striking red hair.
- A pile of books seen from above. The topmost book contains a watercolor illustration of a bird. VERTEX AI is written in bold letters on the book.

```
"""
```

## Usage

Snippet file: "create-venv-step.mdx"

### Step: Set up Vertex AI authentication

Follow the [authentication guide](<https://cloud.google.com/sdk/docs/initializing>) to set up Vertex AI credentials.

```
gcloud auth application-default login
```

### Step: Set your API keys

```
export GOOGLE_API_KEY=xxx
export OPENAI_API_KEY=xxx
export GOOGLE_CLOUD_PROJECT=your-project-id
```

### Step: Install libraries

```
pip install -U google-genai openai agno
```

### Step: Run Agent

```
Mac
python cookbook/models/google/gemini/imagen_tool_advanced
.py
```

```
Windows
python cookbook/models/google/gemini/imagen_tool_advanced
.py
```

## Agent with Knowledge

Source: <https://docs.agno.com/examples/models/gemini/knowledge>

### Code

```
cookbook/models/google/gemini/knowledge.py
from agno.agent import Agent
from agno.knowledge.embedder.google import GeminiEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.google import Gemini
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

knowledge = Knowledge(
 vector_db=PgVector(
 table_name="recipes",
 db_url=db_url,
 embedder=GeminiEmbedder(),
),
)

Add content to the knowledge
knowledge.add_content(
 url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf"
)

agent = Agent(model=Gemini(id="gemini-2.0-flash-001"), knowledge=knowledge)
agent.print_response("How to make Thai curry?", markdown=True)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai sqlalchemy pgvector pypdf openai agno
```

## Step: Run PgVector

```
docker run -d \
 -e POSTGRES_DB=ai \
 -e POSTGRES_USER=ai \
 -e POSTGRES_PASSWORD=ai \
 -e PGDATA=/var/lib/postgresql/data/pgdata \
 -v pgvolume:/var/lib/postgresql/data \
 -p 5532:5432 \
 --name pgvector \
 agnohq/pgvector:16
```

## Step: Run Agent

# Mac

```
python cookbook/models/google/gemini/knowledge.py
```

# Windows

```
python cookbook/models/google/gemini/knowledge.py
```

# Agent with PDF Input (Local file)

Source: [https://docs.agno.com/examples/models/gemini/pdf\\_input\\_local](https://docs.agno.com/examples/models/gemini/pdf_input_local)

## Code

```
cookbook/models/google/gemini/pdf_input_local.py
from pathlib import Path
from agno.agent import Agent
from agno.media import File
from agno.models.google import Gemini
from agno.utils.media import download_file

pdf_path = Path(__file__).parent.joinpath("ThaiRecipes.pdf")

Download the file using the download_file function
download_file(
 "https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf", str(pdf_path)
)

agent = Agent(
 model=Gemini(id="gemini-2.0-flash-exp"),
 markdown=True,
 add_history_to_context=True,
)

agent.print_response(
```

```
 "Summarize the contents of the attached file.",
 files=[File(filepath=pdf_path)],
)
 agent.print_response("Suggest me a recipe from the attached file.")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai agno
```

Step: Run Agent

# Mac

```
python cookbook/models/google/gemini/pdf_input_local.py
```

# Windows

```
python cookbook/models/google/gemini/pdf_input_local.py
```

## Agent with PDF Input (URL)

Source: [https://docs.agno.com/examples/models/gemini/pdf\\_input\\_url](https://docs.agno.com/examples/models/gemini/pdf_input_url)

## Code

```
cookbook/models/google/gemini/pdf_input_url.py
from agno.agent import Agent
from agno.media import File
from agno.models.google import Gemini

agent = Agent(
 model=Gemini(id="gemini-2.0-flash-exp"),
 markdown=True,
)

agent.print_response(
 "Summarize the contents of the attached file.",
 files=[File(url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf")],
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai agno
```

Step: Run Agent

# Mac

```
python cookbook/models/google/gemini/pdf_input_url.py
```

# Windows

```
python cookbook/models/google/gemini/pdf_input_url.py
```

## Agent with Storage

Source: <https://docs.agno.com/examples/models/gemini/storage>

## Code

```
cookbook/models/google/gemini/db.py
from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.google import Gemini
from agno.tools.duckduckgo import DuckDuckGoTools

Setup the database
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
db = PostgresDb(db_url=db_url)

agent = Agent(
 model=Gemini(id="gemini-2.0-flash-001"),
 db=db,
 tools=[DuckDuckGoTools()],
 add_history_to_context=True,
)
agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")
```

## Usage

```
Snippet file: "create-venv-step.mdx"
```

Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai sqlalchemy psycopg2 ddgs agno
```

Step: Run PgVector

```
docker run -d \

)

structured_output_agent = Agent(
 model=Gemini(id="gemini-2.0-flash-001"),
 description="You help people write movie scripts.",
 output_schema=MovieScript,
)

structured_output_agent.print_response("New York")

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai agno
```

Step: Run Agent

```
Mac
python cookbook/models/google/gemini/structured_output.py
```

```
Windows
python cookbook/models/google/gemini/structured_output.py
```

## Agent with Tools

Source: [https://docs.agno.com/examples/models/gemini/tool\\_use](https://docs.agno.com/examples/models/gemini/tool_use)

## Code

```
cookbook/models/google/gemini/tool_use.py
from agno.agent import Agent
from agno.models.google import Gemini
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=Gemini(id="gemini-2.0-flash-001"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)
agent.print_response("Whats happening in France?")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai ddgs agno
```

Step: Run Agent

```
Mac
python cookbook/models/google/gemini/tool_use.py
```

```
Windows
python cookbook/models/google/gemini/tool_use.py
```

## Agent with URL Context

Source: [https://docs.agno.com/examples/models/gemini/url\\_context](https://docs.agno.com/examples/models/gemini/url_context)

## Code

```
cookbook/models/google/gemini/url_context.py
from agno.agent import Agent
from agno.models.google import Gemini

agent = Agent(
 model=Gemini(id="gemini-2.5-flash", url_context=True),
```

```

 markdown=True,
)

 url1 = "https://www.foodnetwork.com/recipes/ina-garten/perfect-roast-chicken-recipe-1940592"
 url2 = "https://www.allrecipes.com/recipe/83557/juicy-roasted-chicken/"

 agent.print_response(
 f"Compare the ingredients and cooking times from the recipes at {url1} and {url2}"
)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai agno
```

Step: Run Agent

```
Mac
python cookbook/models/google/gemini/url_context.py
```

```
Windows
python cookbook/models/google/gemini/url_context.py
```

## Agent with URL Context and Search

Source: [https://docs.agno.com/examples/models/gemini/url\\_context\\_with\\_search](https://docs.agno.com/examples/models/gemini/url_context_with_search)

## Code

```

cookbook/models/google/gemini/url_context_with_search.py
"""Combine URL context with Google Search for comprehensive web analysis.

"""

from agno.agent import Agent
from agno.models.google import Gemini

```

```
Create agent with both Google Search and URL context enabled
agent = Agent(
 model=Gemini(id="gemini-2.5-flash", search=True, url_context=True),
 markdown=True,
)

The agent will first search for relevant URLs, then analyze their content in detail
agent.print_response(
 "Analyze the content of the following URL: https://docs.agno.com/introduction and also
 give me latest updates on AI agents"
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai agno
```

Step: Run Agent

```
Mac
python cookbook/models/google/gemini/url_context_with_search.py

Windows
python cookbook/models/google/gemini/url_context_with_search.py
```

## Agent with Vertex AI

Source: <https://docs.agno.com/examples/models/gemini/vertexai>

## Code

```
cookbook/models/google/gemini/vertexai.py
"""
To use Vertex AI, with the Gemini Model class, you need to set the following environment
variables:
```

```
export GOOGLE_GENAI_USE_VERTEXAI="true"
export GOOGLE_CLOUD_PROJECT="your-project-id"
export GOOGLE_CLOUD_LOCATION="your-location"
```

Or you can set the following parameters in the `Gemini` class:

```
gemini = Gemini(
 vertexai=True,
 project_id="your-google-cloud-project-id",
 location="your-google-cloud-location",
)
"""

from agno.agent import Agent, RunOutput # noqa
from agno.models.google import Gemini

agent = Agent(model=Gemini(id="gemini-2.0-flash-001"), markdown=True)

Get the response in a variable
run: RunOutput = agent.run("Share a 2 sentence horror story")
print(run.content)

Print the response in the terminal
agent.print_response("Share a 2 sentence horror story")
```

## Usage

Snippet file: "create-venv-step.mdx"

### Step: Set up Vertex AI

Set your environment variables:

```
export GOOGLE_GENAI_USE_VERTEXAI="true"
export GOOGLE_CLOUD_PROJECT="your-project-id"
export GOOGLE_CLOUD_LOCATION="your-location"
```

Or configure in code:

```
gemini = Gemini(
 vertexai=True,
 project_id="your-google-cloud-project-id",
 location="your-google-cloud-location",
)
```

### Step: Install libraries

```
pip install -U google-genai agno
```

### Step: Run Agent

```
Mac
python cookbook/models/google/gemini/vertexai.py

Windows
python cookbook/models/google/gemini/vertexai.py
```

## Video Input (Bytes Content)

Source: [https://docs.agno.com/examples/models/gemini/video\\_input\\_bytes\\_content](https://docs.agno.com/examples/models/gemini/video_input_bytes_content)

### Code

```
cookbook/models/google/gemini/video_input_bytes_content.py
import requests
from agno.agent import Agent
from agno.media import Video
from agno.models.google import Gemini

agent = Agent(
 model=Gemini(id="gemini-2.0-flash-exp"),
 markdown=True,
)

url = "https://videos.pexels.com/video-files/5752729/5752729-uhd_2560_1440_30fps.mp4"

Download the video file from the URL as bytes
response = requests.get(url)
video_content = response.content

agent.print_response(
 "Tell me about this video",
 videos=[Video(content=video_content)],
)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai agno
```

## Step: Run Agent

```
Mac
python cookbook/models/google/gemini/video_input_bytes_content.py

Windows
python cookbook/models/google/gemini/video_input_bytes_content.py
```

## Video Input (File Upload)

Source: [https://docs.agno.com/examples/models/gemini/video\\_input\\_file\\_upload](https://docs.agno.com/examples/models/gemini/video_input_file_upload)

## Code

```
cookbook/models/google/gemini/video_input_file_upload.py
import time
from pathlib import Path

from agno.agent import Agent
from agno.media import Video
from agno.models.google import Gemini
from agno.utils.log import logger

model = Gemini(id="gemini-2.0-flash-exp")
agent = Agent(
 model=model,

try:
 video_file = model.get_client().files.get(name=remote_file_name)
except Exception as e:
 logger.info(f"Error getting file {video_path.stem}: {e}")
 pass

Upload the video file if it doesn't exist
if not video_file:
 try:
 logger.info(f"Uploading video: {video_path}")
```

```

video_file = model.get_client().files.upload(
 file=video_path,
 config=dict(name=video_path.stem, display_name=video_path.stem),
)

Check whether the file is ready to be used.
while video_file.state.name == "PROCESSING":
 time.sleep(2)
 video_file = model.get_client().files.get(name=video_file.name)

logger.info(f"Uploaded video: {video_file}")
except Exception as e:
 logger.error(f"Error uploading video: {e}")

if __name__ == "__main__":
 agent.print_response(
 "Tell me about this video",
 videos=[Video(content=video_file)],
 stream=True,
)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GOOGLE_API_KEY=xxx
```

Step: Install libraries

```
pip install -U google-genai agno
```

Step: Run Agent

```
Mac
python cookbook/models/google/gemini/video_input_file_upload.py
```

```
Windows
python cookbook/models/google/gemini/video_input_file_upload.py
```

## Video Input (Local File Upload)

Source: [https://docs.agno.com/examples/models/gemini/video\\_input\\_local\\_file\\_upload](https://docs.agno.com/examples/models/gemini/video_input_local_file_upload)

## Code

```
cookbook/models/google/gemini/video_input_local_file_upload.py
from pathlib import Path

from agno.agent import Agent
from agno.media import Video
from agno.models.google import Gemini

agent = Agent(

```

## Deep Knowledge Agent

Source: [https://docs.agno.com/examples/models/groq/deep\\_knowledge](https://docs.agno.com/examples/models/groq/deep_knowledge)

### Code

```
cookbook/models/groq/deep_knowledge.py
""" DeepKnowledge - An AI Agent that iteratively searches a knowledge base to answer questions
```

This agent performs iterative searches through its knowledge base, breaking down complex queries into sub-questions, and synthesizing comprehensive answers. It's designed to explore topics deeply and thoroughly by following chains of reasoning.

In this example, the agent uses the Agno documentation as a knowledge base

Key Features:

- Iteratively searches a knowledge base
  - Source attribution and citations
- ```
"""
```

```
from textwrap import dedent
from typing import List, Optional

import inquirer
import typer
from agno.agent import Agent
from agno.db.sqlite import SqliteDb
```

```

from agno.knowledge.embedder.openai import OpenAIEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.groq import Groq
from agno.vectordb.lancedb import LanceDb, SearchType
from rich import print

def initialize_knowledge_base():
    """Initialize the knowledge base with your preferred documentation or knowledge source
    Here we use Agno docs as an example, but you can replace with any relevant URLs
    """
    agent_knowledge = Knowledge(
        vector_db=LanceDb(
            uri="tmp/lancedb",

            search_type=SearchType.hybrid,
            embedder=OpenAIEmbedder(id="text-embedding-3-small
        ),
    ),
    )
    agent_knowledge.add_content(url="https://docs.agno
.com/llms-full.txt")
    return agent_knowledge

def get_db():
    return SQLiteDatabase(db_file="tmp/agents.db")

def create_agent(session_id: Optional[str] = None) -> Agent:
    """Create and return a configured DeepKnowledge agent."""
    agent_knowledge = initialize_knowledge_base()
    db = get_db()
    return Agent(
        name="DeepKnowledge",
        session_id=session_id,
        model=Groq(id="llama-3.3-70b-versatile"),
        description=dedent("""\
You are DeepKnowledge, an advanced reasoning agent designed to provide thorough,
well-researched answers to any query by searching your knowledge base.

Your strengths include:
- Breaking down complex topics into manageable components
- Connecting information across multiple domains
- Providing nuanced, well-researched answers
- Maintaining intellectual honesty and citing sources
- Explaining complex concepts in clear, accessible terms"""),
        instructions=dedent("""\
Your mission is to leave no stone unturned in your pursuit of the correct answer.

To achieve this, follow these steps:
1. **Analyze the input and break it down into key components**.
2. **Search terms**: You must identify at least 3-5 key search terms to search
for.
3. **Initial Search:** Searching your knowledge base for relevant information. You

```

must make atleast 3 searches to get all relevant information.

4. ****Evaluation:**** If the answer from the knowledge base is incomplete, ambiguous, or insufficient - Ask the user for clarification. Do not make informed guesses.

5. ****Iterative Process:****

- Continue searching your knowledge base till you have a comprehensive answer.
- Reevaluate the completeness of your answer after each search iteration.
- Repeat the search process until you are confident that every aspect of the

question is addressed.

4. ****Reasoning Documentation:**** Clearly document your reasoning process:

- Note when additional searches were triggered.
- Indicate which pieces of information came from the knowledge base and where it was sourced from.
- Explain how you reconciled any conflicting or ambiguous information.

5. ****Final Synthesis:**** Only finalize and present your answer once you have verified it through multiple search passes.

Include all pertinent details and provide proper references.

6. ****Continuous Improvement:**** If new, relevant information emerges even after presenting your answer,

be prepared to update or expand upon your response.

****Communication Style:****

- Use clear and concise language.
- Organize your response with numbered steps, bullet points, or short paragraphs as needed.
- Be transparent about your search process and cite your sources.
- Ensure that your final answer is comprehensive and leaves no part of the query unaddressed.

Remember: ****Do not finalize your answer until every angle of the question has been explored.****"""),

additional_context=dedent("""\

You should only respond with the final answer and the reasoning process.

No need to include irrelevant information.

- User ID: {user_id}

- Memory: You have access to your previous search results and reasoning process.

Async Basic Agent

Source: https://docs.agno.com/examples/models/ibm/async_basic

Code

```
# cookbook/models/ibm/watsonx/async_basic.py
import asyncio

from agno.agent import Agent, RunOutput
from agno.models.ibm import WatsonX
```

```
agent = Agent(model=WatsonX(id="ibm/granite-20b-code-instr
uct"), markdown=True)

# Get the response in a variable
# run: RunOutput = agent.run("Share a 2 sentence horror story")
# print(run.content)

# Print the response in the terminal
asyncio.run(agent.aprint_response("Share a 2 sentence horror story"))
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export IBM_WATSONX_API_KEY=xxx
export IBM_WATSONX_PROJECT_ID=xxx
```

Step: Install libraries

```
pip install -U ibm-watsonx-ai agno
```

Step: Run Agent

```
# Mac
python cookbook/models/ibm/watsonx/async_basic.py
```

```
# Windows
python cookbook\models\ibm\watsonx\async_basic.py
```

This example shows how to use the asynchronous API of Agno with IBM WatsonX. It creates an agent and uses `asyncio.run()` to execute the asynchronous `aprint_response` method.

Async Streaming Agent

Source: https://docs.agno.com/examples/models/ibm/async_basic_stream

Code

```
# cookbook/models/ibm/watsonx/async_basic_stream.py
import asyncio

from agno.agent import Agent, RunOutput
from agno.models.ibm import WatsonX
```

```

agent = Agent(
    model=WatsonX(id="ibm/granite-20b-code-instruct"), debug_mode=True, markdown=True
)

# Get the response in a variable
# run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
stream=True)
# for chunk in run_response:
#     print(chunk.content)

# Print the response in the terminal
asyncio.run(agent.aprint_response("Share a 2 sentence horror story", stream=True))

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```

export IBM_WATSONX_API_KEY=xxx
export IBM_WATSONX_PROJECT_ID=xxx

```

Step: Install libraries

```

pip install -U ibm-watsonx-ai agno

```

Step: Run Agent

```

# Mac
python cookbook/models/ibm/watsonx/async_basic_stream.py

# Windows
python cookbook\models\ibm\watsonx\async_basic_stream.py

```

This example combines asynchronous execution with streaming. It creates an agent with `debug_mode=True` for additional logging and uses the asynchronous API with streaming to get and display responses as they're generated.

Agent with Async Tool Usage

Source: https://docs.agno.com/examples/models/ibm/async_tool_use

Code

```

# cookbook/models/ibm/watsonx/async_tool_use.py

```

```
import asyncio

from agno.agent import Agent
from agno.models.ibm import WatsonX
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
    model=WatsonX(id="meta-llama/llama-3-3-70b-instruct"),
    tools=[DuckDuckGoTools()],
    markdown=True,
)

asyncio.run(agent.aprint_response("Whats happening in France?", stream=True))
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export IBM_WATSONX_API_KEY=xxx
export IBM_WATSONX_PROJECT_ID=xxx
```

Step: Install libraries

```
pip install -U ibm-watsonx-ai ddgs agno
```

Step: Run Agent

```
# Mac
python cookbook/models/ibm/watsonx/async_tool_use.py
```

```
# Windows
python cookbook\models\ibm\watsonx\async_tool_use.py
```

Basic Agent

Source: <https://docs.agno.com/examples/models/ibm/basic>

Code

```
# cookbook/models/ibm/watsonx/basic.py
from agno.agent import Agent, RunOutput
from agno.models.ibm import WatsonX

agent = Agent(model=WatsonX(id="ibm/granite-20b-code-instruct"), markdown=True)
```

```
# Get the response in a variable
# run: RunOutput = agent.run("Share a 2 sentence horror story")
# print(run.content)

# Print the response in the terminal
agent.print_response("Share a 2 sentence horror story")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export IBM_WATSONX_API_KEY=xxx
export IBM_WATSONX_PROJECT_ID=xxx
```

Step: Install libraries

```
pip install -U ibm-watsonx-ai agno
```

Step: Run Agent

```
# Mac
python cookbook/models/ibm/watsonx/basic.py

# Windows
python cookbook\models\ibm\watsonx\basic.py
```

This example creates an agent using the IBM WatsonX model and prints a response directly to the terminal. The `markdown=True` parameter tells the agent to format the output as markdown, which can be useful for displaying rich text content.

Streaming Basic Agent

Source: https://docs.agno.com/examples/models/ibm/basic_stream

Code

```
# cookbook/models/ibm/watsonx/basic_stream.py
from typing import Iterator
from agno.agent import Agent, RunOutput
from agno.models.ibm import WatsonX

agent = Agent(model=WatsonX(id="ibm/granite-20b-code-instruct"), markdown=True)
```

```
# Get the response in a variable
# run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
stream=True)
# for chunk in run_response:
#     print(chunk.content)

# Print the response in the terminal
agent.print_response("Share a 2 sentence horror story", stream=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export IBM_WATSONX_API_KEY=xxx
export IBM_WATSONX_PROJECT_ID=xxx
```

Step: Install libraries

```
pip install -U ibm-watsonx-ai agno
```

Step: Run Agent

```
# Mac
python cookbook/models/ibm/watsonx/basic_stream.py
```

```
# Windows
python cookbook\models\ibm\watsonx\basic_stream.py
```

This example shows how to use streaming with IBM WatsonX. Setting `stream=True` when calling `print_response()` or `run()` enables token-by-token streaming, which can provide a more interactive user experience.

Image Agent

Source: https://docs.agno.com/examples/models/ibm/image_agent_bytes

Code

```
# cookbook/models/ibm/watsonx/image_agent_bytes.py
from pathlib import Path

from agno.agent import Agent
from agno.media import Image
```

```

from agno.models.ibm import WatsonX
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
    model=WatsonX(id="meta-llama/llama-3-2-11b-vision-
instruct"),
    tools=[DuckDuckGoTools()],
    markdown=True,
)

image_path = Path(__file__).parent.joinpath("sample.jpg")

# Read the image file content as bytes
with open(image_path, "rb") as img_file:
    image_bytes = img_file.read()

agent.print_response(
    "Tell me about this image and give me the latest news about it.",
    images=[
        Image(content=image_bytes),
    ],
    stream=True,
)

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```

export IBM_WATSONX_API_KEY=xxx
export IBM_WATSONX_PROJECT_ID=xxx

```

Step: Install libraries

```

pip install -U ibm-watsonx-ai ddgs agno

```

Step: Add sample image

Place a sample image named "sample.jpg" in the same directory as the script.

Step: Run Agent

```

# Mac
python cookbook/models/ibm/watsonx/image_agent_bytes.py

# Windows
python cookbook\models\ibm\watsonx\image_agent_bytes.py

```

This example shows how to use IBM WatsonX with vision capabilities. It loads an image from a file and passes it to the model along with a prompt. The model can then analyze the image and provide relevant information.

Note: This example uses a vision-capable model (meta-llama/llama-3-2-11b-vision-instruct) and requires a sample image file.

RAG Agent

Source: <https://docs.agno.com/examples/models/ibm/knowledge>
e

Code

```
# cookbook/models/ibm/watsonx/knowledge.py
from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.models.ibm import WatsonX
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"

knowledge_base = Knowledge(
    vector_db=PgVector(table_name="recipes", db_url=db_url),
)
knowledge_base.add_content(
    url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf"
)

agent = Agent(
    model=WatsonX(id="ibm/granite-20b-code-instruct"),
    knowledge=knowledge_base,
)
agent.print_response("How to make Thai curry?", markdown=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export IBM_WATSONX_API_KEY=xxx
export IBM_WATSONX_PROJECT_ID=xxx
```

Step: Install libraries

```
pip install -U ibm-watsonx-ai sqlalchemy pgvector psycpg pypdf openai agno
```

Step: Set up PostgreSQL with pgvector

You need a PostgreSQL database with the pgvector extension installed. Adjust the ``db_url`` in the code to match your database configuration.

Step: Run Agent

```
# Mac
python cookbook/models/ibm/watsonx/knowledge.py

# Windows
python cookbook\models\ibm\watsonx\knowledge.py
```

Step: For subsequent runs

After the first run, comment out the ``knowledge_base.load(recreate=True)`` line to avoid reloading the PDF.

This example shows how to integrate a knowledge base with IBM WatsonX. It loads a PDF from a URL, processes it into a vector database (PostgreSQL with pgvector in this case), and then creates an agent that can query this knowledge base.

Note: You need to install several packages (pgvector, pypdf, etc.) and have a PostgreSQL database with the pgvector extension available.

Agent with Storage

Source: <https://docs.agno.com/examples/models/ibm/storage>

Code

```
# cookbook/models/ibm/watsonx/db.py
from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.ibm import WatsonX
from agno.tools.duckduckgo import DuckDuckGoTools

# Setup the database
db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"
db = PostgresDb(db_url=db_url)

agent = Agent(
    model=WatsonX(id="mistralai/mistral-small-3-1-24b-instruct-2503"),
    db=db,
    tools=[DuckDuckGoTools()],
    add_history_to_context=True,
)
agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export IBM_WATSONX_API_KEY=xxx
export IBM_WATSONX_PROJECT_ID=xxx
```

Step: Install libraries

```
pip install -U ddgs psycopg sqlalchemy ibm-watsonx-ai agno
```

Step: Set up PostgreSQL

Make sure you have a PostgreSQL database running. You can adjust the ``db_url`` in the code to match your database configuration.

Step: Run Agent

```
# Mac
python cookbook/models/ibm/watsonx/db.py
```

```
# Windows
python cookbook\models\ibm\watsonx\db.py
```

This example shows how to use PostgreSQL storage with IBM WatsonX to maintain conversation state across multiple interactions. It creates an agent with a PostgreSQL storage backend and sends multiple messages, with the conversation history being preserved between them.

Note: You need to install the sqlalchemy package and have a PostgreSQL database available.

Agent with Structured Output

Source: https://docs.agno.com/examples/models/ibm/structured_output

Code

```
# cookbook/models/ibm/watsonx/structured_output.py
from typing import List

from agno.agent import Agent, RunOutput # noqa
from agno.models.ibm import WatsonX
from pydantic import BaseModel, Field
from rich.pretty import pprint # noqa

class MovieScript(BaseModel):
```

```

    setting: str = Field(
        ..., description="Provide a nice setting for a blockbuster movie."
    )
    ending: str = Field(
        ...,
        description="Ending of the movie. If not available, provide a happy ending.",
    )
    genre: str = Field(
        ...,
        description="Genre of the movie. If not available, select action, thriller or
romantic comedy.",
    )
    name: str = Field(..., description="Give a name to this movie")
    characters: List[str] = Field(..., description="Name of characters for this movie.")
    storyline: str = Field(
        ..., description="3 sentence storyline for the movie. Make it exciting!"
    )

movie_agent = Agent(
    model=WatsonX(id="mistralai/mistral-small-3-1-24b-
instruct-2503"),
    description="You help people write movie scripts.",
    output_schema=MovieScript,
)

# Get the response in a variable
# movie_agent: RunOutput = movie_agent.run("New York")
# pprint(movie_agent.content)

movie_agent.print_response("New York")

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```

export IBM_WATSONX_API_KEY=xxx
export IBM_WATSONX_PROJECT_ID=xxx

```

Step: Install libraries

```

pip install -U ibm-watsonx-ai pydantic rich agno

```

Step: Run Agent

```

# Mac
python cookbook/models/ibm/watsonx/structured_output.py

```

```
# Windows
python cookbook\models\ibm\watsonx\structured_output.py
```

This example shows how to use structured output with IBM WatsonX. It defines a Pydantic model `MovieScript` with various fields and their descriptions, then creates an agent using this model as the `output_schema`. The model's output will be parsed into this structured format.

Agent with Tools

Source: https://docs.agno.com/examples/models/ibm/tool_use

Code

```
# cookbook/models/ibm/watsonx/tool_use.py
from agno.agent import Agent
from agno.models.ibm import WatsonX
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
    model=WatsonX(id="meta-llama/llama-3-3-70b-instruct"),
    tools=[DuckDuckGoTools()],
    markdown=True,
)
agent.print_response("Whats happening in France?", stream=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export IBM_WATSONX_API_KEY=xxx
export IBM_WATSONX_PROJECT_ID=xxx
```

Step: Install libraries

```
pip install -U ibm-watsonx-ai ddgs agno
```

Step: Run Agent

```
# Mac
python cookbook/models/ibm/watsonx/tool_use.py
```

```
# Windows
python cookbook\models\ibm\watsonx\tool_use.py
```

Basic Agent

Source: <https://docs.agno.com/examples/models/langdb/basic>

Code

```
# cookbook/models/langdb/basic.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.langdb import LangDB

agent = Agent(model=LangDB(id="llama3-1-70b-instruct-v1.0"
), markdown=True)

# Get the response in a variable
# run: RunOutput = agent.run("Share a 2 sentence horror story")
# print(run.content)

# Print the response in the terminal
agent.print_response("Share a 2 sentence horror story")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export LANGDB_API_KEY=xxx
export LANGDB_PROJECT_ID=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
# Mac
python cookbook/models/langdb/basic.py
```

```
# Windows
python cookbook/models/langdb/basic.py
```

Basic Streaming Agent

Source: https://docs.agno.com/examples/models/langdb/basic_stream

Code

```
# cookbook/models/langdb/basic_stream.py
from typing import Iterator # noqa
from agno.agent import Agent, RunOutput # noqa
from agno.models.langdb import LangDB

agent = Agent(
    model=LangDB(id="llama3-1-70b-instruct-v1.0"),
    markdown=True,
)

# Get the response in a variable
# run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
# stream=True)
# for chunk in run_response:
#     print(chunk.content)

# Print the response in the terminal
agent.print_response("Share a 2 sentence horror story", stream=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export LANGDB_API_KEY=xxx
export LANGDB_PROJECT_ID=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
# Mac
python cookbook/models/langdb/basic_stream.py

# Windows
python cookbook/models/langdb/basic_stream.py
```

Data Analyst Agent

Source: https://docs.agno.com/examples/models/langdb/data_analyst

Code

```
# cookbook/models/langdb/data_analyst.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.langdb import LangDB
from agno.tools.duckdb import DuckDbTools

duckdb_tools = DuckDbTools(
    create_tables=False, export_tables=False, summarize_tables=False
)
duckdb_tools.create_table_from_path(
    path="https://phidata-public.s3.amazonaws.com/demo_data/IMDB-Movie-Data.csv",
    table="movies",
)

agent = Agent(
    model=LangDB(id="llama3-1-70b-instruct-v1.0"),
    tools=[duckdb_tools],
    markdown=True,
    additional_context=dedent("""\
You have access to the following tables:
- movies: contains information about movies from IMDB.
"""),
)
agent.print_response("What is the average rating of movies?", stream=False)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export LANGDB_API_KEY=xxx
export LANGDB_PROJECT_ID=xxx
```

Step: Install libraries

```
pip install -U openai agno duckdb
```

Step: Run Agent

```
# Mac
python cookbook/models/langdb/data_analyst.py
```

```
# Windows
python cookbook/models/langdb/data_analyst.py
```

Structured Output

Source: https://docs.agno.com/examples/models/langdb/structured_output

Code

```
# cookbook/models/langdb/structured_output.py
from typing import List

from agno.agent import Agent, RunOutput # noqa
from agno.models.langdb import LangDB
from pydantic import BaseModel, Field
from rich.pretty import pprint # noqa

class MovieScript(BaseModel):
    setting: str = Field(
        ..., description="Provide a nice setting for a blockbuster movie."
    )
    ending: str = Field(
        ...,
        description="Ending of the movie. If not available, provide a happy ending.",
    )
    genre: str = Field(
        ...,
        description="Genre of the movie. If not available, select action, thriller or romantic comedy.",
    )
    name: str = Field(..., description="Give a name to this movie")
    characters: List[str] = Field(..., description="Name of characters for this movie.")
    storyline: str = Field(
        ..., description="3 sentence storyline for the movie. Make it exciting!"
    )

# Agent that uses JSON mode
json_mode_agent = Agent(
    model=LangDB(id="llama3-1-70b-instruct-v1.0"),
    description="You write movie scripts.",
    output_schema=MovieScript,
    use_json_mode=True,
)

# Agent that uses structured outputs
structured_output_agent = Agent(
    model=LangDB(id="llama3-1-70b-instruct-v1.0"),
    description="You write movie scripts.",
    output_schema=MovieScript,
)
```

```
# Get the response in a variable
# json_mode_response: RunOutput = json_mode_agent.run("New York")
# pprint(json_mode_response.content)
# structured_output_response: RunOutput = structured_output_agent.run("New York")
# pprint(structured_output_response.content)

json_mode_agent.print_response("New York")
structured_output_agent.print_response("New York")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export LANGDB_API_KEY=xxx
export LANGDB_PROJECT_ID=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
# Mac
python cookbook/models/langdb/structured_output.py
```

```
# Windows
python cookbook/models/langdb/structured_output.py
```

Web Search Agent

Source: https://docs.agno.com/examples/models/langdb/tool_use

Code

```
# cookbook/models/langdb/web_search.py
from agno.agent import Agent
from agno.models.langdb import LangDB
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
    model=LangDB(id="llama3-1-70b-instruct-v1.0"),
    tools=[DuckDuckGoTools()],
```

```
        markdown=True,  
    )  
    agent.print_response("Whats happening in France?", stream=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export LANGDB_API_KEY=xxx  
export LANGDB_PROJECT_ID=xxx
```

Step: Install libraries

```
pip install -U openai agno ddgs
```

Step: Run Agent

```
# Mac  
python cookbook/models/langdb/web_search.py
```

```
# Windows  
python cookbook/models/langdb/web_search.py
```

Async Basic Agent

Source: [https://docs.agno.com/examples/models/litellm/async](https://docs.agno.com/examples/models/litellm/async_basic)
c_basic

Code

```
# cookbook/models/litellm/async_basic.py  
import asyncio  
  
from agno.agent import Agent  
from agno.models.litellm import LiteLLM  
  
openai_agent = Agent(  
    model=LiteLLM(  
        id="gpt-5-mini",  
        name="LiteLLM",  
    ),  
    markdown=True,  
)
```

```
asyncio.run(openai_agent.aprint_response("Share a 2 sentence horror story"))
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export LITELLM_API_KEY=xxx
```

Step: Install libraries

```
pip install -U litellm agno
```

Step: Run Agent

```
# Mac
python cookbook/models/litellm/async_basic.py
```

```
# Windows
python cookbook/models/litellm/async_basic.py
```

Async Basic Streaming Agent

Source: https://docs.agno.com/examples/models/litellm/async_basic_stream

Code

```
# cookbook/models/litellm/async_basic_stream.py
import asyncio

from agno.agent import Agent
from agno.models.litellm import LiteLLM

openai_agent = Agent(
    model=LiteLLM(
        id="gpt-5-mini",
        name="LiteLLM",
    ),
    markdown=True,
)

# Print the response in the terminal
asyncio.run(
    openai_agent.aprint_response("Share a 2 sentence horror story", stream=True)
```

)

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export LITELLM_API_KEY=xxx
```

Step: Install libraries

```
pip install -U litellm agno
```

Step: Run Agent

Mac

```
python cookbook/models/litellm/async_basic_stream.py
```

Windows

```
python cookbook/models/litellm/async_basic_stream.py
```

Async Tool Use

Source: https://docs.agno.com/examples/models/litellm/async_tool_use

Code

```
# cookbook/models/litellm/async_tool_use.py
import asyncio

from agno.agent import Agent
from agno.models.litellm import LiteLLM
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
    model=LiteLLM(
        id="gpt-5-mini",
        name="LiteLLM",
    ),
    markdown=True,
    tools=[DuckDuckGoTools()],
)

# Ask a question that would likely trigger tool use
```

```
asyncio.run(agent.aprint_response("What is happening in France?"))
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export LITELLM_API_KEY=xxx
```

Step: Install libraries

```
pip install -U litellm agno ddgs
```

Step: Run Agent

Mac

```
python cookbook/models/litellm/async_tool_use.py
```

Windows

```
python cookbook/models/litellm/async_tool_use.py
```

Audio Input Agent

Source: https://docs.agno.com/examples/models/litellm/audio_input_agent

Code

```
# cookbook/models/litellm/audio_input_agent.py
import requests
from agno.agent import Agent
from agno.media import Audio
from agno.models.litellm import LiteLLM

# Fetch the QA audio file and convert it to a base64 encoded string
url = "https://agno-public.s3.us-east-1.amazonaws.com/demo_data/QA-01.mp3"
response = requests.get(url)
response.raise_for_status()
mp3_data = response.content

# Audio input requires specific audio-enabled models like gpt-5-mini-audio-preview
agent = Agent(
    model=LiteLLM(id="gpt-5-mini-audio-preview"),
    markdown=True,
```

```
)
agent.print_response(
    "What's the audio about?",
    audio=[Audio(content=mp3_data, format="mp3")],
    stream=True,
)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export LITELLM_API_KEY=xxx
```

Step: Install libraries

```
pip install -U litellm agno
```

Step: Run Agent

```
# Mac
python cookbook/models/litellm/audio_input_agent.py
```

```
# Windows
python cookbook/models/litellm/audio_input_agent.py
```

Basic Agent

Source: <https://docs.agno.com/examples/models/litellm/basic>

Code

```
# cookbook/models/litellm/basic.py
from agno.agent import Agent
from agno.models.litellm import LiteLLM

openai_agent = Agent(
    model=LiteLLM(
        id="huggingface/mistralai/Mistral-7B-Instruct-v0.2",
        top_p=0.95,
    ),
    markdown=True,
)
```

```
openai_agent.print_response("Whats happening in France?")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export LITELLM_API_KEY=xxx
```

Step: Install libraries

```
pip install -U litellm agno
```

Step: Run Agent

Mac

```
python cookbook/models/litellm/basic.py
```

Windows

```
python cookbook/models/litellm/basic.py
```

Streaming Agent

Source: https://docs.agno.com/examples/models/litellm/basic_stream

Code

```
# cookbook/models/litellm/basic_stream.py
from agno.agent import Agent
from agno.models.litellm import LiteLLM
```

```
openai_agent = Agent(
    model=LiteLLM(
        id="gpt-5-mini",
        name="LiteLLM",
    ),
    markdown=True,
)
```

```
openai_agent.print_response("Share a 2 sentence horror story", stream=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export LITELLM_API_KEY=xxx
```

Step: Install libraries

```
pip install -U litellm openai agno
```

Step: Run Agent

```
# Mac
python cookbook/models/litellm/basic_stream.py

# Windows
python cookbook/models/litellm/basic_stream.py
```

Agent with Knowledge

Source: <https://docs.agno.com/examples/models/litellm/knowledge>

Code

```
# cookbook/models/litellm/knowledge.py

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your LLAMA API key

```
export LLAMA_API_KEY=YOUR_API_KEY
```

Step: Install libraries

```
pip install llama-api-client agno
```

Step: Run Agent

```
# Mac
python cookbook/models/meta/llama/async_basic.py
```

```
# Windows
python cookbook/models/meta/llama/async_basic.py
```

Asynchronous Streaming Agent

Source: https://docs.agno.com/examples/models/meta/async_stream

Code

```
# cookbook/models/meta/llama/async_basic_stream.py
import asyncio
from typing import Iterator # noqa

from agno.agent import Agent, RunOutput # noqa
from agno.models.meta import Llama

agent = Agent(model=Llama(id="Llama-4-Maverick-17B-128E-Instruct-FP8"), markdown=True)

# Get the response in a variable
# run_response: Iterator[RunOutputEvent] = asyncio.run(agent.arun("Share a 2 sentence horror story", stream=True))
# for chunk in run_response:
#     print(chunk.content)

# Print the response in the terminal
asyncio.run(agent.aprint_response("Share a 2 sentence horror story", stream=True))
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your LLAMA API key

```
export LLAMA_API_KEY=YOUR_API_KEY
```

Step: Install libraries

```
pip install llama-api-client agno
```

Step: Run Agent

```
# Mac
```

```
python cookbook/models/meta/async_stream.py
```

```
# Windows
```

```
python cookbook/models/meta/async_stream.py
```

Agent with Async Tool Usage

Source: https://docs.agno.com/examples/models/meta/async_tool_use

Code

```
# cookbook/models/meta/llama/async_tool_use.py
"""Run `pip install agno llama-api-client` to install dependencies."""

import asyncio

```

Windows

```
python cookbook/models/nvidia/basic.py
```

Basic Streaming Agent

Source: https://docs.agno.com/examples/models/nvidia/basic_stream

Code

```
# cookbook/models/nvidia/basic_stream.py
from agno.agent import Agent, RunOutputEvent # noqa
from agno.models.nvidia import Nvidia

agent = Agent(model=Nvidia(id="meta/llama-3.3-70b-instruct"), markdown=True)

# Get the response in a variable
# run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
# stream=True)
# for chunk in run_response:
#     print(chunk.content)

# Print the response in the terminal
agent.print_response("Share a 2 sentence horror story", stream=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export NVIDIA_API_KEY=xxx
```

Step: Install libraries

```
pip install -U agno
```

Step: Run Agent

```
# Mac
python cookbook/models/nvidia/basic_stream.py

# Windows
python cookbook/models/nvidia/basic_stream.py
```

Agent with Tools

Source: https://docs.agno.com/examples/models/nvidia/tool_use

Code

```
# cookbook/models/nvidia/tool_use.py
from agno.agent import Agent
from agno.models.nvidia import Nvidia
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
    model=Nvidia(id="meta/llama-3.3-70b-instruct"),
    tools=[DuckDuckGoTools()],
    markdown=True,
)

agent.print_response("Whats happening in France?", stream=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export NVIDIA_API_KEY=xxx
```

Step: Install libraries

```
pip install -U agno ddgs
```

Step: Run Agent

```
# Mac
python cookbook/models/nvidia/tool_use.py

# Windows
python cookbook/models/nvidia/tool_use.py
```

Async Basic

Source: https://docs.agno.com/examples/models/ollama/async_basic

Code

```
# cookbook/models/ollama/async_basic.py
import asyncio

from agno.agent import Agent
from agno.models.ollama import Ollama

agent = Agent(
    model=Ollama(id="llama3.1:8b"),
    description="You help people with their health and fitness goals.",
    instructions=["Recipes should be under 5 ingredients"],
)
# -*- Print a response to the cli
asyncio.run(agent.aprint_response("Share a breakfast recipe.", markdown=True))
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull llama3.1:8b
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

```
# Mac
python cookbook/models/ollama/async_basic.py
```

```
# Windows
python cookbook/models/ollama/async_basic.py
```

Async Basic Stream

Source: https://docs.agno.com/examples/models/ollama/async_basic_stream

Code

```
# cookbook/models/ollama/async_basic_stream.py
import asyncio
from typing import Iterator # noqa

from agno.agent import Agent, RunOutput # noqa
from agno.models.ollama import Ollama

agent = Agent(model=Ollama(id="llama3.1:8b"), markdown=True)

# Get the response in a variable
# run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
# stream=True)
# for chunk in run_response:
#     print(chunk.content)

# Print the response in the terminal
asyncio.run(agent.aprint_response("Share a 2 sentence horror story", stream=True))
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull llama3.1:8b
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run the example

```
# Mac/Linux
python examples/models/ollama/async_basic_stream.py
```

```
# Windows
python examples/models/ollama/async_basic_stream.py
```

Basic

Source: <https://docs.agno.com/examples/models/ollama/basic>

Code

```
# cookbook/models/ollama/basic.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.ollama import Ollama

agent = Agent(model=Ollama(id="llama3.1:8b"), markdown=True)

# Get the response in a variable
# run: RunOutput = agent.run("Share a 2 sentence horror story")
# print(run.content)

# Print the response in the terminal
agent.print_response("Share a 2 sentence horror story")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull llama3.1:8b
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

```
# Mac
python cookbook/models/ollama/basic.py

# Windows
python cookbook/models/ollama/basic.py
```

Cloud Alternative

For easier setup without local installation, you can use Ollama Cloud (/examples/models/ollama/cloud) with your API key:

```
from agno.agent import Agent
from agno.models.ollama import Ollama

# No local setup required - just set OLLAMA_API_KEY
agent = Agent(model=Ollama(id="gpt-oss:120b-cloud", host="https://ollama.com"))
agent.print_response("Share a 2 sentence horror story")
```

Basic Stream

Source: https://docs.agno.com/examples/models/ollama/basic_stream

Code

```
# cookbook/models/ollama/basic_stream.py
from typing import Iterator # noqa
from agno.agent import Agent, RunOutputEvent # noqa
from agno.models.ollama import Ollama

agent = Agent(model=Ollama(id="llama3.1:8b"), markdown=True)

# Get the response in a variable
# run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
# stream=True)
# for chunk in run_response:
#     print(chunk.content)

# Print the response in the terminal
agent.print_response("Share a 2 sentence horror story", stream=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull llama3.1:8b
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

```
# Mac
python cookbook/models/ollama/basic_stream.py

# Windows
python cookbook/models/ollama/basic_stream.py
```

Cloud Alternative

For easier setup without local installation, you can use Ollama Cloud (/examples/models/ollama/cloud) with your API key:

```
from agno.agent import Agent
from agno.models.ollama import Ollama

# No local setup required - just set OLLAMA_API_KEY
agent = Agent(model=Ollama(id="gpt-oss:120b-cloud", host="https://ollama.com"))
agent.print_response("Share a 2 sentence horror story", stream=True)
```

Ollama Cloud

Source: <https://docs.agno.com/examples/models/ollama/cloud>

Code

```
# cookbook/models/ollama/ollama_cloud.py
from agno.agent import Agent
from agno.models.ollama import Ollama

agent = Agent(
    model=Ollama(id="gpt-oss:120b-cloud", host="https://ollama.com"),
)

agent.print_response("How many r's in the word 'strawberry'?", stream=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set up Ollama Cloud API Key

Sign up at ollama.com and get your API key, then export it:

```
export OLLAMA_API_KEY=your_api_key_here
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

```
# Mac
```

```
python cookbook/models/ollama/ollama_cloud.py
```

```
# Windows
```

```
python cookbook/models/ollama/ollama_cloud.py
```

Key Features

- * No local setup required: Access powerful models instantly without downloading or managing local installations
- * Production-ready: Enterprise-grade infrastructure with reliable uptime and performance
- * Wide model selection: Access to powerful models including GPT-OSS and other optimized cloud models
- * Automatic configuration: When `api_key` is provided, the host automatically defaults to <https://ollama.com>

Db

Source: <https://docs.agno.com/examples/models/ollama/db>

Code

```
# cookbook/models/ollama/db.py
"""Run `pip install ddgs sqlalchemy ollama` to install dependencies."""

from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.ollama import Ollama
from agno.tools.duckduckgo import DuckDuckGoTools

# Setup the database
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
db = PostgresDb(db_url=db_url)

agent = Agent(
    model=Ollama(id="llama3.1:8b"),
    db=db,
    tools=[DuckDuckGoTools()],
    add_history_to_context=True,
)

agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](https://github.com/ollama/ollama?tab=readme-ov-file#macos) and run:

```
ollama pull llama3.1:8b
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

Mac

```
python cookbook/models/ollama/db.py
```

Windows

```
python cookbook/models/ollama/db.py
```

Demo Deepseek R1

Source: https://docs.agno.com/examples/models/ollama/demo_deepseek_r1

Code

```
# cookbook/models/ollama/demo_deepseek_r1.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.ollama import Ollama

agent = Agent(model=Ollama(id="deepseek-r1:14b"), markdown=True)

# Print the response in the terminal
agent.print_response(
    "Write me python code to solve quadratic equations. Explain your reasoning."
)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](https://github.com/ollama/ollama?tab=readme-ov-file#macos) and run:

```
ollama pull deepseek-r1:14b
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

Mac

```
python cookbook/models/ollama/demo_deepseek_r1.py
```

Windows

```
python cookbook/models/ollama/demo_deepseek_r1.py
```

Demo Gemma

Source: https://docs.agno.com/examples/models/ollama/demo_gemma

Code

```
# cookbook/models/ollama/demo_gemma.py
from pathlib import Path

from agno.agent import Agent
from agno.media import Image
from agno.models.ollama import Ollama

agent = Agent(model=Ollama(id="gemma3:12b"), markdown=True)

image_path = Path(__file__).parent.joinpath("super-agents.png")
agent.print_response(
    "Write a 3 sentence fiction story about the image",
    images=[Image(filepath=image_path)],
    stream=True,
)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](https://github.com/ollama/ollama?tab=readme

-ov-file#macos) and run:

```
ollama pull gemma3:12b
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

Mac

```
python cookbook/models/ollama/demo_gemma.py
```

Windows

```
python cookbook/models/ollama/demo_gemma.py
```

Demo Phi4

Source: https://docs.agno.com/examples/models/ollama/demo_phi4

Code

```
# cookbook/models/ollama/demo_phi4.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.ollama import Ollama

agent = Agent(model=Ollama(id="phi4"), markdown=True)

# Print the response in the terminal
agent.print_response("Tell me a scary story in exactly 10 words.")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull phi4
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

```
# Mac
python cookbook/models/ollama/demo_phi4.py

# Windows
python cookbook/models/ollama/demo_phi4.py
```

Demo Qwen

Source: https://docs.agno.com/examples/models/ollama/demo_qwen

Code

```
# cookbook/models/ollama/demo_qwen.py
from agno.agent import Agent
from agno.models.ollama import Ollama
from agno.tools.yfinance import YFinanceTools

agent = Agent(
    model=Ollama(id="qwen3:8b"),
    tools=[
        YFinanceTools(
            stock_price=True,
            analyst_recommendations=True,
            company_info=True,
            company_news=True,
        ),
    ],
    instructions="Use tables to display data.",
)

agent.print_response("Write a report on NVDA", stream=True, markdown=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull qwen3:8b
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

```
# Mac
python cookbook/models/ollama/demo_qwen.py

# Windows
python cookbook/models/ollama/demo_qwen.py
```

Image Agent

Source: https://docs.agno.com/examples/models/ollama/image_agent

Code

```
# cookbook/models/ollama/image_agent.py
from pathlib import Path

from agno.agent import Agent
from agno.media import Image
from agno.models.ollama import Ollama

agent = Agent(
    model=Ollama(id="llama3.2-vision"),
    markdown=True,
)

image_path = Path(__file__).parent.joinpath("super-agents.png")
agent.print_response(
    "Write a 3 sentence fiction story about the image",
    images=[Image(filepath=image_path)],
)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull llama3.2-vision
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

```
# Mac
```

```
python cookbook/models/ollama/image_agent.py
```

```
# Windows
```

```
python cookbook/models/ollama/image_agent.py
```

Knowledge

Source: <https://docs.agno.com/examples/models/ollama/knowledge>

Code

```
# cookbook/models/ollama/knowledge.py
from agno.agent import Agent
from agno.knowledge.embedder.ollama import OllamaEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.ollama import Ollama
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"

knowledge = Knowledge(
    vector_db=PgVector(
        table_name="recipes",
        db_url=db_url,
        embedder=OllamaEmbedder(id="llama3.2", dimensions=3072),
    ),
)

# Add content to the knowledge
knowledge.add_content(
    url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf"
)

agent = Agent(model=Ollama(id="llama3.2"), knowledge=knowledge)
agent.print_response("How to make Thai curry?", markdown=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](https://github.com/ollama/ollama?tab=readme-ov-file#macos) and run:

```
ollama pull llama3.2
```

Step: Install libraries

```
pip install -U agno ddgs sqlalchemy pgvector pypdf openai ollama
```

Step: Run Agent

```
# Mac
python cookbook/models/ollama/knowledge.py
```

```
# Windows
python cookbook/models/ollama/knowledge.py
```

Memory

Source: <https://docs.agno.com/examples/models/ollama/memory>

Code

```
# cookbook/models/ollama/memory.py
"""
from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.ollama.chat import Ollama

# Setup the database
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
db = PostgresDb(db_url=db_url)

agent = Agent(
    model=Ollama(id="qwen2.5:latest"),
    # Pass the database to the Agent
    db=db,
    # Enable user memories
    enable_user_memories=True,
    # Enable session summaries
    enable_session_summaries=True,
    # Show debug logs so, you can see the memory being created
)

# -*- Share personal information
agent.print_response("My name is john billings?", stream=True)

# -*- Share personal information
```

```
agent.print_response("I live in nyc?", stream=True)

# *- Share personal information
agent.print_response("I'm going to a concert tomorrow?", stream=True)

# Ask about the conversation
agent.print_response(
    "What have we been talking about, do you know my name?", stream=True
)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull qwen2.5:latest
```

Step: Install libraries

```
pip install -U ollama agno sqlalchemy psycopg pgvector
```

Step: Run Agent

```
# Mac
python cookbook/models/ollama/memory.py
```

```
# Windows
python cookbook/models/ollama/memory.py
```

Multimodal Agent

Source: <https://docs.agno.com/examples/models/ollama/multimodal>

Code

```
# cookbook/models/ollama/image_agent_bytes.py
from pathlib import Path

from agno.agent import Agent
from agno.media import Image
from agno.models.ollama import Ollama
```

```
agent = Agent(
    model=Ollama(id="gemma3"),
    markdown=True,
)

image_path = Path(__file__).parent.joinpath("sample.jpg")
agent.print_response(
    "Write a 3 sentence fiction story about the image",
    images=[Image(filepath=image_path)],
)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull gemma3
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Add sample image

Place a sample image named `sample.jpg` in the same directory as your script, or update the `image\_path` to point to your desired image.

Step: Run Agent

Mac

```
python cookbook/models/ollama/image_agent_bytes.py
```

Windows

```
python cookbook/models/ollama/image_agent_bytes.py
```

Set Client

Source: https://docs.agno.com/examples/models/ollama/set_client

Code

```
# cookbook/models/ollama/set_client.py
from agno.agent import Agent, RunOutput # noqa
```

```
from agno.models.ollama import Ollama
from ollama import Client as OllamaClient

agent = Agent(
    model=Ollama(id="llama3.1:8b", client=OllamaClient()),
    markdown=True,
)

# Print the response in the terminal
agent.print_response("Share a 2 sentence horror story")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull llama3.1:8b
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

```
# Mac
python cookbook/models/ollama/set_client.py
```

```
# Windows
python cookbook/models/ollama/set_client.py
```

Set Temperature

Source: https://docs.agno.com/examples/models/ollama/set_temperature

Code

```
# cookbook/models/ollama/set_temperature.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.ollama import Ollama

agent = Agent(model=Ollama(id="llama3.2", options={"temperature": 0.5}), markdown=True)
```

```
# Get the response in a variable
# run: RunOutput = agent.run("Share a 2 sentence horror story")
# print(run.content)

# Print the response in the terminal
agent.print_response("Share a 2 sentence horror story")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull llama3.2
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

```
# Mac
python cookbook/models/ollama/set_temperature.py
```

```
# Windows
python cookbook/models/ollama/set_temperature.py
```

Agent with Storage

Source: <https://docs.agno.com/examples/models/ollama/storage>

Code

```
# cookbook/models/ollama/db.py
from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.ollama import Ollama
from agno.tools.duckduckgo import DuckDuckGoTools

# Setup the database
db_url = "postgresql+psycopg://ai:ai@localhost:5532/ai"
db = PostgresDb(db_url=db_url)
```

```

agent = Agent(
    model=Ollama(id="llama3.1:8b"),
    db=db,
    tools=[DuckDuckGoTools()],
    add_history_to_context=True,
)
agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull llama3.1:8b
```

Step: Install libraries

```
pip install-U ddgs sqlalchemy psycopg ollama agno
```

Step: Run PgVector

```

docker run -d \
    -e POSTGRES_DB=ai \
    -e POSTGRES_USER=ai \
    -e POSTGRES_PASSWORD=ai \
    -e PGDATA=/var/lib/postgresql/data/pgdata \
    -v pgvolume:/var/lib/postgresql/data \
    -p 5532:5432 \
    --name pgvector \
    agnohq/pgvector:16

```

Step: Run Agent

```
# Mac
python cookbook/models/ollama/db.py
```

```
# Windows
python cookbook\models\ollama\db.py
```

Structured Output

Source: https://docs.agno.com/examples/models/ollama/structured_output

Code

```
# cookbook/models/ollama/structured_output.py
from typing import List
from agno.agent import Agent, RunOutput # noqa
from agno.models.ollama import Ollama
from pydantic import BaseModel, Field
from rich.pretty import pprint # noqa

class MovieScript(BaseModel):
    name: str = Field(..., description="Give a name to this movie")
    setting: str = Field(
        ..., description="Provide a nice setting for a blockbuster movie."
    )
    ending: str = Field(
        ...,
        description="Ending of the movie. If not available, provide a happy ending.",
    )
    genre: str = Field(
        ...,
        description="Genre of the movie. If not available, select action, thriller or
romantic comedy.",
    )
    characters: List[str] = Field(..., description="Name of characters for this movie.")
    storyline: str = Field(
        ..., description="3 sentence storyline for the movie. Make it exciting!"
    )

# Agent that returns a structured output
structured_output_agent = Agent(
    model=Ollama(id="llama3.2"),
    description="You write movie scripts.",
    output_schema=MovieScript,
)

# Get the response in a variable
# json_mode_response: RunOutput = json_mode_agent.run("New York")
# pprint(json_mode_response.content)
# structured_output_response: RunOutput = structured_output_agent.run("New York")
# pprint(structured_output_response.content)

# Run the agent
structured_output_agent.print_response("New York")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](https://github.com/ollama/ollama?tab=readme-ov-file#macos) and run:

```
ollama pull llama3.2
```

Step: Install libraries

```
pip install -U ollama agno
```

Step: Run Agent

Mac

```
python cookbook/models/ollama/structured_output.py
```

Windows

```
python cookbook/models/ollama/structured_output.py
```

Tool Use

Source: https://docs.agno.com/examples/models/ollama/tool_use

Code

```
# cookbook/models/ollama/tool_use.py
from agno.agent import Agent
from agno.models.ollama import Ollama
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
    model=Ollama(id="llama3.2:latest"),
    tools=[DuckDuckGoTools()],
    markdown=True,
)
agent.print_response("Whats happening in France?")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](https://github.com/ollama/ollama?tab=readme-ov-file#macos) and run:

```
ollama pull llama3.2:latest
```

Step: Install libraries

```
pip install -U ollama agno ddgs
```

Step: Run Agent

Mac

```
python cookbook/models/ollama/tool_use.py
```

Windows

```
python cookbook/models/ollama/tool_use.py
```

Tool Use Stream

Source: https://docs.agno.com/examples/models/ollama/tool_use_stream

Code

```
# cookbook/models/ollama/tool_use_stream.py
from agno.agent import Agent
from agno.models.ollama import Ollama
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
    model=Ollama(id="llama3.2:latest"),
    tools=[DuckDuckGoTools()],
    markdown=True,
)
agent.print_response("Whats happening in France?", stream=True)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Install Ollama

Follow the [Ollama installation guide](<https://github.com/ollama/ollama?tab=readme-ov-file#macos>) and run:

```
ollama pull llama3.2:latest
```

Step: Install libraries

```
pip install -U ollama agno ddgs
```

Step: Run Agent

```
# Mac
python cookbook/models/ollama/tool_use_stream.py

# Windows
python cookbook/models/ollama/tool_use_stream.py
```

Audio Input Agent

Source: https://docs.agno.com/examples/models/openai/chat/audio_input_agent

Code

```
# cookbook/models/openai/chat/audio_input_agent.py
import requests
from agno.agent import Agent, RunOutput # noqa
from agno.media import Audio
from agno.models.openai import OpenAIChat

# Fetch the audio file and convert it to a base64 encoded string
url = "https://openaiassets.blob.core.windows.net/$web/API/docs/audio/alloy.wav"
response = requests.get(url)
response.raise_for_status()
wav_data = response.content

# Provide the agent with the audio file and get result as text
agent = Agent(
    model=OpenAIChat(id="gpt-5-mini-audio-preview", modalities=["text"]),
    markdown=True,
)
agent.print_response(
    "What is in this audio?", audio=[Audio(content=wav_data, format="wav")]
)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai requests agno
```

Step: Run Agent

```
# Mac
python cookbook/models/openai/chat/audio_input_agent.py

# Windows
python cookbook/models/openai/chat/audio_input_agent.py
```

Audio Output Agent

Source: https://docs.agno.com/examples/models/openai/chat/audio_output_agent

Code

```
# cookbook/models/openai/chat/audio_output_agent.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.openai import OpenAIChat
from agno.utils.audio import write_audio_to_file
from agno.db.in_memory import InMemoryDb

# Provide the agent with the audio file and audio configuration and get result as text +
audio
agent = Agent(
    model=OpenAIChat(
        id="gpt-4o-audio-preview",
        modalities=["text", "audio"],
        audio={"voice": "sage", "format": "wav"},
    ),
    db=InMemoryDb(),
    add_history_to_context=True,
    markdown=True,
)
run_output: RunOutput = agent.run("Tell me a 5 second scary story")

# Save the response audio to a file
if run_output.response_audio:
    write_audio_to_file(
        audio=run_output.response_audio.content, filename="tmp/scary_story.wav"
    )

run_output: RunOutput = agent.run("What would be in a sequel of this story?")

# Save the response audio to a file
if run_output.response_audio:
    write_audio_to_file(
        audio=run_output.response_audio.content,
        filename="tmp/scary_story_sequal.wav",
    )
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```

```
python cookbook/models/openai/chat/basic_stream.py
```

Response Caching

Source: https://docs.agno.com/examples/models/openai/chat/cache_response

Learn how to cache model responses to avoid redundant API calls and reduce costs.

Note:

For a conceptual overview of response caching, see [Response Caching \(/concepts/models/cache-response\)](/concepts/models/cache-response).

Response caching allows you to cache model responses, which can significantly improve response times and reduce API costs during development and testing.

Basic Usage

Enable caching by setting `cache_response=True` when initializing the model. The first call will hit the API and cache the response, while subsequent identical calls will return the cached result.

```
# cache_model_response.py
```

```
import time
```

```
from agno.agent import Agent
```

```
from agno.models.openai import OpenAIChat
```

```
agent = Agent(model=OpenAIChat(id="gpt-4o", cache_response=True))
```

```
# Run the same query twice to demonstrate caching
```

```
for i in range(1, 3):
```

```
    print(f"\n{'=' * 60}")
```

```
    print(
```

```
        f"Run {i}: {'Cache Miss (First Request)' if i == 1 else 'Cache Hit (Cached Response)'}"
```

```
    )
```

```
    print(f"\n{'=' * 60}\n")
```

```
response = agent.run(
    "Write me a short story about a cat that can talk and solve problems."
)
print(response.content)
print(f"\n Elapsed time: {response.metrics.duration:.3f}s")

# Small delay between iterations for clarity
if i == 1:
    time.sleep(0.5)
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
# Mac
python cache_model_response.py
```

```
# Windows
python cache_model_response.py
```

Generate Images

Source: https://docs.agno.com/examples/models/openai/chat/generate_images

Code

```
# cookbook/models/openai/chat/generate_images.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.dalle import DalleTools

image_agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[DalleTools()],
    description="You are an AI agent that can generate images using DALL-E.",
    instructions="When the user asks you to create an image, use the `create_image` tool
```

```

to create the image.",
    markdown=True,
)

image_agent.print_response("Generate an image of a white siamese cat")

images = image_agent.get_images()
if images and isinstance(images, list):
    for image_response in images:
        image_url = image_response.url
        print(image_url)

```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
# Mac

Image Generation Agent

Source: https://docs.agno.com/examples/models/openai/responses/image_generation_agent

Code

```
# cookbook/models/openai/responses/image_generation_agent.py
""" Example: Using the OpenAITools Toolkit for Image Generation
```

This script demonstrates how to use the `OpenAITools` toolkit, which includes a tool for generating images using OpenAI's DALL-E within an Agno Agent.

Example prompts to try:

- "Create a surreal painting of a floating city in the clouds at sunset"
- "Generate a photorealistic image of a cozy coffee shop interior"
- "Design a cute cartoon mascot for a tech startup"
- "Create an artistic portrait of a cyberpunk samurai"

Run `pip install openai agno` to install the necessary dependencies.

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.openai import OpenAITools
from agno.utils.media import save_base64_data

agent = Agent(
    model=OpenAIChat(id="gpt-5-mini"),
    tools=[OpenAITools(image_model="gpt-image-1")],
    markdown=True,
)

response = agent.run(
    "Generate a photorealistic image of a cozy coffee shop interior",
)

if response.images and response.images[0].content:
    save_base64_data(str(response.images[0].content), "tmp/coffee_shop.png")
```

Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
# Mac
python cookbook/models/openai/responses/image_generation_
agent.py
```

```
# Windows
python cookbook/models/openai/responses/image_generation_
agent.py
```

Knowledge

Source: <https://docs.agno.com/examples/models/openai/responses/knowledge>

```
`bash pip install -U agno ddgs openai `
```

Step: Run Agent

```
Mac
python cookbook/models/siliconflow/tool_use.py
```

```
Windows
python cookbook/models/siliconflow/tool_use.py
```

## Basic Agent

Source: <https://docs.agno.com/examples/models/together/basic>

## Code

```
cookbook/models/together/basic.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.together import Together

agent = Agent(
 model=Together(id="meta-llama/Meta-Llama-3.1-8B-Instruct-Turbo"), markdown=True
)
```

```
Get the response in a variable
run: RunOutput = agent.run("Share a 2 sentence horror story")
print(run.content)

Print the response in the terminal
agent.print_response("Share a 2 sentence horror story")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export TOGETHER_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
Mac
python cookbook/models/together/basic.py
```

```
Windows
python cookbook/models/together/basic.py
```

## Streaming Agent

Source: [https://docs.agno.com/examples/models/together/basic\\_stream](https://docs.agno.com/examples/models/together/basic_stream)

## Code

```
cookbook/models/together/basic_stream.py
from typing import Iterator # noqa
from agno.agent import Agent, RunOutputEvent # noqa
from agno.models.together import Together

agent = Agent(
 model=Together(id="meta-llama/Meta-Llama-3.1-8B-Instruct-Turbo"), markdown=True
)

Get the response in a variable
run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
stream=True)
```

```
for chunk in run_response:
print(chunk.content)

Print the response in the terminal
agent.print_response("Share a 2 sentence horror story", stream=True)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export TOGETHER_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
Mac
python cookbook/models/together/basic_stream.py
```

```
Windows
python cookbook/models/together/basic_stream.py
```

## Image Agent

Source: [https://docs.agno.com/examples/models/together/image\\_agent](https://docs.agno.com/examples/models/together/image_agent)

## Code

```
cookbook/models/together/image_agent.py
from agno.agent import Agent
from agno.media import Image
from agno.models.together import Together

agent = Agent(
 model=Together(id="meta-llama/Llama-Vision-Free"),
 markdown=True,
)

agent.print_response(
 "Tell me about this image",
 images=[
 Image(
```

```
 url="https://upload.wikimedia.org/wikipedia/commons/0/0c/GoldenGateBridge-001.jpg"
)
],
stream=True,
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export TOGETHER_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
Mac
python cookbook/models/together/image_agent.py
```

```
Windows
python cookbook/models/together/image_agent.py
```

## Image Input Bytes Content

Source: [https://docs.agno.com/examples/models/together/image\\_agent\\_bytes](https://docs.agno.com/examples/models/together/image_agent_bytes)

## Code

```
cookbook/models/together/image_agent_bytes.py
from pathlib import Path

from agno.agent import Agent
from agno.media import Image
from agno.models.together import Together

agent = Agent(
 model=Together(id="meta-llama/Llama-Vision-Free"),
 markdown=True,
)

image_path = Path(__file__).parent.joinpath("sample.jpg")
```

```
Read the image file content as bytes
image_bytes = image_path.read_bytes()

agent.print_response(
 "Tell me about this image",
 images=[
 Image(content=image_bytes),
],
 stream=True,
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export TOGETHER_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Add sample image

Add a sample image file:

```
Add your sample.jpg file to examples/models/together/together/ directory
```

Step: Run Agent

# Mac

```
python cookbook/models/together/image_agent_bytes.py
```

# Windows

```
python cookbook/models/together/image_agent_bytes.py
```

## Image Agent with Memory

Source: [https://docs.agno.com/examples/models/together/image\\_agent\\_memory](https://docs.agno.com/examples/models/together/image_agent_memory)

## Code

```
cookbook/models/together/image_agent_memory.py
from agno.agent import Agent
```

```

from agno.media import Image
from agno.models.together import Together

agent = Agent(
 model=Together(id="meta-llama/Llama-Vision-Free"),
 markdown=True,
 add_history_to_context=True,
 num_history_runs=3,
)

agent.print_response(
 "Tell me about this image",
 images=[
 Image(
 url="https://upload.wikimedia.org/wikipedia/commons/0/0c/GoldenGateBridge-001.jpg"
)
],
 stream=True,
)

agent.print_response("Tell me where I can get more images?")

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export TOGETHER_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

# Mac

```
python cookbook/models/together/image_agent_memory.py
```

# Windows

```
python cookbook/models/together/image_agent_memory.py
```

## Agent with Structured Outputs

Source: [https://docs.agno.com/examples/models/together/structured\\_output](https://docs.agno.com/examples/models/together/structured_output)

## Code

```
cookbook/models/together/structured_output.py
from typing import List

from agno.agent import Agent, RunOutput # noqa
from agno.models.together import Together
from pydantic import BaseModel, Field
from rich.pretty import pprint # noqa

class MovieScript(BaseModel):
 setting: str = Field(
 ..., description="Provide a nice setting for a blockbuster movie."
)
 ending: str = Field(
 ...,
 description="Ending of the movie. If not available, provide a happy ending.",
)
 genre: str = Field(
 ...,
 description="Genre of the movie. If not available, select action, thriller or
romantic comedy.",
)
 name: str = Field(..., description="Give a name to this movie")
 characters: List[str] = Field(..., description="Name of characters for this movie.")
 storyline: str = Field(
 ..., description="3 sentence storyline for the movie. Make it exciting!"
)

Agent that uses JSON mode
json_mode_agent = Agent(
 model=Together(id="meta-llama/Meta-Llama-3.1-8B-In
struct-Turbo"),
 description="You write movie scripts.",
 output_schema=MovieScript,
 use_json_mode=True,
)

Get the response in a variable
json_mode_response: RunOutput = json_mode_agent.run("New York")
pprint(json_mode_response.content)
structured_output_response: RunOutput = structured_output_agent.run("New York")
pprint(structured_output_response.content)

json_mode_agent.print_response("New York")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export TOGETHER_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

# Mac

```
python cookbook/models/together/structured_output.py
```

# Windows

```
python cookbook/models/together/structured_output.py
```

## Agent with Tools

Source: [https://docs.agno.com/examples/models/together/tool\\_use](https://docs.agno.com/examples/models/together/tool_use)

### Code

```
cookbook/models/together/tool_use.py
from agno.agent import Agent
from agno.models.together import Together
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=Together(id="meta-llama/Meta-Llama-3.1-8B-Instruct-Turbo"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)
agent.print_response("Whats happening in France?")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export TOGETHER_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai ddgs agno
```

### Step: Run Agent

```
Mac
python cookbook/models/together/tool_use.py
```

```
Windows
python cookbook/models/together/tool_use.py
```

## Basic Agent

Source: <https://docs.agno.com/examples/models/vercel/basic>

### Code

```
cookbook/models/vercel/basic.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.vercel import V0

agent = Agent(model=V0(id="v0-1.0-md"), markdown=True)

Get the response in a variable
run: RunOutput = agent.run("Share a 2 sentence horror story")
print(run.content)

Print the response in the terminal
agent.print_response("Share a 2 sentence horror story")

agent.print_response("Create a simple web app that displays a random number between 1
and 100.")
```

### Usage

Snippet file: "create-venv-step.mdx"

### Step: Set your API key

```
export V0_API_KEY=xxx
```

### Step: Install libraries

```
pip install -U openai agno
```

### Step: Run Agent

```
Mac
```

```
python cookbook/models/vercel/basic.py
```

```
Windows
```

```
python cookbook/models/vercel/basic.py
```

## Streaming Agent

Source: [https://docs.agno.com/examples/models/vercel/basic\\_stream](https://docs.agno.com/examples/models/vercel/basic_stream)

### Code

```
cookbook/models/vercel/basic_stream.py
from typing import Iterator # noqa
from agno.agent import Agent, RunOutput # noqa
from agno.models.vercel import V0

agent = Agent(model=V0(id="v0-1.0-md"), markdown=True)

Get the response in a variable
run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
stream=True)
for chunk in run_response:
print(chunk.content)

Print the response in the terminal
agent.print_response("Share a 2 sentence horror story", stream=True)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export V0_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
Mac
```

```
python cookbook/models/vercel/basic_stream.py
```

```
Windows
```

```
python cookbook/models/vercel/basic_stream.py
```

# Image Agent

Source: [https://docs.agno.com/examples/models/vercel/image\\_agent](https://docs.agno.com/examples/models/vercel/image_agent)

## Code

```
cookbook/models/vercel/image_agent.py
from agno.agent import Agent
from agno.media import Image
from agno.models.vercel import V0
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=V0(id="v0-1.0-md"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)

agent.print_response(
 "Tell me about this image and give me the latest news about it.",
 images=[
 Image(
 url="https://upload.wikimedia.org/wikipedia/commons/0/0c/GoldenGateBridge-001.jpg"

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export V0_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai ddgs agno
```

Step: Run Agent

```
Mac
python cookbook/models/vercel/image_agent.py
```

```
Windows
```

python cookbook/models/vercel/image\_agent.py

## Agent with Knowledge

Source: <https://docs.agno.com/examples/models/vercel/knowledge>

### Code

```
cookbook/models/vercel/knowledge.py
from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.models.vercel import V0
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"

knowledge = Knowledge(
 vector_db=PgVector(table_name="recipes", db_url=db_url),
)
Add content to the knowledge
knowledge.add_content(
 url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf"
)

agent = Agent(model=V0(id="v0-1.0-md"), knowledge=knowledge)
agent.print_response("How to make Thai curry?", markdown=True)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export V0_API_KEY=xxx
```

Step: Install libraries

```
pip install -U ddgs sqlalchemy pgvector pypdf openai agno
```

Step: Run PgVector

```
docker run -d \
 -e POSTGRES_DB=ai \
 -e POSTGRES_USER=ai \
 -e POSTGRES_PASSWORD=ai \
 -e PGDATA=/var/lib/postgresql/data/pgdata \
```

```
-v pgvolume:/var/lib/postgresql/data \
-p 5532:5432 \
--name pgvector \
agnohq/pgvector:16
```

Step: Run Agent

```
Mac
python cookbook/models/vercel/knowledge.py
```

```
Windows
python cookbook/models/vercel/knowledge.py
```

## Agent with Tools

Source: [https://docs.agno.com/examples/models/vercel/tool\\_use](https://docs.agno.com/examples/models/vercel/tool_use)

## Code

## PDF Input Bytes Agent

Source: [https://docs.agno.com/examples/models/vertexai/claude/pdf\\_input\\_bytes](https://docs.agno.com/examples/models/vertexai/claude/pdf_input_bytes)

### Code

```
cookbook/models/vertexai/claude/pdf_input_bytes.py
from pathlib import Path

from agno.agent import Agent
from agno.media import File
from agno.models.vertexai.claude import Claude
from agno.utils.media import download_file

pdf_path = Path(__file__).parent.joinpath("ThaiRecipes.pdf")

Download the file using the download_file function
download_file(
 "https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf", str(pdf_path)
)

agent = Agent(
 model=Claude(id="claude-sonnet-4@20250514"),
 markdown=True,
)

agent.print_response(
 "Summarize the contents of the attached file.",
 files=[
 File(
 content=pdf_path.read_bytes(),
),
],
)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your environment variables

```
Mac
```

```
export CLOUD_ML_REGION=xxx
export GOOGLE_CLOUD_PROJECT=xxx
```

# Windows

```
setx CLOUD_ML_REGION xxx
setx GOOGLE_CLOUD_PROJECT xxx
```

Step: Authenticate your CLI session

```
`gcloud auth application-default login `
```

Note: You dont need to authenticate your CLI every time.

Step: Install libraries

```
pip install -U anthropic agno
```

Step: Run Agent

# Mac

```
python cookbook/models/vertexai/claude/pdf_input_bytes.py
```

# Windows

```
python cookbook/models/vertexai/claude/pdf_input_bytes.py
```

## PDF Input Local Agent

Source: [https://docs.agno.com/examples/models/vertexai/claude/pdf\\_input\\_local](https://docs.agno.com/examples/models/vertexai/claude/pdf_input_local)

### Code

```
cookbook/models/vertexai/claude/pdf_input_local.py
from pathlib import Path

from agno.agent import Agent
from agno.media import File
from agno.models.vertexai.claude import Claude
from agno.utils.media import download_file

pdf_path = Path(__file__).parent.joinpath("ThaiRecipes.pdf")

Download the file using the download_file function
download_file(

 characters: List[str] = Field(..., description="Name of characters for this movie.")
 storyline: str = Field(
 ..., description="3 sentence storyline for the movie. Make it exciting!"
)

movie_agent = Agent(
 model=Claude(id="claude-sonnet-4@20250514"),
 description="You help people write movie scripts.",
 output_schema=MovieScript,
)

Get the response in a variable
run: RunOutput = movie_agent.run("New York")
pprint(run.content)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your environment variables

```
Mac
export CLOUD_ML_REGION=xxx
export GOOGLE_CLOUD_PROJECT=xxx
```

```
Windows
setx CLOUD_ML_REGION xxx
setx GOOGLE_CLOUD_PROJECT xxx
```

Step: Authenticate your CLI session

```
`gcloud auth application-default login `
```

Note: You dont need to authenticate your CLI every time.

Step: Install libraries

```
pip install -U anthropic agno
```

Step: Run Agent

```
Mac
python cookbook/models/vertexai/claude/structured_output.py
```

```
Windows
python cookbook/models/vertexai/claude/structured_output.py
```

## Agent with Tools

Source: [https://docs.agno.com/examples/models/vertexai/claude/tool\\_use](https://docs.agno.com/examples/models/vertexai/claude/tool_use)

### Code

```
cookbook/models/vertexai/claude/tool_use.py
from agno.agent import Agent
from agno.models.vertexai.claude import Claude
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=Claude(id="claude-sonnet-4@20250514"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)
```

```
agent.print_response("Whats happening in France?")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your environment variables

```
Mac
export CLOUD_ML_REGION=xxx
export GOOGLE_CLOUD_PROJECT=xxx
```

```
Windows
setx CLOUD_ML_REGION xxx
setx GOOGLE_CLOUD_PROJECT xxx
```

Step: Authenticate your CLI session

```
`gcloud auth application-default login `
```

Note: You dont need to authenticate your CLI every time.

Step: Install libraries

```
pip install -U anthropic agno
```

Step: Run Agent

```
Mac
python cookbook/models/vertexai/claude/tool_use.py
```

```
Windows
python cookbook/models/vertexai/claude/tool_use.py
```

## Async Agent

Source: [https://docs.agno.com/examples/models/vllm/async\\_basic](https://docs.agno.com/examples/models/vllm/async_basic)

## Code

```
cookbook/models/vllm/async_basic.py
import asyncio

from agno.agent import Agent
from agno.models.vllm import VLLM

agent = Agent(model=VLLM(id="Qwen/Qwen2.5-7B-Instruct"), markdown=True)
```

```
asyncio.run(agent.aprint_response("Share a 2 sentence horror story"))
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install -U agno openai vllm
```

Step: Start vLLM server

```
vllm serve Qwen/Qwen2.5-7B-Instruct \
 --enable-auto-tool-choice \
 --tool-call-parser hermes \
 --dtype float16 \
 --max-model-len 8192 \
 --gpu-memory-utilization 0.9
```

Step: Run Agent

```
python cookbook/models/vllm/async_basic.py
```

## Async Agent with Streaming

Source: [https://docs.agno.com/examples/models/vllm/async\\_b  
asic\\_stream](https://docs.agno.com/examples/models/vllm/async_basic_stream)

## Code

```
cookbook/models/vllm/async_basic_stream.py
import asyncio

from agno.agent import Agent
from agno.models.vllm import VLLM

agent = Agent(model=VLLM(id="Qwen/Qwen2.5-7B-Instruct"), markdown=True)
asyncio.run(agent.aprint_response("Share a 2 sentence horror story", stream=True))
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install Libraries

```
pip install -U agno openai vllm
```

Step: Start vLLM server

```
vllm serve Qwen/Qwen2.5-7B-Instruct \
 --enable-auto-tool-choice \
 --tool-call-parser hermes \
 --dtype float16 \
 --max-model-len 8192 \
 --gpu-memory-utilization 0.9
```

Step: Run Agent

```
python cookbook/models/vllm/async_basic_stream.py
```

## Async Agent with Tools

Source: [https://docs.agno.com/examples/models/vllm/async\\_tool\\_use](https://docs.agno.com/examples/models/vllm/async_tool_use)

### Code

```
cookbook/models/vllm/async_tool_use.py
"""Run `pip install ddgs` to install dependencies."""

import asyncio

from agno.agent import Agent
from agno.models.vllm import VLLM
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=VLLM(id="Qwen/Qwen2.5-7B-Instruct", top_k=20, enable_thinking=False),
 tools=[DuckDuckGoTools()],
 markdown=True,
)
asyncio.run(agent.aprint_response("Whats happening in France?", stream=True))
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Install Libraries

```
pip install -U agno openai vllm ddgs
```

Step: Start vLLM server

```
vllm serve Qwen/Qwen2.5-7B-Instruct \
 --enable-auto-tool-choice \
```

```
--tool-call-parser hermes \
--dtype float16 \
--max-model-len 8192 \
--gpu-memory-utilization 0.9
```

Step: Run Agent

```
python cookbook/models/vllm/async_tool_use.py
```

## Basic Agent

Source: <https://docs.agno.com/examples/models/vllm/basic>

### Code

```
cookbook/models/vllm/basic.py
from agno.agent import Agent
from agno.models.vllm import VLLM

agent = Agent(
 model=VLLM(id="Qwen/Qwen2.5-7B-Instruct", top_k=20, enable_thinking=False),
 markdown=True,
)

agent.print_response("Share a 2 sentence horror story")
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Setup vLLM Server

Start a vLLM server locally:

```
pip install vllm
python -m vllm.entrypoints.openai.api_server \
 --model Qwen/Qwen2.5-7B-Instruct \
 --port 8000
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
Mac
python cookbook/models/vllm/basic.py
```

```
Windows
python cookbook/models/vllm/basic.py
```

## Agent with Streaming

Source: [https://docs.agno.com/examples/models/vllm/basic\\_stream](https://docs.agno.com/examples/models/vllm/basic_stream)

### Code

```
cookbook/models/vllm/basic_stream.py
from agno.agent import Agent
from agno.models.vllm import VLLM

agent = Agent(
 model=VLLM(id="Qwen/Qwen2.5-7B-Instruct", top_k=20, enable_thinking=False),
 markdown=True,
)
agent.print_response("Share a 2 sentence horror story", stream=True)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Install Libraries

```
pip install -U agno openai vllm
```

Step: Start vLLM server

```
vllm serve Qwen/Qwen2.5-7B-Instruct \
 --enable-auto-tool-choice \
 --tool-call-parser hermes \
 --dtype float16 \
 --max-model-len 8192 \
 --gpu-memory-utilization 0.9
```

Step: Run Agent

```
python cookbook/models/vllm/basic_stream.py
```

## Code Generation

Source: [https://docs.agno.com/examples/models/vllm/code\\_generation](https://docs.agno.com/examples/models/vllm/code_generation)

### Code

```
cookbook/models/vllm/code_generation.py
from agno.agent import Agent
from agno.models.vllm import VLLM

agent = Agent(
 model=VLLM(id="deepseek-ai/deepseek-coder-6.7b-instruct"),
 description="You are an expert Python developer.",
 markdown=True,
)

agent.print_response(
 "Write a Python function that returns the nth Fibonacci number using dynamic programming."
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install Libraries

```
pip install -U agno openai vllm
```

Step: Start vLLM server

```
vllm serve deepseek-ai/deepseek-coder-6.7b-instruct \
 --dtype float32 \
 --tool-call-parser pythonic
```

Step: Run Agent

```
python cookbook/models/vllm/code_generation.py
```

## Agent with Memory

Source: <https://docs.agno.com/examples/models/vllm/memory>

## Code

```
cookbook/models/vllm/memory.py
from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.vllm import VLLM
from agno.utils.pprint import pprint

Change this if your Postgres container is running elsewhere
DB_URL = "postgresql+psycpg://ai:ai@localhost:5532/ai"
```

```

agent = Agent(
 model=VLLM(id="microsoft/Phi-3-mini-128k-instruct"
),
 db=PostgresDb(db_url=DB_URL),
 enable_user_memories=True,
 enable_session_summaries=True,
)

-*- Share personal information
agent.print_response("My name is john billings?", stream=True)
-*- Print memories and summary
if agent.db:
 pprint(agent.get_user_memories(user_id="test_user"
))
 pprint(
 agent.get_session(session_id="test_session").summa
ry # type: ignore
)

-*- Share personal information
agent.print_response("I live in nyc?", stream=True)
-*- Print memories and summary
if agent.db:
 pprint(agent.get_user_memories(user_id="test_user"
))
 pprint(
 agent.get_session(session_id="test_session").summa
ry # type: ignore
)

-*- Share personal information
agent.print_response("I'm going to a concert tomorrow?", stream=True)
-*- Print memories and summary
if agent.db:
 pprint(agent.get_user_memories(user_id="test_user"
))
 pprint(
 agent.get_session(session_id="test_session").summa
ry # type: ignore
)

Ask about the conversation
agent.print_response(
 "What have we been talking about, do you know my name?", stream=True
)

```

Note:

Ensure Postgres database is running.

## Usage

```
Snippet file: "create-venv-step.mdx"
```

Step: Start Postgres database

```
./cookbook/scripts/run_pgvector.sh
```

Step: Install Libraries

```
pip install -U agno openai vllm sqlalchemy psycopy pgvector
```

Step: Start vLLM server

```
vllm serve microsoft/Phi-3-mini-128k-instruct \
 --dtype float32 \
 --enable-auto-tool-choice \
 --tool-call-parser pythonic
```

Step: Run Agent

```
python cookbook/models/vllm/memory.py
```

## Agent with Storage

Source: <https://docs.agno.com/examples/models/vllm/storage>

### Code

```
cookbook/models/vllm/db.py

from agno.agent import Agent
from agno.db.postgres import PostgresDb
from agno.models.vllm import VLLM
from agno.tools.duckduckgo import DuckDuckGoTools

Setup the database
db_url = "postgresql+psycopy://ai:ai@localhost:5532/ai"
db = PostgresDb(db_url=db_url)

agent = Agent(
 model=VLLM(id="Qwen/Qwen2.5-7B-Instruct"),
 db=db,
 tools=[DuckDuckGoTools()],
 add_history_to_context=True,
)

agent.print_response("How many people live in Canada?")
agent.print_response("What is their national anthem called?")
```

Note:

Ensure Postgres database is running.

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install Libraries

```
pip install -U agno openai vllm sqlalchemy psycpg ddgs
```

Step: Start Postgres database

```
./cookbook/scripts/run_pgvector.sh
```

Step: Start vLLM server

```
vllm serve Qwen/Qwen2.5-7B-Instruct \
 --enable-auto-tool-choice \
 --tool-call-parser hermes \
 --dtype float16 \
 --max-model-len 8192 \
 --gpu-memory-utilization 0.9
```

Step: Run Agent

```
python cookbook/models/vllm/db.py
```

## Structured Output

Source: [https://docs.agno.com/examples/models/vllm/structured\\_output](https://docs.agno.com/examples/models/vllm/structured_output)

## Code

```
cookbook/models/vllm/structured_output.py
from typing import List

from agno.agent import Agent
from agno.models.vllm import VLLM
from pydantic import BaseModel, Field

class MovieScript(BaseModel):
 name: str = Field(..., description="Give a name to this movie")
 setting: str = Field(
 ..., description="Provide a nice setting for a blockbuster movie."
)
```

```

ending: str = Field(
 ...,
 description="Ending of the movie. If not available, provide a happy ending.",
)
genre: str = Field(
 ...,
 description="Genre of the movie. If not available, select action, thriller or
romantic comedy.",
)
characters: List[str] = Field(..., description="Name of characters for this movie.")
storyline: str = Field(
 ..., description="3 sentence storyline for the movie. Make it exciting!"
)

agent = Agent(
 model=VLLM(id="Qwen/Qwen2.5-7B-Instruct", top_k=20, enable_thinking=False),
 description="You write movie scripts.",
 output_schema=MovieScript,
)

agent.print_response("Llamas ruling the world")

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install Libraries

```
pip install -U agno pydantic vllm openai
```

Step: Start vLLM server

```

vllm serve Qwen/Qwen2.5-7B-Instruct \
 --enable-auto-tool-choice \
 --tool-call-parser hermes \
 --dtype float16 \
 --max-model-len 8192 \
 --gpu-memory-utilization 0.9

```

Step: Run Agent

```
python cookbook/models/vllm/structured_output.py
```

## Agent with Tools

Source: [https://docs.agno.com/examples/models/vllm/tool\\_use](https://docs.agno.com/examples/models/vllm/tool_use)

## Code

```
cookbook/models/vllm/tool_use.py
"""Build a Web Search Agent using xAI."""

from agno.agent import Agent
from agno.models.vllm import VLLM
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=VLLM(
 id="NousResearch/Nous-Hermes-2-Mistral-7B-DPO", top_k=20, enable_thinking=False
),
 tools=[DuckDuckGoTools()],
 markdown=True,
)
agent.print_response("Whats happening in France?")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install Libraries

```
pip install -U agno openai vllm ddgs
```

Step: Start vLLM server

```
vllm serve NousResearch/Nous-Hermes-2-Mistral-7B-DPO \
 --enable-auto-tool-choice \
 --tool-call-parser hermes \
 --dtype float16 \
 --max-model-len 8192 \
 --gpu-memory-utilization 0.9
```

Step: Run Agent

```
python cookbook/models/vllm/tool_use.py
```

## Async Tool Use

Source: [https://docs.agno.com/examples/models/xai/async\\_tool\\_use](https://docs.agno.com/examples/models/xai/async_tool_use)

## Code

```
cookbook/models/xai/async_tool_use.py
"""Run `pip install ddgs` to install dependencies."""

import asyncio
```

```

from agno.agent import Agent
from agno.models.xai import xAI
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=xAI(id="grok-2"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)
asyncio.run(agent.aprint_response("Whats happening in France?", stream=True))

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export XAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U xai ddgs agno
```

Step: Run Agent

```
Mac
python cookbook/models/xai/async_tool_use.py
```

```
Windows
python cookbook/models/xai/async_tool_use.py
```

## Basic

Source: <https://docs.agno.com/examples/models/xai/basic>

## Code

```

cookbook/models/xai/basic.py
from agno.agent import Agent, RunOutput # noqa
from agno.models.xai import xAI

agent = Agent(model=xAI(id="grok-2"), markdown=True)

Get the response in a variable
run: RunOutput = agent.run("Share a 2 sentence horror story")
print(run.content)

```

```
Print the response in the terminal
agent.print_response("Share a 2 sentence horror story")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export XAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U xai agno
```

Step: Run Agent

```
Mac
python cookbook/models/xai/basic.py
```

```
Windows
python cookbook/models/xai/basic.py
```

## Async Basic Agent

Source: [https://docs.agno.com/examples/models/xai/basic\\_async](https://docs.agno.com/examples/models/xai/basic_async)

## Code

```
cookbook/models/xai/basic_async.py
import asyncio

from agno.agent import Agent, RunOutput
from agno.models.xai import xAI

agent = Agent(model=xAI(id="grok-3"), markdown=True)

Get the response in a variable
run: RunOutput = agent.run("Share a 2 sentence horror story")
print(run.content)

Print the response in the terminal
asyncio.run(agent.aprint_response("Share a 2 sentence horror story"))
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export XAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
python cookbook/models/xai/basic_async.py
```

## Async Streaming Agent

Source: [https://docs.agno.com/examples/models/xai/basic\\_async\\_stream](https://docs.agno.com/examples/models/xai/basic_async_stream)

## Code

```
cookbook/models/xai/basic_async_stream.py
import asyncio
from typing import Iterator

from agno.agent import Agent, RunOutputEvent
from agno.models.xai import xAI

agent = Agent(model=xAI(id="grok-3"), markdown=True)

Get the response in a variable
run_response: Iterator[RunOutputEvent] = agent.run("Share a 2 sentence horror story",
stream=True)
for chunk in run_response:
print(chunk.content)

Print the response in the terminal
asyncio.run(agent.aprint_response("Share a 2 sentence horror story", stream=True))
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export XAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U openai agno
```

Step: Run Agent

```
python cookbook/models/xai/basic_async_stream.py
```

## Basic Stream

Source: [https://docs.agno.com/examples/models/xai/basic\\_stream](https://docs.agno.com/examples/models/xai/basic_stream)

## Code

```
cookbook/models/xai/basic_stream.py
from typing import Iterator # noqa

```

## Image Agent

Source: [https://docs.agno.com/examples/models/xai/image\\_agent](https://docs.agno.com/examples/models/xai/image_agent)

### Code

```
cookbook/models/xai/image_agent.py
from agno.agent import Agent
from agno.media import Image
from agno.models.xai import xAI
from agno.tools.duckduckgo import DuckDuckGoTools

agent = Agent(
 model=xAI(id="grok-2-vision-latest"),
 tools=[DuckDuckGoTools()],
 markdown=True,
)

agent.print_response(
 "Tell me about this image and give me the latest news about it.",
 images=[
 Image(
 url="https://upload.wikimedia.org/wikipedia/commons/0/0c/GoldenGateBridge-001.jpg"
)
],
 stream=True,
)
```

### Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export XAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U xai ddgs agno
```

## Step: Run Agent

```
Mac
python cookbook/models/xai/image_agent.py
```

```
Windows
python cookbook/models/xai/image_agent.py
```

# Image Agent Bytes

Source: [https://docs.agno.com/examples/models/xai/image\\_agent\\_bytes](https://docs.agno.com/examples/models/xai/image_agent_bytes)

## Code

```
cookbook/models/xai/image_agent_bytes.py
from pathlib import Path

from agno.agent import Agent
from agno.media import Image
from agno.models.xai import xAI
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.utils.media import download_image

agent = Agent(

image_path = Path(__file__).parent.joinpath("sample.jpg")

download_image(
 url="https://upload.wikimedia.org/wikipedia/commons/0/0c/GoldenGateBridge-001.jpg",
 output_path=str(image_path),
)

Read the image file content as bytes
image_bytes = image_path.read_bytes()

agent.print_response(
 "Tell me about this image and give me the latest news about it.",
 images=[
 Image(content=image_bytes),
],
 stream=True,
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export XAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U xai ddgs agno
```

Step: Run Agent

```
Mac
python cookbook/models/xai/image_agent_bytes.py
```

```
Windows
python cookbook/models/xai/image_agent_bytes.py
```

## Live Search Agent

Source: [https://docs.agno.com/examples/models/xai/live\\_search\\_agent](https://docs.agno.com/examples/models/xai/live_search_agent)

## Code

```
cookbook/models/xai/live_search_agent.py
from agno.agent import Agent
from agno.models.xai.xai import xAI

agent = Agent(
 model=xAI(
 id="grok-3",
 search_parameters={
 "mode": "on",
 "max_search_results": 20,
 "return_citations": True,
 },
),
 markdown=True,
)
agent.print_response("Provide me a digest of world news in the last 24 hours.")
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export XAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U xai agno
```

Step: Run Agent

```
Mac
python cookbook/models/xai/live_search_agent.py

Windows
python cookbook/models/xai/live_search_agent.py
```

## Live Search Agent Stream

Source: [https://docs.agno.com/examples/models/xai/live\\_search\\_agent\\_stream](https://docs.agno.com/examples/models/xai/live_search_agent_stream)

### Code

```
cookbook/models/xai/live_search_agent_stream.py
from agno.agent import Agent
from agno.models.xai.xai import xAI

agent = Agent(
 model=xAI(
 id="grok-3",
 search_parameters={
 "mode": "on",
 "max_search_results": 20,
 "return_citations": True,
 },
),
 markdown=True,
)
agent.print_response(
 "Provide me a digest of world news in the last 24 hours.", stream=True
)
```

### Usage

```
Snippet file: "create-venv-step.mdx"
```

Step: Set your API key

```
export XAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U xai agno
```

Step: Run Agent

# Mac

```
python cookbook/models/xai/live_search_agent_stream.py
```

# Windows

```
python cookbook/models/xai/live_search_agent_stream.py
```

## Reasoning Agent

Source: [https://docs.agno.com/examples/models/xai/reasoning\\_agent](https://docs.agno.com/examples/models/xai/reasoning_agent)

### Code

```
cookbook/models/xai/reasoning_agent.py
from agno.agent import Agent
from agno.models.xai import xAI
from agno.tools.reasoning import ReasoningTools
from agno.tools.yfinance import YFinanceTools

reasoning_agent = Agent(

## Airbnb Mcp

Source: [https://docs.agno.com/examples/use-cases/agents/airbnb\\_mcp](https://docs.agno.com/examples/use-cases/agents/airbnb_mcp)

MCP Airbnb Agent - Search for Airbnb listings!

This example shows how to create an agent that uses MCP and Llama 4 to search for Airbnb listings.

## Code

```
cookbook/examples/agents/airbnb_mcp.py
import asyncio
from textwrap import dedent

from agno.agent import Agent
from agno.models.groq import Groq
from agno.tools.mcp import MCPTools
from agno.tools.reasoning import ReasoningTools

async def run_agent(message: str) -> None:
 async with MCPTools(
 "npx -y @openbnb/mcp-server-airbnb --ignore-robots-txt"
) as mcp_tools:
 agent = Agent(
 model=Groq(id="meta-llama/llama-4-scout-17b-16e-instruct"),
 tools=[ReasoningTools(add_instructions=True), mcp_tools],
 instructions=dedent("""\
 ## General Instructions
 - Always start by using the think tool to map out the steps needed to complete the task.
 - After receiving tool results, use the think tool as a scratchpad to validate the results for correctness
 - Before responding to the user, use the think tool to jot down final thoughts and ideas.
 - Present final outputs in well-organized tables whenever possible.
 - Always provide links to the listings in your response.
```

- Show your top 10 recommendations in a table and make a case for why each is the best choice.

```
Using the think tool
At every step, use the think tool as a scratchpad to:
- Restate the object in your own words to ensure full comprehension.
- List the specific rules that apply to the current request
- Check if all required information is collected and is valid
- Verify that the planned action completes the task\
"""),
add_datetime_to_context=True,
markdown=True,
)
await agent.aprint_response(message, stream=True)

if __name__ == "__main__":
 task = dedent("""\
 I'm traveling to San Francisco from April 20th - May 8th. Can you find me the best
 deals for a 1 bedroom apartment?
 I'd like a dedicated workspace and close proximity to public transport.\
 """)
 asyncio.run(run_agent(task))
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GROQ_API_KEY=xxx
```

Step: Install libraries

```
pip install -U groq mcp agno
```

Step: Run Agent

```
Mac
python cookbook/examples/agents/airbnb_mcp.py
```

```
Windows
python cookbook/examples/agents/airbnb_mcp.py
```

## Books Recommender

Source: <https://docs.agno.com/examples/use-cases/agents/books-recommender>

This example shows how to create an intelligent book recommendation system that provides comprehensive literary suggestions based on your preferences. The agent combines book databases, ratings, reviews, and upcoming releases to deliver personalized reading recommendations.

Example prompts to try:

- \* "I loved 'The Seven Husbands of Evelyn Hugo' and 'Daisy Jones & The Six', what should I read next?"
- \* "Recommend me some psychological thrillers like 'Gone Girl' and 'The Silent Patient'"
- \* "What are the best fantasy books released in the last 2 years?"
- \* "I enjoy historical fiction with strong female leads, any suggestions?"
- \* "Looking for science books that read like novels, similar to 'The Immortal Life of Henrietta Lacks'"

## Code

```
books_recommender.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.exa import ExaTools

book_recommendation_agent = Agent(
 name="Shelfie",
 tools=[ExaTools()],
 model=OpenAIChat(id="gpt-5-mini"),
 description=dedent("""\
 You are Shelfie, a passionate and knowledgeable literary curator with expertise in
 books worldwide!

 Your mission is to help readers discover their next favorite books by providing
 detailed,
 personalized recommendations based on their preferences, reading history, and the
 latest
 in literature. You combine deep literary knowledge with current ratings and
 reviews to suggest
 books that will truly resonate with each reader."""),
 instructions=dedent("""\
 Approach each recommendation with these steps:

 1. Analysis Phase
 - Understand reader preferences from their input
 - Consider mentioned favorite books' themes and styles
 - Factor in any specific requirements (genre, length, content warnings)

 2. Search & Curate
 - Use Exa to search for relevant books
 - Ensure diversity in recommendations
 - Verify all book data is current and accurate
```

### 3. Detailed Information

- Book title and author
- Publication year
- Genre and subgenres
- Goodreads/StoryGraph rating
- Page count
- Brief, engaging plot summary
- Content advisories
- Awards and recognition

### 4. Extra Features

- Include series information if applicable
- Suggest similar authors
- Mention audiobook availability
- Note any upcoming adaptations

#### Presentation Style:

- Use clear markdown formatting
- Present main recommendations in a structured table
- Group similar books together
- Add emoji indicators for genres ( )
- Minimum 5 recommendations per query
- Include a brief explanation for each recommendation
- Highlight diversity in authors and perspectives
- Note trigger warnings when relevant"""),

markdown=True,

add\_datetime\_to\_context=True,

)

# Example usage with different types of book queries

book\_recommendation\_agent.print\_response(

"I really enjoyed 'Anxious People' and 'Lessons in Chemistry', can you suggest similar books?",

stream=True,

)

# More example prompts to explore:

"""

Genre-specific queries:

1. "Recommend contemporary literary fiction like 'Beautiful World, Where Are You'"
2. "What are the best fantasy series completed in the last 5 years?"
3. "Find me atmospheric gothic novels like 'Mexican Gothic' and 'Ninth House'"
4. "What are the most acclaimed debut novels from this year?"

Contemporary Issues:

1. "Suggest books about climate change that aren't too depressing"
2. "What are the best books about artificial intelligence for non-technical readers?"
3. "Recommend memoirs about immigrant experiences"
4. "Find me books about mental health with hopeful endings"

Book Club Selections:

1. "What are good book club picks that spark discussion?"
2. "Suggest literary fiction under 350 pages"
3. "Find thought-provoking novels that tackle current social issues"
4. "Recommend books with multiple perspectives/narratives"

Upcoming Releases:

1. "What are the most anticipated literary releases next month?"
  2. "Show me upcoming releases from my favorite authors"
  3. "What debut novels are getting buzz this season?"
  4. "List upcoming books being adapted for screen"
- ""

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install required libraries

```
pip install openai exa_py agno
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
export EXA_API_KEY=****
```

Step: Run the agent

```
python books_recommender.py
```

## Competitor Analysis Agent

Source: [https://docs.agno.com/examples/use-cases/agents/competitor\\_analysis\\_agent](https://docs.agno.com/examples/use-cases/agents/competitor_analysis_agent)

This example demonstrates how to build a sophisticated competitor analysis agent that combines powerful search and scraping capabilities with advanced reasoning tools to provide comprehensive competitive intelligence. The agent performs deep analysis of competitors including market positioning, product offerings, and strategic insights.

Key capabilities:

- \* Company discovery using Firecrawl search
- \* Website scraping and content analysis
- \* Competitive intelligence gathering
- \* SWOT analysis with reasoning
- \* Strategic recommendations
- \* Structured thinking and analysis

Example queries to try:

- \* "Analyze OpenAI's main competitors in the LLM space"
- \* "Compare Uber vs Lyft in the ride-sharing market"
- \* "Analyze Tesla's competitive position vs traditional automakers"
- \* "Research fintech competitors to Stripe"
- \* "Analyze Nike vs Adidas in the athletic apparel market"

## Code

```
cookbook/examples/agents/competitor_analysis_agent
.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.firecrawl import FirecrawlTools

 ReasoningTools(
 add_instructions=True,
),
],
 instructions=[
 "1. Initial Research & Discovery:",
 " - Use search tool to find information about the target company",
 " - Search for '[company name] competitors', 'companies like [company name]'",
 " - Search for industry reports and market analysis",
 " - Use the think tool to plan your research approach",
 "2. Competitor Identification:",
 " - Search for each identified competitor using Firecrawl",
 " - Find their official websites and key information sources",
 " - Map out the competitive landscape",
 "3. Website Analysis:",
 " - Scrape competitor websites using Firecrawl",
 " - Map their site structure to understand their offerings",
 " - Extract product information, pricing, and value propositions",
```

```

 " - Look for case studies and customer testimonials",
"4. Deep Competitive Analysis:",
 " - Use the analyze tool after gathering information on each competitor",
 " - Compare features, pricing, and market positioning",
 " - Identify patterns and competitive dynamics",
 " - Think through the implications of your findings",
"5. Strategic Synthesis:",
 " - Conduct SWOT analysis for each major competitor",
 " - Use reasoning to identify competitive advantages",
 " - Analyze market trends and opportunities",
 " - Develop strategic recommendations",
"- Always use the think tool before starting major research phases",
"- Use the analyze tool to process findings and draw insights",
"- Search for multiple perspectives on each competitor",
"- Verify information by checking multiple sources",
"- Be thorough but focused in your analysis",
"- Provide evidence-based recommendations",
],
expected_output=dedent("""\

# Deep Knowledge

Source: [https://docs.agno.com/examples/use-cases/agents/deep\\_knowledge](https://docs.agno.com/examples/use-cases/agents/deep_knowledge)

This agent performs iterative searches through its knowledge base, breaking down complex queries into sub-questions, and synthesizing comprehensive answers. It's designed to explore topics deeply and thoroughly by following chains of reasoning.

In this example, the agent uses the Agno documentation as a knowledge base

## Key Features:

- \* Iteratively searches a knowledge base
- \* Source attribution and citations

## Code

```
cookbook/examples/agents/deep_knowledge.py
from textwrap import dedent
from typing import List, Optional

import inquirer
import typer
from agno.agent import Agent
from agno.db.base import SessionType
from agno.db.sqlite import SqliteDb
from agno.knowledge.embedder.openai import OpenAIEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.models.openai import OpenAIChat
from agno.vectordb.lancedb import LanceDb, SearchType
from rich import print

def initialize_knowledge_base():
 """Initialize the knowledge base with your preferred documentation or knowledge source
 Here we use Agno docs as an example, but you can replace with any relevant URLs
 """

You are DeepKnowledge, an advanced reasoning agent designed to provide thorough,
well-researched answers to any query by searching your knowledge base.

Your strengths include:
- Breaking down complex topics into manageable components
- Connecting information across multiple domains
- Providing nuanced, well-researched answers
- Maintaining intellectual honesty and citing sources
- Explaining complex concepts in clear, accessible terms"""),
 instructions=dedent("""\
Your mission is to leave no stone unturned in your pursuit of the correct answer.

To achieve this, follow these steps:
1. Analyze the input and break it down into key components.
2. Search terms: You must identify at least 3-5 key search terms to search
for.
3. Initial Search: Searching your knowledge base for relevant information. You
must make atleast 3 searches to get all relevant information.
4. Evaluation: If the answer from the knowledge base is incomplete, ambiguous,
or insufficient - Ask the user for clarification. Do not make informed guesses.
5. Iterative Process:
- Continue searching your knowledge base till you have a comprehensive answer.
- Reevaluate the completeness of your answer after each search iteration.
- Repeat the search process until you are confident that every aspect of the
question is addressed.
4. Reasoning Documentation: Clearly document your reasoning process:
- Note when additional searches were triggered.
```

- Indicate which pieces of information came from the knowledge base and where it was sourced from.

- Explain how you reconciled any conflicting or ambiguous information.

5. **\*\*Final Synthesis:\*\*** Only finalize and present your answer once you have verified it through multiple search passes.

Include all pertinent details and provide proper references.

6. **\*\*Continuous Improvement:\*\*** If new, relevant information emerges even after presenting your answer,

be prepared to update or expand upon your response.

**\*\*Communication Style:\*\***

- Use clear and concise language.

- Organize your response with numbered steps, bullet points, or short paragraphs as needed.

- Be transparent about your search process and cite your sources.

- Ensure that your final answer is comprehensive and leaves no part of the query unaddressed.

Remember: **\*\*Do not finalize your answer until every angle of the question has been explored.\*\***"""),

8. "How can I implement custom knowledge sources?"
"""

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=****
```

Step: Install libraries

```
pip install -U agno openai lancedb tantivy inquirer
```

Step: Run Agent

```
Mac
python cookbook/examples/agents/deep_knowledge.py
```

```
Windows
python cookbook/examples/agents/deep_knowledge.py
```

## Deep Research Agent

Source: [https://docs.agno.com/examples/use-cases/agents/deep\\_research\\_agent\\_exa](https://docs.agno.com/examples/use-cases/agents/deep_research_agent_exa)

This example demonstrates how to use the Exa research tool for complex, structured research tasks with automatic citation tracking.

### Code

```
cookbook/examples/agents/deep_research_agent_exa.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.exa import ExaTools

agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[ExaTools(research=True, research_model="exa-research-pro")],
 instructions=dedent("""
 You are an expert research analyst with access to advanced research tools.

 When you are given a schema to use, pass it to the research tool as output_schema
 parameter to research tool.

 The research tool has two parameters:
 - instructions (str): The research topic/question
 - output_schema (dict, optional): A JSON schema for structured output

 Example: If user says "Research X. Use this schema {'type': 'object', ...}", you
 must call research tool with the schema.

 If no schema is provided, the tool will auto-infer an appropriate schema.

 Present the findings exactly as provided by the research tool.
 """),
)

Example 1: Basic research with simple string
agent.print_response(
 "Perform a comprehensive research on the current flagship GPUs from NVIDIA, AMD and Intel. Return a table of model name, MSRP USD, TDP watts, and launch date. Include citations for each cell."
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
export EXA_API_KEY=xxx
```

Step: Install libraries

```
pip install -U agno openai exa_py
```

Step: Run Agent

```
Mac
python cookbook/examples/agents/deep_research_agent_exa.py

Windows
python cookbook/examples/agents/deep_research_agent_exa.py
```

## Legal Consultant

Source: [https://docs.agno.com/examples/use-cases/agents/legal\\_consultant](https://docs.agno.com/examples/use-cases/agents/legal_consultant)

This example demonstrates how to create a specialized AI agent that provides legal information and guidance based on a knowledge base of legal documents. The Legal Consultant agent is designed to help users understand legal concepts, consequences, and procedures by leveraging a vector database of legal content.

Key Features:

- \* Legal Knowledge Base: Integrates with a PostgreSQL vector database containing legal documents and resources
- \* Document Processing: Automatically ingests and indexes legal PDFs from authoritative sources (e.g., Department of Justice manuals)
- \* Contextual Responses: Provides relevant legal information with proper citations and sources
- \* Professional Disclaimers: Always clarifies that responses are for informational purposes only, not professional legal advice
- \* Attorney Referrals: Recommends consulting licensed attorneys for specific legal situations

Use Cases:

- \* Legal research and education

- \* Understanding criminal penalties and consequences
- \* Learning about legal procedures and requirements
- \* Getting preliminary legal information before consulting professionals

## Code

```
cookbook/examples/agents/legal_consultant.py
import asyncio

from agno.agent import Agent
from agno.knowledge.knowledge import Knowledge
from agno.models.openai import OpenAIChat
from agno.vectordb.pgvector import PgVector

db_url = "postgresql+psycpg://ai:ai@localhost:5532/ai"

knowledge = Knowledge(
 vector_db=PgVector(table_name="legal_docs", db_url=db_url),
)

asyncio.run(
 knowledge.add_content_async(
 url="https://www.justice.gov/d9/criminal-ccips/leg
acy/2015/01/14/ccmanual_0.pdf",
)
)

legal_agent = Agent(
 name="LegalAdvisor",
 knowledge=knowledge,
 search_knowledge=True,
 model=OpenAIChat(id="gpt-5-mini"),
 markdown=True,
 instructions=[
 "Provide legal information and advice based on the knowledge base.",
 "Include relevant legal citations and sources when answering questions.",
 "Always clarify that you're providing general legal information, not professional
legal advice.",
 "Recommend consulting with a licensed attorney for specific legal situations.",
],
)

legal_agent.print_response(
 "What are the legal consequences and criminal penalties for spoofing Email Address?",
 stream=True,
)
```

## Usage

```
Snippet file: "create-venv-step.mdx"
```

Step: Set your API key

```
export OPENAI_API_KEY=xxx
```

Step: Install libraries

```
pip install -U agno sqlalchemy openai psycpg
```

Step: Run Agent

```
Mac
```

```
python cookbook/examples/agents/legal_consultant.py
```

```
Windows
```

```
python cookbook/examples/agents/legal_consultant.py
```

## Media Trend Analysis Agent

Source: [https://docs.agno.com/examples/use-cases/agents/media\\_trend\\_analysis\\_agent](https://docs.agno.com/examples/use-cases/agents/media_trend_analysis_agent)

The Media Trend Analysis Agent Example demonstrates a sophisticated AI-powered tool designed to analyze media trends, track digital conversations, and provide actionable insights across various online platforms. This agent combines web search capabilities with content scraping to deliver comprehensive trend analysis reports.

### What It Does

This agent specializes in:

- \* Trend Identification: Detects emerging patterns and shifts in media coverage
- \* Source Analysis: Identifies key influencers and authoritative sources
- \* Data Extraction: Gathers information from news sites, social platforms, and digital media
- \* Insight Generation: Provides actionable recommendations based on trend analysis
- \* Future Forecasting: Predicts potential developments based on current patterns

### Key Features

- \* Multi-Source Analysis: Combines Exa search tools with Firecrawl scraping capabilities
- \* Intelligent Filtering: Uses keyword-based searches with date filtering for relevant results
- \* Smart Scraping: Only scrapes content when search results are insufficient
- \* Structured Reporting: Generates comprehensive markdown reports with executive summaries
- \* Real-time Data: Analyzes current trends with configurable time windows

## Code

```
cookbook/examples/agents/media_trend_analysis_agent.py
"""Please install dependencies using:
pip install openai exa-py agno firecrawl
"""

from datetime import datetime, timedelta
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.exa import ExaTools
from agno.tools.firecrawl import FirecrawlTools

def calculate_start_date(days: int) -> str:
 """Calculate start date based on number of days."""
 start_date = datetime.now() - timedelta(days=days)
 return start_date.strftime("%Y-%m-%d")

agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[
 ExaTools(start_published_date=calculate_start_date(
30), type="keyword"),
 FirecrawlTools(scrape=True),
],
 description=dedent("""\
 You are an expert media trend analyst specializing in:
 1. Identifying emerging trends across news and digital platforms
 2. Recognizing pattern changes in media coverage
 3. Providing actionable insights based on data
 4. Forecasting potential future developments
 """),
 instructions=[
 "Analyze the provided topic according to the user's specifications:",
 "1. Use keywords to perform targeted searches",
 "2. Identify key influencers and authoritative sources",
 "3. Extract main themes and recurring patterns",
 "4. Provide actionable recommendations",
 "5. if got sources less then 2, only then scrape them using firecrawl tool, dont
crawl it and use them to generate the report",
 "6. growth rate should be in percentage , and if not possible dont give growth
rate",
],
 expected_output=dedent("""\
 # Media Trend Analysis Report

 ## Executive Summary
 {High-level overview of findings and key metrics}
 """))
```

```

Trend Analysis
Volume Metrics
- Peak discussion periods: {dates}
- Growth rate: {percentage or dont show this}

Source Analysis
Top Sources
1. {Source 1}

2. {Source 2}

Actionable Insights
1. {Insight 1}
 - Evidence: {data points}
 - Recommended action: {action}

Future Predictions
1. {Prediction 1}
 - Supporting evidence: {evidence}

References
{Detailed source list with links}
"""),
markdown=True,
add_datetime_to_context=True,
)

Example usage:
analysis_prompt = """\
Analyze media trends for:
Keywords: ai agents
Sources: verge.com ,linkedin.com, x.com
"""

agent.print_response(analysis_prompt, stream=True)

Alternative prompt example
crypto_prompt = """\
Analyze media trends for:
Keywords: cryptocurrency, bitcoin, ethereum
Sources: coindesk.com, cointelegraph.com
"""

agent.print_response(crypto_prompt, stream=True)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
export EXA_API_KEY=xxx
export FIRECRAWL_API_KEY=xxx
```

### Step: Install libraries

```
pip install -U agno openai exa-py agno firecrawl
```

### Step: Run Agent

```
Mac
python cookbook/examples/agents/media_trend_analysis_agent.py

Windows
python cookbook/examples/agents/media_trend_analysis_agent.py
```

## Customization Options

You can customize the agent's behavior by:

- \* Adjusting Time Windows: Modify the `calculate_start_date()` function to analyze different time periods
- \* Adding Sources: Include additional websites or platforms in your analysis prompts
- \* Modifying Keywords: Change search terms to focus on specific topics or industries
- \* Customizing Output: Modify the `expected_output` template to match your reporting needs

## Example Prompts

Here are some additional prompt examples you can try:

```
Technology trends
tech_prompt = """\
Analyze media trends for:
Keywords: artificial intelligence, machine learning, automation
Sources: techcrunch.com, arstechnica.com, wired.com
"""
```

```
Business trends
business_prompt = """\
Analyze media trends for:
Keywords: remote work, digital transformation, sustainability
Sources: forbes.com, bloomberg.com, hbr.org
"""
```

```
Entertainment trends
entertainment_prompt = """\
```

```
Analyze media trends for:
Keywords: streaming, gaming, social media
Sources: variety.com, polygon.com, theverge.com
"""
```

## Meeting Summarizer Agent

Source: [https://docs.agno.com/examples/use-cases/agents/meeting\\_summarizer\\_agent](https://docs.agno.com/examples/use-cases/agents/meeting_summarizer_agent)

This agent uses OpenAITools (transcribe\\_audio, generate\\_image, generate\\_speech) to process a meeting recording, summarize it, visualize it, and create an audio summary.

## Code

```
cookbook/examples/agents/meeting_summarizer_agent.
```

```
py
```

```
"""Example: Meeting Summarizer & Visualizer Agent
```

This script uses OpenAITools (transcribe\\_audio, generate\\_image, generate\\_speech) to process a meeting recording, summarize it, visualize it, and create an audio summary.

```
Requires: pip install openai agno
```

```
"""
```

```
import base64
```

```
from pathlib import Path
```

```
from textwrap import dedent
```

```
from agno.agent import Agent
```

```
from agno.models.google import Gemini
```

```
from agno.tools.openai import OpenAITools
```

```
from agno.tools.reasoning import ReasoningTools
```

```
from agno.utils.media import download_file, save_base64_data
```

```
input_audio_url: str = (
 "https://agno-public.s3.us-east-1.amazonaws.com/de
mo_data/sample_audio.mp3"
)
```

```
local_audio_path = Path("tmp/meeting_recording.mp3")
print(f"Downloading file to local path: {local_audio_path}")
download_file(input_audio_url, local_audio_path)
```

```
meeting_agent: Agent = Agent(
 model=Gemini(id="gemini-2.0-flash"),
 tools=[OpenAITools(), ReasoningTools()],
 description=dedent("""\
 You are an efficient Meeting Assistant AI.
 Your purpose is to process audio recordings of meetings, extract key information,
 create a visual representation, and provide an audio summary.
```

```

 """),
 instructions=dedent("""\
 Follow these steps precisely:
 1. Receive the path to an audio file.
 2. Use the `transcribe_audio` tool to get the text transcription.
 3. Analyze the transcription and write a concise summary highlighting key
discussion points, decisions, and action items.
 4. Based *only* on the summary created in step 3, generating important meeting
points. This should be a essentially an overview of the summary's content properly ordered
and formatted in the form of meeting minutes.
 5. Convert the meeting minutes into an audio summary using the `generate_speech`
tool.
 """),
 markdown=True,
)

response = meeting_agent.run(
 f"Please process the meeting recording located at '{local_audio_path}'"
)
if response.audio:
 base64_audio = base64.b64encode(response.audio[0].content).decode
("utf-8")
 save_base64_data(base64_audio, Path("tmp/meeting_summary.mp3"))
 print(f"Meeting summary saved to: {Path('tmp/meeting_summary.mp3')}")

```

## Usage

Snippet file: "create-venv-step.mdx"

### Step: Set your API key

```

export OPENAI_API_KEY=xxx
export GOOGLE_API_KEY=xxx

```

### Step: Install libraries

```

pip install -U agno openai google-genai

```

### Step: Run Agent

```

Mac
python cookbook/examples/agents/meeting_summarizer_agent.
py

Windows
python cookbook/examples/agents/meeting_summarizer_agent.

```

# Movie Recommender

Source: <https://docs.agno.com/examples/use-cases/agents/movie-recommender>

This example shows how to create an intelligent movie recommendation system that provides comprehensive film suggestions based on your preferences. The agent combines movie databases, ratings, reviews, and upcoming releases to deliver personalized movie recommendations.

Example prompts to try:

- \* "Suggest thriller movies similar to Inception and Shutter Island"
- \* "What are the top-rated comedy movies from the last 2 years?"
- \* "Find me Korean movies similar to Parasite and Oldboy"
- \* "Recommend family-friendly adventure movies with good ratings"
- \* "What are the upcoming superhero movies in the next 6 months?"

## Code

```
movie_recommender.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.exa import ExaTools

movie_recommendation_agent = Agent(
 name="PopcornPal",
 tools=[ExaTools()],
 model=OpenAIChat(id="gpt-5-mini"),
 description=dedent("""\
 You are PopcornPal, a passionate and knowledgeable film curator with expertise in
 cinema worldwide!

 Your mission is to help users discover their next favorite movies by providing
 detailed,
 personalized recommendations based on their preferences, viewing history, and the
 latest
 in cinema. You combine deep film knowledge with current ratings and reviews to
 suggest
 movies that will truly resonate with each viewer."""),
 instructions=dedent("""\
 Approach each recommendation with these steps:
 1. Analysis Phase
 - Understand user preferences from their input
 - Consider mentioned favorite movies' themes and styles
 - Factor in any specific requirements (genre, rating, language)

 2. Search & Curate
 - Use Exa to search for relevant movies
```

- Ensure diversity in recommendations
- Verify all movie data is current and accurate

### 3. Detailed Information

- Movie title and release year
- Genre and subgenres
- IMDB rating (focus on 7.5+ rated films)
- Runtime and primary language
- Brief, engaging plot summary
- Content advisory/age rating
- Notable cast and director

### 4. Extra Features

- Include relevant trailers when available
- Suggest upcoming releases in similar genres
- Mention streaming availability when known

### Presentation Style:

- Use clear markdown formatting
- Present main recommendations in a structured table
- Group similar movies together
- Add emoji indicators for genres ( 🎬 )
- Minimum 5 recommendations per query
- Include a brief explanation for each recommendation

```
"""),
markdown=True,
add_datetime_to_context=True,
)
```

# Example usage with different types of movie queries

```
movie_recommendation_agent.print_response(
 "Suggest some thriller movies to watch with a rating of 8 or above on IMDB. "
 "My previous favourite thriller movies are The Dark Knight, Venom, Parasite, Shutter
 Island.",
 stream=True,
)
```

## More example prompts to explore:

Genre-specific queries:

1. "Find me psychological thrillers similar to Black Swan and Gone Girl"
2. "What are the best animated movies from Studio Ghibli?"
3. "Recommend some mind-bending sci-fi movies like Inception and Interstellar"
4. "What are the highest-rated crime documentaries from the last 5 years?"

International Cinema:

1. "Suggest Korean movies similar to Parasite and Train to Busan"
2. "What are the must-watch French films from the last decade?"

3. "Recommend Japanese animated movies for adults"
4. "Find me award-winning European drama films"

#### Family & Group Watching:

1. "What are good family movies for kids aged 8-12?"
2. "Suggest comedy movies perfect for a group movie night"
3. "Find educational documentaries suitable for teenagers"
4. "Recommend adventure movies that both adults and children would enjoy"

#### Upcoming Releases:

1. "What are the most anticipated movies coming out next month?"
2. "Show me upcoming superhero movie releases"
3. "What horror movies are releasing this Halloween season?"
4. "List upcoming book-to-movie adaptations"

## Usage

Snippet file: "create-venv-step.mdx"

#### Step: Install libraries

```
pip install openai exa_py agno
```

#### Step: Set environment variables

```
export OPENAI_API_KEY=****
export EXA_API_KEY=****
```

#### Step: Run the agent

```
python movie_recommender.py
```

## Readme Generator

Source: [https://docs.agno.com/examples/use-cases/agents/readme\\_generator](https://docs.agno.com/examples/use-cases/agents/readme_generator)

The README Generator Agent is an intelligent automation tool that creates comprehensive, professional README files for open source projects. This agent leverages the power of AI to analyze GitHub repositories and generate well-structured documentation automatically.

## Code

```
cookbook/examples/agents/readme_generator.py
```

```

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.github import GithubTools
from agno.tools.local_file_system import LocalFileSystemTools

readme_gen_agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 name="Readme Generator Agent",
 tools=[GithubTools(), LocalFileSystemTools()],
 markdown=True,
 instructions=[
 "You are readme generator agent",
 "You'll be given repository url or repository name from user."
 "You'll use the `get_repository` tool to get the repository details."
 "You have to pass the repo_name as argument to the tool. It should be in the
format of owner/repo_name. If given url extract owner/repo_name from it."
 "Also call the `get_repository_languages` tool to get the languages used in the
repository."
 "Write a useful README for a open source project, including how to clone and
install the project, run the project etc. Also add badges for the license, size of the
repo, etc"
 "Don't include the project's languages-used in the README"
 "Write the produced README to the local filesystem",
],
)

readme_gen_agent.print_response(
 "Get details of https://github.com/agno-agi/agno", markdown=True
)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```

export OPENAI_API_KEY=xxx
export GITHUB_ACCESS_TOKEN=xxx

```

Step: Install libraries

```

pip install -U agno PyGithub

```

Step: Run Agent

```

Mac
python cookbook/examples/agents/readme_generator.py

```

```
Windows
python cookbook/examples/agents/readme_generator.py
```

## Recipe Creator

Source: <https://docs.agno.com/examples/use-cases/agents/recipe-creator>

This example shows how to create an intelligent recipe recommendation system that provides detailed, personalized recipes based on your ingredients, dietary preferences, and time constraints. The agent combines culinary knowledge, nutritional data, and cooking techniques to deliver comprehensive cooking instructions.

Example prompts to try:

- \* "I have chicken, rice, and vegetables. What can I make in 30 minutes?"
- \* "Create a vegetarian pasta recipe with mushrooms and spinach"
- \* "Suggest healthy breakfast options with oats and fruits"
- \* "What can I make with leftover turkey and potatoes?"
- \* "Need a quick dessert recipe using chocolate and bananas"

## Code

```
recipe_creator.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.exa import ExaTools

recipe_agent = Agent(
 name="ChefGenius",
 tools=[ExaTools()],
 model=OpenAIChat(id="gpt-5-mini"),
 description=dedent("""\
 You are ChefGenius, a passionate and knowledgeable culinary expert with expertise
 in global cuisine!

 Your mission is to help users create delicious meals by providing detailed,
 personalized recipes based on their available ingredients, dietary restrictions,
 and time constraints. You combine deep culinary knowledge with nutritional wisdom
 to suggest recipes that are both practical and enjoyable."""),
 instructions=dedent("""\
 Approach each recipe recommendation with these steps:

 1. Analysis Phase
 - Understand available ingredients
 - Consider dietary restrictions
 - Note time constraints
```

- Factor in cooking skill level
  - Check for kitchen equipment needs
2. Recipe Selection
    - Use Exa to search for relevant recipes
    - Ensure ingredients match availability
    - Verify cooking times are appropriate
    - Consider seasonal ingredients
    - Check recipe ratings and reviews
  3. Detailed Information
    - Recipe title and cuisine type
    - Preparation time and cooking time
    - Complete ingredient list with measurements
    - Step-by-step cooking instructions
    - Nutritional information per serving
    - Difficulty level
    - Serving size
    - Storage instructions
  4. Extra Features
    - Ingredient substitution options
    - Common pitfalls to avoid
    - Plating suggestions
    - Wine pairing recommendations
    - Leftover usage tips
    - Meal prep possibilities

Presentation Style:

- Use clear markdown formatting
- Present ingredients in a structured list
- Number cooking steps clearly
- Add emoji indicators for:
  - Vegetarian
  - Vegan
  - Gluten-free
  - Contains nuts
  - Quick recipes
- Include tips for scaling portions
- Note allergen warnings
- Highlight make-ahead steps
- Suggest side dish pairings"""),

markdown=True,

add\_datetime\_to\_context=True,

)

# Example usage with different types of recipe queries

recipe\_agent.print\_response(

    "I have chicken breast, broccoli, garlic, and rice. Need a healthy dinner recipe that takes less than 45 minutes.",

    stream=True,

)

```
More example prompts to explore:
"""

Quick Meals:
1. "15-minute dinner ideas with pasta and vegetables"
2. "Quick healthy lunch recipes for meal prep"
3. "Easy breakfast recipes with eggs and avocado"
4. "No-cook dinner ideas for hot summer days"

Dietary Restrictions:
1. "Keto-friendly dinner recipes with salmon"
2. "Gluten-free breakfast options without eggs"
3. "High-protein vegetarian meals for athletes"
4. "Low-carb alternatives to pasta dishes"

Special Occasions:
1. "Impressive dinner party main course for 6 people"
2. "Romantic dinner recipes for two"
3. "Kid-friendly birthday party snacks"
4. "Holiday desserts that can be made ahead"

International Cuisine:
1. "Authentic Thai curry with available ingredients"
2. "Simple Japanese recipes for beginners"
3. "Mediterranean diet dinner ideas"
4. "Traditional Mexican recipes with modern twists"

Seasonal Cooking:
1. "Summer salad recipes with seasonal produce"
2. "Warming winter soups and stews"
3. "Fall harvest vegetable recipes"
4. "Spring picnic recipe ideas"

Batch Cooking:
1. "Freezer-friendly meal prep recipes"
2. "One-pot meals for busy weeknights"
3. "Make-ahead breakfast ideas"
4. "Bulk cooking recipes for large families"
"""
```

## Usage

```
Snippet file: "create-venv-step.mdx"
```

Step: Install required libraries

```
pip install agno openai exa_py
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
export EXA_API_KEY=****
```

Step: Run the agent

```
python recipe_creator.py
```

## Recipe Rag Image

Source: [https://docs.agno.com/examples/use-cases/agents/recipe\\_rag\\_image](https://docs.agno.com/examples/use-cases/agents/recipe_rag_image)

An agent that uses Llama 4 for multi-modal RAG and OpenAITools to create a visual, step-by-step image manual for a recipe.

## Code

```
cookbook/examples/agents/recipe_rag_image.py
import asyncio
from pathlib import Path

from agno.agent import Agent
from agno.knowledge.embedder.cohere import CohereEmbedder
from agno.knowledge.knowledge import Knowledge

from agno.models.groq import Groq
from agno.tools.openai import OpenAITools
from agno.utils.media import download_image
from agno.vectordb.pgvector import PgVector

knowledge = Knowledge(
 vector_db=PgVector(
 db_url="postgresql+psycopg://ai:ai@localhost:5532/ai",
 table_name="embed_vision_documents",
 embedder=CohereEmbedder(
 id="embed-v4.0",
),
),
)

asyncio.run(
 knowledge.add_content_async(
 url="https://agno-public.s3.amazonaws.com/recipes/ThaiRecipes.pdf",
)
)

agent = Agent(
 name="EmbedVisionRAGAgent",
```

```

 model=Groq(id="meta-llama/llama-4-scout-17b-16e-in
struct"),
 tools=[OpenAITools()],
 knowledge=knowledge,
 instructions=[
 "You are a specialized recipe assistant.",
 "When asked for a recipe:",
 "1. Search the knowledge base to retrieve the relevant recipe details.",
 "2. Analyze the retrieved recipe steps carefully.",
 "3. Use the `generate_image` tool to create a visual, step-by-step image manual
for the recipe.",
 "4. Present the recipe text clearly and mention that you have generated an
accompanying image manual. Add instructions while generating the image.",
],
 markdown=True,
)

agent.print_response(
 "What is the recipe for a Thai curry?",
)
response = agent.get_last_run_output()

if response.images:
 download_image(response.images[0].url, Path("tmp/recipe_image.png"))

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export GROQ_API_KEY=xxx
```

Step: Install libraries

```
pip install -U agno openai groq cohere
```

Step: Run Agent

# Mac

```
python cookbook/examples/agents/recipe_rag_image.py
```

# Windows

```
python cookbook/examples/agents/recipe_rag_image.py
```

## Reddit Post Generator

Source: <https://docs.agno.com/examples/use-cases/agents/re>

## ddit-post-generator

Reddit Post Generator is a team of agents that can research topics on the web and make posts for a subreddit on Reddit.

Create a file `reddit_post_generator_team.py` with the following code:

```
reddit_post_generator_team.py
from agno.agent import Agent
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.reddit import RedditTools

web_searcher = Agent(
 name="Web Searcher",
 role="Searches the web for information on a topic",
 description="An intelligent agent that performs comprehensive web searches to gather current and accurate information",
 tools=[DuckDuckGoTools()],
 instructions=[
 "1. Perform focused web searches using relevant keywords",
 "2. Filter results for credibility and recency",
 "3. Extract key information and main points",
 "4. Organize information in a logical structure",
 "5. Verify facts from multiple sources when possible",
 "6. Focus on authoritative and reliable sources",
],
)

reddit_agent = Agent(
 name="Reddit Agent",
 role="Uploads post on Reddit",
 description="Specialized agent for crafting and publishing engaging Reddit posts",
 tools=[RedditTools()],
 instructions=[
 "1. Get information regarding the subreddit",
 "2. Create attention-grabbing yet accurate titles",
 "3. Format posts using proper Reddit markdown",

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai praw ddgs
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
export REDDIT_CLIENT_ID=****
export REDDIT_CLIENT_SECRET=****
export REDDIT_USERNAME=****
export REDDIT_PASSWORD=****
```

Step: Run the agent

```
python reddit_post_generator_team.py
```

## Research Agent

Source: <https://docs.agno.com/examples/use-cases/agents/research-agent>

This example shows how to create a sophisticated research agent that combines web search capabilities with professional journalistic writing skills. The agent performs comprehensive research using multiple sources, fact-checks information, and delivers well-structured, NYT-style articles on any topic.

Key capabilities:

- \* Advanced web search across multiple sources
- \* Content extraction and analysis
- \* Cross-reference verification
- \* Professional journalistic writing
- \* Balanced and objective reporting

Example prompts to try:

- \* "Analyze the impact of AI on healthcare delivery and patient outcomes"
- \* "Report on the latest breakthroughs in quantum computing"
- \* "Investigate the global transition to renewable energy sources"
- \* "Explore the evolution of cybersecurity threats and defenses"
- \* "Research the development of autonomous vehicle technology"

## Code

```
research_agent.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.newspaper4k import Newspaper4kTools

Initialize the research agent with advanced journalistic capabilities
research_agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[DuckDuckGoTools(), Newspaper4kTools()],
 description=dedent("""\
 You are an elite investigative journalist with decades of experience at the New
 York Times.
 Your expertise encompasses:

 - Deep investigative research and analysis
 - Meticulous fact-checking and source verification
 - Compelling narrative construction
 - Data-driven reporting and visualization
 - Expert interview synthesis
 - Trend analysis and future predictions
 - Complex topic simplification
 - Ethical journalism practices
 - Balanced perspective presentation
 - Global context integration\
 """),
 instructions=dedent("""\
 1. Research Phase
 - Search for 10+ authoritative sources on the topic
 - Prioritize recent publications and expert opinions
 - Identify key stakeholders and perspectives

 2. Analysis Phase
 - Extract and verify critical information
 - Cross-reference facts across multiple sources
 - Identify emerging patterns and trends
 - Evaluate conflicting viewpoints
 """))
```

### 3. Writing Phase

- Craft an attention-grabbing headline
- Structure content in NYT style
- Include relevant quotes and statistics
- Maintain objectivity and balance
- Explain complex concepts clearly

### 4. Quality Control

- Verify all facts and attributions
- Ensure narrative flow and readability
- Add context where necessary
- Include future implications

"""),

expected\_output=dedent("""\

## Research Agent using Exa

Source: <https://docs.agno.com/examples/use-cases/agents/research-agent-exa>

This example shows how to create a sophisticated research agent that combines academic search capabilities with scholarly writing expertise. The agent performs thorough research using Exa's academic search, analyzes recent publications, and delivers well-structured, academic-style reports on any topic.

Key capabilities:

- \* Advanced academic literature search
- \* Recent publication analysis
- \* Cross-disciplinary synthesis
- \* Academic writing expertise
- \* Citation management

Example prompts to try:

- \* "Explore recent advances in quantum machine learning"
- \* "Analyze the current state of fusion energy research"
- \* "Investigate the latest developments in CRISPR gene editing"
- \* "Research the intersection of blockchain and sustainable energy"
- \* "Examine recent breakthroughs in brain-computer interfaces"

## Code

```
research_agent_exa.py
from datetime import datetime
from textwrap import dedent

from agno.agent import Agent

## Shopping Partner

Source: [https://docs.agno.com/examples/use-cases/agents/shopping\\_partner](https://docs.agno.com/examples/use-cases/agents/shopping_partner)

The Shopping Partner agent is an AI-powered product recommendation system that helps users find the perfect products based on their specific preferences and requirements. This agent specializes in:

- \* **Smart Product Matching:** Analyzes user preferences and finds products that best match their criteria, ensuring a minimum 50% match rate
- \* **Trusted Sources:** Searches only authentic e-commerce platforms like Amazon, Flipkart, Myntra, Meesho, Google Shopping, Nike, and other reputable websites
- \* **Real-time Availability:** Verifies that recommended products are in stock and available for purchase
- \* **Quality Assurance:** Avoids counterfeit or unverified products to ensure user safety
- \* **Detailed Information:** Provides comprehensive product details including price, brand, features, and key attributes
- \* **User-Friendly Formatting:** Presents recommendations in a clear, organized manner for easy understanding

This agent is particularly useful for:

- \* Finding specific products within budget constraints
- \* Discovering alternatives when preferred items are unavailable
- \* Getting personalized recommendations based on multiple criteria
- \* Ensuring purchases from trusted, legitimate sources
- \* Saving time in product research and comparison

## Code

```
cookbook/examples/agents/shopping_partner.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.exa import ExaTools

agent = Agent(
 name="shopping partner",
 model=OpenAIChat(id="gpt-5-mini"),
 instructions=[
 "You are a product recommender agent specializing in finding products that match user preferences.",
 "Prioritize finding products that satisfy as many user requirements as possible, but ensure a minimum match of 50%.",
 "Search for products only from authentic and trusted e-commerce websites such as Amazon, Flipkart, Myntra, Meesho, Google Shopping, Nike, and other reputable platforms.",
 "Verify that each product recommendation is in stock and available for purchase.",
 "Avoid suggesting counterfeit or unverified products.",
 "Clearly mention the key attributes of each product (e.g., price, brand, features) in the response.",
 "Format the recommendations neatly and ensure clarity for ease of user understanding.",
],
 tools=[ExaTools()],
)
agent.print_response(
 "I am looking for running shoes with the following preferences: Color: Black Purpose: Comfortable for long-distance running Budget: Under Rs. 10,000"
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
export EXA_API_KEY=xxx
```

Step: Install libraries

```
pip install -U agno openai exa_py
```

## Step: Run Agent

```

# Social Media Agent

Source: [https://docs.agno.com/examples/use-cases/agents/social\\_media\\_agent](https://docs.agno.com/examples/use-cases/agents/social_media_agent)

## Social Media Agent Example with Dummy Dataset

This example demonstrates how to create an agent that:

1. Analyzes a dummy dataset of tweets
2. Leverages LLM capabilities to perform sophisticated sentiment analysis
3. Provides insights about the overall sentiment around a topic

## Code

```
cookbook/examples/agents/social_media_agent.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.x import XTools
```

```
Create the social media analysis agent
```

```
social_media_agent = Agent(
 name="Social Media Analyst",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[
 XTools(
 include_post_metrics=True,
 wait_on_rate_limit=True,
)
],
```

```
 instructions="""
```

```
 You are a senior Brand Intelligence Analyst with a specialty in social-media listening
 on the X (Twitter) platform.
```

```
 Your job is to transform raw tweet content and engagement metrics into an
 executive-ready intelligence report that helps product, marketing, and support teams make
 data-driven decisions.
```

CORE RESPONSIBILITIES

1. Retrieve tweets with X tools that you have access to and analyze both the text and metrics such as likes, retweets, replies.
2. Classify every tweet as Positive / Negative / Neutral / Mixed, capturing the reasoning (e.g., praise for feature X, complaint about bugs, etc.).
3. Detect patterns in engagement metrics to surface:
  - Viral advocacy (high likes & retweets, low replies)
  - Controversy (low likes, high replies)
  - Influence concentration (verified or high-reach accounts driving sentiment)
4. Extract thematic clusters and recurring keywords covering:
  - Feature praise / pain points
  - UX / performance issues
  - Customer-service interactions
  - Pricing & ROI perceptions
  - Competitor mentions & comparisons
  - Emerging use-cases & adoption barriers
5. Produce actionable, prioritized recommendations (Immediate, Short-term, Long-term) that address the issues and pain points.
6. Supply a response strategy: which posts to engage, suggested tone & template, influencer outreach, and community-building ideas.

#### DELIVERABLE FORMAT (markdown)

##### ### 1 Executive Snapshot

Brand-health score (1-10)  
 Net sentiment ( % positive - % negative )  
 Top 3 positive & negative drivers  
 Red-flag issues that need urgent attention

##### ### 2 Quantitative Dashboard

|     | Sentiment | #Posts | %   | Avg Likes | Avg Retweets | Avg Replies | Notes |
|-----|-----------|--------|-----|-----------|--------------|-------------|-------|
| --- | -----     | -----  | --- | -----     | -----        | -----       |       |
| --: | -----     | -----  | --- | -----     | -----        | -----       |       |

( fill table )

##### ### 3 Key Themes & Representative Quotes

For each major theme list: description, sentiment trend, excerpted tweets (truncated), and key metrics.

##### ### 4 Competitive & Market Signals

Competitors referenced, sentiment vs. Agno  
 Feature gaps users mention  
 Market positioning insights

##### ### 5 Risk Analysis

Potential crises / viral negativity  
 Churn indicators  
 Trust & security concerns

##### ### 6 Opportunity Landscape

Features or updates that delight users

Advocacy moments & influencer opportunities  
Untapped use-cases highlighted by the community

#### ### 7 Strategic Recommendations

**\*\*Immediate (48 h)\*\*** - urgent fixes or comms  
**\*\*Short-term (1-2 wks)\*\*** - quick wins & tests  
**\*\*Long-term (1-3 mo)\*\*** - roadmap & positioning

#### ### 8 Response Playbook

For high-impact posts list: tweet-id/url, suggested response, recommended responder (e. g., support, PM, exec), and goal (defuse, amplify, learn).

#### ASSESSMENT & REASONING GUIDELINES

Weigh sentiment by engagement volume & author influence (verified == 1.5 weight).  
Use reply-to-like ratio > 0.5 as controversy flag.  
Highlight any coordinated or bot-like behaviour.  
Use the tools provided to you to get the data you need.

Remember: your insights will directly inform the product strategy, customer-experience efforts, and brand reputation. Be objective, evidence-backed, and solution-oriented.

```
""",
 markdown=True,
)
```

```
social_media_agent.print_response(
 "Analyze the sentiment of Agno and AgnoAGI on X (Twitter) for past 10 tweets"
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```
export OPENAI_API_KEY=xxx
export X_BEARER_TOKEN=xxx
export X_CONSUMER_KEY=xxx
export X_CONSUMER_SECRET=xxx
export X_ACCESS_TOKEN=xxx
export X_ACCESS_TOKEN_SECRET=xxx
```

Step: Install libraries

```
pip install -U agno openai tweepy
```

Step: Run Agent

```
Mac
python cookbook/examples/agents/social_media_agent.py

Windows
python cookbook/examples/agents/social_media_agent.py
```

## Startup Analyst Agent

Source: <https://docs.agno.com/examples/use-cases/agents/startup-analyst-agent>

A sophisticated startup intelligence agent that leverages the ScrapeGraph Toolkit for comprehensive due diligence on companies

Key capabilities:

- \* Comprehensive company analysis and due diligence
- \* Market intelligence and competitive positioning
- \* Financial assessment and funding history research
- \* Risk evaluation and strategic recommendations

## Code

```
startup_analyst_agent.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.scrapegraph import ScrapeGraphTools

startup_analyst = Agent(
 name="Startup Analyst",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[ScrapeGraphTools(markdownify=True, crawl=True, searchscraper=True)],
 instructions=dedent("""
 You are an elite startup analyst providing comprehensive due diligence
 for investment decisions.

 ANALYSIS FRAMEWORK:

 1. **Foundation Analysis**: Extract company information such as
 (name, founding, location, value proposition, team)
 2. **Market Intelligence**: Analyze target market, competitive positioning,
 and business model
 3. **Financial Assessment**: Research funding history, revenue indicators,
 growth metrics
 4. **Risk Evaluation**: Identify market, technology, team,
 and financial risks
 """))
```

**\*\*DELIVERABLES:\*\***

**\*\*Executive Summary\*\***

**\*\*Company Profile\*\***

- Business model and revenue streams
- Market opportunity and customer segments
- Team composition and expertise
- Technology and competitive advantages

**\*\*Financial & Growth Metrics\*\***

- Funding history and investor quality
- Revenue/traction indicators
- Growth trajectory and expansion plans
- Burn rate estimates (if available)

**\*\*Risk Assessment\*\***

- Market and competitive threats
- Technology and team dependencies
- Financial and regulatory risks

**\*\*Strategic Recommendations\*\***

- Investment thesis and partnership opportunities
- Competitive response strategies
- Key due diligence focus areas

**\*\*TOOL USAGE:\*\***

- **\*\*SmartScraper\*\***: Extract structured data from specific pages which include team, products, pricing, etc
- **\*\*Markdownify\*\***: Analyze content quality and messaging from key pages
- **\*\*Crawl\*\***: Comprehensive site analysis across multiple pages
- **\*\*SearchScraper\*\***: Find external information such as funding, news and executive backgrounds

**\*\*OUTPUT STANDARDS:\*\***

- Use clear headings and bullet points
- Include specific metrics and evidence
- Cite sources and confidence levels
- Distinguish facts from analysis
- Maintain professional, executive-level language
- Focus on actionable insights

Remember: Your analysis informs million-dollar decisions. Be thorough, accurate, and actionable.

## Study Partner

Source: <https://docs.agno.com/examples/use-cases/agents/study-partner>

### Description

This Study Partner agent demonstrates how to create an AI-powered study partner that combines multiple information sources and tools to provide comprehensive learning support. The agent showcases several key capabilities:

**Multi-tool Integration:** Combines Exa search tools for web research and YouTube tools for video content discovery, enabling the agent to access diverse learning resources.

**Personalized Learning Support:** Creates customized study plans based on user constraints (time available, current knowledge level, daily study hours) and learning preferences.

**Resource Curation:** Searches and recommends high-quality learning materials including documentation, tutorials, research papers, and community discussions from reliable sources.

**Interactive Learning:** Provides step-by-step explanations, practical examples, and hands-on project suggestions to reinforce understanding.

**Progress Tracking:** Designs structured study plans with clear milestones and deadlines to help users stay on track with their learning goals.

**Learning Strategy:** Offers tips on effective study techniques, time management, and motivation maintenance for sustained learning success.

This example is particularly useful for developers, students, or anyone looking to build AI agents

that can assist with educational content discovery, personalized learning path creation, and comprehensive study support across various subjects and skill levels.

## Code

```
cookbook/examples/agents/study_partner.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.exa import ExaTools
from agno.tools.youtube import YouTubeTools

study_partner = Agent(
 name="StudyScout", # Fixed typo in name
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[ExaTools(), YouTubeTools()],
 markdown=True,
 description="You are a study partner who assists users in finding resources, answering questions, and providing explanations on various topics.",
 instructions=[
 "Use Exa to search for relevant information on the given topic and verify information from multiple reliable sources.",
 "Break down complex topics into digestible chunks and provide step-by-step explanations with practical examples.",
 "Share curated learning resources including documentation, tutorials, articles, research papers, and community discussions.",
 "Recommend high-quality YouTube videos and online courses that match the user's learning style and proficiency level.",
 "Suggest hands-on projects and exercises to reinforce learning, ranging from beginner to advanced difficulty.",
 "Create personalized study plans with clear milestones, deadlines, and progress tracking.",
 "Provide tips for effective learning techniques, time management, and maintaining motivation.",
 "Recommend relevant communities, forums, and study groups for peer learning and networking.",
],
)
study_partner.print_response(
 "I want to learn about Postgres in depth. I know the basics, have 2 weeks to learn, and can spend 3 hours daily. Please share some resources and a study plan.",
 stream=True,
)
```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```

## Translation Agent

Source: [https://docs.agno.com/examples/use-cases/agents/translation\\_agent](https://docs.agno.com/examples/use-cases/agents/translation_agent)

This example demonstrates how to create an intelligent translation agent that goes beyond simple text translation. The agent:

- \* Translates text from one language to another
- \* Analyzes emotional content in the translated text
- \* Selects appropriate voices based on language and emotion
- \* Creates localized voices using Cartesia's voice localization tools
- \* Generates audio output with emotion-appropriate voice characteristics

The agent uses a step-by-step approach to ensure high-quality translation and voice generation, making it ideal for creating localized content that maintains the emotional tone of the original text.

## Code

```
cookbook/examples/agents/translation_agent.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.cartesia import CartesiaTools
from agno.utils.media import save_audio

agent_instructions = dedent(
 """Follow these steps SEQUENTIALLY to translate text and generate a localized voice
note:
 1. Identify the text to translate and the target language from the user request.
 2. Translate the text accurately to the target language. Keep this translated text for
the final audio generation step.
```

```

3. Analyze the emotion conveyed by the *translated* text (e.g., neutral, happy, sad,
angry, etc.).
4. Determine the standard 2-letter language code for the target language (e.g., 'fr'
for French, 'es' for Spanish).
5. Call the 'list_voices' tool to get a list of available Cartesia voices. Wait for
the result.
6. Examine the list of voices from the 'list_voices' result. Select the 'id' of an
existing voice that:
 a) Matches the target language code (from step 4).
 b) Best reflects the analyzed emotion (from step 3).
7. Call the 'localize_voice' tool to create a new voice. Provide the following
arguments:
 - 'voice_id': The 'base_voice_id' selected in step 6.
 - 'name': A suitable name for the new voice (e.g., "French Happy Female").
 - 'description': A description reflecting the language and emotion.
 - 'language': The target language code (from step 4).
 - 'original_speaker_gender': User specified gender or the selected base voice
gender.
 Wait for the result of this tool call.
8. Check the result of the 'localize_voice' tool call from step 8:
 a) If the call was successful and returned the details of the newly created voice,
extract the 'id' of this **new** voice. This is the 'final_voice_id'.
9. Call the 'text_to_speech' tool to generate the audio. Provide:
 - 'transcript': The translated text from step 2.
 - 'voice_id': The 'final_voice_id' determined in step 9.
"""
)

agent = Agent(
 name="Emotion-Aware Translator Agent",
 description="Translates text, analyzes emotion, selects a suitable voice,creates a
localized voice, and generates a voice note (audio file) using Cartesia TTStools.",
 instructions=agent_instructions,
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[CartesiaTools(voice_localize_enabled=True)]
,
)

agent.print_response(
 "Convert this phrase 'hello! how are you? Tell me more about the weather in Paris?' to
French and create a voice note"
)
response = agent.get_last_run_output()

print("\nChecking for Audio Artifacts on Agent...")

## Travel Agent

Source: <https://docs.agno.com/examples/use-cases/agents/travel-planner>

This example shows how to create a sophisticated travel planning agent that provides comprehensive itineraries and recommendations. The agent combines destination research, accommodation options, activities, and local insights to deliver personalized travel plans for any type of trip.

Example prompts to try:

- \* "Plan a 5-day cultural exploration trip to Kyoto for a family of 4"
- \* "Create a romantic weekend getaway in Paris with a \">\$2000 budget"
- \* "Organize a 7-day adventure trip to New Zealand for solo travel"
- \* "Design a tech company offsite in Barcelona for 20 people"
- \* "Plan a luxury honeymoon in Maldives for 10 days"

```
travel_planner.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.exa import ExaTools

travel_agent = Agent(
 name="Globe Hopper",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[ExaTools()],
```

```
markdown=True,
description=dedent("""\
 You are Globe Hopper, an elite travel planning expert with decades of experience!

 Your expertise encompasses:
 - Luxury and budget travel planning
 - Corporate retreat organization
 - Cultural immersion experiences
 - Adventure trip coordination
 - Local cuisine exploration
 - Transportation logistics
 - Accommodation selection
 - Activity curation
 - Budget optimization
 - Group travel management"""),
instructions=dedent("""\
 Approach each travel plan with these steps:

 1. Initial Assessment
 - Understand group size and dynamics
 - Note specific dates and duration
 - Consider budget constraints
 - Identify special requirements
 - Account for seasonal factors

 2. Destination Research
 - Use Exa to find current information
 - Verify operating hours and availability
 - Check local events and festivals
 - Research weather patterns
 - Identify potential challenges

 3. Accommodation Planning
 - Select locations near key activities
 - Consider group size and preferences
 - Verify amenities and facilities
 - Include backup options
 - Check cancellation policies

 4. Activity Curation
 - Balance various interests
 - Include local experiences
 - Consider travel time between venues
 - Add flexible backup options
 - Note booking requirements

 5. Logistics Planning
 - Detail transportation options
 - Include transfer times
 - Add local transport tips
 - Consider accessibility
 - Plan for contingencies
```

## 6. Budget Breakdown

- Itemize major expenses
- Include estimated costs
- Add budget-saving tips
- Note potential hidden costs
- Suggest money-saving alternatives

### Presentation Style:

- Use clear markdown formatting
- Present day-by-day itinerary
- Include maps when relevant
- Add time estimates for activities
- Use emojis for better visualization
- Highlight must-do activities
- Note advance booking requirements
- Include local tips and cultural notes"""),

expected\_output=dedent("""\

```
{Destination} Travel Itinerary
```

### ## Overview

- **Dates**: {dates}
- **Group Size**: {size}
- **Budget**: {budget}
- **Trip Style**: {style}

### ## Accommodation

{Detailed accommodation options with pros and cons}

### ## Daily Itinerary

#### ### Day 1

{Detailed schedule with times and activities}

#### ### Day 2

{Detailed schedule with times and activities}

[Continue for each day...]

### ## Budget Breakdown

- Accommodation: {cost}
- Activities: {cost}
- Transportation: {cost}
- Food & Drinks: {cost}
- Miscellaneous: {cost}

### ## Important Notes

{Key information and tips}

### ## Booking Requirements

{What needs to be booked in advance}

```

 ## Local Tips
 {Insider advice and cultural notes}

 Created by Globe Hopper
 Last Updated: {current_time}"""),
 add_datetime_to_context=True,
)

Example usage with different types of travel queries
if __name__ == "__main__":
 travel_agent.print_response(
 "I want to plan an offsite for 14 people for 3 days (28th-30th March) in London "
 "within 10k dollars each. Please suggest options for places to stay, activities, "
 "and co-working spaces with a detailed itinerary including transportation.",
 stream=True,
)

More example prompts to explore:
"""
Corporate Events:
1. "Plan a team-building retreat in Costa Rica for 25 people"
2. "Organize a tech conference after-party in San Francisco"

4. "Create an innovation workshop weekend in Stockholm"

Cultural Experiences:
1. "Plan a traditional arts and crafts tour in Kyoto"
2. "Design a food and wine exploration in Tuscany"
3. "Create a historical journey through Ancient Rome"
4. "Organize a festival-focused trip to India"

Adventure Travel:
1. "Plan a hiking expedition in Patagonia"
2. "Design a safari experience in Tanzania"
3. "Create a diving trip in the Great Barrier Reef"
4. "Organize a winter sports adventure in the Swiss Alps"

Luxury Experiences:
1. "Plan a luxury wellness retreat in the Maldives"
2. "Design a private yacht tour of the Greek Islands"
3. "Create a gourmet food tour in Paris"
4. "Organize a luxury train journey through Europe"
"""

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai exa_py agno
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
export EXA_API_KEY=****
```

Step: Run the agent

```
python travel_planner.py
```

## Tweet Analysis Agent

Source: <https://docs.agno.com/examples/use-cases/agents/tweet-analysis-agent>

An agent that analyzes tweets and provides comprehensive brand monitoring and sentiment analysis.

Key capabilities:

- \* Real-time tweet analysis and sentiment classification
- \* Engagement metrics analysis (likes, retweets, replies)
- \* Brand health monitoring and competitive intelligence
- \* Strategic recommendations and response strategies

## Code

```
social_media_agent.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.x import XTools

social_media_agent = Agent(
 name="Social Media Analyst",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[
 XTools(
 include_post_metrics=True,
 wait_on_rate_limit=True,
)
],
 instructions=dedent("""\
 You are a senior Brand Intelligence Analyst specializing in social media
 listening on X (Twitter).
 Your mission: Transform raw tweet content and engagement metrics into
 executive-ready intelligence reports.
```

#### Core Analysis Steps:

##### 1. Data Collection

- Retrieve tweets using X tools
- Analyze text content and engagement metrics
- Focus on likes, retweets, replies, and reach

##### 2. Sentiment Classification

- Classify each tweet: Positive/Negative/Neutral/Mixed
- Identify reasoning (feature praise, bug complaints, etc.)
- Weight by engagement volume and author influence

##### 3. Pattern Detection

- Viral advocacy (high likes & retweets, low replies)
- Controversy signals (low likes, high replies)
- Influencer impact and verified account activity

##### 4. Thematic Analysis

- Extract recurring keywords and themes
- Identify feature feedback and pain points
- Track competitor mentions and comparisons
- Spot emerging use cases

#### Report Format:

- Executive summary with brand health score (1-10)
- Key themes with representative quotes
- Risk analysis and opportunity identification
- Strategic recommendations (immediate/short-term/long-term)
- Response playbook for high-impact posts

#### Guidelines:

- Be objective and evidence-backed
- Focus on actionable insights
- Highlight urgent issues requiring attention
- Provide solution-oriented recommendations"""),

markdown=True,

)

```
social_media_agent.print_response(
```

```
 "Analyze the sentiment of Agno and AgnoAGI on X (Twitter) for past 10 tweets"
```

```
)
```

|                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```

## Web Extraction Agent

Source: [https://docs.agno.com/examples/use-cases/agents/web\\_extraction\\_agent](https://docs.agno.com/examples/use-cases/agents/web_extraction_agent)

This agent demonstrates how to build an intelligent web scraper that can extract comprehensive, structured information from any webpage. Using OpenAI's GPT-4 model and the Firecrawl tool, it transforms raw web content into organized, actionable data.

### Key Capabilities

- \* Page Metadata Extraction: Captures title, description, and key features
- \* Content Section Parsing: Identifies and extracts main content with headings
- \* Link Discovery: Finds important related pages and resources
- \* Contact Information: Locates contact details when available
- \* Contextual Metadata: Gathers additional site information for context

### Use Cases

- \* Research & Analysis: Quickly gather information from multiple web sources
- \* Competitive Intelligence: Monitor competitor websites and features
- \* Content Monitoring: Track changes and updates on specific pages
- \* Knowledge Base Building: Extract structured data for documentation
- \* Data Collection: Gather information for market research or analysis

The agent outputs structured data in a clean, organized format that makes web content easily digestible and actionable. It's particularly useful when you need to process large amounts of web content quickly and consistently.

## Code

```
cookbook/examples/agents/web_extraction_agent.py
from textwrap import dedent
from typing import Dict, List, Optional

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.firecrawl import FirecrawlTools
from pydantic import BaseModel, Field
from rich.pretty import pprint

class ContentSection(BaseModel):
 """Represents a section of content from the webpage."""

 heading: Optional[str] = Field(None, description="Section heading")
 content: str = Field(..., description="Section content text")

class PageInformation(BaseModel):
 """Structured representation of a webpage."""

 url: str = Field(..., description="URL of the page")
 title: str = Field(..., description="Title of the page")
 description: Optional[str] = Field(
 None, description="Meta description or summary of the page"
)
 features: Optional[List[str]] = Field(None, description="Key feature list")
 content_sections: Optional[List[ContentSection]] = Field(
 None, description="Main content sections of the page"
)
 links: Optional[Dict[str, str]] = Field(
 None, description="Important links found on the page with description"
)
 contact_info: Optional[Dict[str, str]] = Field(
 None, description="Contact information if available"
)
 metadata: Optional[Dict[str, str]] = Field(
 None, description="Important metadata from the page"
)
```

```

agent = Agent(
 model=OpenAIChat(id="gpt-4.1"),
 tools=[FirecrawlTools(scrape=True, crawl=True)],
 instructions=dedent("""
 You are an expert web researcher and content extractor. Extract comprehensive,
structured information
 from the provided webpage. Focus on:

 1. Accurately capturing the page title, description, and key features
 2. Identifying and extracting main content sections with their headings
 3. Finding important links to related pages or resources
 4. Locating contact information if available
 5. Extracting relevant metadata that provides context about the site

 Be thorough but concise. If the page has extensive content, prioritize the most
important information.
 """).strip(),
 output_schema=PageInformation,
)

result = agent.run("Extract all information from https://www.agno.com")
pprint(result.content)

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Set your API key

```

export OPENAI_API_KEY=xxx
export FIRECRAWL_API_KEY=xxx

```

Step: Install libraries

```

pip install -U agno firecrawl

```

Step: Run Agent

```

Mac
python cookbook/examples/agents/web_extraction_agent.py

## Youtube Agent

Source: <https://docs.agno.com/examples/use-cases/agents/yo>

## utube-agent

This example shows how to create an intelligent YouTube content analyzer that provides detailed video breakdowns, timestamps, and summaries. Perfect for content creators, researchers, and viewers who want to efficiently navigate video content.

Example prompts to try:

- \* "Analyze this tech review: \[video\\_url]"
- \* "Get timestamps for this coding tutorial: \[video\\_url]"
- \* "Break down the key points of this lecture: \[video\\_url]"
- \* "Summarize the main topics in this documentary: \[video\\_url]"
- \* "Create a study guide from this educational video: \[video\\_url]"

## Code

```
youtube_agent.py
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.youtube import YouTubeTools

youtube_agent = Agent(
 name="YouTube Agent",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[YouTubeTools()],
 instructions=dedent("""\
You are an expert YouTube content analyst with a keen eye for detail!
Follow these steps for comprehensive video analysis:

1. Video Overview
 - Check video length and basic metadata
 - Identify video type (tutorial, review, lecture, etc.)
 - Note the content structure

2. Timestamp Creation
 - Create precise, meaningful timestamps
 - Focus on major topic transitions
 - Highlight key moments and demonstrations
 - Format: [start_time, end_time, detailed_summary]

3. Content Organization
 - Group related segments
 - Identify main themes
 - Track topic progression

Your analysis style:
- Begin with a video overview
- Use clear, descriptive segment titles
- Include relevant emojis for content types:
 Educational
 Technical
```

```

 Gaming
 Tech Review
 Creative
 - Highlight key learning points
 - Note practical demonstrations
 - Mark important references

 Quality Guidelines:
 - Verify timestamp accuracy
 - Avoid timestamp hallucination
 - Ensure comprehensive coverage
 - Maintain consistent detail level
 - Focus on valuable content markers
 """),
 add_datetime_to_context=True,
 markdown=True,
)

Example usage with different types of videos
youtube_agent.print_response(
 "Analyze this video: https://www.youtube.com/watch?v=zjkBMFhNj_g",
 stream=True,
)

More example prompts to explore:
"""
Tutorial Analysis:
1. "Break down this Python tutorial with focus on code examples"
2. "Create a learning path from this web development course"
3. "Extract all practical exercises from this programming guide"
4. "Identify key concepts and implementation examples"

Educational Content:
1. "Create a study guide with timestamps for this math lecture"
2. "Extract main theories and examples from this science video"
3. "Break down this historical documentary into key events"
4. "Summarize the main arguments in this academic presentation"

Tech Reviews:
1. "List all product features mentioned with timestamps"
2. "Compare pros and cons discussed in this review"
3. "Extract technical specifications and benchmarks"
4. "Identify key comparison points and conclusions"

Creative Content:
1. "Break down the techniques shown in this art tutorial"
2. "Create a timeline of project steps in this DIY video"
3. "List all tools and materials mentioned with timestamps"
4. "Extract tips and tricks with their demonstrations"
"""

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai youtube_transcript_api agno
```

Step: Set environment variables

```
export OPENAI_API_KEY=xxx
```

Step: Run the agent

```
python youtube_agent.py
```

## AI Support Team

Source: [https://docs.agno.com/examples/use-cases/teams/ai\\_support\\_team](https://docs.agno.com/examples/use-cases/teams/ai_support_team)

This example illustrates how to create an AI support team that can route customer inquiries to the appropriate agent based on the nature of the inquiry.

### Code

```
cookbook/examples/teams/route_mode/ai_customer_support_team.py
from agno.agent import Agent

```

## Usage

Snippet file: "create-venv-step.mdx"

Step: Install required libraries

```
pip install agno exa_py slack_sdk pgvector psycopg ddgs
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
```

```
export SLACK_TOKEN=****
export EXA_API_KEY=****
```

Step: Run the agent

```
python cookbook/examples/teams/autonomous_startup_team.py
```

## Content Team

Source: [https://docs.agno.com/examples/use-cases/teams/content\\_team](https://docs.agno.com/examples/use-cases/teams/content_team)

This example shows how to create a content creation team with specialized researchers and writers using the coordinate mode.

## Code

```
cookbook/examples/teams/coordinate_mode/content_team.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.team import Team
from agno.tools.duckduckgo import DuckDuckGoTools

Create individual specialized agents
researcher = Agent(
 name="Researcher",
 role="Expert at finding information",
 tools=[DuckDuckGoTools()],
 model=OpenAIChat(id="gpt-5-mini"),
)

writer = Agent(
 name="Writer",
 role="Expert at writing clear, engaging content",
 model=OpenAIChat(id="gpt-5-mini"),
)

Create a team with these agents
content_team = Team(
 name="Content Team",
 members=[researcher, writer],
 instructions="You are a team of researchers and writers that work together to create high-quality content.",
 model=OpenAIChat(id="gpt-5-mini"),
 show_members_responses=True,
)

Run the team with a task
content_team.print_response("Create a short article about quantum computing")
```

## Usage

```
Snippet file: "create-venv-step.mdx"
```

Step: Install required libraries

```
pip install agno ddgs
```

Step: Set environment variables

```
export OPENAI_API_KEY=****
```

Step: Run the agent

```
python cookbook/examples/teams/content_team.py
```

## Collaboration Team

Source: [https://docs.agno.com/examples/use-cases/teams/discussion\\_team](https://docs.agno.com/examples/use-cases/teams/discussion_team)

This example shows how to create a collaboration team that allows multiple agents to work together on research topics using the collaborate mode. In Collaborate Mode, all team members are given the same task and the team leader synthesizes their outputs into a cohesive response.

## Code

```
cookbook/examples/teams/collaborate_mode/collaboration_team.py
import asyncio
from pathlib import Path
from textwrap import dedent

from agno.agent import Agent
from agno.models.openai import OpenAIChat

## Blog Post Generator

Source: <https://docs.agno.com/examples/use-cases/workflows/blog-post-generator>

This example demonstrates how to migrate from the similar workflows 1.0 example to workflows 2.0 structure.

This advanced example demonstrates how to build a sophisticated blog post generator that combines web research capabilities with professional writing expertise. The workflow uses a multi-stage approach:

1. Intelligent web research and source gathering
2. Content extraction and processing
3. Professional blog post writing with proper citations

Key capabilities:

- \* Advanced web research and source evaluation
- \* Content scraping and processing
- \* Professional writing with SEO optimization
- \* Automatic content caching for efficiency
- \* Source attribution and fact verification

Example blog topics to try:

- \* "The Rise of Artificial General Intelligence: Latest Breakthroughs"
- \* "How Quantum Computing is Revolutionizing Cybersecurity"
- \* "Sustainable Living in 2024: Practical Tips for Reducing Carbon Footprint"
- \* "The Future of Work: AI and Human Collaboration"
- \* "Space Tourism: From Science Fiction to Reality"
- \* "Mindfulness and Mental Health in the Digital Age"

\* "The Evolution of Electric Vehicles: Current State and Future Trends"

Run `pip install openai ddgs newspaper4k lxml_html_clean sqlalchemy agno` to install dependencies.

```
blog_post_generator.py
```

```
""" Blog Post Generator v2.0 - Your AI Content Creation Studio!
```

Snippet file: "create-venv-step.mdx"

Step: Install libraries

```
pip install openai ddgs newspaper4k lxml_html_clean sqlalchemy agno
```

Step: Run the workflow

```
python blog_post_generator.py
```

## Company Description Workflow

Source: <https://docs.agno.com/examples/use-cases/workflows/company-description>

A workflow that generates comprehensive supplier profiles by gathering information from multiple sources and delivers them via email.

## Overview

This workflow combines web crawling, search engines, Wikipedia, and competitor analysis to create detailed supplier profiles. It processes company information through 4 specialized agents running in parallel, then generates a structured markdown report and sends it via email.

The workflow uses workflow session state management to cache analysis results. If the same supplier is analyzed again, it returns cached results instead of re-running the expensive analysis pipeline.

## Getting Started

### Prerequisites

- \* OpenAI API key
- \* Resend API key for emails [\\[https://resend.com/api-keys \(https://resend.com/api-keys\)\]](https://resend.com/api-keys)
- \* Firecrawl API key for web crawling [\\[https://www.firecrawl.dev/app/api-keys\]](https://www.firecrawl.dev/app/api-keys)

(<https://www.firecrawl.dev/app/api-keys>)]

## Quick Setup

```
export OPENAI_API_KEY="your-openai-key"
export RESEND_API_KEY="your-resend-key"
export FIRECRAWL_API_KEY="your-firecrawl-key"
```

Install dependencies

```
pip install agno openai firecrawl-py resend
```

## Code Structure

This company description workflow consists of three main files:

### 1. Agents (agents.py)

Specialized agents for gathering information from multiple sources:

```
agents.py
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.firecrawl import FirecrawlTools
from agno.tools.wikipedia import WikipediaTools
from prompts import (
 COMPETITOR_INSTRUCTIONS,
 CRAWLER_INSTRUCTIONS,
 SEARCH_INSTRUCTIONS,
 SUPPLIER_PROFILE_INSTRUCTIONS_GENERAL,
 WIKIPEDIA_INSTRUCTIONS,
)
from pydantic import BaseModel

class SupplierProfile(BaseModel):
 supplier_name: str
 supplier_homepage_url: str
 user_email: str

crawl_agent: Agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[FirecrawlTools(crawl=True, limit=5)],
 instructions=CRAWLER_INSTRUCTIONS,
)

search_agent: Agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
```

```

 tools=[DuckDuckGoTools()],
 instructions=SEARCH_INSTRUCTIONS,
)

wikipedia_agent: Agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[WikipediaTools()],
 instructions=WIKIPEDIA_INSTRUCTIONS,
)

competitor_agent: Agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[DuckDuckGoTools()],
 instructions=COMPETITOR_INSTRUCTIONS,
)

profile_agent: Agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 instructions=SUPPLIER_PROFILE_INSTRUCTIONS_GENERAL
,
)

```

## 2. Prompts (prompts.py)

Detailed instructions for each specialized agent:

```

prompts.py
CRAWLER_INSTRUCTIONS = """
Your task is to crawl a website starting from the provided homepage URL. Follow these
guidelines:

1. Initial Access: Begin by accessing the homepage URL.
2. Comprehensive Crawling: Recursively traverse the website to capture every accessible
page and resource.
3. Data Extraction: Extract all available content, including text, images, metadata, and
embedded resources, while preserving the original structure and context.
4. Detailed Reporting: Provide an extremely detailed and comprehensive response, including
all extracted content without filtering or omissions.
5. Data Integrity: Ensure that the extracted content accurately reflects the website
without any modifications.
"""

SEARCH_INSTRUCTIONS = """
You are tasked with searching the web for information about a supplier. Follow these
guidelines:

1. Input: You will be provided with the name of the supplier.
2. Web Search: Perform comprehensive web searches to gather information about the
supplier.
3. Latest News: Search for the most recent news and updates regarding the supplier.
4. Information Extraction: From the search results, extract all relevant details about the

```

supplier.

5. Detailed Reporting: Provide an extremely verbose and detailed report that includes all relevant information without filtering or omissions.

"""

WIKIPEDIA\_INSTRUCTIONS = """

You are tasked with searching Wikipedia for information about a supplier. Follow these guidelines:

1. Input: You will be provided with the name of the supplier.
2. Wikipedia Search: Use Wikipedia to find comprehensive information about the supplier.
3. Data Extraction: Extract all relevant details available on the supplier, including history, operations, products, and any other pertinent information.
4. Detailed Reporting: Provide an extremely verbose and detailed report that includes all extracted content without filtering or omissions.

"""

COMPETITOR\_INSTRUCTIONS = """

You are tasked with finding competitors of a supplier. Follow these guidelines:

1. Input: You will be provided with the name of the supplier.
2. Competitor Search: Search the web for competitors of the supplier.
3. Data Extraction: Extract all relevant details about the competitors.
4. Detailed Reporting: Provide an extremely verbose and detailed report that includes all extracted content without filtering or omissions.

"""

SUPPLIER\_PROFILE\_INSTRUCTIONS\_GENERAL = """

You are a supplier profile agent. You are given a supplier name, results from the supplier homepage and search results regarding the supplier, and Wikipedia results regarding the supplier. You need to be extremely verbose in your response. Do not filter out any content.

You are tasked with generating a segment of a supplier profile. The segment will be provided to you. Make sure to format it in markdown.

General format:

Title: [Title of the segment]

[Segment]

Formatting Guidelines:

1. Ensure the profile is structured, clear, and to the point.
2. Avoid assumptions-only include verified details.
3. Use bullet points and short paragraphs for readability.
4. Cite sources where applicable for credibility.

Objective: This supplier profile should serve as a reliable reference document for businesses evaluating potential suppliers. The details should be extracted from official sources, search results, and any other reputable databases. The profile must provide an in-depth understanding of the supplier's operational, competitive, and financial position

to support informed decision-making.

"""

SUPPLIER\_PROFILE\_DICT = {

```
 "1. Supplier Overview": """Company Name: [Supplier Name]
Industry: [Industry the supplier operates in]
Headquarters: [City, Country]
Year Founded: [Year]
Key Offerings: [Brief summary of main products or services]
Business Model: [Manufacturing, Wholesale, B2B/B2C, etc.]
Notable Clients & Partnerships: [List known customers or business partners]
Company Mission & Vision: [Summary of supplier's goals and commitments]""",
 # "2. Website Content Summary": """Extract key details from the supplier's
official website:
 # Website URL: [Supplier's official website link]
 # Products & Services Overview:
 # - [List major product categories or services]
 # - [Highlight any specialized offerings]
 # Certifications & Compliance: (e.g., ISO, FDA, CE, etc.)
 # Manufacturing & Supply Chain Information:
 # - Factory locations, supply chain transparency, etc.
 # Sustainability & Corporate Social Responsibility (CSR):
 # - Environmental impact, ethical sourcing, fair labor practices
 # Customer Support & After-Sales Services:
 # - Warranty, return policies, support channels""",
 # "3. Search Engine Insights": """Summarize search results to provide additional
context on the supplier's market standing:
 # Latest News & Updates: [Any recent developments, funding rounds, expansions]
 # Industry Mentions: [Publications, blogs, or analyst reviews mentioning the supplier]
 # Regulatory Issues or Legal Disputes: [Any lawsuits, recalls, or compliance issues]
 # Competitive Positioning: [How the supplier compares to competitors in the
market]""",
 # "4. Key Contact Information": """Include publicly available contact details for
business inquiries:
 # Email: [Customer support, sales, or partnership email]
 # Phone Number: [+XX-XXX-XXX-XXXX]
 # Office Address: [Headquarters or regional office locations]
 # LinkedIn Profile: [Supplier's LinkedIn page]
 # Other Business Directories: [Crunchbase, Alibaba, etc.]""",
 # "5. Reputation & Reviews": """Analyze customer and partner feedback from
multiple sources:
 # Customer Reviews & Testimonials: [Summarized from Trustpilot, Google Reviews, etc.]
 # Third-Party Ratings: [Any industry-recognized rankings or awards]
 # Complaints & Risks: [Potential risks, delays, quality issues, or fraud warnings]
 # Social Media Presence & Engagement: [Activity on LinkedIn, Twitter, etc.]""",
 # "6. Additional Insights": """Pricing Model: [Wholesale, subscription, per-unit
pricing, etc.]
 # MOQ (Minimum Order Quantity): [If applicable]
 # Return & Refund Policies: [Key policies for buyers]
 # Logistics & Shipping: [Lead times, global shipping capabilities]""",
 # "7. Supplier Insight": """Provide a deep-dive analysis into the supplier's
```

market positioning and business strategy:

```
Market Trends: [How current market trends impact the supplier]
Strategic Advantages: [Unique selling points or competitive edge]
Challenges & Risks: [Any operational or market-related challenges]
Future Outlook: [Predicted growth or strategic initiatives]"""
"8. Supplier Profiles": """Create a comparative profile if multiple suppliers
are being evaluated:
Comparative Metrics: [Key differentiators among suppliers]
Strengths & Weaknesses: [Side-by-side comparison details]
Strategic Fit: [How each supplier aligns with potential buyer needs]"""
"9. Product Portfolio": """Detail the range and depth of the supplier's
offerings:
Major Product Lines: [Detailed listing of core products or services]
Innovations & Specialized Solutions: [Highlight any innovative products or custom
solutions]
Market Segments: [Industries or consumer segments served by the products]"""
"10. Competitive Intelligence": """Summarize the supplier's competitive
landscape:
Industry Competitors: [List of main competitors]
Market Share: [If available, indicate the supplier's market share]
Competitive Strategies: [Pricing, marketing, distribution, etc.]
Recent Competitor Moves: [Any recent competitive actions impacting the market]"""
"11. Supplier Quadrant": """Position the supplier within a competitive quadrant
analysis:
Quadrant Position: [Leader, Challenger, Niche Player, or Visionary]
Analysis Criteria: [Innovativeness, operational efficiency, market impact, etc.]
Visual Representation: [If applicable, describe or include a link to the quadrant
chart]"""
"12. SWOT Analysis": """Perform a comprehensive SWOT analysis:
Strengths: [Internal capabilities and competitive advantages]
Weaknesses: [Areas for improvement or potential vulnerabilities]
Opportunities: [External market opportunities or expansion potentials]
Threats: [External risks, competitive pressures, or regulatory challenges]"""
"13. Financial Risk Summary": """Evaluate the financial stability and risk
factors:
Financial Health: [Overview of revenue, profitability, and growth metrics]
Risk Factors: [Credit risk, market volatility, or liquidity issues]
Investment Attractiveness: [Analysis for potential investors or partners]"""
"14. Financial Information": """Provide detailed financial data (where publicly
available):
Revenue Figures: [Latest annual revenue, growth trends]
Profitability: [Net income, EBITDA, etc.]
Funding & Investment: [Details of any funding rounds, investor names]
Financial Reports: [Links or summaries of recent financial statements]
Credit Ratings: [If available, include credit ratings or financial stability
indicators]"""
}
```

### 3. Workflow Implementation (run\_workflow.py)

Complete workflow with parallel information gathering and email delivery:

```

run_workflow.py

 supplier_homepage_url="https://www.agno.com",
 user_email="yash@agno.com",
)
 company_description_workflow.print_response(
 input=supplier_profile_request,
)

```

## Key Features

- \* Parallel Processing: Four agents gather information simultaneously for maximum efficiency
- \* Multi-Source Data: Combines web crawling, search engines, Wikipedia, and competitor analysis
- \* Email Integration: Automatically sends formatted reports via email using Resend
- \* Markdown Formatting: Generates structured, readable reports in HTML format
- \* Modular Design: Clean separation of agents, prompts, and workflow logic
- \* Efficient Execution: Uses parallel steps to minimize execution time
- \* Type Safety: Pydantic models for structured data validation

## Usage Example

```
Create supplier profile request
supplier_request = SupplierProfile(
 supplier_name="Your Company Name",
 supplier_homepage_url="https://yourcompany.com",
 user_email="your.email@company.com",
)

Run the workflow
company_description_workflow.print_response(
 input=supplier_request,
)
```

## Expected Output

The workflow will:

1. Gather Information: Simultaneously crawl the website, search the web, check Wikipedia, and find competitors
2. Generate Profile: Create a comprehensive supplier profile with detailed sections
3. Send Email: Deliver the formatted HTML report to the specified email address

The generated supplier profile includes:

- \* Company overview and basic information
- \* Detailed analysis from multiple data sources
- \* Structured markdown formatting for readability
- \* Professional email delivery with HTML formatting

Run the workflow with:

```
python run_workflow.py
```

More Examples:

- \* Company Analysis (<https://github.com/agno-agi/agno/tree/main/cookbo>)

ok/examples/workflows/company\_analysis)

\* Customer Support ([https://github.com/agno-agi/agno/tree/main/cookbook/examples/workflows/customer\\_support](https://github.com/agno-agi/agno/tree/main/cookbook/examples/workflows/customer_support))

\* Investment Analyst ([https://github.com/agno-agi/agno/tree/main/cookbook/examples/workflows/investment\\_analyst](https://github.com/agno-agi/agno/tree/main/cookbook/examples/workflows/investment_analyst))

## Employee Recruiter

Source: <https://docs.agno.com/examples/use-cases/workflows/employee-recruiter>

This example demonstrates how to migrate from the similar workflows 1.0 example to workflows 2.0 structure.

### Employee Recruitment Workflow with Simulated Tools

This workflow automates the complete employee recruitment process from resume screening to interview scheduling and email communication. It demonstrates a multi-agent system working together to handle different aspects of the hiring pipeline.

#### Workflow Overview:

1. Resume Screening: Analyzes candidate resumes against job requirements and scores them
2. Interview Scheduling: Schedules interviews for qualified candidates (score  $\geq 5.0$ )
3. Email Communication: Sends professional interview invitation emails

#### Key Features:

- \* Multi-Agent Architecture: Uses specialized agents for screening, scheduling, and email writing
- \* Async Streaming: Provides real-time feedback during execution
- \* Simulated Tools: Uses mock Zoom scheduling and email sending for demonstration
- \* Resume Processing: Extracts text from PDF resumes via URLs
- \* Structured Responses: Uses Pydantic models for type-safe data handling
- \* Session State: Caches resume content to avoid re-processing

#### Agents:

- \* Screening Agent: Evaluates candidates and provides scores/feedback
- \* Scheduler Agent: Creates interview appointments with realistic time slots
- \* Email Writer Agent: Composes professional interview invitation emails
- \* Email Sender Agent: Handles email delivery (simulated)

#### Usage:

```
python employee_recruiter_async_stream.py
```

#### Input Parameters:

- \* message: Instructions for the recruitment process

- \* candidate\\_resume\\_urls: List of PDF resume URLs to process
- \* job\\_description: The job posting requirements and details

Output:

- \* Streaming updates on each phase of the recruitment process
- \* Candidate screening results with scores and feedback
- \* Interview scheduling confirmations
- \* Email delivery confirmations

Note: This workflow uses simulated tools for Zoom scheduling and email sending to demonstrate the concept, you can use the real tools in practice.

Run `pip install openai agno pypdf` to install dependencies.

```

Step: Install libraries

```
openai agno pypdf
```

Step: Run the workflow

```
python employee_recruiter_async_stream.py
```

## Investment Report Generator

Source: <https://docs.agno.com/examples/use-cases/workflows/investment-report-generator>

This example demonstrates how to build a sophisticated investment analysis system that combines market research, financial analysis, and portfolio management.

This advanced example demonstrates how to build a sophisticated investment analysis system that combines market research, financial analysis, and portfolio management. The workflow uses a three-stage approach:

1. Comprehensive stock analysis and market research
2. Investment potential evaluation and ranking
3. Strategic portfolio allocation recommendations

Key capabilities:

- \* Real-time market data analysis
- \* Professional financial research
- \* Investment risk assessment
- \* Portfolio allocation strategy

\* Detailed investment rationale

Example companies to analyze:

- \* "AAPL, MSFT, GOOGL" (Tech Giants)
- \* "NVDA, AMD, INTC" (Semiconductor Leaders)
- \* "TSLA, F, GM" (Automotive Innovation)
- \* "JPM, BAC, GS" (Banking Sector)
- \* "AMZN, WMT, TGT" (Retail Competition)
- \* "PFE, JNJ, MRNA" (Healthcare Focus)
- \* "XOM, CVX, BP" (Energy Sector)

Run `pip install openai ddgs agno` to install dependencies.

```

## Notion Knowledge Manager

Source: <https://docs.agno.com/examples/use-cases/workflows/notion-knowledge-manager>

A workflow that manages knowledge in Notion database.

## Overview

This workflow uses NotionTools to create, update and search for Notion pages with specific tags in a database.

## Prerequisites

To use NotionTools, you need to install notion-client:

```
pip install notion-client
```

```
export NOTION_API_KEY=your_api_key_here
export NOTION_DATABASE_ID=your_database_id_here
```

## Example

The following example demonstrates how to use NotionTools to create, update and search for Notion pages with specific tags in a database.

```
import os

from agno.agent.agent import Agent
from agno.db.sqlite import SqliteDb
from agno.models.openai.chat import OpenAIChat
from agno.os import AgentOS
from agno.tools.notion import NotionTools
from agno.workflow.step import Step, StepInput, StepOutput
from agno.workflow.workflow import Workflow
from pydantic import BaseModel

Pydantic model for classification output
class ClassificationResult(BaseModel):
 query: str
 tag: str
 message: str

Agents
notion_agent = Agent(
 name="Notion Manager",
 model=OpenAIChat(id="gpt-4o"),
 tools=[
 NotionTools(
 api_key=os.getenv("NOTION_API_KEY", ""),
 database_id=os.getenv("NOTION_DATABASE_ID", ""),
)
],
```

```

instructions=[
 "You are a Notion page manager.",
 "You will receive instructions with a query and a pre-classified tag.",
 "CRITICAL: Use ONLY the exact tag provided in the instructions. Do NOT create new
tags or modify the tag name.",
 "The valid tags are: travel, tech, general-blogs, fashion, documents",
 "Workflow:",
 "1. Search for existing pages with the EXACT tag provided",
 "2. If a page exists: Update that page with the new query content",
 "3. If no page exists: Create a new page using the EXACT tag provided",
 "Always preserve the exact tag name as given in the instructions.",
],
)

```

```

Executor functions

```

```

Step 1: Custom classifier function to assign tags

```

```

def classify_query(step_input: StepInput) -> StepOutput:

```

```

 """

```

```

 Classify the user query into one of the predefined tags.

```

```

 Available tags: travel, tech, general-blogs, fashion, documents

```

```

 elif isinstance(previous_output, str):
 # If it's a string, try to parse it or use the original input
 import json

 try:
 classification = ClassificationResult(**json.loads(previous_output))
)
 except (json.JSONDecodeError, TypeError, KeyError, ValueError):
 classification = ClassificationResult(
 query=str(step_input.input),
 tag="general-blogs",
 message="Failed to parse classification",
)
 else:
 classification = previous_output

 # Create a clear instruction for the Notion agent with EXPLICIT tag requirement
 instruction = f"""Process this classified query:

 Query: {classification.query}
 Tag: {classification.tag}

```

IMPORTANT: You MUST use the tag "{classification.tag}" (one of: travel, tech, general-blogs, fashion, documents).

Do NOT create a new tag. Use EXACTLY "{classification.tag}".

Instructions:

1. Use search\_pages tool to find pages with tag "{classification.tag}"
2. If page exists: Use update\_page to add the query content
3. If no page exists: Use create\_page with title "My {classification.tag.title()} Collection", tag "{classification.tag}", and the query as content

The tag MUST be exactly: {classification.tag}

"""

## Startup Idea Validator

Source: <https://docs.agno.com/examples/use-cases/workflows/startup-idea-validator>

This example demonstrates how to migrate from the similar workflows 1.0 example to workflows 2.0 structure.

This workflow helps entrepreneurs validate their startup ideas by:

1. Clarifying and refining the core business concept
2. Evaluating originality compared to existing solutions
3. Defining clear mission and objectives
4. Conducting comprehensive market research and analysis

Why is this helpful:

- \* Get objective feedback on your startup idea before investing resources
- \* Understand your total addressable market and target segments
- \* Validate assumptions about market opportunity and competition
- \* Define clear mission and objectives to guide execution

Example use cases:

- \* New product/service validation
- \* Market opportunity assessment
- \* Competitive analysis
- \* Business model validation
- \* Target customer segmentation
- \* Mission/vision refinement

Run `pip install openai agno googlesearch-python` to install dependencies.

The workflow will guide you through validating your startup idea with AI-powered analysis and research. Use the insights to refine your concept and business plan!

```
startup_idea_validator.py
"""
 Startup Idea Validator - Your Personal Business Validation Assistant!
```

This workflow helps entrepreneurs validate their startup ideas by:

1. Clarifying and refining the core business concept
2. Evaluating originality compared to existing solutions
3. Defining clear mission and objectives
4. Conducting comprehensive market research and analysis

Why is this helpful?

-----  
-----  
Get objective feedback on your startup idea before investing resources  
Understand your total addressable market and target segments  
Validate assumptions about market opportunity and competition  
Define clear mission and objectives to guide execution

Who should use this?

-----  
-----  
Entrepreneurs and Startup Founders  
Product Managers and Business Strategists  
Innovation Teams  
Angel Investors and VCs doing initial screening

Example use cases:

-----  
-----  
New product/service validation  
Market opportunity assessment  
Competitive analysis  
Business model validation  
Target customer segmentation  
Mission/vision refinement

Quick Start:

- -----
1. Install dependencies:  
    pip install openai agno
  2. Set environment variables:  
    - OPENAI\_API\_KEY
  3. Run:  
    python startup\_idea\_validator.py

The workflow will guide you through validating your startup idea with AI-powered analysis and research. Use the insights to refine your concept and business plan!

```

## When to use a Workflow vs a Team in Agno

Source: <https://docs.agno.com/faq/When-to-use-a-Workflow-vs-a-Team-in-Agno>

Agno offers two powerful ways to build multi-agent systems: Workflows and Teams. Each is suited for different kinds of use-cases.

\*

## Use a Workflow when:

You need orchestrated, multi-step execution with flexible control flow and a predictable outcome.

Workflows are ideal for:

- \* Sequential processes - Step-by-step agent executions with dependencies
- \* Parallel execution - Running independent tasks simultaneously
- \* Conditional logic - Dynamic routing based on content analysis
- \* Quality assurance - Iterative loops with end conditions
- \* Complex pipelines - Mixed components (agents, teams, functions) with branching
- \* Structured processes - Data transformation with predictable patterns

Learn more about Workflows (</concepts/workflows/overview>)

\*

## Use an Agent Team when:

Your task requires reasoning, collaboration, or multi-tool decision-making.

Agent Teams are best for:

- \* Research and planning
- \* Tasks where agents divide responsibilities

Learn more about Agent Teams (</concepts/teams/overview>)

\*

## Pro Tip

Think of Workflows as assembly lines for known tasks,

and Agent Teams as collaborative task forces for solving open-ended problems.

## AgentOS Connection Issues

Source: <https://docs.agno.com/faq/agentos-connection>

If you're experiencing connection issues with AgentOS, particularly when trying to connect to local instances, this guide will help you resolve them.

# Browser Compatibility

Some browsers have security restrictions that prevent connections to localhost domains due to mixed content security issues. Here's what you need to know about different browsers:

## Recommended Browsers

- \* Chrome & Edge: These browsers work well with local connections by default and are our recommended choices
- \* Firefox: Generally works well with local connections

## Browsers with Known Issues

- \* Safari: May block local connections due to its strict security policies
- \* Brave: Blocks local connections by default due to its shield feature

## Solutions

### For Brave Users

If you're using Brave browser, you can try these steps:

1. Click on the Brave shield icon in the address bar
2. Turn off the shield for the current site
3. Refresh the endpoint and try connecting again

```
src="https://mintcdn.com/agno-v2/Xj0hQoiFt0n7bXOq/
videos/agentos-brave-issue.mp4?fit=max&auto=format
&n=Xj0hQoiFt0n7bXOq&q=85&s=80ec713d1ca11cc06366c54
60388fdd8" data-path="videos/agentos-brave-issue.mp4"
```

### For Other Browsers

If you're using Safari or experiencing issues with other browsers, you can use one of these solutions:

#### 1. Use Chrome or Edge

The simplest solution is to use Chrome or Edge browsers which have better support for local connections.

#### 2. Use Tunneling Services

You can use tunneling services to expose your local endpoint to the internet:

## Using ngrok

1. Install ngrok from ngrok.com (<https://ngrok.com>)
2. Run your local server
3. Create a tunnel with ngrok:

```
ngrok http <your-local-port>
```

4. Use the provided ngrok URL on AgentOS (<https://os.agno.com>).

## Using Cloudflare Tunnel

1. Install Cloudflare Tunnel (cloudflared) from Cloudflare's website (<https://developers.cloudflare.com/cloudflare-one/connections/connect-apps/install-and-setup/installation/>)
2. Authenticate with Cloudflare
3. Create a tunnel:

```
cloudflared tunnel --url http://localhost:<your-local-port>
```

4. Use the provided Cloudflare URL on AgentOS (<https://os.agno.com>).

# Connecting to Tableplus

Source: <https://docs.agno.com/faq/connecting-to-tableplus>

If you want to inspect your pgvector container to explore your storage or knowledge base, you can use TablePlus. Follow these steps:

## Step 1: Start Your pgvector Container

Run the following command to start a pgvector container locally:

```
docker run -d \
 -e POSTGRES_DB=ai \
 -e POSTGRES_USER=ai \
 -e POSTGRES_PASSWORD=ai \
 -e PGDATA=/var/lib/postgresql/data/pgdata \
 -v pgvolume:/var/lib/postgresql/data \
 -p 5532:5432 \
 --name pgvector \
 agno/pgvector:16
```

\* POSTGRES\_DB=ai sets the default database name.

\* POSTGRES\_USER=ai and POSTGRES\_PASSWORD=ai define the database credentials.

\* The container exposes port 5432 (mapped to 5532 on your local machine).

## Step 2: Configure TablePlus

1. Open TablePlus: Launch the TablePlus application.
2. Create a New Connection: Click on the + icon to add a new connection.
3. Select PostgreSQL: Choose PostgreSQL as the database type.

Fill in the following connection details:

\* Host: localhost

\* Port: 5532

\* Database: ai

\* User: ai

\* Password: ai

```
~/zshrc
```

```
source ~/.zshrc
```

To display the environment variable:

```
echo $VARIABLE_NAME
```

```
Windows
```

```
Setting Environment Variables in PowerShell
```

```
Temporary Environment Variables
```

These environment variables will only be available in the current PowerShell session.

```
$env:VARIABLE_NAME = "value"
```

To display the environment variable:

```
echo $env:VARIABLE_NAME
```

```
Permanent Environment Variables
```

To make environment variables persist across sessions, add them to your PowerShell profile script (e.g., `Microsoft.PowerShell\_profile.ps1`).

```
notepad $PROFILE
```

Add the following line to the profile script:

```
$env:VARIABLE_NAME = "value"
```

Save and close the file, then reload the profile:

```
.$PROFILE
```

To display the environment variable:

```
echo $env:VARIABLE_NAME
```

```
Setting Environment Variables in Windows Command Prompt
```

```
Temporary Environment Variables
```

These environment variables will only be available in the current Command Prompt session.

```
set VARIABLE_NAME=value
```

To display the environment variable:

```
echo %VARIABLE_NAME%
```

```
Permanent Environment Variables
```

To make environment variables persist across sessions, you can use the `setx` command:

```
setx VARIABLE_NAME "value"
```

Note: After setting an environment variable using `setx`, you need to restart the Command Prompt or any applications that need to read the new environment variable.

To display the environment variable in a new Command Prompt session:

```
echo %VARIABLE_NAME%
```

By following these steps, you can effectively set and display environment variables in macOS Shell, Windows Command Prompt, and PowerShell. This will ensure your environment is properly configured for your applications.

```
OpenAI Key Request While Using Other Models
```

```
Source: https://docs.agno.com/faq/openai-key-request-for-other-models
```

If you see a request for an OpenAI API key but haven't explicitly configured OpenAI, it's

because Agno uses OpenAI models by default in several places, including:

- \* The default model when unspecified in `Agent`
- \* The default embedder is OpenAIEmbedder with VectorDBs, unless specified

## Quick fix: Configure a Different Model

It is best to specify the model for the agent explicitly, otherwise it would default to `OpenAIChat`.

For example, to use Google's Gemini instead of OpenAI:

```
from agno.agent import Agent, RunOutput
from agno.models.google import Gemini

agent = Agent(
 model=Gemini(id="gemini-1.5-flash"),
 markdown=True,
)
```

## Print the response in the terminal

```
agent.print_response("Share a 2 sentence horror story.")
```

For more details on configuring different model providers, check our [\[models documentation\]\(/concepts/models\)](#)

## Quick fix: Configure a Different Embedder

The same applies to embeddings. If you want to use a different embedder instead of `OpenAIEmbedder`, configure it explicitly.

For example, to use Google's Gemini as an embedder, use `GeminiEmbedder`:

```
from agno.knowledge.knowledge import Knowledge
from agno.vectordb.pgvector import PgVector
from agno.knowledge.embedder.google import GeminiEmbedder
```

## Embed sentence in database

```
embeddings = GeminiEmbedder().get_embedding("The quick brown fox jumps over the lazy dog.")
```

## Print the embeddings and their dimensions

```
print(f"Embeddings: {embeddings[:5]}")
print(f"Dimensions: {len(embeddings)}")
```

## Use an embedder in a knowledge base

```
knowledge = Knowledge(
```

```

vector_db=PgVector(
 db_url="postgresql+psycopg://ai:ai@localhost:5532/
ai",
 table_name="gemini_embeddings",
 embedder=GeminiEmbedder(),
),
max_results=2,
)

```

For more details on configuring different model providers, check our [Embeddings documentation](/concepts/knowledge/embedder/)

# Structured outputs

Source: <https://docs.agno.com/faq/structured-outputs>

## Structured Outputs vs. JSON Mode

When working with language models, generating responses that match a specific structure is crucial for building reliable applications. Agno Agents support two methods to achieve this: **Structured Outputs** and **JSON mode**.

\*\*\*

### Structured Outputs (Default if supported)

"Structured Outputs" is the **preferred** and most **reliable** way to extract well-formed, schema-compliant responses from a Model. If a model class supports it, Agno Agents use Structured Outputs by default.

With structured outputs, we provide a schema to the model (using Pydantic or JSON Schema), and the model's response is guaranteed to **strictly follow** that schema. This eliminates many common issues like missing fields, invalid enum values, or inconsistent formatting. Structured Outputs are ideal when you need high-confidence, well-structured responses-like entity extraction, content generation for UI rendering, and more.

In this case, the response model is passed as a keyword argument to the model.

## Example

```

from pydantic import BaseModel
from agno.agent import Agent
from agno.models.openai import OpenAIChat

```

```

class User(BaseModel):

```

```

 name: str
 age: int
 email: str

```

```

agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 description="You are a helpful assistant that can extract information from a user's

```

```

profile.",
 output_schema=User,
)

```

In the example above, the model will generate a response that matches the `User` schema using structured outputs via OpenAI's `gpt-5-mini` model. The agent will then return the `User` object as-is.

\*\*\*

### ### JSON Mode

Some model classes **do not support Structured Outputs**, or you may want to fall back to JSON mode even when the model supports both options. In such cases, you can enable **JSON mode** by setting `use\_json\_mode=True`.

JSON mode works by injecting a detailed description of the expected JSON structure into the system prompt. The model is then instructed to return a valid JSON object that follows this structure. Unlike Structured Outputs, the response is **not automatically validated** against the schema at the API level.

### ## Example

```

from pydantic import BaseModel
from agno.agent import Agent
from agno.models.openai import OpenAIChat

```

```

class User(BaseModel):

```

```

 name: str
 age: int
 email: str

```

```

agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 description="You are a helpful assistant that can extract information from a user's profile.",
 output_schema=User,
 use_json_mode=True,
)

```

### ### When to use

Use **Structured Outputs** if the model supports it - it's reliable, clean, and validated automatically.

Use **JSON mode**:

\* When the model doesn't support structured outputs. Agno agents do this by default on your behalf.

- \* When you need broader compatibility, but are okay validating manually.
- \* When the model does not support tools with structured outputs.

#### # How to Switch Between Different Models

Source: <https://docs.agno.com/faq/switching-models>

When working with Agno, you may need to switch between different models. While Agno supports 20+ model providers, switching between different providers can cause compatibility issues. Switching models within the same provider is generally safer and more reliable.

#### ## Recommended Approach

**\*\*Safe:\*\*** Switch models within the same provider (OpenAI OpenAI, Google Google)\

**\*\*Risky:\*\*** Switch between different providers (OpenAI Google Anthropic)

Cross-provider switching is risky because message history between model providers are often not interchangeable, as some require messages that others don't. However, we are actively working to improve interoperability.

#### ## Safe Model Switching

The safest way to switch models is to change the model ID while keeping the same provider:

```
from uuid import uuid4
from agno.agent import Agent
from agno.db.sqlite import SQLiteDatabase
from agno.models.openai.chat import OpenAIChat

db = SQLiteDatabase(db_file="tmp/agent_sessions.db")

session_id = str(uuid4())
user_id = "user@example.com"
```

## Create initial agent with expensive model

```
expensive_agent = Agent(
 model=OpenAIChat(id="gpt-4o"),
 instructions="You are a helpful assistant for technical discussions.",
 db=db,
 add_history_to_context=True,
)
```

## Have a conversation

```
expensive_agent.print_response(
 "Explain quantum computing basics", session_id=session_id, user_id=user_id
)

expensive_agent.print_response(
 "What are the main applications?", session_id=session_id, user_id=user_id
```

```
)
```

## Switch to budget model within same provider (safe)

```
budget_agent = Agent(
 model=OpenAIChat(id="gpt-4o-mini"),
 instructions="You are a helpful assistant for technical discussions.",
 db=db,
 add_history_to_context=True,
)
```

## Continue conversation - history shared via session\_id

```
budget_agent.print_response(
 "Can you summarize our discussion so far?", session_id=session_id, user_id=user_id
)
```

## Cross-Provider Switching

Switching between providers can cause compatibility issues and is not recommended for production use without thorough testing:

```
from uuid import uuid4
from agno.agent import Agent
from agno.db.sqlite import SQLiteDatabase
from agno.models.openai.chat import OpenAIChat
from agno.models.google import Gemini

db = SQLiteDatabase(db_file="tmp/cross_provider_demo.db")

session_id = str(uuid4())
user_id = "user@example.com"
```

## Create OpenAI agent

```
openai_agent = Agent(
 model=OpenAIChat(id="gpt-4o"),
 instructions="You are a helpful assistant.",
 db=db,
 add_history_to_context=True,
)
```

## Have a conversation with OpenAI

```
openai_agent.print_response(
 "Explain machine learning basics", session_id=session_id, user_id=user_id
)
openai_agent.print_response(
 "What about deep learning?", session_id=session_id, user_id=user_id
```

)

## Now switch to Google Gemini using same session

```
gemini_agent = Agent(
 model=Gemini(id="gemini-2.0-flash-exp"),
 instructions="You are a helpful assistant.",
 db=db,
 add_history_to_context=True,
)
```

## This may work but with unpredictable results due to message format differences

```
gemini_agent.print_response(
 "Continue our discussion about machine learning", session_id=session_id,
 user_id=user_id
)
```

## Note: Gemini may not properly interpret OpenAI's message history format

## Learn More

- \* [All supported models](/concepts/models/overview)
- \* [Environment variables setup](/faq/environment-variables)

# Tokens-per-minute rate limiting  
Source: <https://docs.agno.com/faq/tpm-issues>

From here on you have to use `uv pip install` to install missing packages

## Formatting and validation

Ensure your code meets our quality standards by running the appropriate formatting and validation script before submitting a pull request:

- \* For Unix:
  - \* `./scripts/format.sh`
  - \* `./scripts/validate.sh`

These scripts will perform code formatting with `ruff` and static type checks with `mypy`.

Read more about the guidelines [here](<https://github.com/agno-agi/agno/tree/main/CONTRIBUTING.md>)

Message us on [Discord](<https://discord.gg/4MtYHHrgA8>) or post on [Discourse](<https://community.agno.com/>) if you have any questions or need help with credits.

# Cursor Rules for Building Agents

Source: <https://docs.agno.com/how-to/cursor-rules>

Use `.cursorrules` to improve AI coding assistant suggestions when building agents with Agno

A `[`.cursorrules`](https://docs.cursor.com/context/rules-for-ai)` file teaches AI coding assistants (like Cursor, Windsurf) how to build better agents with Agno.

## What is `.cursorrules`?

`.cursorrules`` is a configuration file that provides your AI coding assistant with instructions on how to generate specific code.

Agno's recommended `.cursorrules`` file contains:

- \* Agno-specific patterns and best practices
- \* Correct parameter names and syntax
- \* Common mistakes to avoid
- \* When to use Agent vs Team vs Workflow

Think of it as a reference guide that helps your AI assistant build agents correctly with Agno.

## Why Use It?

Without `.cursorrules``, AI assistants might suggest:

- \* Wrong parameter names (like ``agents=`` instead of ``members=`` for Teams)
- \* Outdated patterns or incorrect syntax
- \* Performance anti-patterns (creating agents in loops)
- \* Non-existent methods or features

With `.cursorrules``, your AI will:

- \* Suggest correct Agno patterns automatically
- \* Follow performance best practices
- \* Use the right approach for your use case
- \* Catch common mistakes before you make them

## How to Use `.cursorrules`

Copy the Agno `.cursorrules`` file to your project root:

## Download the `.cursorrules` file

```
curl -o .cursorrules https://raw.githubusercontent.com/agno-agi/agno/main/.cursorrules
```

## Or clone and copy

```
git clone https://github.com/agno-agi/agno.git
cp agno/.cursorrules /path/to/your/project/
```

Your AI assistant (Cursor, Windsurf, etc.) will automatically detect and use it.

```
<Card title="View .cursorrules on GitHub" icon="github"
href="https://github.com/agno-agi/agno/blob/main/.
cursorrules">
 View the full .cursorrules file for building agents with Agno
</Card>
```

## ## IDE Support

`cursorrules` works with:

- \* **Cursor** - Automatic detection
- \* **Windsurf** - Native support
- \* **Other AI assistants** - Support may vary depending on integration

## ## Learn More

For detailed examples and patterns:

```
<Card title="Agent Examples" icon="code" href="/examples/concepts/agent">
 See complete agent examples
</Card>
```

```
<Card title="Agent Concepts" icon="book" href="/concepts/agents/overview">
 Learn agent fundamentals
</Card>
```

```
<Card title="Teams" icon="users" href="/concepts/teams/overview">
 Multi-agent coordination
</Card>
```

```
<Card title="Workflows" icon="workflow" href="/concepts/workflows/overview">
 Deterministic agent orchestration
</Card>
```

> **Note:**

The `cursorrules` file is focused on **building agents with Agno**. If you're contributing to the Agno framework itself, that will be covered separately.

## # Install & Setup

Source: <https://docs.agno.com/how-to/install>

## ## Install `agno` SDK

We highly recommend:

- \* Installing `agno` using `pip` in a python virtual environment.

**Step: Create a virtual environment**

```
python3 -m venv ~/.venvs/agno
source ~/.venvs/agno/bin/activate
```

```
python3 -m venv agnoenv
agnoenv/scripts/activate
```

**\*\*Step: Install agno\*\***

Install `agno` using pip

```
pip install -U agno
```

```
pip install -U agno
```

<br

> **\*\*Note:\*\***

If you encounter errors, try updating pip using `python -m pip install --upgrade pip`

**\*\*\***

**## Upgrade agno**

To upgrade `agno`, run this in your virtual environment

```
pip install -U agno --no-cache-dir
```

# Agno v2.0 Changelog

Source: <https://docs.agno.com/how-to/v2-changelog>

**\*\*Expandable Topic - Repo Updates\*\***

\* `~/libs/agno` has been restructured to fit the new concepts in Agno and for better organization.

\* All code related to managing workspaces and agent deployment in Agno has been moved to a new package called `agno-infra`. This is a combination of the previous `agno-aws` and `agno-docker` packages, as well as the CLI and other tools.

\* `agno-aws` and `agno-docker` packages have been deprecated and will no-longer be maintained.

\* All code related to the Agno CLI (`ag`) has been moved to this new `agno-infra` package.

\* Added `AgentOS` to `agno` as a comprehensive API solution for building multi-agent systems. This also replaces `Playground` and other Apps. See details below.

\* Cookbook has been completely restructured, with new and more valuable READMEs, better coverage of concepts, and more examples.

> **\*\*Expandable Topic - AgentOS\*\***

\* Introducing `AgentOS`, a system for hosting agents, teams and workflows as a

production-ready API. See full details in the [AgentOS](/agent-os/introduction) section.

- \* This adds routes for session management, memory management, knowledge management, evals management, and metrics.

- \* This enables you to host agents, teams and workflows, and use the [Agent OS UI](https://os.agno.com) to manage them.

> **\*\*Expandable Topic - Apps Deprecations\*\***

- \* Removed `Playground`. Its functionality has been replaced by `AgentOS`.
- \* Removed `AGUIApp` and replace with `AGUI` interface on `AgentOS`.
- \* Removed `SlackApi` and replace with `Slack` interface on `AgentOS`.
- \* Removed `WhatsappApi` and replace with `Whatsapp` interface on `AgentOS`.
- \* Removed `FastAPIApp`. Its functionality has been replaced by `AgentOS`.
- \* `DiscordClient` has been moved to `/integrations/discord`.

## Session & Run State

- \* We have made significant changes to the innerworkings of `Agent`, `Team` and `Workflow` to make them completely stateless.

- \* This means that `agent\_session`, `session\_metrics`, `session\_state`, etc. should not be seen as stateful variables that would be updated during the course of a run, but rather as "defaults" for the agent if they can be set on initialisation.

- \* `CustomEvent` is now supported and you can inherit from it to create your own custom events that can be yielded from your own tools. See the [documentation](/concepts/agents/running-agents#custom-events) for more details.

> **\*\*Expandable Topic - Updates to Run Objects\*\***

For agents:

- \* `RunResponse` -> `RunOutput`
- \* `RunResponseStartedEvent` -> `RunStartedEvent`
- \* `RunResponseContentEvent` -> `RunContentEvent`
- \* `RunResponseCompletedEvent` -> `RunCompletedEvent`
- \* `IntermediateRunResponseContentEvent` -> `IntermediateRunContentEvent`
- \* `RunResponseErrorEvent` -> `RunErrorEvent`
- \* `RunResponseCancelledEvent` -> `RunCancelledEvent`

For teams:

- \* `TeamRunResponse` -> `TeamRunOutput`
- \* `RunResponseStartedEvent` -> `RunStartedEvent`
- \* `RunResponseContentEvent` -> `RunContentEvent`
- \* `RunResponseCompletedEvent` -> `RunCompletedEvent`
- \* `IntermediateRunResponseContentEvent` -> `IntermediateRunContentEvent`
- \* `RunResponseErrorEvent` -> `RunErrorEvent`
- \* `RunResponseCancelledEvent` -> `RunCancelledEvent`

For workflows:

- \* `WorkflowRunResponse` -> `WorkflowRunOutput`

- \* ``WorkflowRunResponseStartedEvent`` -> ``WorkflowRunStartedEvent``

- \* ``WorkflowRunResponseContentEvent`` -> ``WorkflowRunContentEvent``

- \* ``WorkflowRunResponseCompletedEvent`` -> ``WorkflowRunCompletedEvent``

- \* ``WorkflowRunResponseErrorEvent`` -> ``WorkflowRunErrorEvent``

- \* ``WorkflowRunResponseCancelledEvent`` -> ``WorkflowRunCancelledEvent``

- \* The import location for ``RunOutput`` (and events) has been moved to ``agno.run.agent``.

- \* For ``RunOutput``, ``TeamRunOutput`` and ``WorkflowRunOutput`` the ``extra_data`` attribute has been removed and the internal attributes are now top-level. This is ``references``, ``additional_input``, ``reasoning_steps``, and ``reasoning_messages``.

- \* ``metadata`` added to ``RunOutput``, ``TeamRunOutput`` and ``WorkflowRunOutput``. This represents all the set metadata for the run.

#### > **\*\*Expandable Topic - Updates to Session Objects\*\***

- \* Session storage now stores ``AgentSession``, ``TeamSession`` and ``WorkflowSession`` with new schemas. See full details in the [Session](/concepts/agents/sessions) section.

- \* Session objects now have ``runs`` directly on it.

- \* Session objects support new convenience methods:

- \* ``get_run`` -> Get a specific run by ID.

- \* ``get_session_summary`` -> Get the session summary.

- \* ``get_chat_history`` -> Get an aggregated view of all messages for all runs in the session.

#### > **\*\*Expandable Topic - Updates to Metrics\*\***

- \* ``SessionMetrics`` and ``MessageMetrics`` have been unified as a single ``Metrics`` class.

- \* ``audio_tokens`` has been renamed to ``audio_total_tokens``.

- \* ``input_audio_tokens`` has been renamed to ``audio_input_tokens``.

- \* ``output_audio_tokens`` has been renamed to ``audio_output_tokens``.

- \* ``cached_tokens`` has been renamed to ``cache_read_tokens``.

- \* ``prompt_tokens`` and ``completion_tokens`` have been removed (only ``input_tokens`` and ``output_tokens`` should be used)

- \* ``prompt_tokens_details`` and ``completion_tokens_details`` have been removed. Instead ``provider_metrics`` captures any provider-specific metrics.

- \* ``time`` has been renamed to ``duration``.

#### > **\*\*Expandable Topic - Cancelling Runs\*\***

- \* You can now cancel a run by calling ``cancel_run`` on the ``Agent``, ``Team`` or ``Workflow``.

- \* This will cancel the run and return a ``RunCancelledEvent`` during streaming, or set the ``RunOutput.status`` to ``"cancelled"``.

#### ## Storage

\* `Agent`, `Team`, `Workflow` and the various evals now all support a single `db` parameter. This is to enable storage for the instance of that class. This is required for persistence of sessions, memories, metrics, etc.

\* `storage` and `memory` have been removed from `Agent`, `Team` and `Workflow`.

#### > \*\*Expandable Topic - Updates to Storage Classes\*\*

- This means all previous storage providers have been reworked. Also session storage, memory storage and eval storage are all a single solution now referred to as a "DB".

- `PostgresStorage` -> `PostgresDb`
- `SqliteStorage` -> `SqliteDb`
- `MysqlStorage` -> `MysqlDb`
- `RedisStorage` -> `RedisDb`
- `MongoStorage` -> `MongoDb`
- `DynamoDBStorage` -> `DynamoDb`
- `SingleStoreStorage` -> `SingleStoreDb`
- `InMemoryStorage` -> `InMemoryDb`
- `JsonStorage` -> `JsonDb`
- `GCSJsonStorage` -> `GCSJsonDb`

#### ## Memory

\* With the above changes to storage, memory has been simplified.

\* `memory` has been removed from `Agent` and `Team`. Instead memory is enabled with `enable\_user\_memories: bool` (like before) and persisted in the `db` instance.

\* Changes to how memories are created can still be done by overriding the `MemoryManager` class on `Agent` or `Team`. E.g. `Agent(memory\_manager=MyMemoryManager())`.

\* `AgentMemory` and `TeamMemory` have been removed.

#### ## Knowledge

\* Knowledge has been completely reworked. See full details in the [Knowledge](/concepts/knowledge/) section.

\* You now define a single `Knowledge` instance for all types of content. Files (PDF, CSV, etc.), URLs, and other.

\* The agent can still use your knowledge base to search for information at runtime. All existing RAG implementations are still supported.

\* Added \*\*full `async` support\*\* for embedding models and vector DBs. This has a significant impact on performance and is a major speed improvement when adding content to the knowledge base using `knowledge.add\_content\_async(...)`.

\* `AgentKnowledge` and all other knowledge base classes have been removed.

\* Import locations for `embedder`, `document`, `chunking`, `reranker` and `reader` have been moved to `agno.knowledge`. See [examples](/examples/concepts/knowledge) for more details.

#### ## Tools updates

\* General:

\* Since Agents and Teams are now stateless, using attributes from the agent/team object inside a function will give you access to the attributes set on initialisation of that agent/team. E.g. `agent.session\_state` should not be used, instead `session\_state` can now be directly accessed and would have the "current" state of the session.

\* A new flow allows images, audio and video files generated during tool execution to be passed back in a `FunctionExecutionResult` object and this will ensure these artifacts are made available to the model and agent as needed.

\* All tools that handle media (e.g. image generation tools) now correctly add this generated media to the `RunOutput`, but also make it available for subsequent model calls.

\* The interface of almost all the toolkits have been updated for a more consistent experience around switching specific tools on and off. The list of changes is too long to list here. We suggest you take a look at the toolkits you use specifically and how they have been updated.

\* `show_results` is now `True` by default for all tools. If you just set `stop_after_tool_call=True` then `show_results` will be automatically set to `True`.

\* `images`, `videos`, `audio` and `files` are now available as parameters to tools. See the [\[documentation\]\(/concepts/tools/overview\)](#) for more details.

## ## Media

### #### Removals

\* **Removed legacy artifact classes**: `ImageArtifact`, `VideoArtifact`, `AudioArtifact`, and `AudioResponse` classes have been completely removed in favor of unified media classes.

### #### New Unified Media Architecture

\* **Unified `Image` class**: Now serves all use cases (input, output, artifacts) with standardized `content: Optional[bytes]` field for raw image data

\* **Unified `Audio` class**: Replaces both `AudioArtifact` and `AudioResponse` with consistent byte-based content storage and additional fields like `transcript`, `expires_at`, `sample_rate`, and `channels`

\* **Unified `Video` class**: Updated to handle all video use cases with standardized content handling and metadata fields

\* **Enhanced `File` class**: Updated to work seamlessly across agent, team, workflow, and toolkit contexts

### #### New Methods and Features

\* **`from_base64()` class method**: Added to `Image`, `Audio`, and `Video` classes for creating instances from base64-encoded content (automatically converts to raw bytes)

\* **`get_content_bytes()` method**: Retrieves content as raw bytes, handling loading from URLs or file paths

\* **`to_base64()` method**: Converts content to base64 string for transmission/storage

\* **`to_dict()` method**: Enhanced serialization with optional base64 content inclusion

### #### Content Standardization

\* **Byte-based storage**: All media content is now stored as raw bytes (`Optional[bytes]`) instead of mixed string/bytes formats

\* **Automatic validation**: Model validators ensure exactly one content source (`url`, `filepath`, or `content`) is provided

\* **Auto-generated IDs**: Media objects automatically generate UUIDs when not provided

## ## Logging

\* Added support for custom loggers. See the [documentation](/concepts/agents/custom-logger) for more details.

## ## Agent updates

### > \*\*Expandable Topic - Updates to Agent Class\*\*

- \* ``agent_id`` -> ``id`` -> If ``id`` is not set, it is autogenerated using the ``name`` of the agent, or a random UUID if the ``name`` is not set.
- \* ``search_previous_sessions_history`` -> ``search_session_history``
- \* ``context`` -> ``dependencies``
- \* ``add_context`` -> ``add_dependencies_to_context``
- \* ``add_history_to_messages`` -> ``add_history_to_context``
- \* ``add_name_to_instructions`` -> ``add_name_to_context``
- \* ``add_datetime_to_instructions`` -> ``add_datetime_to_context``
- \* ``add_location_to_instructions`` -> ``add_location_to_context``
- \* ``add_messages`` -> ``additional_input``
- \* ``extra_data`` -> ``metadata``
- \* ``create_default_system_message`` -> ``build_context``
- \* ``create_default_user_message`` -> ``build_user_context``
- \* Added ``send_media_to_model`` -> ``True`` by default. Set to ``False`` if you don't want to send media (image, audio, video, files) to the model. This is useful if you only want media for tools.
- \* Added ``store_media`` -> ``True`` by default. Set to ``False`` if you don't want to store any media in the ``RunOutput`` that is persisted with sessions.
- \* ``num_history_responses`` -> ``num_history_runs``
- \* Removed ``success_criteria`` and ``goal``
- \* Removed ``team_session_id`` and ``workflow_session_id``.
- \* Removed ``introduction``
- \* Removed ``show_tool_calls`` -> This is now just always enabled.
- \* Removed ``team`` and ``team_data``
- \* Removed ``respond_directly``, ``add_transfer_instructions``, ``team_response_separator`` and ``team_session_id`` (since team has been removed from ``Agent``)
- \* Removed all ``team`` functionality from inside ``Agent`` (i.e. the deprecated teams implementation has been removed)
- \* Removed all ``monitoring`` from ``Agent``. With the new AgentOS platform, monitoring is done using your own data. Go to [os.agno.com](https://os.agno.com) to get started.

### > \*\*Expandable Topic - Updates to Input & Output\*\*

- \* ``response_model`` -> ``output_schema``
- \* Added ``input_schema`` (a pydantic model) to validate the input to the agent.
- \* Changed ``message`` to ``input`` (which also replaces ``messages``). ``input`` can be of type ``str``, ``list``, ``dict``, ``Message``, ``BaseModel``, or ``list[Message]``.
- \* If a ``dict`` and ``input_schema`` is provided, the dict will be validated against the schema.
- \* If a ``BaseModel`` and ``input_schema`` is provided, the model will be validated against the schema.
- \* ``arun`` and ``acontinue_run`` with ``stream=True`` now return an async iterator of ``RunOutputEvent`` directly and is not a coroutine anymore.
- \* ``debug_mode: bool`` added to ``run``, ``arun``, ``print_response`` and ``aprint_response`` to

enable debug mode for a specific run.

- \* ``add_history_to_context`` added to ``run``, ``arun``, ``print_response`` and ``aprint_response`` to add the chat history to the context for the current run.

- \* ``dependencies`` added to ``run``, ``arun``, ``print_response`` and ``aprint_response`` to add dependencies to the context for the current run.

- \* ``metadata`` added to ``run``, ``arun``, ``print_response`` and ``aprint_response`` to set the metadata for the current run. This is merged with the metadata set on the ``Team`` object.

- \* Added ``get_run_output`` and ``get_last_run_output`` to ``Agent`` to retrieve a run output by ID.

#### > **\*\*Expandable Topic - Updates to Metrics\*\***

- \* Metrics have been simplified and cleaned up.

- \* There are now 3 levels of metrics:

- \* ``Message.metrics`` -> Metrics for each message (assistant, tool, etc.).

- \* ``RunOutput.metrics`` -> Aggregated metrics for the whole run.

- \* ``AgentSession.metrics`` -> Aggregated metrics for the whole session.

#### > **\*\*Expandable Topic - Updates to Knowledge\*\***

- \* ``knowledge`` is now an instance of ``Knowledge`` instead of ``AgentKnowledge``.

- \* ``retriever`` -> ``knowledge_retriever`` -> For a custom retriever.

- \* ``add_references`` -> ``add_knowledge_to_context`` -> To enable traditional RAG.

#### > **\*\*Expandable Topic - Updates to Memory\*\***

- \* ``add_memory_references`` -> ``add_memories_to_context``

- \* You can set a custom ``memory_manager`` to use when creating memories.

- \* Added ``get_user_memories`` to retrieve the user memories.

#### > **\*\*Expandable Topic - Updates to Sessions\*\***

- \* ``add_session_summary_references`` -> ``add_session_summary_to_context``

- \* You can set a custom ``session_summary_manager`` to use when creating session summaries.

- \* Removed ``session_name`` and replace with functions ``get_session_name`` and ``rename_session``.

- \* Added ``get_session`` to retrieve a session by ID.

- \* Added ``get_chat_history`` to retrieve the chat history from a session.

- \* Added ``get_session_metrics`` to retrieve the metrics for a session.

- \* Added ``get_session_state`` to retrieve the session state from a session.

- \* Added ``get_session_summary`` to retrieve the session summary from a session.

- \* Because ``Agent`` is now stateless, ``agent_session``, ``session_metrics``, ``run_id``, ``run_input``, ``run_messages`` and ``run_response`` as "sticky" agent attributes have been removed.

- \* Because ``Agent`` is now stateless, ``images``, ``videos``, ``audio`` are no longer available as agent attributes. Instead these can be accessed on the ``RunOutput`` for a particular run.

- \* Removed ``team_session_state`` and ``workflow_session_state``. Only ``session_state`` is used.

- \* Added ``enable_agentic_state`` to ``Agent`` and ``Team`` to allow the agent to update the session state with a tool call.

## ## Team updates

### > \*\*Expandable Topic - Updates to Team Class\*\*

\* Removed `mode` from `Team`. Instead there are attributes that can be used to control the behavior of the team:

\* `respond\_directly` -> If True, the team leader won't process responses from the members and instead will return them directly

\* `delegate\_task\_to\_all\_members` -> If True, the team leader will delegate tasks to all members simultaneously, instead of one by one. When running async (using `arun`) members will run concurrently.

\* `determine\_input\_for\_members` -> `True` by default. Set to False if you want to send the run input directly to the member agents without the team leader synthesizing its own input.

\* `team\_id` -> `id` -> If `id` is not set, it is autogenerated using the `name` of the team, or a random UUID if the `name` is not set.

\* `search\_previous\_sessions\_history` -> `search\_session\_history`

\* `context` -> `dependencies`

\* `add\_context` -> `add\_dependencies\_to\_context`

\* `add\_history\_to\_messages` -> `add\_history\_to\_context`

\* `add\_name\_to\_instructions` -> `add\_name\_to\_context`

\* `add\_datetime\_to\_instructions` -> `add\_datetime\_to\_context`

\* `add\_location\_to\_instructions` -> `add\_location\_to\_context`

\* `add\_member\_tools\_to\_system\_message` -> `add\_member\_tools\_to\_context`

\* `extra\_data` -> `metadata`

\* Added `additional\_input` (works the same as for `Agent`)

\* Added `store\_member\_responses: bool` to optionally store the member responses on the team run output object.

\* Added `accli\_app` to `Team` to enable the CLI app for the team in async mode.

\* Added `send\_media\_to\_model` -> `True` by default. Set to False if you don't want to send media (image, audio, video, files) to the model. This is useful if you only want media for tools.

\* Added `store\_media` -> `True` by default. Set to False if you don't want to store any media in the `RunOutput` that is persisted with sessions.

\* `num\_history\_responses` -> `num\_history\_runs`

\* Removed `success\_criteria`

\* Removed `team\_session\_id` and `workflow\_session\_id`.

\* Removed `enable\_team\_history`

\* Removed `num\_of\_interactions\_from\_history`

\* Removed `show\_tool\_calls` -> This is now just always enabled.

\* Removed `enable\_agentic\_context`. `session\_state` and `enable\_agentic\_state` should rather be used to manage state shared between the team and the members.

\* Removed all `monitoring` from `Team`. With the new AgentOS platform, monitoring is done using your own data. Go to [os.agno.com](https://os.agno.com) to get started.

### > \*\*Expandable Topic - Updates to Input & Output\*\*

\* `response\_model` -> `output\_schema`

\* Added `input\_schema` (a pydantic model) to validate the input to the agent.

\* Changed `message` to `input` (which also replaces `messages`). `input` can be of type `str`, `list`, `dict`, `Message`, `BaseModel`, or `list[Message]`.

\* If a `dict` and `input\_schema` is provided, the dict will be validated against the

schema.

- \* If a ``BaseModel`` and ``input_schema`` is provided, the model will be validated against the schema.

- \* ``arun`` with ``stream=True`` now return an async iterator of ``TeamRunOutputEvent`` directly and is not a coroutine anymore.

- \* ``debug_mode: bool`` added to ``run``, ``arun``, ``print_response`` and ``aprint_response`` to enable debug mode for a specific run.

- \* ``add_history_to_context`` added to ``run``, ``arun``, ``print_response`` and ``aprint_response`` to add the chat history to the context for the current run.

- \* ``dependencies`` added to ``run``, ``arun``, ``print_response`` and ``aprint_response`` to add dependencies to the context for the current run.

- \* ``metadata`` added to ``run``, ``arun``, ``print_response`` and ``aprint_response`` to set the metadata for the current run. This is merged with the metadata set on the ``Team`` object.

- \* Added ``get_run_output`` and ``get_last_run_output`` to ``Team`` to retrieve a run output by ID.

#### > **\*\*Expandable Topic - Updates to Metrics\*\***

- \* Metrics have been simplified and cleaned up.

- \* There are now 3 levels of metrics:

- \* ``Message.metrics`` -> Metrics for each message (assistant, tool, etc.).

- \* ``RunOutput.metrics`` -> Aggregated metrics for the whole run.

- \* ``TeamSession.metrics`` -> Aggregated metrics for the whole session.

#### > **\*\*Expandable Topic - Updates to Knowledge\*\***

- \* ``knowledge`` is now an instance of ``Knowledge`` instead of ``AgentKnowledge``.

- \* ``retriever`` -> ``knowledge_retriever`` -> For a custom retriever.

- \* ``add_references`` -> ``add_knowledge_to_context`` -> To enable traditional RAG.

- \* Added ``update_knowledge`` tool to update the knowledge base. Works the same as for ``Agent``.

#### > **\*\*Expandable Topic - Updates to Memory\*\***

- \* ``add_memory_references`` -> ``add_memories_to_context``

- \* You can set a custom ``memory_manager`` to use when creating memories.

- \* Added ``get_user_memories`` to retrieve the user memories.

#### > **\*\*Expandable Topic - Updates to Sessions\*\***

- \* ``add_session_summary_references`` -> ``add_session_summary_to_context``

- \* You can set a custom ``session_summary_manager`` to use when creating session summaries.

- \* Removed ``session_name`` and replace with functions ``get_session_name`` and ``rename_session``.

- \* Added ``get_session`` to retrieve a session by ID.

- \* Added ``get_chat_history`` to retrieve the chat history from a session.

- \* Added ``get_session_metrics`` to retrieve the metrics for a session.

- \* Added ``get_session_state`` to retrieve the session state from a session.

- \* Added ``get_session_summary`` to retrieve the session summary from a session.

- \* Because ``Team`` is now stateless, ``team_session``, ``session_metrics``, ``run_id``, ``run_input``, ``run_messages`` and ``run_response`` as "sticky" team attributes have been removed.

\* Because `Team` is now stateless, `images`, `videos`, `audio` are no longer available as team attributes. Instead these can be accessed on the `TeamRunOutput` for a particular run.

\* Removed `team\_session\_state` and `workflow\_session\_state`. Only `session\_state` is used.

\* Added `enable\_agentic\_state` to `Team` to allow the agent to update the session state with a tool call.

## ## Workflow updates

### > \*\*Expandable Topic - Updates to Workflow Class\*\*

\* `workflow\_id` -> `id` -> If `id` is not set, it is autogenerated using the `name` of the workflow, or a random UUID if the `name` is not set.

\* Workflows "v1" has been completely removed and replaced with `Workflows v2`. See full details in the [Workflows](/concepts/workflows) section.

\* This means the import locations for "Workflows v2" is now `agno.workflows`.

\* `extra\_data` -> `metadata`

\* Added `store\_events` to `Workflow` to optionally store the events on the workflow run output object. Also added `events\_to\_skip` to skip certain events from being stored. This works the same as for `Agent` and `Team`.

\* Added `store\_executor\_outputs` to `Workflow` to optionally store the agent/team responses on the workflow run output object.

\* Added `input\_schema` to `Workflow` to validate the input to the workflow.

\* Added support for websocket streaming of the workflow. This is appropriate for long-running workflows that need to be streamed to a client. This is only available for `arun`.

\* Removed all `monitoring` from `Workflow`. With the new AgentOS platform, monitoring is done using your own data. Go to [os.agno.com](https://os.agno.com) to get started.

### > \*\*Expandable Topic - Updates to Input & Output\*\*

\* Changed `message` to `input` (which also replaces `messages`). `input` can be of type `str`, `list`, `dict`, or `BaseModel`.

\* If a `dict` and `input\_schema` is provided, the dict will be validated against the schema.

\* If a `BaseModel` and `input\_schema` is provided, the model will be validated against the schema.

\* `arun` with `stream=True` now return an async iterator of `WorkflowRunOutputEvent` directly and is not a coroutine anymore.

\* `debug\_mode: bool` added to `run`, `arun`, `print\_response` and `aprint\_response` to enable debug mode for a specific run.

\* Added `get\_run\_output` and `get\_last\_run\_output` to `Workflow` to retrieve a run output by ID.

### > \*\*Expandable Topic - Updates to Sessions\*\*

\* Removed `session\_name` and replace with functions `get\_session\_name` and `rename\_session`.

\* Because `Workflow` is now stateless, `workflow\_session`, `session\_metrics`, `run\_id`, `run\_input`, `run\_messages` and `run\_response` as "sticky" workflow attributes have been removed.

\* Because `Workflow` is now stateless, `images`, `videos`, `audio` are no longer available as workflow attributes. Instead these can be accessed on the `WorkflowRunOutput` for a particular run.

\* Added `get\_session` to retrieve a session by ID.

\* Added `get\_session\_metrics` to retrieve the metrics for a session.

\* Added `get\_session\_state` to retrieve the session state from a session.

\* Added `get\_session\_summary` to retrieve the session summary from a session.

# Migrating to Agno v2.0

Source: <https://docs.agno.com/how-to/v2-migration>

Guide to migrate your Agno applications from v1 to v2.

If you have questions during your migration, we can help! Find us on [Discord](<https://discord.gg/4MtYHHrgA8>) or [Discourse](<https://community.agno.com/>).

> **\*\*Tip:\*\***

Reference the [v2.0 Changelog](/how-to/v2-changelog) for the full list of changes.

## Installing Agno v2

If you are already using Agno, you can upgrade to v2 by running:

```
pip install -U agno
```

Otherwise, you can install the latest version of Agno v2 by running:

```
pip install agno
```

## Migrating your Agno DB

If you used our `Storage` or `Memory` functionalities to store Agent sessions and memories in your database, you can start by migrating your tables.

Use our migration script: [`libs/agno/scripts/migrate_to_v2.py`]([https://github.com/agno-agi/agno/blob/main/libs/agno/scripts/migrate\\_to\\_v2.py](https://github.com/agno-agi/agno/blob/main/libs/agno/scripts/migrate_to_v2.py))

The script supports PostgreSQL, MySQL, SQLite, and MongoDB. Update the database connection settings, the batch size (useful if you are migrating large tables) in the script and run it.

Notice:

\* The script won't cleanup the old tables, in case you still need them.

\* The script is idempotent. If something goes wrong or if you stop it mid-run, you can run it again.

\* Metrics are automatically converted from v1 to v2 format.

## Migrating your Agno code

Each section here covers a specific framework domain, with before and after examples and detailed explanations where needed.

### ### 1. Agents and Teams

[Agents](/concepts/agents/overview) and [Teams](/concepts/teams/overview) are the main building blocks in the Agno framework.

Below are some of the v2 updates we have made to the `Agent` and `Team` classes:

1.1. Streaming responses with `arun` now returns an `AsyncIterator`, not a coroutine. This is how you consume the resulting events now, when streaming a run:

async for event in agent.arun(...):

...

1.2. The `RunResponse` class is now `RunOutput`. This is the type of the results you get when running an Agent:

```
from agno.run.agent import RunOutput
```

```
run_output: RunOutput = agent.run(...)
```

1.3. The events you get when streaming an Agent result have been renamed:

```
* `RunOutputStartedEvent` `RunStartedEvent`
* `RunOutputCompletedEvent` `RunCompletedEvent`
* `RunOutputErrorEvent` `RunErrorEvent`
* `RunOutputCancelledEvent` `RunCancelledEvent`
* `RunOutputContinuedEvent` `RunContinuedEvent`
* `RunOutputPausedEvent` `RunPausedEvent`
* `RunOutputContentEvent` `RunContentEvent`
```

1.4. Similarly, for Team output events:

```
* `TeamRunOutputStartedEvent` `TeamRunStartedEvent`
* `TeamRunOutputCompletedEvent` `TeamRunCompletedEvent`
* `TeamRunOutputErrorEvent` `TeamRunErrorEvent`
* `TeamRunOutputCancelledEvent` `TeamRunCancelledEvent`
* `TeamRunOutputContentEvent` `TeamRunContentEvent`
```

1.5. The `add\_state\_in\_messages` parameter has been deprecated. Variables in instructions are now resolved automatically by default.

1.6. The `context` parameter has been renamed to `dependencies`.

This is how it looked like on v1:

```
from agno.agent import Agent
```

```
agent = Agent(
 context={"top_stories": get_top_hackernews_stories},
 instructions="Here are the top stories: {top_stories}",
 add_state_in_messages=True,
)
```

This is how it looks like now, on v2:

```
from agno.agent import Agent
```

```
agent = Agent(
 dependencies={"top_stories": get_top_hackernews_stories},
 instructions="Here are the top stories: {top_stories}",
```

**resolve\_in\_context=True by default - no need to set add\_state\_in\_messages**

```
)
```

```
> **Tip:**
```

See the full list of changes in the [Agent Updates](/how-to/v2-changelog#agent-updates) section of the changelog.

## ### 2. Storage

Storage is used to persist Agent sessions, state and memories in a database.

This is how Storage looks like on v1:

```
from agno.agent import Agent
```

```
from agno.storage.sqlite import SQLiteStorage
```

```
storage = SQLiteStorage(table_name="agent_sessions", db_file="agno.db", mode="agent")
```

```
agent = Agent(storage=storage)
```

These are the changes we have made for v2:

2.1. The `Storage` classes have moved from `agno/storage` to `agno/db`. We will now refer to them as our `Db` classes.

2.2. The `mode` parameter has been deprecated. The same instance can now be used by Agents, Teams and Workflows.

```
from agno.agent import Agent
```

```
from agno.db.sqlite import SQLiteDatabase
```

```
db = SQLiteDatabase(db_file="agno.db")
```

```
agent = Agent(db=db)
```

2.3. The ``table_name`` parameter has been deprecated. One instance now handles multiple tables, you can define their names individually.

```
db = SQLiteDatabase(db_file="agno.db", sessions_table="your_sessions_table_name", ...)
```

These are all the supported tables, each used to persist data related to a specific domain:

```
db = SQLiteDatabase(
 db_file="agno.db",
```

## **Table to store your Agent, Team and Workflow sessions and runs**

```
 session_table="your_session_table_name",
```

## **Table to store all user memories**

```
 memory_table="your_memory_table_name",
```

## **Table to store all metrics aggregations**

```
 metrics_table="your_metrics_table_name",
```

## **Table to store all your evaluation data**

```
 eval_table="your_evals_table_name",
```

## **Table to store all your knowledge content**

```
 knowledge_table="your_knowledge_table_name",
)
```

2.4. Previously running a ``Team`` would create a team session and sessions for every team member participating in the run. Now, only the ``Team`` session is created. The runs for the team leader and all members can be found in the ``Team`` session.

```
team.run(...)
```

```
team_session = team.get_latest_session()
```

## **The runs for the team leader and all team members are here**

```
team_session.runs
```

```
> **Tip:**
```

```
 See more changes in the [Storage Updates](/how-to/v2-changelog#storage)
 section of the changelog.
```

### **### 3. Memory**

Memory gives an Agent the ability to recall relevant information.

This is how Memory looks like on V1:

```
from agno.agent import Agent
from agno.memory.v2.db.sqlite import SqliteMemoryDb
from agno.memory.v2.memory import Memory

memory_db = SqliteMemoryDb(table_name="memory", db_file="agno.db")
memory = Memory(db=memory_db)

agent = Agent(memory=memory)
```

These are the changes we have made for v2:

- 3.1. The `MemoryDb` classes have been deprecated. The main `Db` classes are to be used.
- 3.2. The `Memory` class has been deprecated. You now just need to set `enable_user_memories=True` on an Agent with a `db` for Memory to work.

```
from agno.agent import Agent
from agno.db.sqlite import SqliteDb

db = SqliteDb(db_file="agno.db")

agent = Agent(db=db, enable_user_memories=True)
```

- 3.3. The generated memories will be stored in the `memories_table`. By default, the `agno_memories` will be used. It will be created if needed. You can also set the memory table like this:

```
db = SqliteDb(db_file="agno.db", memory_table="your_memory_table_name")
```

- 3.4. The methods you previously had access to through the Memory class, are now directly available on the relevant `db` object. For example:

```
agent.get_user_memories(user_id="123")
```

You can find examples for other all other databases and advanced scenarios in the [\[examples\]\(/examples/concepts/memory\)](#) section.

```
> **Tip:**
 See more changes in the \[Memory Updates\]\(/how-to/v2-changelog#memory\)
 section of the changelog.
```

#### ### 4. Knowledge

Knowledge gives an Agent the ability to search and retrieve relevant, domain-specific information from a knowledge base.

These are the changes we have made for v2:

4.1. ``AgentKnowledge`` has been deprecated in favor of the new ``Knowledge`` class. Along with this, all of the child classes that used ``AgentKnowledge`` as a base have been removed. Their capabilities are now supported by default in ``Knowledge``. This also means that the correct reader for the content that you are adding is now selected automatically, with the option to override it at any time.

4.2. The ``load()`` method and its variations have been replaced by ``add_content()``. Content is the building block of any piece of knowledge originating from any sources. For a full example of the usage, see the [\[Content Types\]\(/concepts/knowledge/content\\_types\)](#) page.

4.3. ``Knowledge`` now supports a ``contents_db``. This allows the storage and management of every piece of content that is added to your knowledge.

Furthermore, we now support deletion of individual vectors using the ``remove_vectors_by_id()``, ``remove_vectors_by_name()`` and `remove\_vectors by metadata()`` methods.

You can also delete all vectors created by a specific piece of content using ``remove\_content\_by\_id()``.

4.4 In order to support the deletion mentioned above, VectorDB tables have been updated. Two new columns, ``content_hash`` and ``content_id`` have been added.

4.5. The ``retriever`` field has been renamed to ``knowledge_retriever``.

4.6. The ``add_references`` method has been renamed to ``add_knowledge_to_context``.

**Renamed**

```
* `retriever` -> `knowledge_retriever`
* `add_references` -> `add_knowledge_to_context`
```

> **Tip:**

See more changes in the [\[Knowledge Updates\]\(/how-to/v2-changelog#knowledge\)](#) section of the changelog.

### ### 5. Metrics

Metrics are used to understand the usage and consumption related to a Session, a Run or a Message.

These are the changes we have made for v2:

5.1. **Field name changes:**

```
* `time` `duration`
* `audio_tokens` `audio_total_tokens`
* `input_audio_tokens` `audio_input_tokens`
* `output_audio_tokens` `audio_output_tokens`
* `cached_tokens` `cache_read_tokens`
```

## 5.2. **Deprecated fields** (removed in v2):

- \* ``prompt_tokens`` and ``completion_tokens`` - replaced by ``input_tokens`` and ``output_tokens``
- \* ``prompt_tokens_details`` and ``completion_tokens_details`` - detailed info moved to ``provider_metrics``

## 5.3. **New structure**:

- \* Provider-specific metrics fields are now inside the ``provider_metrics`` field
- \* A new ``additional_metrics`` field has been added for custom metrics

> **Tip:**

The migration script automatically converts all metrics from v1 to v2 format, including nested metrics in session data.

## ### 6. Teams

We have refactored the ``Team`` class to be more flexible and powerful.

The biggest changes is that the ``mode`` parameter has been deprecated. Instead there are attributes that can be used to control the behavior of the team:

- \* ``respond_directly`` -> If True, the team leader won't process responses from the members and instead will return them directly
- \* ``delegate_task_to_all_members`` -> If True, the team leader will delegate tasks to all members simultaneously, instead of one by one. When running async (using ``arun``) members will run concurrently.
- \* ``determine_input_for_members`` -> ``True`` by default. Set to False if you want to send the run input directly to the member agents without the team leader synthesizing its own input. This is useful if you want to send pydantic model input directly to the member agents.

Here is a quick migration guide:

- \* If you previously used ``mode=coordinate``, this is now the default behaviour and you can use the ``Team`` without any modifications.
- \* If you previously used ``mode=route``, you can now use ``respond_directly=True`` and ``determine_input_for_members=False`` to achieve the same behaviour.
- \* If you previously used ``mode=collaborate``, you can set ``delegate_task_to_all_members=True`` to achieve the same behaviour.

See the [Team updates](/how-to/v2-changelog#team-updates) section of the changelog for more details.

## ### 7. Workflows

We have heavily updated our Workflows, aiming to provide top-of-the-line tooling to build agentic systems.

> **Tip:**

Make sure to check our [comprehensive migration guide for

```
Workflows](/how-to/workflows-migration).
```

### ### 7. Apps -> Interfaces

The old "apps" system (`AGUIApp`, `SlackApi`, `WhatsappApi`) has been replaced with a unified interfaces system within AgentOS.

#### #### Before - Standalone Apps

```
from agno.app.agui.app import AGUIApp
```

```
agui_app = AGUIApp(agent=agent)
app = agui_app.get_app()
agui_app.serve(port=8000)
```

#### #### After - Unified Interfaces

```
from agno.os import AgentOS
from agno.os.interfaces.agui import AGUI
```

```
agent_os = AgentOS(agents=[agent], interfaces=[AGUI(agent=agent)])
app = agent_os.get_app()
agent_os.serve(port=8000)
```

#### #### Migration Steps

1. **\*\*Update imports\*\***: Replace app imports with interface imports
2. **\*\*Use AgentOS\*\***: Wrap agents with `AgentOS` and specify interfaces
3. **\*\*Update serving\*\***: Use `agent\_os.serve()` instead of `app.serve()`

### ### 8. Playground -> AgentOS

Our `Playground` has been deprecated. Our new [AgentOS](/agent-os/introduction) offering will substitute all usecases.

See [AgentOS](/agent-os/introduction) for more details!

#### # Migrating to Workflows 2.0

Source: <https://docs.agno.com/how-to/workflows-migration>

Learn how to migrate to Workflows 2.0.

#### ## Migrating from Workflows 1.0

Workflows 2.0 is a completely new approach to agent automation, and requires an upgrade from the Workflows 1.0 implementation. It introduces a new, more flexible and powerful way to build workflows.

### ### Key Differences

Workflows 1.0	Workflows 2.0	Migration Path
-----	-----	-----
Linear only	Multiple patterns	Add Parallel/Condition as needed
Agent-focused	Mixed components	Convert functions to Steps
Limited branching	Smart routing	Replace if/else with Router
Manual loops	Built-in Loop	Use Loop component

### ### Migration Steps

1. **\*\*Assess current workflow\*\***: Identify parallel opportunities
2. **\*\*Add conditions\*\***: Convert if/else logic to Condition components
3. **\*\*Extract functions\*\***: Move custom logic to function-based steps
4. **\*\*Enable streaming\*\***: For event-based information
5. **\*\*Add state management\*\***: Use `workflow\_session\_state` for data sharing

### ### Example of Blog Post Generator Workflow

Lets take an example that demonstrates how to build a sophisticated blog post generator that combines web research capabilities with professional writing expertise. The workflow uses a multi-stage approach:

1. Intelligent web research and source gathering
2. Content extraction and processing
3. Professional blog post writing with proper citations

Here's the code for the blog post generator in **\*\*Workflows 1.0\*\***:

```
import json
from textwrap import dedent
from typing import Dict, Iterator, Optional

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.run.workflow import WorkflowCompletedEvent
from agno.storage.sqlite import SqliteDb
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.newspaper4k import Newspaper4kTools
from agno.utils.log import logger
from agno.utils.pprint import pprint_run_response
from agno.workflow import RunOutput, Workflow
from pydantic import BaseModel, Field

class NewsArticle(BaseModel):
 title: str = Field(..., description="Title of the article.")
 url: str = Field(..., description="Link to the article.")
 summary: Optional[str] = Field(
 ..., description="Summary of the article if available."
```

)

```
class SearchResults(BaseModel):
```

```
 articles: list[NewsArticle]
```

```
class ScrapedArticle(BaseModel):
```

```
 title: str = Field(..., description="Title of the article.")
```

```
 url: str = Field(..., description="Link to the article.")
```

```
 summary: Optional[str] = Field(
 ..., description="Summary of the article if available."
)
```

```
 content: Optional[str] = Field(
```

```
 ...,
```

```
 description="Full article content in markdown format. None if content is unavailable.",
```

```
)
```

```
class BlogPostGenerator(Workflow):
```

```
 """Advanced workflow for generating professional blog posts with proper research and citations."""
```

```
 description: str = dedent("""\
```

```
An intelligent blog post generator that creates engaging, well-researched content.
```

```
This workflow orchestrates multiple AI agents to research, analyze, and craft
```

```
compelling blog posts that combine journalistic rigor with engaging storytelling.
```

```
The system excels at creating content that is both informative and optimized for digital consumption.
```

```
""")
```

## Search Agent: Handles intelligent web searching and source gathering

```
searcher: Agent = Agent(
```

```
 model=OpenAIChat(id="gpt-5-mini"),
```

```
 tools=[DuckDuckGoTools()],
```

```
 description=dedent("""\
```

```
You are BlogResearch-X, an elite research assistant specializing in discovering high-quality sources for compelling blog content. Your expertise includes:
```

- Finding authoritative and trending sources
- Evaluating content credibility and relevance
- Identifying diverse perspectives and expert opinions
- Discovering unique angles and insights
- Ensuring comprehensive topic coverage\

```
"""),
```

```
 instructions=dedent("""\
```

### 1. Search Strategy

- Find 10-15 relevant sources and select the 5-7 best ones
- Prioritize recent, authoritative content
- Look for unique angles and expert insights

### 2. Source Evaluation

- Verify source credibility and expertise
- Check publication dates for timeliness
- Assess content depth and uniqueness

### 3. Diversity of Perspectives

- Include different viewpoints
- Gather both mainstream and expert opinions
- Find supporting data and statistics\

```
"""),
 output_schema=SearchResults,
)
```

## Content Scraper: Extracts and processes article content

```
article_scraper: Agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[Newspaper4kTools()],
 description=dedent("""\
 You are ContentBot-X, a specialist in extracting and processing digital content
 for blog creation. Your expertise includes:
```

- Efficient content extraction
- Smart formatting and structuring
- Key information identification
- Quote and statistic preservation
- Maintaining source attribution\

```
"""),
 instructions=dedent("""\
```

### 1. Content Extraction

- Extract content from the article
- Preserve important quotes and statistics
- Maintain proper attribution
- Handle paywalls gracefully

### 2. Content Processing

- Format text in clean markdown
- Preserve key information
- Structure content logically

### 3. Quality Control

- Verify content relevance
- Ensure accurate extraction
- Maintain readability\

```
"""),
 output_schema=ScrapedArticle,
)
```

## Content Writer Agent: Crafts engaging blog posts from research

```
writer: Agent = Agent(
```

```
model=OpenAIChat(id="gpt-5-mini"),
description=dedent("""\
You are BlogMaster-X, an elite content creator combining journalistic excellence
with digital marketing expertise. Your strengths include:
```

- Crafting viral-worthy headlines
- Writing engaging introductions
- Structuring content for digital consumption
- Incorporating research seamlessly
- Optimizing for SEO while maintaining quality
- Creating shareable conclusions\

```
"""),
instructions=dedent("""\
```

#### 1. Content Strategy

- Craft attention-grabbing headlines
- Write compelling introductions
- Structure content for engagement
- Include relevant subheadings

#### 2. Writing Excellence

- Balance expertise with accessibility
- Use clear, engaging language
- Include relevant examples
- Incorporate statistics naturally

#### 3. Source Integration

- Cite sources properly
- Include expert quotes
- Maintain factual accuracy

#### 4. Digital Optimization

- Structure for scanability
- Include shareable takeaways
- Optimize for SEO
- Add engaging subheadings\

```
"""),
expected_output=dedent("""\
```

## {Viral-Worthy Headline}

### Introduction

{Engaging hook and context}

### {Compelling Section 1}

{Key insights and analysis}  
{Expert quotes and statistics}

### {Engaging Section 2}

```
{Deeper exploration}

- Creates a unique session ID based on the topic
- Sets up SQLite storage for caching results

```
generate_blog_post = BlogPostGenerator(
 session_id=f"generate-blog-post-on-{url_safe_topic}
}",
 db=SqliteDb(
 db_file="tmp/agno_workflows.db",
),
 debug_mode=True,
)
```

## Execute the workflow with caching enabled

Returns an iterator of RunOutput objects containing the

## generated content

```
blog_post: Iterator[RunOutputEvent] = generate_blog_post.run(
 topic=topic,
 use_search_cache=True,
 use_scrape_cache=True,
 use_cached_report=True,
)
```

## Print the response

```
pprint_run_response(blog_post, markdown=True)
```

To convert this into **Workflows 2.0** structure, either we can break down the workflow into smaller steps and follow the [development guide](/concepts/workflows/workflow-patterns/overview).

Or for simplicity we can directly replace the run method to a single custom function executor as mentioned [here](/concepts/workflows/workflow-patterns/fully-python-workflow).

It will look like this:

```
import asyncio
import json
from textwrap import dedent
from typing import Dict, Optional

from agno.agent import Agent
from agno.db.sqlite import SQLiteDatabase
from agno.models.openai import OpenAIChat
from agno.tools.googlesearch import GoogleSearchTools
from agno.tools.newspaper4k import Newspaper4kTools
from agno.utils.log import logger
from agno.utils.pprint import pprint_run_response
from agno.workflow.workflow import Workflow
from pydantic import BaseModel, Field
```

## --- Response Models ---

```
class NewsArticle(BaseModel):
 title: str = Field(..., description="Title of the article.")
 url: str = Field(..., description="Link to the article.")
 summary: Optional[str] = Field(
 ..., description="Summary of the article if available."
)
```

```
class SearchResults(BaseModel):
 articles: list[NewsArticle]
```

```

class ScrappedArticle(BaseModel):
 title: str = Field(..., description="Title of the article.")
 url: str = Field(..., description="Link to the article.")
 summary: Optional[str] = Field(
 ..., description="Summary of the article if available."
)
 content: Optional[str] = Field(
 ...,
 description="Full article content in markdown format. None if content is
unavailable.",
)

```

## --- Agents ---

```

research_agent = Agent(
 name="Blog Research Agent",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[GoogleSearchTools()],

# Discord Bot

Source: <https://docs.agno.com/integrations/discord/overview>

Host agents as Discord Bots.

The Discord Bot integration allows you to serve Agents or Teams via Discord, using the

discord.py library to handle Discord events and send messages.

## ## Setup Steps

> **\*\*Snippet file:\*\*** "setup-discord-app.mdx"

## ### Example Usage

Create an agent, wrap it with `DiscordClient`, and run it:

```
from agno.agent import Agent
from agno.integrations.discord import DiscordClient
from agno.models.openai import OpenAIChat
```

```
basic_agent = Agent(
 name="Basic Agent",
 model=OpenAIChat(id="gpt-5-mini"),
 add_history_to_context=True,
 num_history_runs=3,
 add_datetime_to_context=True,
)

discord_agent = DiscordClient(basic_agent)
if name == "main":
 discord_agent.serve()
```

## ## Core Components

- \* `DiscordClient`: Wraps Agno agents/teams for Discord integration using discord.py.
- \* `DiscordClient.serve`: Starts the Discord bot client with the provided token.

## ## `DiscordClient` Class

Main entry point for Agno Discord bot applications.

## ### Initialization Parameters

Parameter	Type	Default	Description
-----	-----	-----	-----
`agent`	`Optional[Agent]`	`None`	Agno `Agent` instance.
`team`	`Optional[Team]`	`None`	Agno `Team` instance.

\*Provide `agent` or `team`, not both.\*

## ## Event Handling

The Discord bot automatically handles various Discord events:

## ### Message Events

\* **\*\*Description\*\***: Processes all incoming messages from users

- \* **Media Support**: Handles images, videos, audio files, and documents
- \* **Threading**: Automatically creates threads for conversations
- \* **Features**:
  - \* Automatic thread creation for each conversation
  - \* Media processing and forwarding to agents
  - \* Message splitting for responses longer than 1500 characters
  - \* Support for reasoning content display
  - \* Context enrichment with username and message URL

### Supported Media Types

- \* **Images**: Direct URL processing for image analysis
- \* **Videos**: Downloads and processes video content
- \* **Audio**: URL-based audio processing
- \* **Files**: Downloads and processes document attachments

### Environment Variables

Ensure the following environment variable is set:

```
export DISCORD_BOT_TOKEN="your-discord-bot-token"
```

### Message Processing

The bot processes messages with the following workflow:

1. **Message Reception**: Receives messages from Discord channels
2. **Media Processing**: Downloads and processes any attached media
3. **Thread Management**: Creates or uses existing threads for conversations
4. **Agent/Team Execution**: Forwards the message and media to the configured agent or team
5. **Response Handling**: Sends the response back to Discord, splitting long messages if necessary
6. **Reasoning Display**: Shows reasoning content in italics if available

### Features

#### Automatic Thread Creation

- \* Creates a new thread for each user's first message
- \* Maintains conversation context within threads
- \* Uses the format: `{username}'s thread`

#### Media Support

- \* **Images**: Passed as `Image` objects with URLs
- \* **Videos**: Downloaded and passed as `Video` objects with content
- \* **Audio**: Passed as `Audio` objects with URLs
- \* **Files**: Downloaded and passed as `File` objects with content

#### Message Formatting

- \* Long messages (>1500 characters) are automatically split
- \* Reasoning content is displayed in *italics*
- \* Batch numbering for split messages: `[1/3] message content`

## ## Testing the Integration

1. Set up your Discord bot token: `export DISCORD\_BOT\_TOKEN="your-token"`
2. Run your application: `python your\_discord\_bot.py`
3. Invite the bot to your Discord server
4. Send a message in any channel where the bot has access
5. The bot will automatically create a thread and respond

## # AgentOps

Source: <https://docs.agno.com/integrations/observability/agentops>

Integrate Agno with AgentOps to send traces and logs to a centralized observability platform.

## ## Integrating Agno with AgentOps

[AgentOps](https://app.agentops.ai/) provides automatic instrumentation for your Agno agents to track all operations including agent interactions, team coordination, tool usage, and workflow execution.

## ## Prerequisites

1. **\*\*Install AgentOps\*\***

Ensure you have the AgentOps package installed:

```
pip install agentops
```

2. **\*\*Authentication\*\***

Go to [AgentOps](https://app.agentops.ai/) and copy your API key

```
export AGENTOPS_API_KEY=<your-api-key>
```

## ## Logging Model Calls with AgentOps

This example demonstrates how to use AgentOps to log model calls.

```
import agentops
from agno.agent import Agent
from agno.models.openai import OpenAIChat
```

# Initialize AgentOps

```
agentops.init()
```

# Create and run an agent

```
agent = Agent(model=OpenAIChat(id="gpt-5-mini"))
response = agent.run("Share a 2 sentence horror story")
```

## Print the response

```
print(response.content)
```

### ## Notes

```
* **Environment Variables**: Ensure your environment variable is correctly set for the AgentOps API key.
* **Initialization**: Call `agentops.init()` to initialize AgentOps.
* **AgentOps Docs**: [AgentOps Docs](https://docs.agentops.ai/v2/integrations/agn
```

o)

Following these steps will integrate Agno with AgentOps, providing comprehensive logging and visualization for your AI agents' model calls.

### # Arize

Source: <https://docs.agno.com/integrations/observability/arize>

Integrate Agno with Arize Phoenix to send traces and gain insights into your agent's performance.

### ## Integrating Agno with Arize Phoenix

[Arize Phoenix](https://phoenix.arize.com/) is a powerful platform for monitoring and analyzing AI models. By integrating Agno with Arize Phoenix, you can leverage OpenInference to send traces and gain insights into your agent's performance.

### ## Prerequisites

#### 1. **\*\*Install Dependencies\*\***

Ensure you have the necessary packages installed:

```
pip install arize-phoenix openai openinference-instrumentation-agno opentelemetry-sdk opentelemetry-exporter-otlp
```

#### 2. **\*\*Setup Arize Phoenix Account\*\***

- \* Create an account at [Arize Phoenix](https://phoenix.arize.com/).
- \* Obtain your API key from the Arize Phoenix dashboard.

#### 3. **\*\*Set Environment Variables\*\***

Configure your environment with the Arize Phoenix API key:

```
export ARIZE_PHOENIX_API_KEY=<your-key>
```

```
Sending Traces to Arize Phoenix
```

```
* ### Example: Using Arize Phoenix with OpenInference
```

This example demonstrates how to instrument your Agno agent with OpenInference and send traces to Arize Phoenix.

```
import asyncio
```

```
import os
```

```
from agno.agent import Agent
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.tools.yfinance import YFinanceTools
```

```
from phoenix.otel import register
```

## Set environment variables for Arize Phoenix

```
os.environ["PHOENIX_CLIENT_HEADERS"]
```

=

```
f"api_key={os.getenv('ARIZE_PHOENIX_API_KEY')}}"
```

```
os.environ["PHOENIX_COLLECTOR_ENDPOINT"] = "https://app.phoenix.arize.com"
```

## Configure the Phoenix tracer

```
tracer_provider = register(
```

```
 project_name="agno-stock-price-agent", # Default is 'default'
```

```
 auto_instrument=True, # Automatically use the installed OpenInference instrumentation
```

```
)
```

## Create and configure the agent

```
agent = Agent(
```

```
 name="Stock Price Agent",
```

```
 model=OpenAIChat(id="gpt-5-mini"),
```

```
 tools=[YFinanceTools()],
```

```
 instructions="You are a stock price agent. Answer questions in the style of a stock analyst.",
```

```
 debug_mode=True,
```

```
)
```

## Use the agent

```
agent.print_response("What is the current price of Tesla?")
```

Now go to the [phoenix cloud](https://app.phoenix.arize.com) and view the traces created by your agent. You can visualize the execution flow, monitor performance, and debug issues directly from the Arize Phoenix dashboard.

```
<Frame caption="Arize Phoenix Trace">
```

```
"
 export LANGDB_PROJECT_ID="<your_langdb_project_id>"
```

## Sending Traces to LangDB

### Example: Basic Agent Setup

This example demonstrates how to instrument your Agno agent with LangDB tracing.

```
from pylangdb.agno import init

Initialize LangDB tracing - must be called before creating agents
init()

from agno.agent import Agent
from agno.models.langdb import LangDB
from agno.tools.duckduckgo import DuckDuckGoTools

Create agent with LangDB model (uses environment variables automatically)
agent = Agent(
 name="Web Research Agent",
 model=LangDB(id="openai/gpt-4.1"),
 tools=[DuckDuckGoTools()],
 instructions="Answer questions using web search and provide comprehensive information"
)

Use the agent
response = agent.run("What are the latest developments in AI agents?")
print(response)
```

### Example: Multi-Agent Team Coordination

For more complex workflows, you can use Agno's Team class with LangDB tracing:

```
from pylangdb.agno import init
init()

from agno.agent import Agent
from agno.team import Team
from agno.models.langdb import LangDB
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.yfinance import YFinanceTools

Research Agent
web_agent = Agent(
 name="Market Research Agent",
 model=LangDB(id="openai/gpt-4.1"),
```

```

 tools=[DuckDuckGoTools()],
 instructions="Research current market conditions and news"
)

Financial Analysis Agent
finance_agent = Agent(
 name="Financial Analyst",
 model=LangDB(id="xai/grok-4"),
 tools=[YFinanceTools(stock_price=True, company_info=True)],
 instructions="Perform quantitative financial analysis"
)

Coordinated Team
reasoning_team = Team(
 name="Finance Reasoning Team",
 model=LangDB(id="xai/grok-4"),
 members=[web_agent, finance_agent],
 instructions=[
 "Collaborate to provide comprehensive financial insights",
 "Consider both fundamental analysis and market sentiment"
]
)

Execute team workflow
reasoning_team.print_response("Analyze Apple (AAPL) investment potential")

```

## Sample Trace

View a complete example trace in the LangDB dashboard: Finance Reasoning Team Trace (<https://app.langdb.ai/sharing/threads/73c91c58-eab7-4c6b-afe1-5ab6324f1ada>)

<Frame caption="LangDB Finance Team Thread">

```
export LANGFUSE_SECRET_KEY=<your-secret-key>
```

## Sending Traces to Langfuse

\* ### Example: Using Langfuse with OpenInference

This example demonstrates how to instrument your Agno agent with OpenInference and send traces to Langfuse.

```
import base64
```

```
import os
```

```
from agno.agent import Agent
```

```
from agno.models.openai import OpenAIChat
```

```
from agno.tools.yfinance import YFinanceTools
```

```

from openinference.instrumentation.agno import AgnoInstrumentor
from opentelemetry import trace as trace_api
from opentelemetry.exporter.otlp.proto.http.trace_exporter import OTLPSpanExporter
from opentelemetry.sdk.trace import TracerProvider
from opentelemetry.sdk.trace.export import SimpleSpanProcessor

```

## Set environment variables for Langfuse

```

LANGFUSE_AUTH = base64.b64encode(
 f'{os.getenv('LANGFUSE_PUBLIC_KEY')}:{os.getenv('LANGFUSE_SECRET_KEY')}'.encode()
).decode()
os.environ["OTEL_EXPORTER_OTLP_ENDPOINT"] = "https://us.cloud.langfuse.com/api/public/otel"
os.environ["OTEL_EXPORTER_OTLP_HEADERS"] = f"Authorization=Basic {LANGFUSE_AUTH}"

```

## Configure the tracer provider

```

tracer_provider = TracerProvider()
tracer_provider.add_span_processor(SimpleSpanProcessor(OTLPSpanExporter()))
trace_api.set_tracer_provider(tracer_provider)

```

## Start instrumenting agno

```

AgnoInstrumentor().instrument()

```

## Create and configure the agent

```

agent = Agent(
 name="Stock Price Agent",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[YFinanceTools()],
 instructions="You are a stock price agent. Answer questions in the style of a stock analyst.",
 debug_mode=True,
)

```

## Use the agent

```

agent.print_response("What is the current price of Tesla?")

```

\* ### Example: Using Langfuse with OpenLIT

This example demonstrates how to use Langfuse via OpenLIT to trace model calls.

```

import base64
import os

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
from opentelemetry.exporter.otlp.proto.http.trace_exporter import OTLPSpanExporter
from opentelemetry.sdk.trace import TracerProvider
from opentelemetry.sdk.trace.export import SimpleSpanProcessor
from opentelemetry import trace

```

## Set environment variables for Langfuse

```

LANGFUSE_AUTH = base64.b64encode(
 f'{os.getenv('LANGFUSE_PUBLIC_KEY')}:{os.getenv('LANGFUSE_SECRET_KEY')}'.encode()
).decode()
os.environ["OTEL_EXPORTER_OTLP_ENDPOINT"] = "https://us.cloud.langfuse.com/api/public/otel"
os.environ["OTEL_EXPORTER_OTLP_HEADERS"] = f"Authorization=Basic {LANGFUSE_AUTH}"

```

## Configure the tracer provider

```

trace_provider = TracerProvider()
trace_provider.add_span_processor(SimpleSpanProcessor(OTLPSpanExporter()))
trace.set_tracer_provider(trace_provider)

```

## Initialize OpenLIT instrumentation

```

import openlit
openlit.init(tracer=trace.get_tracer(name), disable_batch=True)

```

## Create and configure the agent

```

agent = Agent(
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[DuckDuckGoTools()],
 markdown=True,
 debug_mode=True,
)

```

## Use the agent

```

agent.print_response("What is currently trending on Twitter?")

```

## Notes

\* **Environment Variables**: Ensure your environment variables are correctly set for the API keys and OTLP endpoint.

\* **Data Regions**: Adjust the `OTEL_EXPORTER_OTLP_ENDPOINT` for your data region or local deployment as needed. Available regions include:

- \* `https://us.cloud.langfuse.com/api/public/otel` for the US region
- \* `https://eu.cloud.langfuse.com/api/public/otel` for the EU region
- \* `http://localhost:3000/api/public/otel` for local deployment

By following these steps, you can effectively integrate Agno with Langfuse, enabling comprehensive observability and monitoring of your AI agents.

# LangSmith  
Source: <https://docs.agno.com/integrations/observability/langsmith>

Integrate Agno with LangSmith to send traces and gain insights into your agent's performance.

## ## Integrating Agno with LangSmith

LangSmith offers a comprehensive platform for tracing and monitoring AI model calls. By integrating Agno with LangSmith, you can utilize OpenInference to send traces and gain insights into your agent's performance.

### ## Prerequisites

#### 1. Create a LangSmith Account

- \* Sign up for an account at [LangSmith](<https://smith.langchain.com>).
- \* Obtain your API key from the LangSmith dashboard.

#### 2. Set Environment Variables

Configure your environment with the LangSmith API key and other necessary settings:

```
export LANGSMITH_API_KEY=<your-key>
export LANGSMITH_TRACING=true
export LANGSMITH_ENDPOINT=https://eu.api.smith.langchain.com # or https://api.smith.langchain.com for US
export LANGSMITH_PROJECT=<your-project-name>
```

#### 3. Install Dependencies

Ensure you have the necessary packages installed:

```
pip install openai openinference-instrumentation-agno opentelemetry-sdk
opentelemetry-exporter-otlp
```

```
Sending Traces to LangSmith
```

This example demonstrates how to instrument your Agno agent with OpenInference and send traces to LangSmith.

```
import os

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.duckduckgo import DuckDuckGoTools
from openinference.instrumentation.agno import AgnoInstrumentor
from opentelemetry import trace as trace_api
from opentelemetry.exporter.otlp.proto.http.trace_exporter import OTLPTraceExporter
from opentelemetry.sdk.trace import TracerProvider
from opentelemetry.sdk.trace.export import SimpleSpanProcessor
```

## Set the endpoint and headers for LangSmith

```
endpoint = "https://eu.api.smith.langchain.com/otel/v1/traces"

headers = {
 "x-api-key": os.getenv("LANGSMITH_API_KEY"),
 "Langsmith-Project": os.getenv("LANGSMITH_PROJECT"),
}
```

## Configure the tracer provider

```
tracer_provider = TracerProvider()
tracer_provider.add_span_processor(
 SimpleSpanProcessor(OTLPTraceExporter(endpoint=endpoint, headers=headers))
)
trace_api.set_tracer_provider(tracer_provider)
```

## Start instrumenting agno

```
AgnoInstrumentor().instrument()
```

## Create and configure the agent

```
agent = Agent(
 name="Stock Market Agent",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[DuckDuckGoTools()],
 markdown=True,
 debug_mode=True,
)
```

# Use the agent

```
agent.print_response("What is news on the stock market?")
```

## ## Notes

- \* **Environment Variables**: Ensure your environment variables are correctly set for the API key, endpoint, and project name.

- \* **Data Regions**: Choose the appropriate `LANGSMITH_ENDPOINT`` based on your data region.

By following these steps, you can effectively integrate Agno with LangSmith, enabling comprehensive observability and monitoring of your AI agents.

## # Langtrace

Source: <https://docs.agno.com/integrations/observability/langtrace>

## angtrace

Integrate Agno with Langtrace to send traces and gain insights into your agent's performance.

## ## Integrating Agno with Langtrace

Langtrace provides a powerful platform for tracing and monitoring AI model calls. By integrating Agno with Langtrace, you can gain insights into your agent's performance and behavior.

## ## Prerequisites

### 1. **Install Dependencies**

Ensure you have the necessary package installed:

```
pip install langtrace-python-sdk
```

### 2. **Create a Langtrace Account**

- \* Sign up for an account at [Langtrace](<https://app.langtrace.ai/>).
- \* Obtain your API key from the Langtrace dashboard.

### 3. **Set Environment Variables**

Configure your environment with the Langtrace API key:

```
export LANGTRACE_API_KEY=<your-key>
```

## ## Sending Traces to Langtrace

This example demonstrates how to instrument your Agno agent with Langtrace.

```
from agno.agent import Agent
```

```
from agno.models.openai import OpenAIChat
from agno.tools.yfinance import YFinanceTools
from langtrace_python_sdk import langtrace
from langtrace_python_sdk.utils.with_root_span import with_langtrace_root_span
```

## Initialize Langtrace

```
langtrace.init()
```

## Create and configure the agent

```
agent = Agent(
 name="Stock Price Agent",
 model=OpenAIChat(id="gpt-5-mini"),
 tools=[YFinanceTools()],
 instructions="You are a stock price agent. Answer questions in the style of a stock analyst.",
 debug_mode=True,
)
```

## Use the agent

```
agent.print_response("What is the current price of Tesla?")
```

### ## Notes

\* **Environment Variables**: Ensure your environment variable is correctly set for the API key.

\* **Initialization**: Call `langtrace.init()` to initialize Langtrace before using the agent.

By following these steps, you can effectively integrate Agno with Langtrace, enabling comprehensive observability and monitoring of your AI agents.

### # Maxim

Source: <https://docs.agno.com/integrations/observability/maxim>

Connect Agno with Maxim to monitor, trace, and evaluate your agent's activity and performance.

### ## Integrating Agno with Maxim

Maxim AI provides comprehensive agent monitoring, evaluation, and observability for your Agno applications. With Maxim's one-line integration, you can easily trace and analyse agent interactions, performance metrics, and more.

### ## Prerequisites

#### 1. **Install Dependencies**

Ensure you have the necessary packages installed:

```
pip install agno openai maxim-py
```

Or install Maxim separately:

```
pip install maxim-py
```

## 2. **\*\*Setup Maxim Account\*\***

- \* Sign up for an account at [Maxim](https://getmaxim.ai/).
- \* Generate your API key from the Maxim dashboard.
- \* Create a repository to store your traces.

## 3. **\*\*Set Environment Variables\*\***

Configure your environment with the Maxim API key:

```
export MAXIM_API_KEY=<your-api-key>
export MAXIM_LOG_REPO_ID=<your-repo-id>
export OPENAI_API_KEY=<your-openai-api-key>
```

## Sending Traces to Maxim

### Example: Basic Maxim Integration

This example demonstrates how to instrument your Agno agent with Maxim and send traces for monitoring and evaluation.

```
from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.yfinance import YFinanceTools
```

try:

```
 from maxim import Maxim
 from maxim.logger.agno import instrument_agno
```

except ImportError:

```
 raise ImportError(
 "`maxim` not installed. Please install using `pip install maxim-py`"
)
```

# Instrument Agno with Maxim for automatic tracing and logging

```
instrument_agno(Maxim().logger())
```

## Create and configure the agent

```

agent = Agent(
 name="Stock Price Agent",
 model=OpenAIChat(id="gpt-4o"),
 tools=[YFinanceTools()],
 instructions="You are a stock price agent. Answer questions in the style of a stock analyst.",
 show_tool_calls=True,
 markdown=True,
)

```

## Use the agent

```

response = agent.run("What is the current price of Tesla?")
print(response.content)

```

### Example: Multi-Agent System with Maxim

This example demonstrates how to set up a multi-agent system with comprehensive Maxim tracing using the Team class.

.....

This example shows how to use Maxim to log agent calls and traces.

Steps to get started with Maxim:

1. Install Maxim: `pip install maxim-py`
2. Add `instrument_agno(Maxim().logger())` to initialize tracing
3. Authentication:
  - Go to <https://getmaxim.ai> and create an account
  - Generate your API key from the settings
  - Export your API key as an environment variable:
    - `export MAXIM_API_KEY=<your-api-key>`
    - `export MAXIM_LOG_REPO_ID=<your-repo-id>`
4. All agent interactions will be automatically traced and logged to Maxim

.....

```

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.team.team import Team
from agno.tools.duckduckgo import DuckDuckGoTools
from agno.tools.yfinance import YFinanceTools

```

try:

```

 from maxim import Maxim
 from maxim.logger.agno import instrument_agno

```

except ImportError:

```

 raise ImportError(
 "`maxim` not installed. Please install using `pip install maxim-py`"
)

```

# Instrument Agno with Maxim for automatic tracing and logging

```
instrument_agno(Maxim().logger())
```

## Web Search Agent: Fetches financial information from the web

```
web_search_agent = Agent(
 name="Web Agent",
 model=OpenAIChat(id="gpt-4o"),
 tools=[DuckDuckGoTools()],
 instructions="Always include sources",
 markdown=True,
)
```

## Finance Agent: Gets financial data using YFinance tools

```
finance_agent = Agent(
 name="Finance Agent",
 model=OpenAIChat(id="gpt-4o"),
 tools=[YFinanceTools()],
 instructions="Use tables to display data",
 markdown=True,
)
```

## Aggregate both agents into a multi-agent system

```
multi_ai_team = Team(
 members=[web_search_agent, finance_agent],
 model=OpenAIChat(id="gpt-4o"),
 instructions="You are a helpful financial assistant. Answer user questions about
stocks, companies, and financial data.",
 markdown=True,
)
```

```
if name == "main":
```

```
 print("Welcome to the Financial Conversational Agent! Type 'exit' to quit.")
```

```
 messages = []
```

```
 while True:
```

```
 print("*****")
```

```
 user_input = input("You: ")
```

```
 if user_input.strip().lower() in ["exit", "quit"]:
```

```
 print("Goodbye!")
```

```
 break
```

```
 messages.append({"role": "user", "content": user_input})
```

```
 conversation = "\n".join(
 [
 ("User: " + m["content"])
```

```
 ("User: " + m["content"])
```

```
 if m["role"] == "user"
```

```
 else ("Agent: " + m["content"])
```

```
 for m in messages
```

```

]
)
response = multi_ai_team.run(
 f"Conversation so far:\n{conversation}\n\nRespond to the latest user message."
)
agent_reply = getattr(response, "content", response)
print("-----")
print("Agent:", agent_reply)
messages.append({"role": "agent", "content": str(agent_reply)})

```

```

 autoPlay muted loop controls className="w-full aspect-video"
src="https://mintcdn.com/openlit/oP6rqLGiwYvXWG_M/
images/trace-details.mp4?fit=max&auto=format&n=oP6
rqLGiwYvXWG_M&q=85&s=80a9b4bf54862dd386284f175c71f
714"

```

## ## Configuration Options

The ``openlit.init()`` function accepts several parameters:

```

openlit.init(
 otlp_endpoint="http://127.0.0.1:4318", # OTLP collector endpoint
 tracer=None, # Custom OpenTelemetry tracer
 disable_batch=False, # Disable batch span processing
 environment="production", # Environment name for filtering
 application_name="my-agent", # Application identifier
)

```

## ## CLI-Based Instrumentation

For true zero-code instrumentation, you can use the ``openlit-instrument`` CLI command to run your application without modifying any code:

```

openlit-instrument \
--service-name my-ai-app \
--environment production \
--otlp-endpoint http://127.0.0.1:4318 \
python your_app.py

```

This approach is particularly useful for:

- \* Adding observability to existing applications without code changes
- \* CI/CD pipelines where you want to instrument automatically
- \* Testing observability before committing to code modifications

## ## Notes

\* **\*\*Automatic Instrumentation\*\***: OpenLIT automatically instruments supported LLM providers (OpenAI, Anthropic, etc.) and frameworks

- \* **\*\*Zero Code Changes\*\***: Use either ``openlit.init()`` in your code or the ``openlit-instrument`` CLI to trace all LLM calls without modifications
- \* **\*\*OpenTelemetry Native\*\***: OpenLIT uses standard OpenTelemetry protocols, ensuring compatibility with other observability tools
- \* **\*\*Open-Source & Self-Hosted\*\***: OpenLIT is fully open-source and runs on your own infrastructure for complete data privacy and control

## ## Integration with Other Platforms

[OpenLIT](https://openlit.io/) can export traces to other observability platforms like Grafana Cloud, New Relic and more. See the [Langfuse integration guide](/integrations/observability/langfuse) for an example of using OpenLIT with Langfuse.

### # OpenTelemetry

Source: <https://docs.agno.com/integrations/observability/overview>

Agno supports observability through OpenTelemetry, integrating seamlessly with popular tracing and monitoring platforms.

Observability helps us understand, debug, and improve AI agents. Agno supports observability through [OpenTelemetry](https://opentelemetry.io/), integrating seamlessly with popular tracing and monitoring platforms.

## ## Key Benefits

- \* **\*\*Trace\*\***: Visualize and analyze agent execution flows.
- \* **\*\*Monitor\*\***: Track performance, errors, and usage.
- \* **\*\*Debug\*\***: Quickly identify and resolve issues.

## ## OpenTelemetry Support

Agno offers first-class support for OpenTelemetry, the industry standard for distributed tracing and observability.

- \* **\*\*Auto-Instrumentation\*\***: Automatically instrument your agents and tools.
- \* **\*\*Flexible Export\*\***: Send traces to any OpenTelemetry-compatible backend.
- \* **\*\*Custom Tracing\*\***: Extend or customize tracing as needed.

### > **\*\*Note\*\***

OpenTelemetry-compatible backends including Arize Phoenix, Langfuse, Langsmith, Langtrace, Logfire, Maxim, OpenLIT, and Weave are supported by Agno out of the box.

## ## Developer Resources

- \* [Cookbooks](https://github.com/agno-agi/agno/tree/main/cookbook/integrations/observability)

### # Weave

Source: <https://docs.agno.com/integrations/observability/weave>

Integrate Agno with Weave by WandB to send traces and gain insights into your agent's performance.

## Integrating Agno with Weave by WandB

[Weave by Weights & Biases (WandB)](<https://weave-docs.wandb.ai/>) provides a powerful platform for logging and visualizing model calls. By integrating Agno with Weave, you can track and analyze your agent's performance and behavior.

## Prerequisites

1. **Install Weave**

Ensure you have the Weave package installed:

```
pip install weave
```

2. **Authentication**

Go to [WandB](<https://wandb.ai>) and copy your API key

```
export WANDB_API_KEY=<your-api-key>
```

## Logging Model Calls with Weave

This example demonstrates how to use Weave to log model calls.

```
import weave
from agno.agent import Agent
from agno.models.openai import OpenAIChat
```

## Initialize Weave with your project name

```
weave.init("agno")
```

## Create and configure the agent

```
agent = Agent(model=OpenAIChat(id="gpt-5-mini"), markdown=True, debug_mode=True)
```

## Define a function to run the agent, decorated with `weave.op()`

```
@weave.op()
def run(content: str):
 return agent.run(content)
```

## Use the function to log a model call

```
run("Share a 2 sentence horror story")
```

## ## Notes

- \* **Environment Variables**: Ensure your environment variable is correctly set for the WandB API key.
- \* **Initialization**: Call ``weave.init("project-name")`` to initialize Weave with your project name.
- \* **Decorators**: Use ``@weave.op()`` to decorate functions you want to log with Weave.

By following these steps, you can effectively integrate Agno with Weave, enabling comprehensive logging and visualization of your AI agents' model calls.

## # Scenario Testing

Source: <https://docs.agno.com/integrations/testing/scenario-o-testing>

This example demonstrates how to use the [Scenario](<https://github.com/langwatch/scenario>) framework for agentic simulation-based testing. Scenario enables you to simulate conversations between agents, user simulators, and judges, making it easy to test and evaluate agent behaviors in a controlled environment.

> **Tip**: For a more advanced scenario testing example, check out the [customer support scenario]([https://github.com/langwatch/create-agent-app/tree/main/agno\\_example](https://github.com/langwatch/create-agent-app/tree/main/agno_example)) for a more complex agent, including tool calls and advanced scenario features.

## ## Basic Scenario Testing

```
import pytest
import scenario
from agno.agent import Agent
from agno.models.openai import OpenAIChat
```

# Configure Scenario defaults (model for user simulator and judge)

```
scenario.configure(default_model="openai/gpt-4.1-mini")
```

```
@pytest.mark.agent_test
@pytest.mark.asyncio
async def test_vegetarian_recipe_agent() -> None:
```

## 1. Define an AgentAdapter to wrap your agent

```
class VegetarianRecipeAgentAdapter(scenario.AgentAdapter):
 agent: Agent

 def __init__(self) -> None:
 self.agent = Agent(
 model=OpenAIChat(id="gpt-4.1-mini"),
 markdown=True,
```

```

 debug_mode=True,
 instructions="You are a vegetarian recipe agent.",
)

 async def call(self, input: scenario.AgentInput) -> scenario.AgentReturnTypes:
 response = self.agent.run(
 message=input.last_new_user_message_str(), # Pass only the last user
message
 session_id=input.thread_id, # Pass the thread id, this allows the agent to
track history
)
 return response.content

```

## 2. Run the scenario simulation

```

result = await scenario.run(
 name="dinner recipe request",
 description="User is looking for a vegetarian dinner idea.",
 agents=[
 VegetarianRecipeAgentAdapter(),
 scenario.UserSimulatorAgent(),
 scenario.JudgeAgent(
 criteria=[
 "Agent should not ask more than two follow-up questions",
 "Agent should generate a recipe",
 "Recipe should include a list of ingredients",
 "Recipe should include step-by-step cooking instructions",
 "Recipe should be vegetarian and not include any sort of meat",
]
),
],
)

```

## 3. Assert and inspect the result

```
assert result.success
```

## Usage

```
> **Snippet file:** "create-venv-step.mdx"
```

**\*\*Step: Set your API key\*\***

```
export OPENAI_API_KEY=xxx
export LANGWATCH_API_KEY=xxx # Optional, required for Simulation monitoring
```

**\*\*Step: Install libraries\*\***

```
pip install -U openai agno langwatch-scenario pytest pytest-asyncio
```

**or**

```
uv add agno langwatch-scenario openai pytest
```

```
Step: Run Agent
```

```
pytest cookbook/agent_concepts/other/scenario_testing.py
```

```
What is Agno?
```

```
Source: https://docs.agno.com/introduction
```

```
Agno is an incredibly fast multi-agent framework, runtime and control plane.
```

Use it to build multi-agent systems with memory, knowledge, human in the loop and MCP support. You can orchestrate agents as multi-agent teams (more autonomy) or step-based agentic workflows (more control).

Here's an example of an Agent that connects to an MCP server, manages conversation state in a database, and is served using a FastAPI application that you can interact with using the [AgentOS UI](<https://os.agno.com>).

```
from agno.agent import Agent
from agno.db.sqlite import SQLiteDatabase
from agno.models.anthropic import Claude
from agno.os import AgentOS
from agno.tools.mcp import MCPTools
```

## **\* Create Agent \***

```
agno_agent = Agent(
 name="Agno Agent",
 model=Claude(id="claude-sonnet-4-5"),
 db=SQLiteDatabase(db_file="agno.db"),
 tools=[MCPTools(transport="streamable-http", url="https://docs.agno.com/mcp")],
 add_history_to_context=True,
 markdown=True,
)
```

## **\* Create AgentOS \***

```
agent_os = AgentOS(agents=[agno_agent])
app = agent_os.get_app()
```

## **\* Run AgentOS \***

```
if name == "main":
 agent_os.serve(app="agno_agent:app", reload=True)
```

```
What is the AgentOS?
```

AgentOS is a high-performance runtime for multi-agent systems. Key features include:

1. **\*\*Pre-built FastAPI runtime\*\***: AgentOS ships with a ready-to-use FastAPI app for orchestrating your agents, teams, and workflows. This gives you a major head start in building your AI product.
2. **\*\*Integrated Control Plane\*\***: The [AgentOS UI](https://os.agno.com) connects directly to your runtime, letting you test, monitor, and manage your system in real time. This gives you unmatched visibility and control over your system.
3. **\*\*Private by Design\*\***: AgentOS runs entirely in your cloud, ensuring complete data privacy. No data ever leaves your system. This is ideal for security-conscious enterprises.

Here's what the [AgentOS UI](https://os.agno.com) looks like in action:

```
autoPlay muted loop playsInline style={{ borderRadius: "0.5rem", width: "100%", height:
"auto" }}>
 <source src="https://mintcdn.com/agno-v2/aEfJPs-hg36UsUP0/
videos/agno-agent-chat.mp4?fit=max&auto=format&n=a
EfJPs-hg36UsUP0&q=85&s=b8ac56bfb2e9436799299fcafa7
46d4a" type="video/mp4" data-path="videos/agno-agent-chat.mp4"
 <
```

## ## The Complete Agentic Solution

For companies building agents, Agno provides the complete solution:

- \* The fastest framework for building agents, multi-agent teams and agentic workflows.
- \* A ready-to-use FastAPI app that gets you building AI products on day one.
- \* A control plane for testing, monitoring and managing your system.

We bring a novel architecture that no other framework provides, your AgentOS runs securely in your cloud, and the control plane connects directly to it from your browser. You don't need to send data to any external services or pay retention costs, you get complete privacy and control.

## ## Getting started

If you're new to Agno, follow the [quickstart](/introduction/quickstart) to build your first Agent and run it using the AgentOS.

After that, checkout the [examples gallery](/examples/introduction) and build real-world applications with Agno.

> **\*\*Tip:\*\***

If you're looking for Agno 1.0 docs, please visit [docs-v1.agno.com](https://docs-v1.agno.com).

We also have a [migration guide](/how-to/v2-migration) for those coming from Agno 1.0.

# Designed for Agent Engineering

Source: <https://docs.agno.com/introduction/features>

Agno is built for real-world **Agent Engineering**, helping engineers build, deploy, and scale multi-agent systems in production. Here are some key features that make Agno stand out:

### Core Intelligence

- \* **Model Agnostic**: Works with any model provider so you can use your favorite LLMs.
- \* **Type Safe**: Enforce structured I/O through `input_schema`` and `output_schema`` for predictable, composable behavior.
- \* **Dynamic Context Engineering**: Inject variables, state, and retrieved data on the fly into context. Perfect for dependency-driven agents.

### Memory, Knowledge, and Persistence

- \* **Persistent Storage**: Give your Agents, Teams, and Workflows a database to persist session history, state, and messages.
- \* **User Memory**: Built-in memory system that allows Agents to recall user-specific context across sessions.
- \* **Agentic RAG**: Connect to 20+ vector stores (called **Knowledge** in Agno) with hybrid search + reranking out of the box.
- \* **Culture (Collective Memory)**: Shared knowledge that compounds across agents and time.

### Execution & Control

- \* **Human-in-the-Loop**: Native support for confirmations, manual overrides, and external tool execution.
- \* **Guardrails**: Built-in safeguards for validation, security, and prompt protection.
- \* **Agent Lifecycle Hooks**: Pre- and post-hooks to validate or transform inputs and outputs.
- \* **MCP Integration**: First-class support for the Model Context Protocol (MCP) to connect Agents with external systems.
- \* **Toolkits**: 113+ built-in toolkits with thousands of tools - ready for use across domains like data, code, web, and enterprise APIs.

### Runtime & Evaluation

- \* **Runtime**: Pre-built FastAPI based runtime with SSE compatible endpoints, ready for production on day 1.
- \* **Control Plane (UI)**: Integrated interface to visualize, monitor, and debug agent activity in real time.

\* **Natively Multimodal**: Agents can process and generate text, images, audio, video, and files.

\* **Evals**: Measure your Agents' Accuracy, Performance, and Reliability.

### ### Security & Privacy

\* **Private by Design**: Runs entirely in your cloud. The UI connects directly to your AgentOS from your browser - no data is ever sent externally.

\* **Data Governance**: Your data lives securely in your Agent database, with no external data sharing or vendor lock-in.

\* **Access Control**: Role-based access (RBAC) and per-agent permissions to protect sensitive contexts and tools.

Every part of Agno is built for real-world deployment, where developer experience meets production performance.

### # Getting Help

Source: <https://docs.agno.com/introduction/getting-help>

Connect with builders, get support, and explore Agent Engineering.

### ## Need help?

Head over to our [community forum](<https://agno.link/community>) for help and insights from the team.

### ## Building with Agno?

Share what you're building on [X](<https://agno.link/x>), [LinkedIn](<https://www.linkedin.com/company/agno-agi>) or join our [Discord](<https://agno.link/discord>) to connect with other builders.

### ## Looking for dedicated support?

We've helped many companies turn ideas into AI products. [Book a call](<https://cal.com/team/agno/intro>) to get started.

### # Performance

Source: <https://docs.agno.com/introduction/performance>

Get extreme performance out of the box with Agno.

If you're building with Agno, you're guaranteed best-in-class performance by default. Our obsession with performance is necessary because even simple AI workflows can spawn hundreds of Agents and because many tasks are long-running -- stateless, horizontal scalability is key for success.

At Agno, we optimize performance across 3 dimensions:

1. **Agent performance:** We optimize static operations (instantiation, memory footprint) and runtime operations (tool calls, memory updates, history management).
2. **System performance:** The AgentOS API is async by default and has a minimal memory footprint. The system is stateless and horizontally scalable, with a focus on preventing memory leaks. It handles parallel and batch embedding generation during knowledge ingestion, metrics collection in background tasks, and other system-level optimizations.
3. **Agent reliability and accuracy:** Monitored through evals, which we'll explore later.

## ## Agent Performance

Let's measure the time it takes to instantiate an Agent and the memory footprint of an Agent. Here are the numbers (last measured in Oct 2025, on an Apple M4 MacBook Pro):

```
* Agent instantiation: ~3s on average
* Memory footprint: ~6.6Kib on average
```

We'll show below that Agno Agents instantiate **529** faster than Langgraph, **57** faster than PydanticAI, and **70** faster than CrewAI. Agno Agents also use **24** lower memory than Langgraph, **4** lower than PydanticAI, and **10** lower than CrewAI.

> **Note:**

Run time performance is bottlenecked by inference and hard to benchmark accurately, so we focus on minimizing overhead, reducing memory usage, and parallelizing tool calls.

## ### Instantiation Time

Let's measure instantiation time for an Agent with 1 tool. We'll run the evaluation 1000 times to get a baseline measurement. We'll compare Agno to LangGraph, CrewAI and Pydantic AI.

> **Note:**

The code for this benchmark is available [here](<https://github.com/agno-agi/agno/tree/main/cookbook/evals/performance>). You should run the evaluation yourself on your own machine, please, do not take these results at face value.

# Setup virtual environment

```
./scripts/perf_setup.sh
```

```
source .venvs/perfenv/bin/activate
```

## Agno

```
python cookbook/evals/performance/instantiate_agent_with_
tool.py
```

## LangGraph

```
python cookbook/evals/performance/comparison/langgraph_in
stantiation.py
```

## CrewAI

python cookbook/evals/performance/comparison/crewai\_instantiation.py

## Pydantic AI

python cookbook/evals/performance/comparison/pydantic\_ai\_instantiation.py

LangGraph is on the right, **let's start it first and give it a head start**. Then CrewAI and Pydantic AI follow, and finally Agno. Agno obviously finishes first, but let's see by how much.

```
autoPlay muted loop playsInline style={{ borderRadius: "0.5rem", width: "100%", height: "auto" }}>
 <source src="https://mintcdn.com/agno-v2/Xc0-_0HxxYe_vtGw/
videos/performance_benchmark.mp4?fit=max&auto=form
at&n=Xc0-_0HxxYe_vtGw&q=85&s=89288701c4cb61d9d2a55
1fd0b5630a6" type="video/mp4" data-path="videos/performance_benchmark.mp4"
 <
```

### Memory Usage

To measure memory usage, we use the `tracemalloc` library. We first calculate a baseline memory usage by running an empty function, then run the Agent 1000x times and calculate the difference. This gives a (reasonably) isolated measurement of the memory usage of the Agent.

We recommend running the evaluation yourself on your own machine, and digging into the code to see how it works. If we've made a mistake, please let us know.

### Results

Taking Agno as the baseline, we can see that:

Metric	Agno	Langgraph	PydanticAI	CrewAI
<b>Time (seconds)</b>	1	529 slower	57 slower	70 slower
<b>Memory (MiB)</b>	1	24 higher	4 higher	10 higher

Exact numbers from the benchmark:

Metric	Agno	Langgraph	PydanticAI	CrewAI
<b>Time (seconds)</b>	0.000003	0.001587	0.000170	0.000210
<b>Memory (MiB)</b>	0.006642	0.161435	0.028712	0.065652

> **Note:**

Agno agents are designed for performance and while we share benchmarks against other frameworks, we should be mindful that accuracy and reliability are more important than speed.

### Quickstart

Source: <https://docs.agno.com/introduction/quickstart>

Build and run your first Agent using Agno.

**\*\*Agents are AI programs where a language model controls the flow of execution.\*\***

In 10 lines of code, we can build an Agent that uses tools to achieve a task.

```
from agno.agent import Agent
from agno.models.anthropic import Claude
from agno.tools.hackernews import HackerNewsTools

agent = Agent(
 model=Claude(id="claude-sonnet-4-5"),
 tools=[HackerNewsTools()],
 markdown=True,
)
agent.print_response("Write a report on trending startups and products.", stream=True)
```

**## Build your first Agent**

Instead of a toy demo, let's build an Agent that you can extend and build upon. We'll connect our agent to the Agno MCP server, and give it a database to store conversation history and state.

**\*\*This is a simple yet complete example that you can extend by connecting to any MCP server\*\*.**

```
from agno.agent import Agent
from agno.db.sqlite import SQLiteDatabase
from agno.models.anthropic import Claude
from agno.os import AgentOS
from agno.tools.mcp import MCPTools
```

## Create the Agent

```
agno_agent = Agent(
 name="Agno Agent",
 model=Claude(id="claude-sonnet-4-5"),
```

## Add a database to the Agent

```
db=SqliteDatabase(db_file="agno.db"),
```

## Add the Agno MCP server to the Agent

```
tools=[MCPTools(transport="streamable-http", url="https://docs.agno.com/mcp")],
```

## Add the previous session history to the context

```
add_history_to_context=True,
markdown=True,
```

)

## Create the AgentOS

```
agent_os = AgentOS(agents=[agno_agent])
```

## Get the FastAPI app for the AgentOS

```
app = agent_os.get_app()
```

<Check>

There is an incredible amount of alpha in these 25 lines of code.

You get a fully functional Agent with memory and state that can access any MCP server. It's served via a FastAPI app with pre-built endpoints that you can use to build your product.

</Check>

## Run your AgentOS

The AgentOS gives us a FastAPI application with ready-to-use API endpoints for serving, monitoring and managing our Agents. Let's run it.

**\*\*Step: Setup your virtual environment\*\***

```
uv venv --python 3.12
source .venv/bin/activate
```

```
uv venv --python 3.12
.venv/Scripts/activate
```

**\*\*Step: Install dependencies\*\***

```
uv pip install -U agno anthropic mcp 'fastapi[standard]' sqlalchemy
```

```
uv pip install -U agno anthropic mcp 'fastapi[standard]' sqlalchemy
```

**\*\*Step: Export your Anthropic API key\*\***

```
export ANTHROPIC_API_KEY=sk-***
```

```
setx ANTHROPIC_API_KEY sk-***
```

**\*\*Step: Run your AgentOS\*\***

```
fastapi dev agno_agent.py
```

This will start your AgentOS on `http://localhost:8000`

## ## Connect your AgentOS

Agno provides a web interface that connects to your AgentOS, use it to monitor, manage and test your agentic system. Open [os.agno.com](https://os.agno.com) and sign in to your account.

1. Click on **"Add new OS"** in the top navigation bar.
2. Select **"Local"** to connect to a local AgentOS running on your machine.
3. Enter the endpoint URL of your AgentOS. The default is `http://localhost:8000`.
4. Give your AgentOS a descriptive name like "Development OS" or "Local 8000".
5. Click **"Connect"**.

```
autoPlay muted loop playsInline style={{ borderRadius: "0.5rem", width: "100%", height:
"auto" }}>
 <source src="https://mintcdn.com/agno-v2/aEfJPs-hg36UsUP0/
videos/agent-os-connect-1.mp4?fit=max&auto=format&
n=aEfJPs-hg36UsUP0&q=85&s=907888debf7f055f14e0f844
05ba5749" type="video/mp4" data-path="videos/agent-os-connect-1.mp4"
 <
```

Once connected, you'll see your new OS with a live status indicator.

## ## Chat with your Agent

Next, let's chat with our Agent, go to the `Chat` section in the sidebar and select your Agent.

- \* Ask "What is Agno?" and the Agent will answer using the Agno MCP server.
- \* Agents keep their own history, tools, and instructions; switching users won't mix context.

```
autoPlay muted loop playsInline style={{ borderRadius: "0.5rem", width: "100%", height:
"auto" }}>
 <source src="https://mintcdn.com/agno-v2/aEfJPs-hg36UsUP0/
videos/agno-agent-chat.mp4?fit=max&auto=format&n=a
EfJPs-hg36UsUP0&q=85&s=b8ac56bfb2e9436799299fcfa7
46d4a" type="video/mp4" data-path="videos/agno-agent-chat.mp4"
 <
```

> **\*\*Tip:\*\***

Click on Sessions to view your Agent's conversations. This data is stored in your Agent's database, so no need for external tracing services.

## ## Pre-built API endpoints

The FastAPI app generated by your AgentOS comes with pre-built SSE-compatible API endpoints that you can use to build your product. You can always add your own routes, middleware or any other FastAPI feature, but this is such a great starting point.

Checkout the API endpoints at ``/docs`` of your AgentOS url, e.g. `[http://localhost:8000/docs](http://localhost:8000/docs)`

## Next

After running your AgentOS, dive into `[core concepts](/concepts/agents/overview)` and extend your Agents with more capabilities.

Happy building!

# AgentOS API Overview

Source: <https://docs.agno.com/reference-api/overview>

Complete API reference for interacting with AgentOS programmatically

Welcome to the comprehensive API reference for the Agno AgentOS API. This RESTful API enables you to programmatically interact with your AgentOS instance, manage agents, teams, and workflows, and integrate AgentOS capabilities into your applications.

## Authentication

AgentOS supports bearer-token authentication via a single Security Key.

\* When ``OS_SECURITY_KEY`` environment variable is set on the server, all routes require:

Authorization: Bearer `<OS_SECURITY_KEY>`

\* When ``OS_SECURITY_KEY`` is not set, authentication is disabled for that instance.

See the dedicated guide: `[Secure your AgentOS with a Security Key](/agent-os/security)`.

## Core Resources

The AgentOS API is organized around several key resources:

`<Card title="Agents" icon="robot" href="/reference-api/schema/agents/list-all-agents">`

`Create, manage, and execute individual agent runs with tools and knowledge`  
`</Card>`

`<Card title="Teams" icon="users" href="/reference-api/schema/teams/list-all-teams">`

`Orchestrate multiple agents working together on complex tasks`  
`</Card>`

`<Card` `title="Workflows"` `icon="diagram-project"`  
`href="/reference-api/schema/workflows/list-all-workflows">`

`Define and execute multi-step automated processes`  
`</Card>`

```
<Card title="Sessions" icon="clock" href="/reference-api/schema/sessions/list-sessions">
 Track conversation history and maintain context across interactions
</Card>
```

```
<Card title="Memory" icon="brain" href="/reference-api/schema/memory/list-memories">
 Store and retrieve persistent memories for personalized interactions
</Card>
```

```
<Card title="Knowledge" icon="book" href="/reference-api/schema/knowledge/list-content">
 Upload, manage, and query knowledge bases for your agents
</Card>
```

```
<Card title="Evals" icon="chart-bar" href="/reference-api/schema/evals/list-evaluation-runs">
 Run evaluations and track performance metrics for your agents
</Card>
```

#### # Send Message

Source: <https://docs.agno.com/reference-api/schema/a2a/send-message>

```
post /a2a/message/send
```

Send a message to an Agno Agent, Team, or Workflow. The Agent, Team or Workflow is identified via the 'agentId' field in params.message or X-Agent-ID header. Optional: Pass user ID via X-User-ID header (recommended) or 'userId' in params.message.metadata.

#### # Stream Message

Source: <https://docs.agno.com/reference-api/schema/a2a/stream-message>

```
post /a2a/message/stream
```

Stream a message to an Agno Agent, Team, or Workflow. The Agent, Team or Workflow is identified via the 'agentId' field in params.message or X-Agent-ID header. Optional: Pass user ID via X-User-ID header (recommended) or 'userId' in params.message.metadata. Returns real-time updates as newline-delimited JSON (NDJSON).

#### # Cancel Agent Run

Source: <https://docs.agno.com/reference-api/schema/agents/cancel-agent-run>

```
post /agents/{agent_id}/runs/{run_id}/cancel
```

Cancel a currently executing agent run. This will attempt to stop the agent's execution gracefully.

**\*\*Note:\*\*** Cancellation may not be immediate for all operations.

#### # Continue Agent Run

Source: <https://docs.agno.com/reference-api/schema/agents/continue-agent-run>

post /agents/{agent\_id}/runs/{run\_id}/continue  
Continue a paused or incomplete agent run with updated tool results.

**\*\*Use Cases:\*\***

- Resume execution after tool approval/rejection
- Provide manual tool execution results

**\*\*Tools Parameter:\*\***

JSON string containing array of tool execution objects with results.

**# Create Agent Run**

Source: <https://docs.agno.com/reference-api/schema/agents/create-agent-run>

post /agents/{agent\_id}/runs

Execute an agent with a message and optional media files. Supports both streaming and non-streaming responses.

**\*\*Features:\*\***

- Text message input with optional session management
- Multi-media support: images (PNG, JPEG, WebP), audio (WAV, MP3), video (MP4, WebM, etc.)
- Document processing: PDF, CSV, DOCX, TXT, JSON
- Real-time streaming responses with Server-Sent Events (SSE)
- User and session context preservation

**\*\*Streaming Response:\*\***

When `stream=true`, returns SSE events with `event` and `data` fields.

**# Get Agent Details**

Source: <https://docs.agno.com/reference-api/schema/agents/get-agent-details>

get /agents/{agent\_id}

Retrieve detailed configuration and capabilities of a specific agent.

**\*\*Returns comprehensive agent information including:\*\***

- Model configuration and provider details
- Complete tool inventory and configurations
- Session management settings
- Knowledge base and memory configurations
- Reasoning capabilities and settings
- System prompts and response formatting options

**# List All Agents**

Source: <https://docs.agno.com/reference-api/schema/agents/list-all-agents>

get /agents

Retrieve a comprehensive list of all agents configured in this OS instance.

**\*\*Returns:\*\***

- Agent metadata (ID, name, description)

- Model configuration and capabilities
- Available tools and their configurations
- Session, knowledge, memory, and reasoning settings
- Only meaningful (non-default) configurations are included

#### # Get Status

Source: <https://docs.agno.com/reference-api/schema/agui/get-status>

get /status

#### # Run Agent

Source: <https://docs.agno.com/reference-api/schema/agui/run-agent>

post /agui

#### # Get OS Configuration

Source: <https://docs.agno.com/reference-api/schema/core/get-os-configuration>

get /config

Retrieve the complete configuration of the AgentOS instance, including:

- Available models and databases
- Registered agents, teams, and workflows
- Chat, session, memory, knowledge, and evaluation configurations
- Available interfaces and their routes

#### # Delete Evaluation Runs

Source: <https://docs.agno.com/reference-api/schema/evals/delete-evaluation-runs>

delete /eval-runs

Delete multiple evaluation runs by their IDs. This action cannot be undone.

#### # Execute Evaluation

Source: <https://docs.agno.com/reference-api/schema/evals/execute-evaluation>

post /eval-runs

Run evaluation tests on agents or teams. Supports accuracy, performance, and reliability evaluations. Requires either agent\_id or team\_id, but not both.

#### # Get Evaluation Run

Source: <https://docs.agno.com/reference-api/schema/evals/get-evaluation-run>

get /eval-runs/{eval\_run\_id}

Retrieve detailed results and metrics for a specific evaluation run.

#### # List Evaluation Runs

Source: <https://docs.agno.com/reference-api/schema/evals/list-evaluation-runs>

get /eval-runs

Retrieve paginated evaluation runs with filtering and sorting options. Filter by agent, team, workflow, model, or evaluation type.

# Update Evaluation Run

Source: <https://docs.agno.com/reference-api/schema/evals/update-evaluation-run>

patch /eval-runs/{eval\_run\_id}

Update the name or other properties of an existing evaluation run.

# Delete All Content

Source: <https://docs.agno.com/reference-api/schema/knowledge/delete-all-content>

delete /knowledge/content

Permanently remove all content from the knowledge base. This is a destructive operation that cannot be undone. Use with extreme caution.

# Delete Content by ID

Source: <https://docs.agno.com/reference-api/schema/knowledge/delete-content-by-id>

delete /knowledge/content/{content\_id}

Permanently remove a specific content item from the knowledge base. This action cannot be undone.

# Get Content by ID

Source: <https://docs.agno.com/reference-api/schema/knowledge/get-content-by-id>

get /knowledge/content/{content\_id}

Retrieve detailed information about a specific content item including processing status and metadata.

# Get Content Status

Source: <https://docs.agno.com/reference-api/schema/knowledge/get-content-status>

get /knowledge/content/{content\_id}/status

Retrieve the current processing status of a content item. Useful for monitoring asynchronous content processing progress and identifying any processing errors.

# List Content

Source: <https://docs.agno.com/reference-api/schema/knowledge/list-content>

get /knowledge/content

Retrieve paginated list of all content in the knowledge base with filtering and sorting

options. Filter by status, content type, or metadata properties.

#### # Search Knowledge

Source: <https://docs.agno.com/reference-api/schema/knowledge/search-knowledge>

post /knowledge/search

Search the knowledge base for relevant documents using query, filters and search type.

#### # Update Content

Source: <https://docs.agno.com/reference-api/schema/knowledge/update-content>

patch /knowledge/content/{content\_id}

Update content properties such as name, description, metadata, or processing configuration. Allows modification of existing content without re-uploading.

#### # Upload Content

Source: <https://docs.agno.com/reference-api/schema/knowledge/upload-content>

post /knowledge/content

Upload content to the knowledge base. Supports file uploads, text content, or URLs. Content is processed asynchronously in the background. Supports custom readers and chunking strategies.

#### # Create Memory

Source: <https://docs.agno.com/reference-api/schema/memory/create-memory>

post /memories

Create a new user memory with content and associated topics. Memories are used to store contextual information for users across conversations.

#### # Delete Memory

Source: <https://docs.agno.com/reference-api/schema/memory/delete-memory>

delete /memories/{memory\_id}

Permanently delete a specific user memory. This action cannot be undone.

#### # Delete Multiple Memories

Source: <https://docs.agno.com/reference-api/schema/memory/delete-multiple-memories>

delete /memories

Delete multiple user memories by their IDs in a single operation. This action cannot be undone and all specified memories will be permanently removed.

#### # Get Memory by ID

Source: <https://docs.agno.com/reference-api/schema/memory/get-memory-by-id>

get /memories/{memory\_id}

Retrieve detailed information about a specific user memory by its ID.

# Get Memory Topics

Source: <https://docs.agno.com/reference-api/schema/memory/>

get-memory-topics

get /memory\_topics

Retrieve all unique topics associated with memories in the system. Useful for filtering and categorizing memories by topic.

# Get User Memory Statistics

Source: <https://docs.agno.com/reference-api/schema/memory/>

get-user-memory-statistics

get /user\_memory\_stats

Retrieve paginated statistics about memory usage by user. Provides insights into user engagement and memory distribution across users.

# List Memories

Source: <https://docs.agno.com/reference-api/schema/memory/>

list-memories

get /memories

Retrieve paginated list of user memories with filtering and search capabilities. Filter by user, agent, team, topics, or search within memory content.

# Update Memory

Source: <https://docs.agno.com/reference-api/schema/memory/>

update-memory

patch /memories/{memory\_id}

Update an existing user memory's content and topics. Replaces the entire memory content and topic list with the provided values.

# Get AgentOS Metrics

Source: <https://docs.agno.com/reference-api/schema/metrics>

/get-agentos-metrics

get /metrics

Retrieve AgentOS metrics and analytics data for a specified date range. If no date range is specified, returns all available metrics.

# Refresh Metrics

Source: <https://docs.agno.com/reference-api/schema/metrics>

/refresh-metrics

post /metrics/refresh

Manually trigger recalculation of system metrics from raw data. This operation analyzes system activity logs and regenerates aggregated metrics. Useful for ensuring metrics are up-to-date or after system maintenance.

# null

Source: <https://docs.agno.com/reference-api/schema/sessions/create-new-session>

post /sessions

# Delete Multiple Sessions

Source: <https://docs.agno.com/reference-api/schema/sessions/delete-multiple-sessions>

delete /sessions

Delete multiple sessions by their IDs in a single operation. This action cannot be undone and will permanently remove all specified sessions and their runs.

# Delete Session

Source: <https://docs.agno.com/reference-api/schema/sessions/delete-session>

delete /sessions/{session\_id}

Permanently delete a specific session and all its associated runs. This action cannot be undone and will remove all conversation history.

# Get Run by ID

Source: <https://docs.agno.com/reference-api/schema/sessions/get-run-by-id>

get /sessions/{session\_id}/runs/{run\_id}

Retrieve a specific run by its ID from a session. Response schema varies based on the run type (agent run, team run, or workflow run).

# Get Session by ID

Source: <https://docs.agno.com/reference-api/schema/sessions/get-session-by-id>

get /sessions/{session\_id}

Retrieve detailed information about a specific session including metadata, configuration, and run history. Response schema varies based on session type (agent, team, or workflow).

# Get Session Runs

Source: <https://docs.agno.com/reference-api/schema/sessions/get-session-runs>

get /sessions/{session\_id}/runs

Retrieve all runs (executions) for a specific session. Runs represent individual interactions or executions within a session. Response schema varies based on session type.

# List Sessions

Source: <https://docs.agno.com/reference-api/schema/sessions/list-sessions>

get /sessions

Retrieve paginated list of sessions with filtering and sorting options. Supports filtering by session type (agent, team, workflow), component, user, and name. Sessions represent conversation histories and execution contexts.

#### # Rename Session

Source: <https://docs.agno.com/reference-api/schema/sessions/rename-session>

post /sessions/{session\_id}/rename

Update the name of an existing session. Useful for organizing and categorizing sessions with meaningful names for better identification and management.

#### # null

Source: <https://docs.agno.com/reference-api/schema/sessions/update-session>

patch /sessions/{session\_id}

#### # Slack Events

Source: <https://docs.agno.com/reference-api/schema/slack/slack-events>

post /slack/events

Process incoming Slack events

#### # Cancel Team Run

Source: <https://docs.agno.com/reference-api/schema/teams/cancel-team-run>

post /teams/{team\_id}/runs/{run\_id}/cancel

Cancel a currently executing team run. This will attempt to stop the team's execution gracefully.

**\*\*Note:\*\*** Cancellation may not be immediate for all operations.

#### # Create Team Run

Source: <https://docs.agno.com/reference-api/schema/teams/create-team-run>

post /teams/{team\_id}/runs

Execute a team collaboration with multiple agents working together on a task.

#### **\*\*Features:\*\***

- Text message input with optional session management
- Multi-media support: images (PNG, JPEG, WebP), audio (WAV, MP3), video (MP4, WebM, etc.)
- Document processing: PDF, CSV, DOCX, TXT, JSON
- Real-time streaming responses with Server-Sent Events (SSE)
- User and session context preservation

#### **\*\*Streaming Response:\*\***

When `stream=true`, returns SSE events with `event` and `data` fields.

#### # Get Team Details

Source: <https://docs.agno.com/reference-api/schema/teams/get-team-details>

get /teams/{team\_id}

Retrieve detailed configuration and member information for a specific team.

#### # List All Teams

Source: <https://docs.agno.com/reference-api/schema/teams/list-all-teams>

get /teams

Retrieve a comprehensive list of all teams configured in this OS instance.

**\*\*Returns team information including:\*\***

- Team metadata (ID, name, description, execution mode)
- Model configuration for team coordination
- Team member roster with roles and capabilities
- Knowledge sharing and memory configurations

#### # Status

Source: <https://docs.agno.com/reference-api/schema/whatsapp/status>

get /whatsapp/status

#### # Verify Webhook

Source: <https://docs.agno.com/reference-api/schema/whatsapp/verify-webhook>

get /whatsapp/webhook

Handle WhatsApp webhook verification

#### # Webhook

Source: <https://docs.agno.com/reference-api/schema/whatsapp/webhook>

post /whatsapp/webhook

Handle incoming WhatsApp messages

#### # Cancel Workflow Run

Source: <https://docs.agno.com/reference-api/schema/workflows/cancel-workflow-run>

post /workflows/{workflow\_id}/runs/{run\_id}/cancel

Cancel a currently executing workflow run, stopping all active steps and cleanup.

**\*\*Note:\*\*** Complex workflows with multiple parallel steps may take time to fully cancel.

#### # Execute Workflow

Source: <https://docs.agno.com/reference-api/schema/workflows/execute-workflow>

Execute a workflow with the provided input data. Workflows can run in streaming or batch mode.

- **Streaming** (``stream=true``): Real-time step-by-step execution updates via SSE
- **Non-Streaming** (``stream=false``): Complete workflow execution with final result

1. Input validation against workflow schema
2. Sequential or parallel step execution based on workflow design
3. Data flow between steps with transformation
4. Error handling and automatic retries where configured
5. Final result compilation and response

Workflows support session continuity for stateful execution across multiple runs.

Source: <https://docs.agno.com/reference-api/schema/workflows/get-workflow-details>

Retrieve detailed configuration and step information for a specific workflow.

Source: <https://docs.agno.com/reference-api/schema/workflows/list-all-workflows>

Retrieve a comprehensive list of all workflows configured in this OS instance.

- Workflow metadata (ID, name, description)
- Input schema requirements
- Step sequence and execution flow
- Associated agents and teams

Source: <https://docs.agno.com/reference/agent-os/agent-os>

Parameter	Type
Default	Description
-----	-----
-----   -----	-----
-----	
----	
`id`	`Optional[str]`
Autogenerated UUID	AgentOS ID

`name`	`Optional[str]`	
`None`	AgentOS name	
`description`	`Optional[str]`	
`None`	AgentOS description	
`version`	`Optional[str]`	
`None`	AgentOS version	
`agents`	`Optional[List[Agent]]`	
`None`	List of agents available in the AgentOS	
`teams`	`Optional[List[Team]]`	
`None`	List of teams available in the AgentOS	
`workflows`	`Optional[List[Workflow]]`	
`None`	List of workflows available in the AgentOS	
`knowledge`	`Optional[List[Knowledge]]`	
`None`	List of standalone knowledge instances available in the AgentOS	
`interfaces`	`Optional[List[BaseInterface]]`	
`None`	List of interfaces available in the AgentOS	
`config`	`Optional[Union[str, AgentOSConfig]]`	
`None`	User-provided configuration for the AgentOS. Either a path to a	
	YAML file or an `AgentOSConfig` instance.	
`settings`	`Optional[AgnoAPISettings]`	
`None`	Settings for the AgentOS API	
`base_app`	`Optional[FastAPI]`	
`None`	Custom FastAPI APP to use for the AgentOS	
`lifespan`	`Optional[Any]`	
`None`	Lifespan context manager for the FastAPI app	
`enable_mcp_server`	`bool`	
`False`	Whether to enable MCP (Model Context Protocol)	
`on_route_conflict`	`Literal["preserve_agents", "preserve_base_app", "error"]`	
`"preserve_agents"`	What to do when a route conflict is detected in case a custom	
	base_app is provided.	
`telemetry`	`bool`	
`True`	Log minimal telemetry for analytics	

## Functions

### `get\_app`

Get the FastAPI APP configured for the AgentOS.

```
`get_routes`
```

Get the routes configured for the AgentOS.

```
`serve`
```

Run the app, effectively starting the AgentOS.

```
Parameters:
```

```
* `app` (Union[str, FastAPI]): FastAPI APP instance
* `host` (str): Host to bind. Defaults to `localhost`
* `port` (int): Port to bind. Defaults to `7777`
* `workers` (Optional[int]): Number of workers to use. Defaults to `None`
* `reload` (bool): Enable auto-reload for development. Defaults to `False`
```

```
AgentOSConfig
```

Source: <https://docs.agno.com/reference/agent-os/configuration>

```
> **Snippet file:** "agent-os-configuration-reference.mdx"
```

```
Using a YAML Configuration File
```

You can also provide your AgentOS configuration via a YAML file.

You can define all the previously mentioned configuration options in the file:

## List of models available in the AgentOS

available\_models:

- <MODEL\_STRING>

...

## Configuration for the Chat page

chat:

# Agent

Source: <https://docs.agno.com/reference/agents/agent>

## ## Parameters

Parameter		Type
	Default	Description
		----- -----
	-----	-----
		-----
		-----
		-----
`model`		`Optional[Union[Model, str]]`
	`None`	Model to use for this Agent. Can be a Model object or a model string (`provider:model_id`)
`name`		`Optional[str]`
	`None`	Agent name
`id`		`Optional[str]`
	`None`	Agent ID (autogenerated UUID if not set)
`user_id`		`Optional[str]`
	`None`	Default user\_id to use for this agent
`session_id`		`Optional[str]`
	`None`	Default session\_id to use for this agent (autogenerated if not set)
`session_state`		`Optional[Dict[str, Any]]`
	`None`	Default session state (stored in the database to persist across runs)
`add_session_state_to_context`		`bool`
	`False`	Set to True to add the session\_state to the context
`enable_agentic_state`		`bool`
	`False`	Set to True to give the agent tools to update the session\_state dynamically
`overwrite_db_session_state`		`bool`
	`False`	Set to True to overwrite the session state in the database

with the session state provided in the run

```
|
| `cache_session` | `bool`
| `False` | If True, cache the current Agent session in memory for faster
access
|
| `search_session_history` | `Optional[bool]`
| `False` | Set this to `True` to allow searching through previous
sessions.
|
| `num_history_sessions` | `Optional[int]`
| `None` | Specify the number of past sessions to include in the search.
It's advisable to keep this number to 2 or 3 for now, as a larger number might fill up the
context length of the model, potentially leading to performance issues. |
| `dependencies` | `Optional[Dict[str, Any]]`
| `None` | Dependencies available for tools and prompt functions
|
| `add_dependencies_to_context` | `bool`
| `False` | If True, add the dependencies to the user prompt
|
| `db` | `Optional[BaseDb]`
| `None` | Database to use for this agent
|
| `memory_manager` | `Optional[MemoryManager]`
| `None` | Memory manager to use for this agent
|
| `enable_agentic_memory` | `bool`
| `False` | Enable the agent to manage memories of the user
|
| `enable_user_memories` | `bool`
| `False` | If True, the agent creates/updates user memories at the end of
runs
|
| `add_memories_to_context` | `Optional[bool]`
| `None` | If True, the agent adds a reference to the user memories in
the response
|
| `enable_session_summaries` | `bool`
| `False` | If True, the agent creates/updates session summaries at the
end of runs
|
| `add_session_summary_to_context` | `Optional[bool]`
| `None` | If True, the agent adds session summaries to the context
|
| `session_summary_manager` | `Optional[SessionSummaryManager]`
| `None` | Session summary manager
```

`add_history_to_context`	`bool`	
`False`	Add the chat history of the current session to the messages sent to the Model	
`num_history_runs`	`Optional[int]`	
`None`	Number of historical runs to include in the messages.	
`num_history_messages`	`Optional[int]`	
`None`	Number of historical messages to include messages list sent to the Model.	
`knowledge`	`Optional[Knowledge]`	
`None`	Agent Knowledge	
`knowledge_filters`	`Optional[Dict[str, Any]]`	
`None`	Knowledge filters to apply to the knowledge base	
`enable_agentic_knowledge_filters`	`Optional[bool]`	
`None`	Let the agent choose the knowledge filters	
`add_knowledge_to_context`	`bool`	
`False`	Enable RAG by adding references from Knowledge to the user prompt	
`knowledge_retriever`	`Optional[Callable[..., Optional[List[Union[Dict, str]]]]]`	
`None`	Function to get references to add to the user\_message	
`references_format`	`Literal["json", "yaml"]`	
`json`	Format of the references	
`metadata`	`Optional[Dict[str, Any]]`	
`None`	Metadata stored with this agent	
`tools`	`Optional[List[Union[Toolkit, Callable, Function, Dict]]]`	
`None`	A list of tools provided to the Model	
`tool_call_limit`	`Optional[int]`	
`None`	Maximum number of tool calls allowed for a single run	
`tool_choice`	`Optional[Union[str, Dict[str, Any]]]`	
`None`	Controls which (if any) tool is called by the model	

`max_tool_calls_from_history`	`Optional[int]`
`None`	Maximum number of tool calls from history to keep in context. If None, all tool calls from history are included. If set to N, only the last N tool calls from history are added to the context for memory management
`tool_hooks`	`Optional[List[Callable]]`
`None`	Functions that will run between tool calls
`pre_hooks`	`Optional[Union[List[Callable[..., Any]], List[BaseGuardrail]]]`
`None`	Functions called right after agent-session is loaded, before processing starts
`post_hooks`	`Optional[Union[List[Callable[..., Any]], List[BaseGuardrail]]]`
`None`	Functions called after output is generated but before the response is returned
`reasoning`	`bool`
`False`	Enable reasoning by working through the problem step by step
`reasoning_model`	`Optional[Union[Model, str]]`
`None`	Model to use for reasoning. Can be a Model object or a model string (`provider:model_id`)
`reasoning_agent`	`Optional[Agent]`
`None`	Agent to use for reasoning
`reasoning_min_steps`	`int`
`1`	Minimum number of reasoning steps
`reasoning_max_steps`	`int`
`10`	Maximum number of reasoning steps
`read_chat_history`	`bool`
`False`	Add a tool that allows the Model to read the chat history
`search_knowledge`	`bool`
`True`	Add a tool that allows the Model to search the knowledge base
`update_knowledge`	`bool`
`False`	Add a tool that allows the Model to update the knowledge base
`read_tool_call_history`	`bool`
`False`	Add a tool that allows the Model to get the tool call history

`send_media_to_model`	`bool`	
`True`	If False, media (images, videos, audio, files) is only available to tools and not sent to the LLM	
`store_media`	`bool`	
`True`	If True, store media in the database	
`store_tool_messages`	`bool`	
`True`	If True, store tool results in the database	
`store_history_messages`	`bool`	
`True`	If True, store history messages in the database	
`system_message`	`Optional[Union[str, Callable, Message]]`	
`None`	Provide the system message as a string or function	
`system_message_role`	`str`	
`"system"`	Role for the system message	
`build_context`	`bool`	
`True`	Set to False to skip context building	
`description`	`Optional[str]`	
`None`	A description of the Agent that is added to the start of the system message	
`instructions`	`Optional[Union[str, List[str], Callable]]`	
`None`	List of instructions for the agent	
`expected_output`	`Optional[str]`	
`None`	Provide the expected output from the Agent	
`additional_context`	`Optional[str]`	
`None`	Additional context added to the end of the system message	
`markdown`	`bool`	
`False`	If markdown=true, add instructions to format the output using markdown	
`add_name_to_context`	`bool`	
`False`	If True, add the agent name to the instructions	

`add_datetime_to_context`	`bool`	
`False`	If True, add the current datetime to the instructions to give the agent a sense of time	
`add_location_to_context`	`bool`	
`False`	If True, add the current location to the instructions to give the agent a sense of place	
`timezone_identifier`	`Optional[str]`	
`None`	Allows for custom timezone for datetime instructions following the TZ Database format (e.g. "Etc/UTC")	
`resolve_in_context`	`bool`	
`True`	If True, resolve session\_state, dependencies, and metadata in the user and system messages	
`additional_input`	`Optional[List[Union[str, Dict, BaseModel, Message]]]`	
`None`	A list of extra messages added after the system message and before the user message	
`user_message_role`	`str`	
`"user"`	Role for the user message	
`build_user_context`	`bool`	
`True`	Set to False to skip building the user context	
`retries`	`int`	
`0`	Number of retries to attempt	
`delay_between_retries`	`int`	
`1`	Delay between retries (in seconds)	
`exponential_backoff`	`bool`	
`False`	If True, the delay between retries is doubled each time	
`input_schema`	`Optional[Type[BaseModel]]`	
`None`	Provide an input schema to validate the input	
`output_schema`	`Optional[Type[BaseModel]]`	
`None`	Provide a response model to get the response as a Pydantic model	
`parser_model`	`Optional[Union[Model, str]]`	
`None`	Provide a secondary model to parse the response from the	

```

primary model. Can be a Model object or a model string (`provider:model_id`)
|
| `parser_model_prompt` | `Optional[str]`
| `None` | Provide a prompt for the parser model
|
| `output_model` | `Optional[Union[Model, str]]`
| `None` | Provide an output model to structure the response from the
main model. Can be a Model object or a model string (`provider:model_id`)
|
| `output_model_prompt` | `Optional[str]`
| `None` | Provide a prompt for the output model
|
| `parse_response` | `bool`
| `True` | If True, the response from the Model is converted into the
output\schema
|
| `structured_outputs` | `Optional[bool]`
| `None` | Use model enforced structured\outputs if supported (e.g.
OpenAIChat)
|
| `use_json_mode` | `bool`
| `False` | If `output_schema` is set, sets the response mode of the
model, i.e. if the model should explicitly respond with a JSON object instead of a
Pydantic model
|
| `save_response_to_file` | `Optional[str]`
| `None` | Save the response to a file
|
| `stream` | `Optional[bool]`
| `None` | Stream the response from the Agent
|
| `stream_events` | `bool`
| `False` | Stream the intermediate steps from the Agent
|
| `store_events` | `bool`
| `False` | Persist the events on the run response
|
| `events_to_skip` | `Optional[List[RunEvent]]`
| `None` | Specify which event types to skip when storing events on the
RunOutput
|
| `role` | `Optional[str]`
| `None` | If this Agent is part of a team, this is the role of the agent
in the team
|
| `debug_mode` | `bool`
| `False` | Enable debug logs

```

`debug_level`	`Literal[1, 2]`	
`1`	Debug level for logging	
`telemetry`	`bool`	
`True`	Log minimal telemetry for analytics	

## Functions

### `run`

Run the agent.

**\*\*Parameters:\*\***

- \* `input` (Union\[str, List, Dict, Message, BaseModel, List\[Message]]): The input to send to the agent
- \* `stream` (Optional\[bool]): Whether to stream the response
- \* `stream\_events` (Optional\[bool]): Whether to stream intermediate steps
- \* `user\_id` (Optional\[str]): User ID to use
- \* `session\_id` (Optional\[str]): Session ID to use
- \* `session\_state` (Optional\[Dict\[str, Any]]): Session state to use. By default, merged with the session state in the db.
- \* `audio` (Optional\[Sequence\[Audio]]): Audio files to include
- \* `images` (Optional\[Sequence\[Image]]): Image files to include
- \* `videos` (Optional\[Sequence\[Video]]): Video files to include
- \* `files` (Optional\[Sequence\[File]]): Files to include
- \* `retries` (Optional\[int]): Number of retries to attempt
- \* `knowledge\_filters` (Optional\[Dict\[str, Any]]): Knowledge filters to apply
- \* `add\_history\_to\_context` (Optional\[bool]): Whether to add history to context
- \* `add\_dependencies\_to\_context` (Optional\[bool]): Whether to add dependencies to context
- \* `add\_session\_state\_to\_context` (Optional\[bool]): Whether to add session state to context
- \* `dependencies` (Optional\[Dict\[str, Any]]): Dependencies to use for this run
- \* `metadata` (Optional\[Dict\[str, Any]]): Metadata to use for this run
- \* `debug\_mode` (Optional\[bool]): Whether to enable debug mode

### `arun`

Run the agent asynchronously.

**\*\*Parameters:\*\***

- \* `input` (Union\[str, List, Dict, Message, BaseModel, List\[Message]]): The input to send to the agent
- \* `stream` (Optional\[bool]): Whether to stream the response
- \* `user\_id` (Optional\[str]): User ID to use
- \* `session\_id` (Optional\[str]): Session ID to use

\* ``session_state`` (Optional\[Dict\[str, Any]]): Session state to use. By default, merged with the session state in the db.

\* ``audio`` (Optional\[Sequence\[Audio]]): Audio files to include

\* ``images`` (Optional\[Sequence\[Image]]): Image files to include

\* ``videos`` (Optional\[Sequence\[Video]]): Video files to include

\* ``files`` (Optional\[Sequence\[File]]): Files to include

\* ``stream_events`` (Optional\[bool]): Whether to stream intermediate steps

\* ``retries`` (Optional\[int]): Number of retries to attempt

\* ``knowledge_filters`` (Optional\[Dict\[str, Any]]): Knowledge filters to apply

\* ``add_history_to_context`` (Optional\[bool]): Whether to add history to context

\* ``add_dependencies_to_context`` (Optional\[bool]): Whether to add dependencies to context

\* ``add_session_state_to_context`` (Optional\[bool]): Whether to add session state to context

\* ``dependencies`` (Optional\[Dict\[str, Any]]): Dependencies to use for this run

\* ``metadata`` (Optional\[Dict\[str, Any]]): Metadata to use for this run

\* ``debug_mode`` (Optional\[bool]): Whether to enable debug mode

**\*\*Returns:\*\***

\* ``Union[RunOutput, AsyncIterator[RunOutputEvent]]``: Either a RunOutput or an iterator of RunOutputEvents, depending on the ``stream`` parameter

### ``continue_run``

Continue a run.

**\*\*Parameters:\*\***

\* ``run_response`` (Optional\[RunOutput]): The run response to continue

\* ``run_id`` (Optional\[str]): The run ID to continue

\* ``updated_tools`` (Optional\[List\[ToolExecution]]): Updated tools to use, required if the run is resumed using ``run_id``

\* ``stream`` (Optional\[bool]): Whether to stream the response

\* ``stream_events`` (Optional\[bool]): Whether to stream intermediate steps

\* ``user_id`` (Optional\[str]): User ID to use

\* ``session_id`` (Optional\[str]): Session ID to use

\* ``retries`` (Optional\[int]): Number of retries to attempt

\* ``knowledge_filters`` (Optional\[Dict\[str, Any]]): Knowledge filters to apply

\* ``dependencies`` (Optional\[Dict\[str, Any]]): Dependencies to use for this run

\* ``debug_mode`` (Optional\[bool]): Whether to enable debug mode

**\*\*Returns:\*\***

\* ``Union[RunOutput, Iterator[RunOutputEvent]]``: Either a RunOutput or an iterator of RunOutputEvents, depending on the ``stream`` parameter

### ``acontinue_run``

Continue a run asynchronously.

**\*\*Parameters:\*\***

- \* ``run_response`` (Optional\[RunOutput]): The run response to continue
- \* ``run_id`` (Optional\[str]): The run ID to continue
- \* ``updated_tools`` (Optional\[List\[ToolExecution]]): Updated tools to use, required if the run is resumed using ``run_id``
- \* ``stream`` (Optional\[bool]): Whether to stream the response
- \* ``stream_events`` (Optional\[bool]): Whether to stream intermediate steps
- \* ``user_id`` (Optional\[str]): User ID to use
- \* ``session_id`` (Optional\[str]): Session ID to use
- \* ``retries`` (Optional\[int]): Number of retries to attempt
- \* ``knowledge_filters`` (Optional\[Dict\[str, Any]]): Knowledge filters to apply
- \* ``dependencies`` (Optional\[Dict\[str, Any]]): Dependencies to use for this run
- \* ``debug_mode`` (Optional\[bool]): Whether to enable debug mode

**\*\*Returns:\*\***

\* ``Union[RunOutput, AsyncIterator[Union[RunOutputEvent, RunOutput]]``: Either a RunOutput or an iterator of RunOutputEvents, depending on the ``stream`` parameter

### ``print_response``

Run the agent and print the response.

**\*\*Parameters:\*\***

- \* ``input`` (Union\[List, Dict, str, Message, BaseModel, List\[Message]]): The input to send to the agent
- \* ``session_id`` (Optional\[str]): Session ID to use
- \* ``session_state`` (Optional\[Dict\[str, Any]]): Session state to use. By default, merged with the session state in the db.
- \* ``user_id`` (Optional\[str]): User ID to use
- \* ``audio`` (Optional\[Sequence\[Audio]]): Audio files to include
- \* ``images`` (Optional\[Sequence\[Image]]): Image files to include
- \* ``videos`` (Optional\[Sequence\[Video]]): Video files to include
- \* ``files`` (Optional\[Sequence\[File]]): Files to include
- \* ``stream`` (Optional\[bool]): Whether to stream the response
- \* ``stream_events`` (Optional\[bool]): Whether to stream intermediate steps
- \* ``markdown`` (Optional\[bool]): Whether to format output as markdown
- \* ``show_message`` (bool): Whether to show the input message
- \* ``show_reasoning`` (bool): Whether to show reasoning steps
- \* ``show_full_reasoning`` (bool): Whether to show full reasoning information
- \* ``console`` (Optional\[Any]): Console to use for output
- \* ``tags_to_include_in_markdown`` (Optional\[Set\[str]]): Tags to include in markdown content
- \* ``knowledge_filters`` (Optional\[Dict\[str, Any]]): Knowledge filters to apply
- \* ``add_history_to_context`` (Optional\[bool]): Whether to add history to context
- \* ``dependencies`` (Optional\[Dict\[str, Any]]): Dependencies to use for this run
- \* ``add_dependencies_to_context`` (Optional\[bool]): Whether to add dependencies to context
- \* ``add_session_state_to_context`` (Optional\[bool]): Whether to add session state to context
- \* ``metadata`` (Optional\[Dict\[str, Any]]): Metadata to use for this run
- \* ``debug_mode`` (Optional\[bool]): Whether to enable debug mode

```
`aprint_response`
```

Run the agent and print the response asynchronously.

```
Parameters:
```

```
* `input` (Union\[List, Dict, str, Message, BaseModel, List\[Message]\]): The input to send to the agent
* `session_id` (Optional\[str]): Session ID to use
* `session_state` (Optional\[Dict\[str, Any]]): Session state to use. By default, merged with the session state in the db.
* `user_id` (Optional\[str]): User ID to use
* `audio` (Optional\[Sequence\[Audio]]): Audio files to include
* `images` (Optional\[Sequence\[Image]]): Image files to include
* `videos` (Optional\[Sequence\[Video]]): Video files to include
* `files` (Optional\[Sequence\[File]]): Files to include
* `stream` (Optional\[bool]): Whether to stream the response
* `stream_events` (Optional\[bool]): Whether to stream intermediate steps
* `markdown` (Optional\[bool]): Whether to format output as markdown
* `show_message` (bool): Whether to show the message
* `show_reasoning` (bool): Whether to show reasoning
* `show_full_reasoning` (bool): Whether to show full reasoning
* `console` (Optional\[Any]): Console to use for output
* `tags_to_include_in_markdown` (Optional\[Set\[str]]): Tags to include in markdown content
* `knowledge_filters` (Optional\[Dict\[str, Any]]): Knowledge filters to apply
* `add_history_to_context` (Optional\[bool]): Whether to add history to context
* `add_dependencies_to_context` (Optional\[bool]): Whether to add dependencies to context
* `add_session_state_to_context` (Optional\[bool]): Whether to add session state to context
* `dependencies` (Optional\[Dict\[str, Any]]): Dependencies to use for this run
* `metadata` (Optional\[Dict\[str, Any]]): Metadata to use for this run
* `debug_mode` (Optional\[bool]): Whether to enable debug mode
```

```
`cli_app`
```

Run an interactive command-line interface to interact with the agent.

```
Parameters:
```

```
* `input` (Optional\[str]): The input to send to the agent
* `session_id` (Optional\[str]): Session ID to use
* `user_id` (Optional\[str]): User ID to use
* `user` (str): Name for the user (default: "User")
* `emoji` (str): Emoji for the user (default: ":sunglasses:")
* `stream` (bool): Whether to stream the response (default: False)
* `markdown` (bool): Whether to format output as markdown (default: False)
* `exit_on` (Optional\[List\[str]]): List of commands to exit the CLI
* `**kwargs`: Additional keyword arguments
```

```
`accli_app`
```

Run an interactive command-line interface to interact with the agent asynchronously.

**\*\*Parameters:\*\***

- \* ``input`` (Optional\[str]): The input to send to the agent
- \* ``session_id`` (Optional\[str]): Session ID to use
- \* ``user_id`` (Optional\[str]): User ID to use
- \* ``user`` (str): Name for the user (default: "User")
- \* ``emoji`` (str): Emoji for the user (default: ":sunglasses:")
- \* ``stream`` (bool): Whether to stream the response (default: False)
- \* ``markdown`` (bool): Whether to format output as markdown (default: False)
- \* ``exit_on`` (Optional\[List\[str]]): List of commands to exit the CLI
- \* ``**kwargs``: Additional keyword arguments

### `cancel\_run`

Cancel a run by run ID.

**\*\*Parameters:\*\***

- \* ``run_id`` (str): The run ID to cancel

**\*\*Returns:\*\***

- \* ``bool``: True if the run was successfully cancelled

### `get\_run\_output`

Get the run output for the given run ID.

**\*\*Parameters:\*\***

- \* ``run_id`` (str): The run ID
- \* ``session_id`` (str): Session ID to use

**\*\*Returns:\*\***

- \* ``Optional[RunOutput]``: The run output

### `get\_last\_run\_output`

Get the last run output for the session.

**\*\*Parameters:\*\***

- \* ``session_id`` (str): Session ID to use

**\*\*Returns:\*\***

- \* ``Optional[RunOutput]``: The last run output

### `get\_session`

Get the session for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to use

**\*\*Returns:\*\***

\* `Optional[AgentSession]`: The agent session

### get\\_session\\_summary

Get the session summary for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to use

**\*\*Returns:\*\***

\* Session summary for the given session

### get\\_user\\_memories

Get the user memories for the given user ID.

**\*\*Parameters:\*\***

\* `user\_id` (str): User ID to use

**\*\*Returns:\*\***

\* `Optional[List[UserMemory]]`: The user memories

### aget\\_user\\_memories

Get the user memories for the given user ID asynchronously.

**\*\*Parameters:\*\***

\* `user\_id` (str): User ID to use

**\*\*Returns:\*\***

\* `Optional[List[UserMemory]]`: The user memories

### get\\_session\\_state

Get the session state for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to use

**\*\*Returns:\*\***

\* `Dict[str, Any]`: The session state

### update\\_session\\_state

Update the session state for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to use

\* `session\_state\_updates` (Dict[str, Any]): The session state keys and values to update. Overwrites the existing session state.

**\*\*Returns:\*\***

\* `Dict[str, Any]`: The updated session state

### get\\_session\\_metrics

Get the session metrics for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to use

**\*\*Returns:\*\***

\* `Optional[Metrics]`: The session metrics

### delete\\_session

Delete a session.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to delete

### save\\_session

Save a session to the database.

**\*\*Parameters:\*\***

\* `session` (AgentSession): The session to save

### asave\\_session

Save a session to the database asynchronously.

**\*\*Parameters:\*\***

\* `session` (AgentSession): The session to save

### rename

Rename the agent and update the session.

**\*\*Parameters:\*\***

\* `name` (str): The new name for the agent

\* `session\_id` (str): Session ID to use

### get\\_session\\_name

Get the session name for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to use

**\*\*Returns:\*\***

\* `str`: The session name

### set\\_session\\_name

Set the session name.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to use

\* `autogenerate` (bool): Whether to autogenerate the name

\* `session\_name` (Optional[str]): The name to set

**\*\*Returns:\*\***

\* `AgentSession`: The updated session

### get\\_messages\\_for\\_session

Get the messages for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to use

**\*\*Returns:\*\***

\* `List[Message]`: The messages for the session

### ### get\\_chat\\_history

Get the chat history for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to use

**\*\*Returns:\*\***

\* `List[Message]`: The chat history

### ### add\\_tool

Add a tool to the agent.

**\*\*Parameters:\*\***

\* `tool` (Union[Toolkit, Callable, Function, Dict]): The tool to add

### ### set\\_tools

Replace the tools of the agent.

**\*\*Parameters:\*\***

\* `tools` (List[Union[Toolkit, Callable, Function, Dict]]): The tools to set

### # RunOutput

Source: <https://docs.agno.com/reference/agents/run-responses>

e

### ## RunOutput Attributes

Attribute	Type	Default	
Description			
-----	-----	-----	-----
-----			
`run_id`	`Optional[str]`	`None`	Run ID
`agent_id`	`Optional[str]`	`None`	Agent ID for the run
`agent_name`	`Optional[str]`	`None`	Agent name for the run
`session_id`	`Optional[str]`	`None`	Session ID for the run
`parent_run_id`	`Optional[str]`	`None`	Parent run ID
`workflow_id`	`Optional[str]`	`None`	Workflow ID if this run is part of a workflow
`user_id`	`Optional[str]`	`None`	User

ID associated with the run			
`content`	`Optional[Any]`	`None`	
Content of the response			
`content_type`	`str`	`"str"`	
Specifies the data type of the content			
`reasoning_content`	`Optional[str]`	`None`	Any
reasoning content the model produced			
`reasoning_steps`	`Optional[List[ReasoningStep]]`	`None`	List
of reasoning steps			
`reasoning_messages`	`Optional[List[Message]]`	`None`	List
of reasoning messages			
`model`	`Optional[str]`	`None`	The
model used in the run			
`model_provider`	`Optional[str]`	`None`	The
model provider used in the run			
`messages`	`Optional[List[Message]]`	`None`	A
list of messages included in the response			
`metrics`	`Optional[Metrics]`	`None`	
Usage metrics of the run			
`additional_input`	`Optional[List[Message]]`	`None`	
Additional input messages			
`tools`	`Optional[List[ToolExecution]]`	`None`	List
of tool executions			
`images`	`Optional[List[Image]]`	`None`	List
of images attached to the response			
`videos`	`Optional[List[Video]]`	`None`	List
of videos attached to the response			
`audio`	`Optional[List[Audio]]`	`None`	List
of audio snippets attached to the response			
`files`	`Optional[List[File]]`	`None`	List
of files attached to the response			
`response_audio`	`Optional[Audio]`	`None`	The
model's raw response in audio			
`input`	`Optional[RunInput]`	`None`	
Input media and messages from user			
`citations`	`Optional[Citations]`	`None`	Any
citations used in the response			
`model_provider_data`	`Optional[Any]`	`None`	
Model provider specific metadata			
`references`	`Optional[List[MessageReferences]]`	`None`	
References used in the response			
`metadata`	`Optional[Dict[str, Any]]`	`None`	
Metadata associated with the run			
`created_at`	`int`	Current timestamp	Unix
timestamp of the response creation			
`events`	`Optional[List[RunOutputEvent]]`	`None`	List
of events that occurred during the run			
`status`	`RunStatus`	`RunStatus.running`	
Status of the run (running, completed, paused, cancelled, error)			
`workflow_step_id`	`Optional[str]`	`None`	
Workflow step ID (foreign key relationship)			

## ## RunOutputEvent Types and Attributes

### ### Base RunOutputEvent Attributes

All events inherit from `BaseAgentRunEvent` which provides these common attributes:

Attribute	Type	Default	Description
-----	-----	-----	-----
`created_at` of the event creation	`int`	Current timestamp	Unix timestamp
`event` event	`str`	Event type value	The type of event
`agent_id` agent generating the event	`str`	``	ID of the agent
`agent_name` agent generating the event	`str`	``	Name of the agent
`run_id` current run	`Optional[str]`	`None`	ID of the current run
`session_id` current session	`Optional[str]`	`None`	ID of the current session
`workflow_id` workflow if part of workflow execution	`Optional[str]`	`None`	ID of the workflow
`workflow_run_id` workflow run	`Optional[str]`	`None`	ID of the workflow run
`step_id` workflow step	`Optional[str]`	`None`	ID of the workflow step
`step_name` workflow step	`Optional[str]`	`None`	Name of the workflow step
`step_index` workflow step	`Optional[int]`	`None`	Index of the workflow step
`tools` associated with this event	`Optional[List[ToolExecution]]`	`None`	Tools
`content` compatibility	`Optional[Any]`	`None`	For backwards compatibility

### ### RunStartedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"RunStarted"`	Event type
`model`	`str`	``	The model being used
`model_provider`	`str`	``	The provider of the model

### ### RunContentEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"RunContent"`	Event

type				
`content`		`Optional[Any]`		`None`
content of the response				
`content_type`		`str`		`"str"`
the content				
`reasoning_content`		`Optional[str]`		`None`
content produced				
`citations`		`Optional[Citations]`		`None`
used in the response				
`model_provider_data`		`Optional[Any]`		`None`
provider specific metadata				
`response_audio`		`Optional[Audio]`		`None`
audio response				
`image`		`Optional[Image]`		`None`
attached to the response				
`references`		`Optional[List[MessageReferences]]`		`None`
References used in the response				
`additional_input`		`Optional[List[Message]]`		`None`
Additional input messages				
`reasoning_steps`		`Optional[List[ReasoningStep]]`		`None`
steps				
`reasoning_messages`		`Optional[List[Message]]`		`None`
messages				

### RunContentCompletedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"RunContentCompleted"`	Event type

### IntermediateRunContentEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"RunIntermediateContent"`	Event type
`content`	`Optional[Any]`	`None`	Intermediate content of the response
`content_type`	`str`	`"str"`	Type of the content

### RunCompletedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"RunCompleted"`	Event type
`content`	`Optional[Any]`	`None`	Final

content of the response			
`content_type`	`str`	`str`	Type of
the content			
`reasoning_content`	`Optional[str]`	`None`	
Reasoning content produced			
`citations`	`Optional[Citations]`	`None`	
Citations used in the response			
`model_provider_data`	`Optional[Any]`	`None`	Model
provider specific metadata			
`images`	`Optional[List[Image]]`	`None`	Images
attached to the response			
`videos`	`Optional[List[Video]]`	`None`	Videos
attached to the response			
`audio`	`Optional[List[Audio]]`	`None`	Audio
snippets attached to the response			
`response_audio`	`Optional[Audio]`	`None`	Model's
audio response			
`references`	`Optional[List[MessageReferences]]`	`None`	
References used in the response			
`additional_input`	`Optional[List[Message]]`	`None`	
Additional input messages			
`reasoning_steps`	`Optional[List[ReasoningStep]]`	`None`	
Reasoning steps			
`reasoning_messages`	`Optional[List[Message]]`	`None`	
Reasoning messages			
`metadata`	`Optional[Dict[str, Any]]`	`None`	
Additional metadata			
`metrics`	`Optional[Metrics]`	`None`	Usage
metrics			

### RunPausedEvent

Attribute	Type	Default	Description
`event`	`str`	`RunPaused`	Event type
`tools`	`Optional[List[ToolExecution]]`	`None`	Tools that require
confirmation			

### RunContinuedEvent

Attribute	Type	Default	Description
`event`	`str`	`RunContinued`	Event type

### RunErrorEvent

Attribute	Type	Default	Description
`event`	`str`	`RunError`	Event type

`content`	`Optional[str]`	`None`	Error message
-----------	-----------------	--------	---------------

### RunCancelledEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"RunCancelled"`	Event type
`reason`	`Optional[str]`	`None`	Reason for cancellation

### PreHookStartedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"PreHookStarted"`	Event type
`pre_hook_name`	`Optional[str]`	`None`	Name of the pre-hook being executed
`run_input`	`Optional[RunInput]`	`None`	The run input passed to the hook

### PreHookCompletedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"PreHookCompleted"`	Event type
`pre_hook_name`	`Optional[str]`	`None`	Name of the pre-hook that completed
`run_input`	`Optional[RunInput]`	`None`	The run input passed to the hook

### PostHookStartedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"PostHookStarted"`	Event type
`post_hook_name`	`Optional[str]`	`None`	Name of the post-hook being executed

### PostHookCompletedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----

`event`	`str`	`"PostHookCompleted"`	Event type
`post_hook_name`	`Optional[str]`	`None`	Name of the post-hook that completed

### ### ReasoningStartedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"ReasoningStarted"`	Event type

### ### ReasoningStepEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"ReasoningStep"`	Event type
`content`	`Optional[Any]`	`None`	Content of the reasoning step
`content_type`	`str`	`"str"`	Type of the content
`reasoning_content`	`str`	`""`	Detailed reasoning content

### ### ReasoningCompletedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"ReasoningCompleted"`	Event type
`content`	`Optional[Any]`	`None`	Content of the reasoning step
`content_type`	`str`	`"str"`	Type of the content

### ### ToolCallStartedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"ToolCallStarted"`	Event type
`tool`	`Optional[ToolExecution]`	`None`	The tool being called

### ### ToolCallCompletedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----

`event`	`str`	`"ToolCallCompleted"`	Event type
`tool`	`Optional[ToolExecution]`	`None`	The tool that was called
`content`	`Optional[Any]`	`None`	Result of the tool call
`images`	`Optional[List[Image]]`	`None`	Images produced by the tool
`videos`	`Optional[List[Video]]`	`None`	Videos produced by the tool
`audio`	`Optional[List[Audio]]`	`None`	Audio produced by the tool

### ### MemoryUpdateStartedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"MemoryUpdateStarted"`	Event type

### ### MemoryUpdateCompletedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"MemoryUpdateCompleted"`	Event type

### ### SessionSummaryStartedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"SessionSummaryStarted"`	Event type

### ### SessionSummaryCompletedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"SessionSummaryCompleted"`	Event type
`session_summary`	`Optional[SessionSummary]`	`None`	The generated session summary

### ### ParserModelResponseStartedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"ParserModelResponseStarted"`	Event type

### ### ParserModelResponseCompletedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----

`event`	`str`	`"ParserModelResponseCompleted"`	Event type	
---------	-------	----------------------------------	------------	--

### ### OutputModelResponseStartedEvent

Attribute	Type	Default	Description	
-----	----	-----	-----	
`event`	`str`	`"OutputModelResponseStarted"`	Event type	

### ### OutputModelResponseCompletedEvent

Attribute	Type	Default	Description	
-----	----	-----	-----	
`event`	`str`	`"OutputModelResponseCompleted"`	Event type	

### ### CustomEvent

Attribute	Type	Default	Description	
-----	----	-----	-----	
`event`	`str`	`"CustomEvent"`	Event type	

## # AgentSession

Source: <https://docs.agno.com/reference/agents/session>

### ## AgentSession Attributes

Parameter	Type	Default	Description	
-----	----	-----	-----	
`session_id`	`str`	Required	Session UUID	
`agent_id`	`Optional[str]`	`None`	ID of the agent that this session is associated with	
`team_id`	`Optional[str]`	`None`	ID of the team that this session is associated with	
`user_id`	`Optional[str]`	`None`	ID of the user interacting with this agent	
`workflow_id`	`Optional[str]`	`None`	ID of the workflow that this session is associated with	
`session_data`	`Optional[Dict[str, Any]]`	`None`	Session Data: session\_name, session\_state, images, videos, audio	
`metadata`	`Optional[Dict[str, Any]]`	`None`	Metadata stored with this agent	
`agent_data`	`Optional[Dict[str, Any]]`	`None`	Agent Data: agent\_id, name and model	
`runs`	`Optional[List[RunOutput]]`	`None`	List of all runs in the session	
`summary`	`Optional[SessionSummary]`	`None`	Summary of the session	
`created_at`	`Optional[int]`	`None`	The unix timestamp when this session was created	

```

| `updated_at` | `Optional[int]` | `None` | The unix timestamp when this
session was last updated |

AgentSession Methods

`upsert_run(run: RunOutput)`

Adds a RunOutput to the runs list. If a run with the same `run_id` already exists, it
updates the existing run.

`get_run(run_id: str) -> Optional[RunOutput]`

Retrieves a specific run by its `run_id`.

`get_messages_from_last_n_runs(...) -> List[Message]`

Gets messages from the last N runs with various filtering options:

* `agent_id`: Filter by agent ID
* `team_id`: Filter by team ID
* `last_n`: Number of recent runs to include
* `skip_role`: Skip messages with specific role
* `skip_status`: Skip runs with specific statuses
* `skip_history_messages`: Whether to skip history messages

`get_session_summary() -> Optional[SessionSummary]`

Get the session summary for the session

`get_chat_history() -> List[Message]`

Get the chat history for the session

ag infra config
Source: https://docs.agno.com/reference/agno-infra/cli/ws/
config

Prints active infra config

Params

<ResponseField name="print_debug_log" type="bool">
 Print debug logs. `--debug` `-d`
</ResponseField>

ag infra create
Source: https://docs.agno.com/reference/agno-infra/cli/ws/
create

Create a new infra in the current directory.

Params

```

```
<ResponseField name="name" type="str">
 Name of the new infra. `--name` `-n`
</ResponseField>
```

```
<ResponseField name="template" type="str">
 Starter template for the infra. `--template` `-t`
</ResponseField>
```

```
<ResponseField name="url" type="str">
 URL of the starter template. `--url` `-u`
</ResponseField>
```

```
<ResponseField name="print_debug_log" type="bool">
 Print debug logs. `--debug` `-d`
</ResponseField>
```

```
ag infra delete
Source: https://docs.agno.com/reference/agno-infra/cli/ws/delete
```

Delete infra record

```
Params
```

```
<ResponseField name="infra_name" type="str">
 Name of the infra to delete `--infra`
</ResponseField>
```

```
<ResponseField name="print_debug_log" type="bool">
 Print debug logs. `--debug` `-d`
</ResponseField>
```

```

BaseGuardrail
Source: https://docs.agno.com/reference/hooks/base-guardrail

```

```
Methods
```

```
`check`
```

Perform the guardrail checks synchronously.

```
Parameters:
```

```
* `run_input` (RunInput | TeamRunInput): The input provided to the Agent or Team when invoking the run.
```

```
Returns: `None`
```

```
`async_check`
```

Perform the guardrail checks asynchronously.

```
Parameters:
```

\* `run\_input` (RunInput | TeamRunInput): The input provided to the Agent or Team when invoking the run.

**Returns:** `None`

# OpenAIModerationGuardrail

Source: <https://docs.agno.com/reference/hooks/openai-moderation-guardrail>

## Parameters

Parameter	Type	Default	Description
-----	-----	-----	-----
-----			
`moderation_model`	`str`	`"omni-moderation-latest"`	The model to use for moderation.
`raise_for_categories`	`List[str]`	`None`	The categories to raise for.
`api_key`	`str`	`None`	The API key to use for moderation. Defaults to the OPENAI_API_KEY environment variable.

## Moderation categories

You can check the current list of moderation categories in [OpenAI's docs](<https://platform.openai.com/docs/guides/moderation#content-classifications>).

# PIIDetectionGuardrail

Source: <https://docs.agno.com/reference/hooks/pii-guardrail>

## Parameters

Parameter	Type	Default	Description
-----	-----	-----	-----
-----			
`mask_pii`	`bool`	`False`	Whether to mask the PII in the input, rather than raising an error.
`enable_ssn_check`	`bool`	`True`	Whether to check for Social Security Numbers.
`enable_credit_card_check`	`bool`	`True`	Whether to check for credit cards.
`enable_email_check`	`bool`	`True`	Whether to check for emails.
`enable_phone_check`	`bool`	`True`	Whether to check for phone numbers.
-----			
`custom_patterns`	`dict`	`{}`	A dictionary of custom PII patterns to detect. This is added to the default patterns.

## # Post-hooks

Source: <https://docs.agno.com/reference/hooks/post-hooks>

### ## Parameters

Running a post-hook is handled automatically during the Agent or Team run. These are the parameters that will be injected:

Parameter	Type	Default	Description
-----			
-----			
`agent`	`Agent`	Required	The Agent that is running the post-hook. Only present in Agent runs.
`team`	`Team`	Required	The Team that is running the post-hook. Only present in Team runs.
`run_output`	`RunOutput` or `TeamRunOutput`	Required	The output of the current Agent or Team run.
`session`	`AgentSession`	Required	The `AgentSession` or `TeamSession` object representing the current session.
`session_state`	`Optional[Dict[str, Any]]`	`None`	The session state of the current session.
`dependencies`	`Optional[Dict[str, Any]]`	`None`	The dependencies of the current run.
`metadata`	`Optional[Dict[str, Any]]`	`None`	The metadata of the current run.
`user_id`	`Optional[str]`	`None`	The contextual user ID, if any.
`debug_mode`	`Optional[bool]`	`None`	Whether the debug mode is enabled.

## # Pre-hooks

Source: <https://docs.agno.com/reference/hooks/pre-hooks>

### ## Parameters

Running a pre-hook is handled automatically during the Agent or Team run. These are the parameters that will be injected:

Parameter	Type	Default	Description
-----			
-----			
`agent`	`Agent`	Required	The Agent that is running the pre-hook. Only present in Agent runs.
`team`	`Team`	Required	The Team that is running the pre-hook. Only present in Team runs.
`run_input`	`RunInput`	Required	The input provided to the Agent or Team when invoking the run.

`session`	`AgentSession`	Required	The `AgentSession` or `TeamSession` object representing the current session.
`session_state`	`Optional[Dict[str, Any]]`	`None`	The session state of the current session.
`dependencies`	`Optional[Dict[str, Any]]`	`None`	The dependencies of the current run.
`metadata`	`Optional[Dict[str, Any]]`	`None`	The metadata of the current run.
`user_id`	`Optional[str]`	`None`	The contextual user ID, if any.
`debug_mode`	`Optional[bool]`	`None`	Whether the debug mode is enabled.

## # PromptInjectionGuardrail

Source: <https://docs.agno.com/reference/hooks/prompt-injection-guardrail>

### ## Parameters

Parameter	Type	Default	Description
`injection_patterns`	`Optional[List[str]]`	`None`	A list of patterns to check for. Defaults to a list of common prompt injection patterns.

### ## Injection patterns

The default list of injection patterns handled by the guardrail are:

- \* "ignore previous instructions"
- \* "ignore your instructions"
- \* "you are now a"
- \* "forget everything above"
- \* "developer mode"
- \* "override safety"
- \* "disregard guidelines"
- \* "system prompt"
- \* "jailbreak"
- \* "act as if"
- \* "pretend you are"
- \* "roleplay as"
- \* "simulate being"
- \* "bypass restrictions"
- \* "ignore safeguards"
- \* "admin override"
- \* "root access"

## # Agentic Chunking

Source: <https://docs.agno.com/reference/knowledge/chunking/agentic>

Agentic chunking is an intelligent method of splitting documents into smaller chunks by using a model to determine natural breakpoints in the text.

Rather than splitting text at fixed character counts, it analyzes the content to find semantically meaningful boundaries like paragraph breaks and topic transitions.

```
> **Snippet file:** "chunking-agentic.mdx"
```

```
CSV Row Chunking
```

```
Source: https://docs.agno.com/reference/knowledge/chunking/csv-row
```

CSV row chunking is a method of splitting CSV files into smaller chunks based on the number of rows, rather than character count. This approach is particularly useful for structured data where you want to process CSV files in manageable row-based chunks while preserving the integrity of individual records.

```
> **Snippet file:** "chunking-csv-row.mdx"
```

```
Document Chunking
```

```
Source: https://docs.agno.com/reference/knowledge/chunking/document
```

Document chunking is a method of splitting documents into smaller chunks based on document structure like paragraphs and sections.

It analyzes natural document boundaries rather than splitting at fixed character counts. This is useful when you want to process large documents while preserving semantic meaning and context.

```
> **Snippet file:** "chunking-document.mdx"
```

```
Fixed Size Chunking
```

```
Source: https://docs.agno.com/reference/knowledge/chunking/fixed-size
```

Fixed size chunking is a method of splitting documents into smaller chunks of a specified size, with optional overlap between chunks.

This is useful when you want to process large documents in smaller, manageable pieces.

```
> **Snippet file:** "chunking-fixed-size.mdx"
```

```
Markdown Chunking
```

```
Source: https://docs.agno.com/reference/knowledge/chunking/markdown
```

Markdown chunking is a method of splitting markdown based on structure like headers, paragraphs and sections.

This is useful when you want to process large markdown documents in smaller, manageable pieces.

```
> **Snippet file:** "chunking-markdown.mdx"
```

## # Recursive Chunking

Source: <https://docs.agno.com/reference/knowledge/chunking/recursive>

Recursive chunking is a method of splitting documents into smaller chunks by recursively applying a chunking strategy.

This is useful when you want to process large documents in smaller, manageable pieces.

```
> **Snippet file:** "chunking-recursive.mdx"
```

## # Semantic Chunking

Source: <https://docs.agno.com/reference/knowledge/chunking/semantic>

Semantic chunking is a method of splitting documents into smaller chunks by analyzing semantic similarity between text segments using embeddings.

It uses the chonkie library to identify natural breakpoints where the semantic meaning changes significantly, based on a configurable similarity threshold.

This helps preserve context and meaning better than fixed-size chunking by ensuring semantically related content stays together in the same chunk, while splitting occurs at meaningful topic transitions.

```
> **Snippet file:** "chunking-semantic.mdx"
```

## # Azure OpenAI

Source: [https://docs.agno.com/reference/knowledge/embedder/azure\\_openai](https://docs.agno.com/reference/knowledge/embedder/azure_openai)

Azure OpenAI Embedder is a class that allows you to embed documents using Azure OpenAI.

```
> **Snippet file:** "embedder-azure-openai-reference.mdx"
```

## # Cohere

Source: <https://docs.agno.com/reference/knowledge/embedder/cohere>

Cohere Embedder is a class that allows you to embed documents using Cohere's embedding models.

```
> **Snippet file:** "embedder-cohere-reference.mdx"
```

## # FastEmbed

Source: <https://docs.agno.com/reference/knowledge/embedder/fastembed>

FastEmbed Embedder is a class that allows you to embed documents using FastEmbed's efficient embedding models, with BAAI/bge-small-en-v1.5 as the default model.

```
> **Snippet file:** "embedder-fastembed-reference.mdx"
```

## # Fireworks

Source: <https://docs.agno.com/reference/knowledge/embedder>

/fireworks

Fireworks Embedder is a class that allows you to embed documents using Fireworks.ai's embedding models. It extends the OpenAI Embedder class and uses a compatible API interface.

> \*\*Snippet file:\*\* "embedder-fireworks-reference.mdx"

# Gemini

Source: <https://docs.agno.com/reference/knowledge/embedder/gemini>

Gemini Embedder is a class that allows you to embed documents using Google's Gemini embedding models through the Google Generative AI API.

> \*\*Snippet file:\*\* "embedder-gemini-reference.mdx"

# Hugging Face

Source: <https://docs.agno.com/reference/knowledge/embedder/huggingface>

Hugging Face Embedder is a class that allows you to embed documents using any embedding model hosted on HuggingFace's Inference API.

> \*\*Snippet file:\*\* "embedder-huggingface-reference.mdx"

# Mistral

Source: <https://docs.agno.com/reference/knowledge/embedder/mistral>

Mistral Embedder is a class that allows you to embed documents using Mistral AI's embedding models.

> \*\*Snippet file:\*\* "embedder-mistral-reference.mdx"

# Nebius

Source: <https://docs.agno.com/reference/knowledge/embedder/nebius>

Nebius Embedder is a class that allows you to embed documents using Nebius AI Studio's embedding models. It extends the OpenAI Embedder class and uses a compatible API interface.

### Parameters

Parameter	Type	Description
	Default	
	-----	-----
`id`	`str`	The model ID to use for embeddings
	`"BAAI/bge-en-icl"`	
`dimensions`	`int`	Output dimensions of the embedding

`1024`		
`encoding_format`   `Literal["float", "base64"]`		Format of the embedding output
`float`		
`user`   `Optional[str]`		A unique identifier representing your
end-user   `None`		
`api_key`   `Optional[str]`		Nebius API key
Environment variable `NEBIUS_API_KEY`		
`organization`   `Optional[str]`		Organization ID for API requests
`None`		
`base_url`   `str`		Base URL for API requests
`https://api.studio.nebius.com/v1/`		
`request_params`   `Optional[Dict[str, Any]]`		Additional parameters for embedding
requests   `None`		
`client_params`   `Optional[Dict[str, Any]]`		Additional parameters for client
initialization   `None`		
`openai_client`   `Optional[OpenAIClient]`		Pre-configured OpenAI client
`None`		
`enable_batch`   `bool`		Enable batch processing to reduce API
calls   `False`		
`batch_size`   `int`		Number of texts to process in each
API call   `100`		

# Ollama

Source: <https://docs.agno.com/reference/knowledge/embedder/ollama>

Ollama Embedder is a class that allows you to embed documents using locally hosted Ollama models. This embedder provides integration with Ollama's API for generating embeddings from various open-source models.

> **Snippet file:** "embedder-ollama-reference.mdx"

# OpenAI

Source: <https://docs.agno.com/reference/knowledge/embedder/openai>

OpenAI Embedder is a class that allows you to embed documents using OpenAI's embedding models, including the latest text-embedding-3 series.

> **Snippet file:** "embedder-openai-reference.mdx"

# Sentence Transformer

Source: <https://docs.agno.com/reference/knowledge/embedder/sentence-transformer>

Sentence Transformer Embedder is a class that allows you to embed documents using Hugging Face's sentence-transformers library, providing access to a wide range of open-source embedding models that can run locally.

> **Snippet file:** "embedder-sentence-transformer-reference.mdx"

# Together

Source: <https://docs.agno.com/reference/knowledge/embedder/together>

Together Embedder is a class that allows you to embed documents using Together AI's embedding models. It extends the OpenAI Embedder class and uses a compatible API interface.

> **\*\*Snippet file:\*\*** "embedder-together-reference.mdx"

# vLLM

Source: <https://docs.agno.com/reference/knowledge/embedder/vllm>

The vLLM Embedder provides high-performance embedding inference with support for both local and remote deployment modes. It can load models directly for local inference or connect to a remote vLLM server via an OpenAI-compatible API.

## Usage

```
from agno.knowledge.embedder.vllm import VLLMEmbedder
from agno.knowledge.knowledge import Knowledge
from agno.vectordb.pgvector import PgVector
```

## Local mode

```
embedder = VLLMEmbedder(
 id="intfloat/e5-mistral-7b-instruct",
 dimensions=4096,
 enforce_eager=True,
 vllm_kwargs={
 "disable_sliding_window": True,
 "max_model_len": 4096,
 },
)
```

## Use with Knowledge

```
knowledge = Knowledge(
 vector_db=PgVector(
 db_url="postgres+psycopg://ai:ai@localhost:5532/ai",
 table_name="vllm_embeddings",
 embedder=embedder,
),
)
```

## Parameters

Parameter	Type	Default
Description		
-----	-----	-----

```

----- |
| `id` | `str` | | `"intfloat/e5-mistral-7b-instruct"` |
Model identifier (HuggingFace model name) |
| `dimensions` | `int` | | `4096` |
Embedding vector dimensions |
| `base_url` | `Optional[str]` | | `None` |
Remote vLLM server URL (enables remote mode) |
| `api_key` | `Optional[str]` | | `getenv("VLLM_API_KEY")` |
API key for remote server authentication |
| `enable_batch` | `bool` | | `False` |
Enable batch processing for multiple texts |
| `batch_size` | `int` | | `10` |
Number of texts to process per batch |
| `enforce_eager` | `bool` | | `True` |
Use eager execution mode (local mode) |
| `vllm_kwargs` | `Optional[Dict[str, Any]]` | | `None` |
Additional vLLM engine parameters (local mode) |
| `request_params` | `Optional[Dict[str, Any]]` | | `None` |
Additional request parameters (remote mode) |
| `client_params` | `Optional[Dict[str, Any]]` | | `None` |
OpenAI client configuration (remote mode) |

```

## ## Developer Resources

\* View [Cookbook]([https://github.com/agno-agi/agno/tree/main/cookbook/knowledge/embedders/vllm\\_embedder.py](https://github.com/agno-agi/agno/tree/main/cookbook/knowledge/embedders/vllm_embedder.py))

### # VoyageAI

Source: <https://docs.agno.com/reference/knowledge/embedder/voyageai>

VoyageAI Embedder is a class that allows you to embed documents using VoyageAI's embedding models, which are specifically designed for high-performance text embeddings.

```
> **Snippet file:** "embedder-voyageai-reference.mdx"
```

### # Knowledge

Source: <https://docs.agno.com/reference/knowledge/knowledge>

Knowledge is a class that manages knowledge bases for AI agents. It provides comprehensive knowledge management capabilities including adding new content to the knowledge base, searching the knowledge base and deleting content from the knowledge base.

```
> **Snippet file:** "knowledge-reference.mdx"
```

### # Arxiv Reader

Source: <https://docs.agno.com/reference/knowledge/reader/arxiv>

ArxivReader is a reader class that allows you to read papers from the Arxiv API.

```
> **Snippet file:** "arxiv-reader-reference.mdx"
```

```
Reader
```

```
Source: https://docs.agno.com/reference/knowledge/reader/base
```

Reader is the base class for all reader classes in Agno.

```
> **Snippet file:** "base-reader-reference.mdx"
```

```
CSV Reader
```

```
Source: https://docs.agno.com/reference/knowledge/reader/csv
```

CSVReader is a reader class that allows you to read data from CSV files.

```
> **Snippet file:** "csv-reader-reference.mdx"
```

```
Docx Reader
```

```
Source: https://docs.agno.com/reference/knowledge/reader/docx
```

DocxReader is a reader class that allows you to read data from Docx files.

```
> **Snippet file:** "docx-reader-reference.mdx"
```

```
Field Labeled CSV Reader
```

```
Source: https://docs.agno.com/reference/knowledge/reader/field-labeled-csv
```

FieldLabeledCSVReader is a reader class that converts CSV rows into field-labeled text documents.

```
> **Snippet file:** "field-labeled-csv-reader-reference.mdx"
```

```
FireCrawl Reader
```

```
Source: https://docs.agno.com/reference/knowledge/reader/firecrawl
```

FireCrawlReader is a reader class that allows you to read data from websites using Firecrawl.

```
> **Snippet file:** "firecrawl-reader-reference.mdx"
```

```
JSON Reader
```

```
Source: https://docs.agno.com/reference/knowledge/reader/json
```

JSONReader is a reader class that allows you to read data from JSON files.

```
> **Snippet file:** "json-reader-reference.mdx"
```

#### # PDF Reader

Source: <https://docs.agno.com/reference/knowledge/reader/pdf>

PDFReader is a reader class that allows you to read data from PDF files.

```
> **Snippet file:** "pdf-reader-reference.mdx"
```

#### # PPTX Reader

Source: <https://docs.agno.com/reference/knowledge/reader/pptx>

PPTXReader is a reader class that allows you to read data from PowerPoint (.pptx) files.

```
> **Snippet file:** "pptx-reader-reference.mdx"
```

#### # Text Reader

Source: <https://docs.agno.com/reference/knowledge/reader/text>

TextReader is a reader class that allows you to read data from text files.

```
> **Snippet file:** "text-reader-reference.mdx"
```

#### # Web Search Reader

Source: <https://docs.agno.com/reference/knowledge/reader/web-search>

WebSearchReader is a reader class that allows you to read data from web search results.

```
> **Snippet file:** "web-search-reader-reference.mdx"
```

#### # Website Reader

Source: <https://docs.agno.com/reference/knowledge/reader/website>

WebsiteReader is a reader class that allows you to read data from websites.

```
> **Snippet file:** "website-reader-reference.mdx"
```

#### # Wikipedia Reader

Source: <https://docs.agno.com/reference/knowledge/reader/wikipedia>

WikipediaReader is a reader class that allows you to read Wikipedia articles.

```
> **Snippet file:** "wikipedia-reader-reference.mdx"
```

#### # YouTube Reader

Source: <https://docs.agno.com/reference/knowledge/reader/youtube>

YouTubeReader is a reader class that allows you to read transcript from YouTube videos.

```
> **Snippet file:** "youtube-reader-reference.mdx"
```

```
GCS Content
```

```
Source: https://docs.agno.com/reference/knowledge/remote-content/gcs-content
```

GCSContent is a class that allows you to add content from a GCS bucket to the knowledge base.

```
> **Snippet file:** "gcs-remote-content-params.mdx"
```

```
S3 Content
```

```
Source: https://docs.agno.com/reference/knowledge/remote-content/s3-content
```

S3Content is a class that allows you to add content from a S3 bucket to the knowledge base.

```
> **Snippet file:** "s3-remote-content-params.mdx"
```

```
Cohere Reranker
```

```
Source: https://docs.agno.com/reference/knowledge/reranker/cohere
```

```
> **Snippet file:** "reranker-cohere-params.mdx"
```

```
Memory Manager
```

```
Source: https://docs.agno.com/reference/memory/memory
```

Memory is a class that manages conversation history, session summaries, and long-term user memories for AI agents. It provides comprehensive memory management capabilities including adding new memories, searching memories, and deleting memories.

```
> **Snippet file:** "memory-manager-reference.mdx"
```

```
AI/ML API
```

```
Source: https://docs.agno.com/reference/models/aimlapi
```

The **AI/ML API** provider gives unified access to over **300+ AI models**, including **Deepseek**, **Gemini**, **ChatGPT**, and others, via a single standardized interface.

The models run with **enterprise-grade rate limits and uptime**, and are ideal for production use.

You can sign up at [aimlapi.com](https://aimlapi.com/?utm\_source=agno&utm\_medium=integration&utm\_campaign=aimlapi) and view full provider documentation at [docs.aimlapi.com](https://docs.aimlapi.com/?utm\_source=agno&utm\_medium=github&utm\_campaign=integration).

## ## Parameters

Parameter	Type	Default	Description
-----	-----	-----	-----
-----	-----	-----	-----
`id`	`str`	`"gpt-4o-mini"`	The id of the model to use
`name`	`str`	`"AIMLAPI"`	The name of the model
`provider`	`str`	`"AIMLAPI"`	The provider of the model
`api_key`	`Optional[str]`	`None`	The API key for AI/ML API (defaults to AIMLAPI\_API\_KEY env var)
`base_url`	`str`	`"https://api.aimlapi.com/v1"`	The base URL for the AI/ML API
`max_tokens`	`int`	`4096`	Maximum number of tokens to generate

AIMLAPI extends the OpenAI-compatible interface and supports most parameters from OpenAI.

## # Claude

Source: <https://docs.agno.com/reference/models/anthropic>

The Claude model provides access to Anthropic's Claude models.

## ## Parameters

Parameter	Type	Default
-----	-----	-----
-----	-----	-----
-----	-----	-----
`id`	`str`	
`"claude-3-5-sonnet-20241022"`		The id of the Anthropic Claude model to use
-----	-----	-----
`name`	`str`	`"Claude"`
	The name of the model	
`provider`	`str`	`"Anthropic"`
	The provider of the model	
`max_tokens`	`Optional[int]`	`4096`
	Maximum number of tokens to generate in the chat completion	
`thinking`	`Optional[Dict[str, Any]]`	`None`
	Configuration for the thinking (reasoning) process	
`temperature`	`Optional[float]`	`None`
	Controls randomness in the model's output	
`stop_sequences`	`Optional[List[str]]`	`None`
	A list of strings that the model should stop generating text at	
`top_p`	`Optional[float]`	`None`
	Controls diversity via nucleus sampling	
`top_k`	`Optional[int]`	`None`

Controls diversity via top-k sampling	
`cache_system_prompt`   `Optional[bool]`	`False`
Whether to cache the system prompt for improved performance	
`extended_cache_time`   `Optional[bool]`	`False`
Whether to use extended cache time (1 hour instead of default)	
`request_params`   `Optional[Dict[str, Any]]`	`None`
Additional parameters to include in the request	
`mcp_servers`   `Optional[List[MCPServerConfiguration]]`	`None`
List of MCP (Model Context Protocol) server configurations	
`api_key`   `Optional[str]`	`None`
The API key for authenticating with Anthropic	
`default_headers`   `Optional[Dict[str, Any]]`	`None`
Default headers to include in all requests	
`client_params`   `Optional[Dict[str, Any]]`	`None`
Additional parameters for client configuration	
`client`   `Optional[AnthropicClient]`	`None`
A pre-configured instance of the Anthropic client	
`async_client`   `Optional[AsyncAnthropicClient]`	`None`
A pre-configured instance of the async Anthropic client	

# Azure AI Foundry

Source: <https://docs.agno.com/reference/models/azure>

The Azure AI Foundry model provides access to Azure-hosted AI Foundry models.

## Parameters

Parameter	Type	Default	Description
-----	-----	-----	-----
-----	-----	-----	-----
`id`	`str`	`"gpt-4o"`	The id of the model to use
`name`	`str`	`"AzureAIFoundry"`	The name of the model
`provider`	`str`	`"Azure"`	The provider of the model
`temperature`	`Optional[float]`	`None`	Controls randomness in the model's output (0.0 to 2.0)
`max_tokens`	`Optional[int]`	`None`	Maximum number of tokens to generate in the response
`frequency_penalty`	`Optional[float]`	`None`	Penalizes new tokens based on their frequency in the text so far (-2.0 to 2.0)
`presence_penalty`	`Optional[float]`	`None`	Penalizes new tokens based on whether they appear in the text so far (-2.0 to 2.0)
`top_p`	`Optional[float]`	`None`	Controls diversity via nucleus sampling (0.0 to 1.0)
`stop`	`Optional[Union[str, List[str]]]`	`None`	Up to 4 sequences where the API will stop generating further tokens
`seed`	`Optional[int]`	`None`	Random seed for deterministic sampling

`model_extras`	`Optional[Dict[str, Any]]`	`None`	
Additional model-specific parameters			
`strict_output`	`bool`	`True`	Controls
schema adherence for structured outputs			
`request_params`	`Optional[Dict[str, Any]]`	`None`	
Additional parameters to include in the request			
`api_key`	`Optional[str]`	`None`	The API
key for Azure AI Foundry (defaults to AZURE\_API\_KEY env var)			
`api_version`	`Optional[str]`	`None`	The API
version to use (defaults to AZURE\_API\_VERSION env var)			
`azure_endpoint`	`Optional[str]`	`None`	The Azure
endpoint URL (defaults to AZURE\_ENDPOINT env var)			
`timeout`	`Optional[float]`	`None`	Request
timeout in seconds			
`max_retries`	`Optional[int]`	`None`	Maximum
number of retries for failed requests			
`http_client`	`Optional[httpx.Client]`	`None`	HTTP
client instance for making requests			
`client_params`	`Optional[Dict[str, Any]]`	`None`	
Additional parameters for client configuration			

# Azure OpenAI

Source: [https://docs.agno.com/reference/models/azure\\_open\\_ai](https://docs.agno.com/reference/models/azure_open_ai)

The AzureOpenAI model provides access to Azure-hosted OpenAI models.

## ## Parameters

Parameter	Type	Default	
Description			
-----	-----	-----	
-----			
`id`	`str`	`"gpt-4o"`	
The id of the Azure OpenAI model to use			
`name`	`str`	`"AzureOpenAI"`	
The name of the model			
`provider`	`str`	`"Azure"`	
The provider of the model			
`temperature`	`Optional[float]`	`None`	
Controls randomness in the model's output (0.0 to 2.0)			
`max_tokens`	`Optional[int]`	`None`	
Maximum number of tokens to generate in the response			
`max_completion_tokens`	`Optional[int]`	`None`	
Maximum number of completion tokens to generate			
`frequency_penalty`	`Optional[float]`	`None`	
Penalizes new tokens based on their frequency in the text so far (-2.0 to 2.0)			
`presence_penalty`	`Optional[float]`	`None`	
Penalizes new tokens based on whether they appear in the text so far (-2.0 to 2.0)			
`top_p`	`Optional[float]`	`None`	
Controls diversity via nucleus sampling (0.0 to 1.0)			

`stop`	`Optional[Union[str, List[str]]]`	`None`	
Up to 4 sequences where the API will stop generating further tokens			
`seed`	`Optional[int]`	`None`	
Random seed for deterministic sampling			
`logprobs`	`Optional[bool]`	`None`	
Whether to return log probabilities of the output tokens			
`top_logprobs`	`Optional[int]`	`None`	
Number of most likely tokens to return log probabilities for (0 to 20)			
`user`	`Optional[str]`	`None`	
A unique identifier representing your end-user			
`request_params`	`Optional[Dict[str, Any]]`	`None`	
Additional parameters to include in the request			
`azure_endpoint`	`Optional[str]`	`None`	
The Azure endpoint URL (defaults to AZURE\OPENAI_ENDPOINT env var)			
`api_key`	`Optional[str]`	`None`	
The API key for Azure OpenAI (defaults to AZURE\OPENAI_API_KEY env var)			
`api_version`	`str`	`"2024-12-01-preview"`	
The API version to use			
`azure_ad_token`	`Optional[str]`	`None`	
Azure AD token for authentication			
`azure_ad_token_provider`	`Optional[Any]`	`None`	
Azure AD token provider for authentication			
`timeout`	`Optional[float]`	`None`	
Request timeout in seconds			
`max_retries`	`Optional[int]`	`None`	
Maximum number of retries for failed requests			
`client_params`	`Optional[Dict[str, Any]]`	`None`	
Additional parameters for client configuration			

# AWS Bedrock

Source: <https://docs.agno.com/reference/models/bedrock>

Learn how to use AWS Bedrock models in Agno.

The AWS Bedrock model provides access to models hosted on AWS Bedrock.

## ## Parameters

Parameter	Type	Default	Description
-----	-----	-----	-----
-----	-----	-----	-----
`id`	`str`	Required	The id of the
AWS Bedrock model to use			
`name`	`str`	`"AwsBedrock"`	The name of the
model			
`provider`	`str`	`"AWS"`	The provider of
the model			
`temperature`	`Optional[float]`	`None`	Controls
randomness in the model's output			
`max_tokens`	`Optional[int]`	`None`	Maximum number

of tokens to generate			
`top_p`	`Optional[float]`	`None`	Controls
diversity via nucleus sampling			
`top_k`	`Optional[int]`	`None`	Controls
diversity via top-k sampling			
`stop_sequences`	`Optional[List[str]]`	`None`	A list of
strings that the model should stop generating text at			
`response_format`	`Optional[str]`	`None`	The format of
the response			
`request_params`	`Optional[Dict[str, Any]]`	`None`	Additional
parameters to include in the request			
`aws_region`	`Optional[str]`	`None`	The AWS region
to use (defaults to AWS\_REGION env var)			
`aws_access_key_id`	`Optional[str]`	`None`	AWS access key
ID (defaults to AWS\_ACCESS\_KEY\_ID env var)			
`aws_secret_access_key`	`Optional[str]`	`None`	AWS secret
access key (defaults to AWS\_SECRET\_ACCESS\_KEY env var)			
`aws_session_token`	`Optional[str]`	`None`	AWS session
token (defaults to AWS\_SESSION\_TOKEN env var)			
`aws_profile`	`Optional[str]`	`None`	AWS profile to
use (defaults to AWS\_PROFILE env var)			
`client_params`	`Optional[Dict[str, Any]]`	`None`	Additional
parameters for client configuration			

# AWS Bedrock Claude

Source: [https://docs.agno.com/reference/models/bedrock\\_claude](https://docs.agno.com/reference/models/bedrock_claude)

The AWS Bedrock Claude model provides access to Anthropic's Claude models hosted on AWS Bedrock.

## ## Parameters

Parameter	Type	Default	Description
-----	-----	-----	-----
-----	-----	-----	-----
-----	-----	-----	-----
`id`	`str`		
"anthropic.claude-3-5-sonnet-20241022-v2:0"			The id of the AWS Bedrock Claude model to use
`name`	`str`	`"BedrockClaude"`	
The name of the model			
`provider`	`str`	`"AWS"`	
The provider of the model			
`max_tokens`	`Optional[int]`	`4096`	
Maximum number of tokens to generate in the chat completion			
`thinking`	`Optional[Dict[str, Any]]`	`None`	
Configuration for the thinking (reasoning) process			
`temperature`	`Optional[float]`	`None`	
Controls randomness in the model's output			

`stop_sequences`	`Optional[List[str]]`	`None`	
	A list of strings that the model should stop generating text at		
`top_p`	`Optional[float]`	`None`	
	Controls diversity via nucleus sampling		
`top_k`	`Optional[int]`	`None`	
	Controls diversity via top-k sampling		
`cache_system_prompt`	`Optional[bool]`	`False`	
	Whether to cache the system prompt for improved performance		
`extended_cache_time`	`Optional[bool]`	`False`	
	Whether to use extended cache time (1 hour instead of default)		
`request_params`	`Optional[Dict[str, Any]]`	`None`	
	Additional parameters to include in the request		
`aws_region`	`Optional[str]`	`None`	
	The AWS region to use (defaults to AWS_REGION env var)		
`aws_access_key_id`	`Optional[str]`	`None`	
	AWS access key ID (defaults to AWS_ACCESS_KEY_ID env var)		
`aws_secret_access_key`	`Optional[str]`	`None`	
	AWS secret access key (defaults to AWS_SECRET_ACCESS_KEY env var)		
`aws_session_token`	`Optional[str]`	`None`	
	AWS session token (defaults to AWS_SESSION_TOKEN env var)		
`aws_profile`	`Optional[str]`	`None`	
	AWS profile to use (defaults to AWS_PROFILE env var)		
`client_params`	`Optional[Dict[str, Any]]`	`None`	
	Additional parameters for client configuration		

# Cohere

Source: <https://docs.agno.com/reference/models/cohere>

The Cohere model provides access to Cohere's language models.

## ## Parameters

Parameter	Type	Default	
Description			
-----	-----	-----	
-----			
`id`	`str`	`"command-r-plus-08-2024"`	The id
of the Cohere model to use			
`name`	`str`	`"CohereChat"`	The name
of the model			
`provider`	`str`	`"Cohere"`	The
provider of the model			
`api_key`	`Optional[str]`	`None`	The API
key for Cohere (defaults to COHERE_API_KEY env var)			
`max_tokens`	`Optional[int]`	`None`	Maximum
number of tokens to generate			
`temperature`	`Optional[float]`	`None`	Controls
randomness in the model's output (0.0 to 1.0)			
`p`	`Optional[float]`	`None`	Controls
diversity via nucleus sampling (0.0 to 1.0)			
`k`	`Optional[int]`	`None`	Controls

diversity via top-k sampling		
`seed`	`Optional[int]`	`None`   Random
seed for deterministic sampling		
`frequency_penalty`	`Optional[float]`	`None`   Reduces
repetition by penalizing frequent tokens (0.0 to 1.0)		
`presence_penalty`	`Optional[float]`	`None`   Reduces
repetition by penalizing present tokens (0.0 to 1.0)		
`stop_sequences`	`Optional[List[str]]`	`None`   List of
strings that stop generation		
`response_format`	`Optional[Dict[str, Any]]`	`None`
Specifies the format of the response (e.g., JSON)		
`citation_options`	`Optional[Dict[str, Any]]`	`None`   Options
for citation generation		
`request_params`	`Optional[Dict[str, Any]]`	`None`
Additional parameters to include in the request		
`client_params`	`Optional[Dict[str, Any]]`	`None`
Additional parameters for client configuration		

# DeepInfra

Source: <https://docs.agno.com/reference/models/deepinfra>

The DeepInfra model provides access to DeepInfra's hosted language models.

## Parameters

Parameter	Type	Default	Description
-----		-----	-----
-----		-----	-----
`id`	`str`	`"meta-llama/Llama-2-70b-chat-hf"`	The id of the
DeepInfra model to use			
`name`	`str`	`"DeepInfra"`	The name of the
model			
`provider`	`str`	`"DeepInfra"`	The provider of
the model			
`api_key`	`Optional[str]`	`None`	The API key for
DeepInfra (defaults to DEEPINFRA_API_KEY env var)			
`base_url`	`str`	`"https://api.deepinfra.com/v1/openai"`	The base URL
for the DeepInfra API			

DeepInfra extends the OpenAI-compatible interface and supports most parameters from OpenAI.

# DeepSeek

Source: <https://docs.agno.com/reference/models/deepseek>

The DeepSeek model provides access to DeepSeek's language models.

## Parameters

Parameter	Type	Default	Description
-----------	------	---------	-------------

Parameter	Type	Default	Description
<code>`id`</code>	<code>`str`</code>	<code>`"deepseek-chat"`</code>	The id of the DeepSeek model to use
<code>`name`</code>	<code>`str`</code>	<code>`"DeepSeek"`</code>	The name of the model
<code>`provider`</code>	<code>`str`</code>	<code>`"DeepSeek"`</code>	The provider of the model
<code>`api_key`</code>	<code>`Optional[str]`</code>	<code>`None`</code>	The API key for DeepSeek (defaults to <code>DEEPSEEK_API_KEY</code> env var)
<code>`base_url`</code>	<code>`str`</code>	<code>`"https://api.deepseek.com"`</code>	The base URL for the DeepSeek API

DeepSeek extends the OpenAI-compatible interface and supports most parameters from OpenAI.

#### # Fireworks

Source: <https://docs.agno.com/reference/models/fireworks>

The Fireworks model provides access to Fireworks' language models.

#### ## Parameters

Parameter	Type	Default	Description
<code>`id`</code>	<code>`str`</code>	<code>`"accounts/fireworks/models/llama-v3p1-405b-instruct"`</code>	The id of the Fireworks model to use
<code>`name`</code>	<code>`str`</code>	<code>`"Fireworks"`</code>	The name of the model
<code>`provider`</code>	<code>`str`</code>	<code>`"Fireworks"`</code>	The provider of the model
<code>`api_key`</code>	<code>`Optional[str]`</code>	<code>`None`</code>	The API key for Fireworks (defaults to <code>FIREWORKS_API_KEY</code> env var)
<code>`base_url`</code>	<code>`str`</code>	<code>`"https://api.fireworks.ai/inference/v1"`</code>	The base URL for the Fireworks API

Fireworks extends the OpenAI-compatible interface and supports most parameters from OpenAI.

#### # Gemini

Source: <https://docs.agno.com/reference/models/gemini>

The Gemini model provides access to Google's Gemini models.

#### ## Parameters

Parameter	Type	Default	Description
-----------	------	---------	-------------

Parameter	Type	Default	Description
<code>`id`</code>	<code>`str`</code>	<code>`"gemini-1.5-flash"`</code>	The id of the Gemini model to use
<code>`name`</code>	<code>`str`</code>	<code>`"Gemini"`</code>	The name of the model
<code>`provider`</code>	<code>`str`</code>	<code>`"Google"`</code>	The provider of the model
<code>`api_key`</code>	<code>`Optional[str]`</code>	<code>`None`</code>	The API key for Google AI (defaults to <code>GOGLE_API_KEY</code> env var)
<code>`generation_config`</code>	<code>`Optional[Dict[str, Any]]`</code>	<code>`None`</code>	Generation configuration parameters for the model
<code>`safety_settings`</code>	<code>`Optional[List[Dict]]`</code>	<code>`None`</code>	Safety settings to filter content
<code>`tools`</code>	<code>`Optional[List[Dict]]`</code>	<code>`None`</code>	Tools available to the model
<code>`tool_config`</code>	<code>`Optional[Dict[str, Any]]`</code>	<code>`None`</code>	Configuration for tool use
<code>`system_instruction`</code>	<code>`Optional[str]`</code>	<code>`None`</code>	System instruction for the model
<code>`cached_content`</code>	<code>`Optional[str]`</code>	<code>`None`</code>	Cached content identifier for context caching
<code>`request_params`</code>	<code>`Optional[Dict[str, Any]]`</code>	<code>`None`</code>	Additional parameters to include in the request
<code>`client_params`</code>	<code>`Optional[Dict[str, Any]]`</code>	<code>`None`</code>	Additional parameters for client configuration
<code>`thinking_enabled`</code>	<code>`Optional[bool]`</code>	<code>`None`</code>	Whether to enable thinking mode for supported models

## # Groq

Source: <https://docs.agno.com/reference/models/groq>

The Groq model provides access to Groq's high-performance language models.

## ## Parameters

Parameter	Type	Default	Description
<code>`id`</code>	<code>`str`</code>	<code>`"llama-3.3-70b-versatile"`</code>	The id of the Groq model to use
<code>`name`</code>	<code>`str`</code>	<code>`"Groq"`</code>	The name of the model
<code>`provider`</code>	<code>`str`</code>	<code>`"Groq"`</code>	The provider of the model
<code>`api_key`</code>	<code>`Optional[str]`</code>	<code>`None`</code>	The API key for Groq (defaults to <code>GROQ_API_KEY</code> env var)
<code>`base_url`</code>	<code>`str`</code>	<code>`"https://api.groq.com/openai/v1"`</code>	The base URL for the Groq API

Groq extends the OpenAI-compatible interface and supports most parameters from OpenAI.

# HuggingFace

Source: <https://docs.agno.com/reference/models/huggingface>

The HuggingFace model provides access to models hosted on the HuggingFace Hub.

## Parameters

Parameter	Type	Default
Description		
-----		-----
-----		-----
-----		-----
-----		-----
`id`	`str`	`"microsoft/DialoGPT-medium"`
The id of the Hugging Face model to use		
`name`	`str`	`"HuggingFace"`
The name of the model		
`provider`	`str`	`"HuggingFace"`
The provider of the model		
`api_key`	`Optional[str]`	`None`
The API key for Hugging Face (defaults to HF_TOKEN env var)		
`base_url`	`str`	
"https://api-inference.huggingface.co/models"		The base URL for Hugging Face Inference API
`wait_for_model`	`bool`	`True`
Whether to wait for the model to load if it's cold		
`use_cache`	`bool`	`True`
Whether to use caching for faster inference		
`max_tokens`	`Optional[int]`	`None`
Maximum number of tokens to generate		
`temperature`	`Optional[float]`	`None`
Controls randomness in the model's output		
`top_p`	`Optional[float]`	`None`
Controls diversity via nucleus sampling		
`repetition_penalty`	`Optional[float]`	`None`
Penalty for repeating tokens (higher values reduce repetition)		

# IBM WatsonX

Source: <https://docs.agno.com/reference/models/ibm-watsonx>

The IBM WatsonX model provides access to IBM's language models.

## Parameters

Parameter	Type	Default
Description		
-----		-----
-----		-----
-----		-----
-----		-----

`id`	`str`	`"meta-llama/llama-3-1-70b-instruct"`	
The id of the IBM WatsonX model to use			
`name`	`str`	`"IBMWatsonx"`	
The name of the model			
`provider`	`str`	`"IBM"`	
The provider of the model			
`api_key`	`Optional[str]`	`None`	
The API key for IBM WatsonX (defaults to WATSONX\_API\_KEY env var)			
`base_url`	`str`	`"https://us-south.ml.cloud.ibm.com/ml/v1/text/cha t"`	
The base URL for the IBM WatsonX API			
`project_id`	`Optional[str]`	`None`	
The project ID for IBM WatsonX (defaults to WATSONX\_PROJECT\_ID env var)			

IBM WatsonX extends the OpenAI-compatible interface and supports most parameters from OpenAI.

#### # InternLM

Source: <https://docs.agno.com/reference/models/internlm>

The InternLM model provides access to the InternLM model.

#### ## Parameters

Parameter	Type	Default	
Description			
-----	-----	-----	
----	-----		
-----			
`id`	`str`	`"internlm/internlm2_5-7b-chat"`	
The id of the InternLM model to use			
`name`	`str`	`"InternLM"`	
The name of the model			
`provider`	`str`	`"InternLM"`	
The provider of the model			
`api_key`	`Optional[str]`	`None`	
The API key for InternLM (defaults to INTERNLM\_API\_KEY env var)			
`base_url`	`str`	`"https://internlm-chat.intern-ai.org.cn/puyu/api/ v1"`	
The base URL for the InternLM API			

InternLM extends the OpenAI-compatible interface and supports most parameters from OpenAI.

#### # Meta

Source: <https://docs.agno.com/reference/models/meta>

The Meta model provides access to Meta's language models.

#### ## Parameters

Parameter	Type	Default	Description
-----	-----	-----	
-----			

```

----- |
| `id` | `str` | `"meta-llama/Meta-Llama-3.1-405B-Instruct"` | The id of
the Meta model to use |
| `name` | `str` | `"MetaLlama"` | The name of
the model |
| `provider` | `str` | `"Meta"` | The
provider of the model |
| `api_key` | `Optional[str]` | `None` | The API key
for Meta (defaults to META_API_KEY env var) |
| `base_url` | `str` | `"https://api.llama-api.com"` | The base
URL for the Meta API |

```

Meta extends the OpenAI-compatible interface and supports most parameters from OpenAI.

# Mistral

Source: <https://docs.agno.com/reference/models/mistral>

The Mistral model provides access to Mistral's language models.

## Parameters

Parameter	Type	Default	Description
<code>`id`</code>	<code>`str`</code>	<code>`"mistral-large-latest"`</code>	The id of the Mistral model to use
<code>`name`</code>	<code>`str`</code>	<code>`"Mistral"`</code>	The name of the model
<code>`provider`</code>	<code>`str`</code>	<code>`"Mistral"`</code>	The provider of the model
<code>`api_key`</code>	<code>`Optional[str]`</code>	<code>`None`</code>	The API key for Mistral (defaults to MISTRAL_API_KEY env var)
<code>`base_url`</code>	<code>`str`</code>	<code>`"https://api.mistral.ai/v1"`</code>	The base URL for the Mistral API

Mistral extends the OpenAI-compatible interface and supports most parameters from OpenAI.

# Model

Source: <https://docs.agno.com/reference/models/model>

The Model class is the base class for all models in Agno. It provides common functionality and parameters that are inherited by specific model implementations like OpenAIChat, Claude, etc.

## Parameters

Parameter	Type	Default	Description

-----			
`id`	`str`	Required	The id/name of the
model to use			
`name`	`Optional[str]`	`None`	The display name of
the model			
`provider`	`Optional[str]`	`None`	The provider of the
model			
`frequency_penalty`	`Optional[float]`	`None`	Penalizes new
tokens based on their frequency in the text so far			
`presence_penalty`	`Optional[float]`	`None`	Penalizes new
tokens based on whether they appear in the text so far			
`response_format`	`Optional[str]`	`None`	The format of the
response			
`seed`	`Optional[int]`	`None`	Random seed for
deterministic sampling			
`stop`	`Optional[Union[str, List[str]]]`	`None`	Up to 4 sequences
where the API will stop generating further tokens			
`stream`	`bool`	`True`	Whether to stream
the response			
`temperature`	`Optional[float]`	`None`	Controls randomness
in the model's output			
`top_p`	`Optional[float]`	`None`	Controls diversity
via nucleus sampling			
`max_tokens`	`Optional[int]`	`None`	Maximum number of
tokens to generate			
`request_params`	`Optional[Dict[str, Any]]`	`None`	Additional
parameters to include in the request			
`cache_response`	`bool`	`False`	Enable caching of
model responses to avoid redundant API calls			
`cache_ttl`	`Optional[int]`	`None`	Time-to-live for
cached model responses, in seconds. If None, cache never expires			
`cache_dir`	`Optional[str]`	`None`	Directory path for
storing cached model responses. If None, uses default cache location			

# Nebius

Source: <https://docs.agno.com/reference/models/nebius>

The Nebius model provides access to Nebius's text and image models.

## ## Parameters

Parameter	Type	Default	Description
-----			
-----			
`id`	`str`	`"meta-llama/Meta-Llama-3.1-70B-Instruct"`	The id of
the Nebius model to use			
`name`	`str`	`"Nebius"`	The name of
the model			
`provider`	`str`	`"Nebius"`	The provider
of the model			

`api_key`	`Optional[str]`	`None`	The API key
for Nebius (defaults to NEBIUS\_API\_KEY env var)			
`base_url`	`str`	`"https://api.studio.nebius.ai/v1"`	The base URL
for the Nebius API			

Nebius extends the OpenAI-compatible interface and supports most parameters from OpenAI.

# Nvidia

Source: <https://docs.agno.com/reference/models/nvidia>

The Nvidia model provides access to Nvidia's language models.

## Parameters

Parameter	Type	Default	Description
-----			
`id`	`str`	`"nvidia/llama-3.1-nemotron-70b-instruct"`	The id of the NVIDIA model to use
`name`	`str`	`"NVIDIA"`	The name of the model
`provider`	`str`	`"NVIDIA"`	The provider of the model
`api_key`	`Optional[str]`	`None`	The API key for NVIDIA (defaults to NVIDIA\_API\_KEY env var)
`base_url`	`str`	`"https://integrate.api.nvidia.com/v1"`	The base URL for the NVIDIA API

NVIDIA extends the OpenAI-compatible interface and supports most parameters from OpenAI.

# Ollama

Source: <https://docs.agno.com/reference/models/ollama>

The Ollama model provides access to open source models, both locally-hosted and via **Ollama Cloud**.

**Local Usage**: Run models on your own hardware using the Ollama client. Perfect for development, privacy-sensitive workloads, and when you want full control over your infrastructure.

**Cloud Usage**: Access cloud-hosted models via [Ollama Cloud](<https://ollama.com>) with an API key for scalable, production-ready deployments. No local setup required - simply set your `OLLAMA_API_KEY` and start using powerful models instantly.

## Key Features

- Dual Deployment Options**: Choose between local hosting for privacy and control, or cloud hosting for scalability
- Seamless Switching**: Easy transition between local and cloud deployments with minimal code changes

\* **\*\*Auto-configuration\*\***: When using an API key, the host automatically defaults to Ollama Cloud

\* **\*\*Wide Model Support\*\***: Access to extensive library of open-source models including GPT-OSS, Llama, Qwen, DeepSeek, and Phi models

## ## Parameters

Parameter	Type	Default	Description
-----	-----	-----	-----
-----			
-----			
`id` the Ollama model to use	`str`	`"llama3.2"`	The name of
`name` the model	`str`	`"Ollama"`	The name of
`provider` of the model	`str`	`"Ollama"`	The provider
`host` for the Ollama server	`str`	`"http://localhost:11434"`	The host URL
`timeout` timeout in seconds	`Optional[int]`	`None`	Request
`format` to return the response in (e.g., "json")	`Optional[str]`	`None`	The format
`options` model options (temperature, top_p, etc.)	`Optional[Dict[str, Any]]`	`None`	Additional
`keep_alive` keep the model loaded (e.g., "5m", 3600 seconds)	`Optional[Union[float, str]]`	`None`	How long to
`template` template to use	`Optional[str]`	`None`	The prompt
`system` message to use	`Optional[str]`	`None`	System
`raw` return raw response without formatting	`Optional[bool]`	`None`	Whether to
`stream` stream the response	`bool`	`True`	Whether to

## # Ollama Tools

Source: [https://docs.agno.com/reference/models/ollama\\_tools](https://docs.agno.com/reference/models/ollama_tools)

The Ollama Tools model provides access to the Ollama models and passes tools in XML format to the model.

## ## Parameters

Parameter	Type	Default	Description
-----	-----	-----	-----
-----			
-----			
`id`	`str`	`"llama3.2"`	The name of

the Ollama model to use		
`name`   `str`		the name of the model
`provider`   `str`		the provider of the model
`host`   `str`		the host URL for the Ollama server
`timeout`   `Optional[int]`		Request timeout in seconds
`format`   `Optional[str]`		The format to return the response in (e.g., "json")
`options`   `Optional[Dict[str, Any]]`		Additional model options (temperature, top_p, etc.)
`keep_alive`   `Optional[Union[float, str]]`		How long to keep the model loaded (e.g., "5m", 3600 seconds)
`template`   `Optional[str]`		The prompt template to use
`system`   `Optional[str]`		System message to use
`raw`   `Optional[bool]`		Whether to return raw response without formatting
`stream`   `bool`		Whether to stream the response

This model passes tools in XML format instead of JSON for better compatibility with certain models.

# OpenAI

Source: <https://docs.agno.com/reference/models/openai>

The OpenAIChat model provides access to OpenAI models like GPT-4o.

## Parameters

Parameter	Type	Default
Description		
-----	-----	
-----	-----	
-----		
`id`   `str`		
the id of the OpenAI model to use		
`name`   `str`		
The name of the model		
`provider`   `str`		
The provider of the model		
`store`   `Optional[bool]`		`None`
Whether to store the conversation for training purposes		

`reasoning_effort`	`Optional[str]`	`None`
The reasoning effort level for o1 models ("low", "medium", "high")		
`verbosity`	`Optional[Literal["low", "medium", "high"]]	`None`
Controls verbosity level of reasoning models		
`metadata`	`Optional[Dict[str, Any]]`	`None`
Developer-defined metadata to associate with the completion		
`frequency_penalty`	`Optional[float]`	`None`
Penalizes new tokens based on their frequency in the text so far (-2.0 to 2.0)		
`logit_bias`	`Optional[Any]`	`None`
Modifies the likelihood of specified tokens appearing in the completion		
`logprobs`	`Optional[bool]`	`None`
Whether to return log probabilities of the output tokens		
`top_logprobs`	`Optional[int]`	`None`
Number of most likely tokens to return log probabilities for (0 to 20)		
`max_tokens`	`Optional[int]`	`None`
Maximum number of tokens to generate (deprecated, use max_completion_tokens)		
`max_completion_tokens`	`Optional[int]`	`None`
Maximum number of completion tokens to generate		
`modalities`	`Optional[List[str]]`	`None`
List of modalities to use ("text" and/or "audio")		
`audio`	`Optional[Dict[str, Any]]`	`None`
Audio configuration (e.g., `{"voice": "alloy", "format": "wav"}`)		
`presence_penalty`	`Optional[float]`	`None`
Penalizes new tokens based on whether they appear in the text so far (-2.0 to 2.0)		
`seed`	`Optional[int]`	`None`
Random seed for deterministic sampling		
`stop`	`Optional[Union[str, List[str]]]	`None`
Up to 4 sequences where the API will stop generating further tokens		
`temperature`	`Optional[float]`	`None`
Controls randomness in the model's output (0.0 to 2.0)		
`user`	`Optional[str]`	`None`
A unique identifier representing your end-user		
`top_p`	`Optional[float]`	`None`
Controls diversity via nucleus sampling (0.0 to 1.0)		
`service_tier`	`Optional[str]`	`None`

```

 | Service tier to use ("auto", "default", "flex", "priority")
|
| `strict_output` | `bool` | `True`
| | Controls schema adherence for structured outputs
|
| `extra_headers` | `Optional[Any]` | `None`
| | Additional headers to include in requests
|
| `extra_query` | `Optional[Any]` | `None`
| | Additional query parameters to include in requests
|
| `extra_body` | `Optional[Any]` | `None`
| | Additional body parameters to include in requests
|
| `request_params` | `Optional[Dict[str, Any]]` | `None`
| | Additional parameters to include in the request
|
| `role_map` | `Optional[Dict[str, str]]` | `None`
| | Mapping of message roles to OpenAI roles
|
| `api_key` | `Optional[str]` | `None`
| | The API key for authenticating with OpenAI (defaults to OPENAI_API_KEY env var)
|
| `organization` | `Optional[str]` | `None`
| | The organization ID to use for requests
|
| `base_url` | `Optional[Union[str, httpx.URL]]` | `None`
| | The base URL for the OpenAI API
|
| `timeout` | `Optional[float]` | `None`
| | Request timeout in seconds
|
| `max_retries` | `Optional[int]` | `None`
| | Maximum number of retries for failed requests
|
| `default_headers` | `Optional[Any]` | `None`
| | Default headers to include in all requests
|
| `default_query` | `Optional[Any]` | `None`
| | Default query parameters to include in all requests
|
| `http_client` | `Optional[Union[httpx.Client, httpx.AsyncClient]]` | `None`
| | HTTP client instance for making requests
|
| `client_params` | `Optional[Dict[str, Any]]` | `None`
| | Additional parameters for client configuration
|

```

# OpenAI Like

Source: [https://docs.agno.com/reference/models/openai\\_like](https://docs.agno.com/reference/models/openai_like)

The OpenAI Like model works as a wrapper for the OpenAIIlike models.

## ## Parameters

Parameter	Type	Default	Description
-----			
`id`	`str`	`"gpt-4o"`	The id of the model to use
`name`	`str`		The name of the model
-----			
`provider`	`str`		The provider of the model
-----			
`api_key`	`Optional[str]`	`None`	The API key for authentication (defaults to OPENAI_API_KEY env var)
-----			
`base_url`	`str`		The base URL for the API
-----			
`supports_native_structured_outputs`	`Optional[bool]`	`None`	Whether the model supports native structured outputs
-----			
`response_format`	`Optional[str]`	`None`	The format of the response
-----			
`seed`	`Optional[int]`	`None`	Random seed for deterministic sampling
-----			
`stop`	`Optional[Union[str, List[str]]]`	`None`	Up to 4 sequences where the API will stop generating further tokens
-----			
`stream`	`bool`	`True`	Whether to stream the response
-----			
`temperature`	`Optional[float]`	`None`	Controls randomness in the model's output
-----			
`top_p`	`Optional[float]`	`None`	Controls diversity via nucleus sampling
-----			
`request_params`	`Optional[Dict[str, Any]]`	`None`	Additional parameters to include in the request
-----			
`client_params`	`Optional[Dict[str, Any]]`	`None`	Additional parameters for client configuration

## # OpenRouter

Source: <https://docs.agno.com/reference/models/openrouter>

The OpenRouter model provides unified access to various language models through OpenRouter.

## ## Parameters

Parameter	Type	Default	Description
-----			

-----			
`id`	`str`	`"openai/gpt-4o-mini"`	The id of the
OpenRouter model to use			
`name`	`str`	`"OpenRouter"`	The name of the model
`provider`	`str`	`"OpenRouter"`	The provider of the
model			
`api_key`	`Optional[str]`	`None`	The API key for
OpenRouter (defaults to OPENROUTER\_API\_KEY env var)			
`base_url`	`str`	`"https://openrouter.ai/api/v1"`	The base URL for the
OpenRouter API			
`app_name`	`Optional[str]`	`"agno"`	Application name for
OpenRouter request headers			

OpenRouter extends the OpenAI-compatible interface and supports most parameters from OpenAI.

# Perplexity  
Source: <https://docs.agno.com/reference/models/perplexity>

The Perplexity model provides access to Perplexity's language models.

## ## Parameters

Parameter	Type	Default	Description
-----	-----	-----	-----
-----			
`id`	`str`	`"llama-3.1-sonar-small-128k-online"`	The id of the
Perplexity model to use			
`name`	`str`	`"Perplexity"`	The name of the
model			
`provider`	`str`	`"Perplexity"`	The provider of
the model			
`api_key`	`Optional[str]`	`None`	The API key for
Perplexity (defaults to PERPLEXITY\_API\_KEY env var)			
`base_url`	`str`	`"https://api.perplexity.ai"`	The base URL for
the Perplexity API			

Perplexity extends the OpenAI-compatible interface and supports most parameters from OpenAI.

# Requesty  
Source: <https://docs.agno.com/reference/models/requesty>

The Requesty model provides access to models through Requesty AI.

## ## Parameters

Parameter	Type	Default	Description

Parameter	Type	Default	Description
`id`	`str`	`"openai/gpt-4.1"`	The id of the model to use through Requesty
`name`	`str`	`"Requesty"`	The name of the model
`provider`	`str`	`"Requesty"`	The provider of the model
`api_key`	`Optional[str]`	`None`	The API key for Requesty (defaults to REQUESTY_API_KEY env var)
`base_url`	`str`	`"https://router.requesty.ai/v1"`	The base URL for the Requesty API
`max_tokens`	`int`	`1024`	The maximum number of tokens to generate

Requesty extends the OpenAI-compatible interface and supports most parameters from OpenAI.

# Sambanova

Source: <https://docs.agno.com/reference/models/sambanova>

The Sambanova model provides access to Sambanova's language models.

## Parameters

Parameter	Type	Default	Description
`id`	`str`	`"Meta-Llama-3.1-8B-Instruct"`	The id of the SambaNova model to use
`name`	`str`	`"SambaNova"`	The name of the model
`provider`	`str`	`"SambaNova"`	The provider of the model
`api_key`	`Optional[str]`	`None`	The API key for SambaNova (defaults to SAMBANOVA_API_KEY env var)
`base_url`	`str`	`"https://api.sambanova.ai/v1"`	The base URL for the SambaNova API

SambaNova extends the OpenAI-compatible interface and supports most parameters from OpenAI.

# Together

Source: <https://docs.agno.com/reference/models/together>

The Together model provides access to Together's language models.

## Parameters

Parameter	Type	Default	
-----------	------	---------	--

Description			
Parameter	Type	Default	Description
-----			
-----			
<code>`id`</code>	<code>`str`</code>	<code>`"meta-llama/Meta-Llama-3.1-8B-Instruct-Turbo"`</code>	The id of the Together model to use
<code>`name`</code>	<code>`str`</code>	<code>`"Together"`</code>	The name of the model
<code>`provider`</code>	<code>`str`</code>	<code>`"Together"`</code>	The provider of the model
<code>`api_key`</code>	<code>`Optional[str]`</code>	<code>`None`</code>	The API key for Together (defaults to <code>TOGETHER_API_KEY</code> env var)
<code>`base_url`</code>	<code>`str`</code>	<code>`"https://api.together.xyz/v1"`</code>	The base URL for the Together API

Together extends the OpenAI-compatible interface and supports most parameters from OpenAI.

# Vercel v0

Source: <https://docs.agno.com/reference/models/vercel>

The Vercel v0 model provides access to Vercel's language models.

## Parameters

Parameter	Type	Default	Description
-----			
-----			
<code>`id`</code>	<code>`str`</code>	<code>`"v0"`</code>	The id of the Vercel model to use
<code>`name`</code>	<code>`str`</code>	<code>`"VercelV0"`</code>	The name of the model
<code>`provider`</code>	<code>`str`</code>	<code>`"Vercel"`</code>	The provider of the model
<code>`api_key`</code>	<code>`Optional[str]`</code>	<code>`None`</code>	The API key for Vercel (defaults to <code>VERCEL_API_KEY</code> env var)
<code>`base_url`</code>	<code>`str`</code>	<code>`"https://api.vercel.com/v1"`</code>	The base URL for the Vercel API

Vercel extends the OpenAI-compatible interface and supports most parameters from OpenAI.

# xAI

Source: <https://docs.agno.com/reference/models/xai>

The xAI model provides access to xAI's language models.

## Parameters

Parameter	Type	Default	Description
-----			
-----			

```

----- |
| `id` | `str` | `"grok-beta"` | The id of the xAI model to use
| | | |
| `name` | `str` | `"xAI"` | The name of the model
| | | |
| `provider` | `str` | `"xAI"` | The provider of the model
| | | |
| `api_key` | `Optional[str]`| `None` | The API key for xAI (defaults
to XAI_API_KEY env var) |
| `base_url` | `str` | `"https://api.x.ai/v1"` | The base URL for the xAI API
| | | |

```

xAI extends the OpenAI-compatible interface and supports most parameters from OpenAI.

```

RunContext
Source: https://docs.agno.com/reference/run/run_context

```

The `RunContext` is an object that can be referenced in pre- and post-hooks, tools, and other parts of the run.

See [Agent State](/concepts/agents/state) for examples of how to use the `RunContext` in your code.

#### ## RunContext Attributes

Attribute	Type	Description
<code>run_id</code>	<code>str</code>	Run ID
<code>session_id</code>	<code>str</code>	Session ID for the run
<code>user_id</code>	<code>Optional[str]</code>	User ID associated with the run
<code>dependencies</code>	<code>Dict[str, Any]</code>	Dependencies for the run
<code>knowledge_filters</code>	<code>Dict[str, Any]</code>	Knowledge filters for the run
<code>metadata</code>	<code>Dict[str, Any]</code>	Metadata associated with the run
<code>session_state</code>	<code>Dict[str, Any]</code>	Session state for the run

```

SessionSummaryManager
Source: https://docs.agno.com/reference/session/summary_ma
nager

```

The `SessionSummaryManager` is responsible for generating and managing session summaries. It uses a model to analyze conversations and create concise summaries with optional topic extraction.

#### ## SessionSummaryManager Attributes

Parameter	Type	Default
<code>description</code>		

```
| `model` | `Optional[Model]` | `None`
| Model used for session summary generation |
| `session_summary_prompt` | `Optional[str]` | `None`
| Custom prompt for session summary generation. If not provided, uses default prompt |
| `summary_request_message` | `str` | `"Provide the summary of the
conversation."` | User message prompt for requesting the summary
|
| `summaries_updated` | `bool` | `False`
| Whether session summaries were created in the last run |
```

## ## SessionSummaryManager Methods

```
`create_session_summary(session: Union[AgentSession, TeamSession]) -> Optional[SessionSummary`
```

Creates a summary of the session synchronously.

```

Parameters:

```

- \* ``session``: The agent or team session to summarize

```

Returns:

```

```
* `Optional[SessionSummary]`: A SessionSummary object containing the summary text, topics,
and timestamp, or None if generation fails
```

```
`acreate_session_summary(session: Union[AgentSession, TeamSession]) ->
Optional[SessionSummary]`
```

Creates a summary of the session asynchronously.

```

Parameters:

```

- \* ``session``: The agent or team session to summarize

```

Returns:

```

\* `Optional[SessionSummary]`: A SessionSummary object containing the summary text, topics, and timestamp, or None if generation fails

```
SessionSummary Object
```

The ``SessionSummary`` object returned by the summary manager contains:

```
| Attribute | Type | Description
| | |
| | ----- | -----
| | |
|-----|
| | |
| `summary` | `str` | Concise summary of the session focusing on
important information |
| `topics` | `Optional[List[str]]` | List of topics discussed in the session
```

```
 |
| `updated_at` | `Optional[datetime]` | Timestamp when the summary was created
 |
```

#### # DynamoDB

Source: <https://docs.agno.com/reference/storage/dynamodb>

DynamoDB is a class that implements the Db interface using Amazon DynamoDB as the backend storage system. It provides scalable, managed storage for agent sessions with support for indexing and efficient querying.

```
> **Snippet file:** "db-dynamodb-params.mdx"
```

```
> **Snippet file:** "db-new-bulk-methods.mdx"
```

#### # FirestoreDb

Source: <https://docs.agno.com/reference/storage/firestore>

`FirestoreDb` is a class that implements the Db interface using Google Firestore as the backend storage system. It provides high-performance, distributed storage for agent sessions with support for JSON data types and schema versioning.

```
> **Snippet file:** "db-firestore-params.mdx"
```

```
> **Snippet file:** "db-new-bulk-methods.mdx"
```

#### # GcsJsonDb

Source: <https://docs.agno.com/reference/storage/gcs>

`GcsJsonDb` is a class that implements the Db interface using Google Cloud Storage as a database using JSON files. It provides high-performance, distributed storage for agent sessions with support for JSON data types and schema versioning.

```
> **Snippet file:** "db-gcs-params.mdx"
```

```
> **Snippet file:** "db-new-bulk-methods.mdx"
```

#### # InMemoryDb

Source: [https://docs.agno.com/reference/storage/in\\_memory](https://docs.agno.com/reference/storage/in_memory)

`InMemoryDb` is a class that implements the Db interface using an in-memory database. It provides lightweight, in-memory storage for agent/team sessions.

```
> **Snippet file:** "db-in-memory-params.mdx"
```

```
> **Snippet file:** "db-new-bulk-methods.mdx"
```

#### # JsonDb

Source: <https://docs.agno.com/reference/storage/json>

`JsonDb` is a class that implements the Db interface using JSON files as the backend storage system. It provides a simple, file-based storage solution for agent sessions with

each session stored in a separate JSON file.

```
> **Snippet file:** "db-json-params.mdx"
```

```
> **Snippet file:** "db-new-bulk-methods.mdx"
```

#### # MongoDB

Source: <https://docs.agno.com/reference/storage/mongodb>

`MongoDb` is a class that implements the Db interface using MongoDB as the backend storage system. It provides scalable, document-based storage for agent sessions with support for indexing and efficient querying.

```
> **Snippet file:** "db-mongodb-params.mdx"
```

```
> **Snippet file:** "db-new-bulk-methods.mdx"
```

#### # MySQLDb

Source: <https://docs.agno.com/reference/storage/mysql>

`MySQLDb` is a class that implements the Db interface using MySQL as the backend storage system. It provides robust, relational storage for agent sessions with support for JSONB data types, schema versioning, and efficient querying.

```
> **Snippet file:** "db-mysql-params.mdx"
```

```
> **Snippet file:** "db-new-bulk-methods.mdx"
```

#### # PostgresDb

Source: <https://docs.agno.com/reference/storage/postgres>

`PostgresDb` is a class that implements the Db interface using PostgreSQL as the backend storage system. It provides robust, relational storage for agent sessions with support for JSONB data types, schema versioning, and efficient querying.

```
> **Snippet file:** "db-postgres-params.mdx"
```

```
> **Snippet file:** "db-new-bulk-methods.mdx"
```

#### # RedisDb

Source: <https://docs.agno.com/reference/storage/redis>

`RedisDb` is a class that implements the Db interface using Redis as the backend storage system. It provides high-performance, distributed storage for agent sessions with support for JSON data types and schema versioning.

```
> **Snippet file:** "db-redis-params.mdx"
```

```
> **Snippet file:** "db-new-bulk-methods.mdx"
```

#### # SingleStoreDb

Source: <https://docs.agno.com/reference/storage/singlestor>

e

`SingleStoreDb` is a class that implements the Db interface using SingleStore as the backend storage system. It provides high-performance, distributed storage for agent sessions with support for JSON data types and schema versioning.

> **\*\*Snippet file:\*\*** "db-singlestore-params.mdx"

> **\*\*Snippet file:\*\*** "db-new-bulk-methods.mdx"

# SqliteDb

Source: <https://docs.agno.com/reference/storage/sqlite>

`SqliteDb` is a class that implements the Db interface using SQLite as the backend storage system. It provides lightweight, file-based storage for agent sessions with support for JSON data types and schema versioning.

> **\*\*Snippet file:\*\*** "db-sqlite-params.mdx"

> **\*\*Snippet file:\*\*** "db-new-bulk-methods.mdx"

# Team Session

Source: <https://docs.agno.com/reference/teams/session>

## TeamSession Attributes

Parameter	Type	Default	
Description			
-----	-----	-----	-----
-----	-----	-----	-----
-----	-----	-----	-----
`session_id`	`str`	Required	Session
UUID			
`team_id`	`Optional[str]`	`None`	ID of
the team that this session is associated with			
`user_id`	`Optional[str]`	`None`	ID of
the user interacting with this team			
`workflow_id`	`Optional[str]`	`None`	ID of
the workflow that this session is associated with			
`team_data`	`Optional[Dict[str, Any]]`	`None`	Team
Data: name, team\_id, model, and mode			
`session_data`	`Optional[Dict[str, Any]]`	`None`	Session
Data: session\_state, images, videos, audio			
`metadata`	`Optional[Dict[str, Any]]`	`None`	Metadata
stored with this team			
`runs`	`Optional[List[Union[TeamRunOutput, RunOutput]]]`	`None`	List of
all runs in the session			
`summary`	`Optional[SessionSummary]`	`None`	Summary
of the session			
`created_at`	`Optional[int]`	`None`	The unix
timestamp when this session was created			
`updated_at`	`Optional[int]`	`None`	The unix

timestamp when this session was last updated |

```
`upsert_run(run: TeamRunOutput)`
```

```
`get_run(run_id: str) -> Optional[RunOutput]`
```

```
`get_messages_from_last_n_runs(...)` -> List[Message]
```

```
* `agent_id`: Filter by agent ID
* `team_id`: Filter by team ID
* `last_n`: Number of recent runs to include
* `skip_role`: Skip messages with specific role
* `skip_status`: Skip runs with specific statuses
* `skip_history_messages`: Whether to skip history messages
```

Get the session summary for the session

```
`get_chat_history()` -> List[Message]
```

# Team

Source: <https://docs.agno.com/reference/teams/team>

### ## Parameters

[illegible]

```

| - | List of agents or teams that make up this team

|
|
|
| `id` | `Optional[str]`
| `None` | Team UUID (autogenerated if not set)

|
|
|
| `model` | `Optional[Union[Model, str]]`
| `None` | Model to use for the team. Can be a Model object or a model
string (`provider:model_id`)

|
|
|
| `name` | `Optional[str]`
| `None` | Name of the team

|
|
|
| `role` | `Optional[str]`
| `None` | Role of the team within its parent team

|
|
|
| `respond_directly` | `bool`
| `False` | If True, the team leader won't process responses from the
members and instead will return them directly

|
|
|
| `determine_input_for_members` | `bool`
| `True` | Set to False if you want to send the run input directly to the
member agents

|
|
|
| `delegate_task_to_all_members` | `bool`
| `False` | If True, the team leader will delegate tasks to all members
automatically, without any decision from the team leader

|
|
|
| `user_id` | `Optional[str]`
| `None` | Default user ID for this team

|
|
|

```

```

|
| `session_id` | `Optional[str]`
| `None` | Default session ID for this team (autogenerated if not set)
|
|
|
|
| `session_state` | `Optional[Dict[str, Any]]`
| `None` | Session state (stored in the database to persist across runs)
|
|
|
|
| `add_session_state_to_context` | `bool`
| `False` | Set to True to add the session_state to the context
|
|
|
|
| `enable_agentic_state` | `bool`
| `False` | Set to True to give the team tools to update the
session_state dynamically
|
|
|
|
| `overwrite_db_session_state` | `bool`
| `False` | Set to True to overwrite the session state in the database
with the session state provided in the run
|
|
|
|
| `cache_session` | `bool`
| `False` | If True, cache the current Team session in memory for faster
access
|
|
|
|
| `resolve_in_context` | `bool`
| `True` | If True, resolve the session_state, dependencies, and
metadata in the user and system messages
|
|
|
|
| `description` | `Optional[str]`
| `None` | A description of the Team that is added to the start of the
system message
|
|
|
|
| `instructions` | `Optional[Union[str, List[str], Callable]]`
| `None` | List of instructions for the team

```

```

|
|
|
|
| `expected_output` | `Optional[str]`
| `None` | Provide the expected output from the Team
|
|
|
|
| `additional_context` | `Optional[str]`
| `None` | Additional context added to the end of the system message
|
|
|
|
| `markdown` | `bool`
| `False` | If markdown=true, add instructions to format the output using
markdown
|
|
|
|
| `add_datetime_to_context` | `bool`
| `False` | If True, add the current datetime to the instructions to give
the team a sense of time
|
|
|
|
| `add_location_to_context` | `bool`
| `False` | If True, add the current location to the instructions to give
the team a sense of location
|
|
|
|
| `timezone_identifier` | `Optional[str]`
| `None` | Allows for custom timezone for datetime instructions following
the TZ Database format
|
|
|
|
| `add_name_to_context` | `bool`
| `False` | If True, add the team name to the instructions
|
|
|
|
| `add_member_tools_to_context` | `bool`
| `True` | If True, add the tools available to team members to the
context
|
|
|
|
| `system_message` | `Optional[Union[str, Callable, Message]]`

```

	`None`	Provide the system message as a string or function
	`system_message_role`	`str`
	`"system"`	Role for the system message
	`additional_input`	`Optional[List[Union[str, Dict, BaseModel, Message]]`
	`None`	A list of extra messages added after the system message and before the user message
	`db`	`Optional[BaseDb]`
	`None`	Database to use for this team
	`memory_manager`	`Optional[MemoryManager]`
	`None`	Memory manager to use for this team
	`dependencies`	`Optional[Dict[str, Any]]`
	`None`	User provided dependencies
	`add_dependencies_to_context`	`bool`
	`False`	If True, add the dependencies to the user prompt
	`knowledge`	`Optional[Knowledge]`
	`None`	Add a knowledge base to the team
	`knowledge_filters`	`Optional[Dict[str, Any]]`
	`None`	Filters to apply to knowledge base searches

```

|
| `enable_agentic_knowledge_filters` | `Optional[bool]`
| | `False` | Let the team choose the knowledge filters
|
|
| | |
| | |
| `update_knowledge` | `bool`
| | `False` | Add a tool that allows the Team to update Knowledge
|
|
| | |
| | |
| `add_knowledge_to_context` | `bool`
| | `False` | If True, add references to the user prompt
|
|
| | |
| | |
| `knowledge_retriever` | `Optional[Callable[..., Optional[List[Union[Dict,
str]]]]]` | `None` | Retrieval function to get references
|
|
| | |
| | |
| `references_format` | `Literal["json", "yaml"]`
| | `"json"` | Format of the references
|
|
| | |
| | |
| `share_member_interactions` | `bool`
| | `False` | If True, send all member interactions (request/response)
during the current run to members that have been delegated a task to
|
| | |
| | |
| `get_member_information_tool` | `bool`
| | `False` | If True, add a tool to get information about the team members
|
|
| | |
| | |
| `search_knowledge` | `bool`
| | `True` | Add a tool to search the knowledge base (aka Agentic RAG)
|
|
| | |
| | |
| `send_media_to_model` | `bool`
| | `True` | If False, media (images, videos, audio, files) is only
available to tools and not sent to the LLM

```

```

|
|
|
|
| `store_media` | `bool`
| `True` | If True, store media in the database
|
|
|
|
| `store_tool_messages` | `bool`
| `True` | If True, store tool results in the database
|
|
|
|
| `store_history_messages` | `bool`
| `True` | If True, store history messages in the database
|
|
|
|
| `tools` | `Optional[List[Union[Toolkit, Callable, Function, Dict]]]`
| `None` | A list of tools provided to the Model
|
|
|
|
| `tool_choice` | `Optional[Union[str, Dict[str, Any]]]`
| `None` | Controls which (if any) tool is called by the team model
|
|
|
|
| `tool_call_limit` | `Optional[int]`
| `None` | Maximum number of tool calls allowed
|
|
|
|
| `max_tool_calls_from_history` | `Optional[int]`
| `None` | Maximum number of tool calls from history to keep in context.
If None, all tool calls from history are included. If set to N, only the last N tool calls
from history are added to the context for memory management |
|
|
|
|
| `tool_hooks` | `Optional[List[Callable]]`
| `None` | A list of hooks to be called before and after the tool call
|
|
|
|
| `pre_hooks` | `Optional[Union[List[Callable[..., Any]],
```

```

List[BaseGuardrail]]` | `None` | Functions called right after team session is loaded,
before processing starts

|
|
|
|
| `post_hooks` | `Optional[Union[List[Callable[..., Any]],
List[BaseGuardrail]]` | `None` | Functions called after output is generated but
before the response is returned

|
|
|
|
| `input_schema` | `Optional[Type[BaseModel]]`
| `None` | Input schema for validating input

|
|
|
|
| `output_schema` | `Optional[Type[BaseModel]]`
| `None` | Output schema for the team response

|
|
|
|
| `parser_model` | `Optional[Union[Model, str]]`
| `None` | Provide a secondary model to parse the response from the
primary model. Can be a Model object or a model string (`provider:model_id`)

|
|
|
|
| `parser_model_prompt` | `Optional[str]`
| `None` | Provide a prompt for the parser model

|
|
|
|
| `output_model` | `Optional[Union[Model, str]]`
| `None` | Provide an output model to parse the response from the team.
Can be a Model object or a model string (`provider:model_id`)

|
|
|
|
| `output_model_prompt` | `Optional[str]`
| `None` | Provide a prompt for the output model

|
|
|
|
| `use_json_mode` | `bool`
| `False` | If `output_schema` is set, sets the response mode of the model

|
|
|

```

```

|
| `parse_response` | `bool`
| `True` | If True, parse the response
|
|
|
|
| `enable_agentic_memory` | `bool`
| `False` | Enable the team to manage memories of the user
|
|
|
|
| `enable_user_memories` | `bool`
| `False` | If True, the team creates/updates user memories at the end of
runs
|
|
|
|
| `add_memories_to_context` | `Optional[bool]`
| `None` | If True, the team adds a reference to the user memories in the
response
|
|
|
|
| `enable_session_summaries` | `bool`
| `False` | If True, the team creates/updates session summaries at the end
of runs
|
|
|
|
| `session_summary_manager` | `Optional[SessionSummaryManager]`
| `None` | Session summary manager
|
|
|
|
|
| `add_session_summary_to_context` | `Optional[bool]`
| `None` | If True, the team adds session summaries to the context
|
|
|
|
|
|
|
|
|
| `add_history_to_context` | `bool`
| `False` | Add messages from the chat history to the messages list sent
to the Model. This only applies to the team leader, not the members.
|
|
|
|
|
|
|
|
| `num_history_runs` | `Optional[int]`
| `None` | Number of historical runs to include in the messages.

```

```

|
|
|
|
| `num_history_messages` | `Optional[int]`
| `None` | Number of historical messages to include messages list sent to
the Model.
|
| `add_team_history_to_members`
| `bool` | `False` | If True, send the team-level history to the members, not the
agent-level history |
| `num_team_history_runs` | `int`
| `3` | Number of historical runs to include in the messages sent to
the members
|
|
|
|
| `search_session_history` | `Optional[bool]`
| `False` | If True, adds a tool to allow searching through previous
sessions
|
|
|
|
| `num_history_sessions` | `Optional[int]`
| `None` | Number of past sessions to include in the search
|
|
|
|
| `read_team_history` | `bool`
| `False` | If True, adds a tool to allow the team to read the team
history (deprecated and will be removed in a future version)
|
|
|
|
| `read_chat_history` | `bool`
| `False` | If True, adds a tool to allow the team to read the chat
history
|
|
|
|
| `metadata` | `Optional[Dict[str, Any]]`
| `None` | Metadata stored with this team
|
|
|
|
| `reasoning` | `bool`
| `False` | Enable reasoning for the team
|
|
|
|
| `reasoning_model` | `Optional[Union[Model, str]]`

```

```

 | `None` | Model to use for reasoning. Can be a Model object or a model
string (`provider:model_id`)

|
|
|
|
| `reasoning_agent` | `Optional[Agent]`
| `None` | Agent to use for reasoning

|
|
|
|
| `reasoning_min_steps` | `int`
| `1` | Minimum number of reasoning steps

|
|
|
|
| `reasoning_max_steps` | `int`
| `10` | Maximum number of reasoning steps

|
|
|
|
| `stream` | `Optional[bool]`
| `None` | Stream the response from the Team

|
|
|
|
| `stream_events` | `bool`
| `False` | Stream the intermediate steps from the Team

|
|
|
|
| `stream_member_events` | `bool`
| `True` | Stream the member events from the Team members

|
|
|
|
| `store_events` | `bool`
| `False` | Store the events from the Team

|
|
|
|
| `events_to_skip` | `Optional[List[Union[RunEvent, TeamRunEvent]]]`
| `None` | List of events to skip from the Team

|
|
|

```

```

|
| `store_member_responses` | `bool`
| `False` | Store member agent runs inside the team's RunOutput
|
|
|
|
| `debug_mode` | `bool`
| `False` | Enable debug logs
|
|
|
|
| `debug_level` | `Literal[1, 2]`
| `1` | Debug level: 1 = basic, 2 = detailed
|
|
|
|
| `show_members_responses` | `bool`
| `False` | Enable member logs - Sets the debug_mode for team and members
|
|
|
|
| `retries` | `int`
| `0` | Number of retries to attempt
|
|
|
|
| `delay_between_retries` | `int`
| `1` | Delay between retries (in seconds)
|
|
|
|
| `exponential_backoff` | `bool`
| `False` | Exponential backoff: if True, the delay between retries is
doubled each time
|
|
|
|
| `telemetry` | `bool`
| `True` | Log minimal telemetry for analytics
|
|
|
|

```

## Functions

### `run`

Run the team.

**\*\*Parameters:\*\***

- \* `input` (Union\[str, List, Dict, Message, BaseModel, List\[Message]]): The input to send to the team
- \* `stream` (Optional\[bool]): Whether to stream the response
- \* `stream\_events` (Optional\[bool]): Whether to stream intermediate steps
- \* `session\_id` (Optional\[str]): Session ID to use
- \* `session\_state` (Optional\[Dict\[str, Any]]): Session state to use. By default, merged with the session state in the db.
- \* `user\_id` (Optional\[str]): User ID to use
- \* `retries` (Optional\[int]): Number of retries to attempt
- \* `audio` (Optional\[Sequence\[Audio]]): Audio files to include
- \* `images` (Optional\[Sequence\[Image]]): Image files to include
- \* `videos` (Optional\[Sequence\[Video]]): Video files to include
- \* `files` (Optional\[Sequence\[File]]): Files to include
- \* `knowledge\_filters` (Optional\[Dict\[str, Any]]): Knowledge filters to apply
- \* `add\_history\_to\_context` (Optional\[bool]): Whether to add history to context
- \* `add\_dependencies\_to\_context` (Optional\[bool]): Whether to add dependencies to context
- \* `add\_session\_state\_to\_context` (Optional\[bool]): Whether to add session state to context
- \* `dependencies` (Optional\[Dict\[str, Any]]): Dependencies to use for this run
- \* `metadata` (Optional\[Dict\[str, Any]]): Metadata to use for this run
- \* `debug\_mode` (Optional\[bool]): Whether to enable debug mode
- \* `yield\_run\_response` (bool): Whether to yield the run response (only for streaming)

**\*\*Returns:\*\***

- \* `Union[TeamRunOutput, Iterator[Union[RunOutputEvent, TeamRunOutputEvent]]`: Either a TeamRunOutput or an iterator of events, depending on the `stream` parameter

### `arun`

Run the team asynchronously.

**\*\*Parameters:\*\***

- \* `input` (Union\[str, List, Dict, Message, BaseModel, List\[Message]]): The input to send to the team
- \* `stream` (Optional\[bool]): Whether to stream the response
- \* `stream\_events` (Optional\[bool]): Whether to stream intermediate steps
- \* `session\_id` (Optional\[str]): Session ID to use
- \* `session\_state` (Optional\[Dict\[str, Any]]): Session state to use. By default, merged with the session state in the db.
- \* `user\_id` (Optional\[str]): User ID to use
- \* `retries` (Optional\[int]): Number of retries to attempt
- \* `audio` (Optional\[Sequence\[Audio]]): Audio files to include
- \* `images` (Optional\[Sequence\[Image]]): Image files to include
- \* `videos` (Optional\[Sequence\[Video]]): Video files to include

- \* ``files`` (Optional\[Sequence\[File]]): Files to include
- \* ``knowledge_filters`` (Optional\[Dict\[str, Any]]): Knowledge filters to apply
- \* ``add_history_to_context`` (Optional\[bool]): Whether to add history to context
- \* ``add_dependencies_to_context`` (Optional\[bool]): Whether to add dependencies to context
- \* ``add_session_state_to_context`` (Optional\[bool]): Whether to add session state to context
- \* ``dependencies`` (Optional\[Dict\[str, Any]]): Dependencies to use for this run
- \* ``metadata`` (Optional\[Dict\[str, Any]]): Metadata to use for this run
- \* ``debug_mode`` (Optional\[bool]): Whether to enable debug mode
- \* ``yield_run_response`` (bool): Whether to yield the run response (only for streaming)

**\*\*Returns:\*\***

\* ``Union[TeamRunOutput, AsyncIterator[Union[RunOutputEvent, TeamRunOutputEvent]]]``: Either a TeamRunOutput or an async iterator of events, depending on the ``stream`` parameter

### ``print_response``

Run the team and print the response.

**\*\*Parameters:\*\***

- \* ``input`` (Union\[List, Dict, str, Message, BaseModel, List\[Message]]): The input to send to the team
- \* ``stream`` (Optional\[bool]): Whether to stream the response
- \* ``stream_events`` (Optional\[bool]): Whether to stream intermediate steps
- \* ``session_id`` (Optional\[str]): Session ID to use
- \* ``session_state`` (Optional\[Dict\[str, Any]]): Session state to use. By default, merged with the session state in the db.
- \* ``user_id`` (Optional\[str]): User ID to use
- \* ``show_message`` (bool): Whether to show the message (default: True)
- \* ``show_reasoning`` (bool): Whether to show reasoning (default: True)
- \* ``show_full_reasoning`` (bool): Whether to show full reasoning (default: False)
- \* ``console`` (Optional\[Any]): Console to use for output
- \* ``tags_to_include_in_markdown`` (Optional\[Set\[str]]): Tags to include in markdown content
- \* ``audio`` (Optional\[Sequence\[Audio]]): Audio files to include
- \* ``images`` (Optional\[Sequence\[Image]]): Image files to include
- \* ``videos`` (Optional\[Sequence\[Video]]): Video files to include
- \* ``files`` (Optional\[Sequence\[File]]): Files to include
- \* ``markdown`` (Optional\[bool]): Whether to format output as markdown
- \* ``knowledge_filters`` (Optional\[Dict\[str, Any]]): Knowledge filters to apply
- \* ``add_history_to_context`` (Optional\[bool]): Whether to add history to context
- \* ``dependencies`` (Optional\[Dict\[str, Any]]): Dependencies to use for this run
- \* ``add_dependencies_to_context`` (Optional\[bool]): Whether to add dependencies to context
- \* ``add_session_state_to_context`` (Optional\[bool]): Whether to add session state to context
- \* ``metadata`` (Optional\[Dict\[str, Any]]): Metadata to use for this run
- \* ``debug_mode`` (Optional\[bool]): Whether to enable debug mode

### ``aprint_response``

Run the team and print the response asynchronously.

**\*\*Parameters:\*\***

- \* ``input`` (Union[List, Dict, str, Message, BaseModel, List[Message]]): The input to send to the team
- \* ``stream`` (Optional[bool]): Whether to stream the response
- \* ``stream_events`` (Optional[bool]): Whether to stream intermediate steps
- \* ``session_id`` (Optional[str]): Session ID to use
- \* ``session_state`` (Optional[Dict[str, Any]]): Session state to use. By default, merged with the session state in the db.
- \* ``user_id`` (Optional[str]): User ID to use
- \* ``show_message`` (bool): Whether to show the message (default: True)
- \* ``show_reasoning`` (bool): Whether to show reasoning (default: True)
- \* ``show_full_reasoning`` (bool): Whether to show full reasoning (default: False)
- \* ``console`` (Optional[Any]): Console to use for output
- \* ``tags_to_include_in_markdown`` (Optional[Set[str]]): Tags to include in markdown content
- \* ``audio`` (Optional[Sequence[Audio]]): Audio files to include
- \* ``images`` (Optional[Sequence[Image]]): Image files to include
- \* ``videos`` (Optional[Sequence[Video]]): Video files to include
- \* ``files`` (Optional[Sequence[File]]): Files to include
- \* ``markdown`` (Optional[bool]): Whether to format output as markdown
- \* ``knowledge_filters`` (Optional[Dict[str, Any]]): Knowledge filters to apply
- \* ``add_history_to_context`` (Optional[bool]): Whether to add history to context
- \* ``dependencies`` (Optional[Dict[str, Any]]): Dependencies to use for this run
- \* ``add_dependencies_to_context`` (Optional[bool]): Whether to add dependencies to context
- \* ``add_session_state_to_context`` (Optional[bool]): Whether to add session state to context
- \* ``metadata`` (Optional[Dict[str, Any]]): Metadata to use for this run
- \* ``debug_mode`` (Optional[bool]): Whether to enable debug mode

### ``cli_app``

Run an interactive command-line interface to interact with the team.

**\*\*Parameters:\*\***

- \* ``input`` (Optional[str]): The input to send to the team
- \* ``user`` (str): Name for the user (default: "User")
- \* ``emoji`` (str): Emoji for the user (default: ":sunglasses:")
- \* ``stream`` (bool): Whether to stream the response (default: False)
- \* ``markdown`` (bool): Whether to format output as markdown (default: False)
- \* ``exit_on`` (Optional[List[str]]): List of commands to exit the CLI
- \* ``**kwargs``: Additional keyword arguments

### ``accli_app``

Run an interactive command-line interface to interact with the team asynchronously.

**\*\*Parameters:\*\***

```
* `input` (Optional\[str]): The input to send to the team
* `session_id` (Optional\[str]): Session ID to use
* `user_id` (Optional\[str]): User ID to use
* `user` (str): Name for the user (default: "User")
* `emoji` (str): Emoji for the user (default: ":sunglasses:")
* `stream` (bool): Whether to stream the response (default: False)
* `markdown` (bool): Whether to format output as markdown (default: False)
* `exit_on` (Optional\[List\[str]]): List of commands to exit the CLI
* `**kwargs`: Additional keyword arguments
```

```
`get_session_summary`
```

Get the session summary for the given session ID.

```
Parameters:
```

```
* `session_id` (Optional\[str]): Session ID to use (if not provided, the current session is used)
```

```
Returns:
```

```
* Session summary for the given session
```

```
`get_user_memories`
```

Get the user memories for the given user ID.

```
Parameters:
```

```
* `user_id` (Optional\[str]): User ID to use (if not provided, the current user is used)
```

```
Returns:
```

```
* `Optional[List[UserMemory]]`: The user memories
```

```
`add_tool`
```

Add a tool to the team.

```
Parameters:
```

```
* `tool` (Union\[Toolkit, Callable, Function, Dict]): The tool to add
```

```
`set_tools`
```

Replace the tools of the team.

```
Parameters:
```

```
* `tools` (List\[Union\[Toolkit, Callable, Function, Dict]]): The tools to set
```

```
`cancel_run`
```

Cancel a run by run ID.

**\*\*Parameters:\*\***

\* `run\_id` (str): The run ID to cancel

**\*\*Returns:\*\***

\* `bool`: True if the run was successfully cancelled

### `get\_run\_output`

Get the run output for the given run ID.

**\*\*Parameters:\*\***

\* `run\_id` (str): The run ID

\* `session\_id` (Optional[str]): Session ID to use

**\*\*Returns:\*\***

\* `Optional[Union[TeamRunOutput, RunOutput]]`: The run output

### `get\_last\_run\_output`

Get the last run output for the session.

**\*\*Parameters:\*\***

\* `session\_id` (Optional[str]): Session ID to use (if not provided, the current session is used)

**\*\*Returns:\*\***

\* `Optional[TeamRunOutput]`: The last run output

### `get\_session`

Get the session for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (Optional[str]): Session ID to use (if not provided, the current session is used)

**\*\*Returns:\*\***

\* `Optional[TeamSession]`: The team session

### `save\_session`

Save a session to the database.

**\*\*Parameters:\*\***

\* `session` (TeamSession): The session to save

### `asave\_session`

Save a session to the database asynchronously.

**\*\*Parameters:\*\***

\* `session` (TeamSession): The session to save

### `delete\_session`

Delete a session.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to delete

### `get\_session\_name`

Get the session name for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (Optional[str]): Session ID to use (if not provided, the current session is used)

**\*\*Returns:\*\***

\* `str`: The session name

### `set\_session\_name`

Set the session name.

**\*\*Parameters:\*\***

\* `session\_id` (Optional[str]): Session ID to use (if not provided, the current session is used)

\* `autogenerate` (bool): Whether to autogenerate the name

\* `session\_name` (Optional[str]): The name to set

**\*\*Returns:\*\***

\* `TeamSession`: The updated session

### `get\_session\_state`

Get the session state for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (Optional\[str]): Session ID to use (if not provided, the current session is used)

**\*\*Returns:\*\***

\* `Dict[str, Any]`: The session state

### `update\_session\_state`

Update the session state for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to use

\* `session\_state\_updates` (Dict\[str, Any]): The session state keys and values to update. Overwrites the existing session state.

**\*\*Returns:\*\***

\* `Dict[str, Any]`: The updated session state

### `get\_session\_metrics`

Get the session metrics for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (Optional\[str]): Session ID to use (if not provided, the current session is used)

**\*\*Returns:\*\***

\* `Optional[Metrics]`: The session metrics

### `get\_chat\_history`

Get the chat history for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (Optional\[str]): Session ID to use (if not provided, the current session is used)

**\*\*Returns:\*\***

\* `List[Message]`: The chat history

### `get\_messages\_for\_session`

Get the messages for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (Optional\[str]): Session ID to use (if not provided, the current session is used)

**\*\*Returns:\*\***

\* `List[Message]`: The messages for the session

# TeamRunOutput

Source: <https://docs.agno.com/reference/teams/team-response>

The `TeamRunOutput` class represents the response from a team run, containing both the team's overall response and individual member responses. It supports streaming and provides real-time events throughout the execution of a team.

## TeamRunOutput Attributes

Attribute	Type	Default
Description		
-----	-----	-----
-----	-----	-----
`content`	`Any`	`None`
Content of the response		
`content_type`	`str`	`"str"`
Specifies the data type of the content		
`messages`	`List[Message]`	`None`
A list of messages included in the response		
`metrics`	`Metrics`	`None`
Usage metrics of the run		
`model`	`str`	`None`
The model used in the run		
`model_provider`	`str`	`None`
The model provider used in the run		
`member_responses`	`List[Union[TeamRunOutput, RunOutput]]`	`[]`
Responses from individual team members		
`run_id`	`str`	`None`
Run Id		
`team_id`	`str`	`None`
Team Id for the run		
`team_name`	`str`	`None`
Name of the team		
`session_id`	`str`	`None`
Session Id for the run		
`parent_run_id`	`str`	`None`
Parent run ID if this is a nested run		
`tools`	`List[ToolExecution]`	`None`
List of tools provided to the model		

`images`	`List[Image]`	`None`
List of images from member runs		
`videos`	`List[Video]`	`None`
List of videos from member runs		
`audio`	`List[Audio]`	`None`
List of audio snippets from member runs		
`files`	`List[File]`	`None`
List of files from member runs		
`response_audio`	`Audio`	`None`
The model's raw response in audio		
`input`	`TeamRunInput`	`None`
Input media and messages from user		
`reasoning_content`	`str`	`None`
Any reasoning content the model produced		
`citations`	`Citations`	`None`
Any citations used in the response		
`model_provider_data`	`Any`	`None`
Model provider specific metadata		
`metadata`	`Dict[str, Any]`	`None`
Additional metadata for the run		
`references`	`List[MessageReferences]`	`None`
Message references		
`additional_input`	`List[Message]`	`None`
Additional input messages		
`reasoning_steps`	`List[ReasoningStep]`	`None`
Reasoning steps taken during execution		
`reasoning_messages`	`List[Message]`	`None`
Messages related to reasoning		
`created_at`	`int`	Current timestamp
Unix timestamp of the response creation		
`events`	`List[Union[RunOutputEvent, TeamRunOutputEvent]]`	`None`
List of events that occurred during the run		
`status`	`RunStatus`	
`RunStatus.running`	Current status of the run	
`workflow_step_id`	`str`	`None`
FK: Points to StepOutput.step\_id		

## ## TeamRunOutputEvent Types

The following events are sent by the `Team.run()` function depending on the team's configuration:

### ### Core Events

Event Type	Description	
-----	-----	
-----		
`TeamRunStarted`	Indicates the start of a team run	
`TeamRunContent`	Contains the model's response text as individual chunks	
`TeamRunContentCompleted`	Signals completion of content streaming	
`TeamRunIntermediateContent`	Contains intermediate content during the run	
`TeamRunCompleted`	Signals successful completion of the team run	

`TeamRunError`	Indicates an error occurred during the team run	
`TeamRunCancelled`	Signals that the team run was cancelled	

### ### Pre-Hook Events

Event Type	Description	
-----	-----	
`TeamPreHookStarted`	Indicates the start of a pre-run hook	
`TeamPreHookCompleted`	Signals completion of a pre-run hook execution	

### ### Post-Hook Events

Event Type	Description	
-----	-----	
`TeamPostHookStarted`	Indicates the start of a post-run hook	
`TeamPostHookCompleted`	Signals completion of a post-run hook execution	

### ### Tool Events

Event Type	Description	
-----	-----	
-----		
`TeamToolCallStarted`	Indicates the start of a tool call	
`TeamToolCallCompleted`	Signals completion of a tool call, including tool call results	

### ### Reasoning Events

Event Type	Description	
-----	-----	
-		
`TeamReasoningStarted`	Indicates the start of the team's reasoning process	
`TeamReasoningStep`	Contains a single step in the reasoning process	
`TeamReasoningCompleted`	Signals completion of the reasoning process	

### ### Memory Events

Event Type	Description	
-----	-----	
`TeamMemoryUpdateStarted`	Indicates that the team is updating its memory	
`TeamMemoryUpdateCompleted`	Signals completion of a memory update	

### ### Session Summary Events

Event Type	Description	
-----	-----	
`TeamSessionSummaryStarted`	Indicates the start of session summary generation	
`TeamSessionSummaryCompleted`	Signals completion of session summary generation	

### ## Event Attributes

### ### Base TeamRunOutputEvent

All events inherit from `BaseTeamRunEvent` which provides these common attributes:

Attribute	Type	Default	Description
-----	-----	-----	-----
`created_at` creation	`int`	Current timestamp	Unix timestamp of the event
`event`	`str`	``	The type of event
`team_id` event	`str`	``	ID of the team generating the
`team_name` the event	`str`	``	Name of the team generating
`run_id`	`Optional[str]`	`None`	ID of the current run
`session_id`	`Optional[str]`	`None`	ID of the current session
`workflow_id`	`Optional[str]`	`None`	ID of the workflow
`workflow_run_id`	`Optional[str]`	`None`	ID of the workflow's run
`step_id`	`Optional[str]`	`None`	ID of the workflow step
`step_name`	`Optional[str]`	`None`	Name of the workflow step
`step_index`	`Optional[int]`	`None`	Index of the workflow step
`content`	`Optional[Any]`	`None`	For backwards compatibility

### ### RunStartedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"TeamRunStarted"`	Event type
`model`	`str`	``	The model being used
`model_provider`	`str`	``	The provider of the model

### ### IntermediateRunContentEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"TeamRunIntermediateContent"`	Event type
`content` of the response	`Optional[Any]`	`None`	Intermediate content

`content_type`	`str`	`"str"`	Type of the content

### ### RunContentCompletedEvent

Attribute	Type	Default	Description
-----	----	-----	-----
`event`	`str`	`"TeamRunContentCompleted"`	Event type

### ### RunContentEvent

Attribute	Type	Default	
Description			
-----	-----	-----	
-----			
`event`	`str`	`"TeamRunContent"`	Event type
`content`	`Optional[Any]`	`None`	The content of the response
`content_type`	`str`	`"str"`	Type of the content
`reasoning_content`	`Optional[str]`	`None`	Reasoning content produced
`citations`	`Optional[Citations]`	`None`	Citations used in the response
`model_provider_data`	`Optional[Any]`	`None`	Model provider specific metadata
`response_audio`	`Optional[Audio]`	`None`	Model's audio response
`image`	`Optional[Image]`	`None`	Image attached to the response
`references`	`Optional[List[MessageReferences]]`	`None`	Message references
`additional_input`	`Optional[List[Message]]`	`None`	Additional input messages
`reasoning_steps`	`Optional[List[ReasoningStep]]`	`None`	Reasoning steps
`reasoning_messages`	`Optional[List[Message]]`	`None`	Reasoning messages

### ### RunCompletedEvent

Attribute	Type	Default	
Description			
-----	-----	-----	
-----			
`event`	`str`	`"TeamRunCompleted"`	Event type
`content`	`Optional[Any]`	`None`	Final content of the response
`content_type`	`str`	`"str"`	Type of the content

`reasoning_content`	`Optional[str]`	`None`	
Reasoning content produced			
`citations`	`Optional[Citations]`	`None`	
Citations used in the response			
`model_provider_data`	`Optional[Any]`	`None`	
Model provider specific metadata			
`images`	`Optional[List[Image]]`	`None`	
Images attached to the response			
`videos`	`Optional[List[Video]]`	`None`	
Videos attached to the response			
`audio`	`Optional[List[Audio]]`	`None`	
Audio snippets attached to the response			
`response_audio`	`Optional[Audio]`	`None`	
Model's audio response			
`references`	`Optional[List[MessageReferences]]`	`None`	
Message references			
`additional_input`	`Optional[List[Message]]`	`None`	
Additional input messages			
`reasoning_steps`	`Optional[List[ReasoningStep]]`	`None`	
Reasoning steps			
`reasoning_messages`	`Optional[List[Message]]`	`None`	
Reasoning messages			
`member_responses`	`List[Union[TeamRunOutput, RunOutput]]`	`[]`	
Responses from individual team members			
`metadata`	`Optional[Dict[str, Any]]`	`None`	
Additional metadata			
`metrics`	`Optional[Metrics]`	`None`	
Usage metrics			

### RunErrorEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"TeamRunError"`	Event type
`content`	`Optional[str]`	`None`	Error message

### RunCancelledEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"TeamRunCancelled"`	Event type
`reason`	`Optional[str]`	`None`	Reason for cancellation

### PreHookStartedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"TeamPreHookStarted"`	Event type
`pre_hook_name`	`Optional[str]`	`None`	Name of the

```

pre-hook being executed |
| `run_input` | `Optional[TeamRunInput]` | `None` | The run input
passed to the hook |

```

### ### PreHookCompletedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
-----	-----	-----	-----
`event`	`str`	`"TeamPreHookCompleted"`	Event type
`pre_hook_name`	`Optional[str]`	`None`	Name of the pre-hook that completed
`run_input`	`Optional[TeamRunInput]`	`None`	The run input passed to the hook

### ### PostHookStartedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
-----	-----	-----	-----
`event`	`str`	`"TeamPostHookStarted"`	Event type
`post_hook_name`	`Optional[str]`	`None`	Name of the post-hook being executed

### ### PostHookCompletedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
-----	-----	-----	-----
`event`	`str`	`"TeamPostHookCompleted"`	Event type
`post_hook_name`	`Optional[str]`	`None`	Name of the post-hook that completed

### ### ToolCallStartedEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
-----	-----	-----	-----
`event`	`str`	`"TeamToolCallStarted"`	Event type
`tool`	`Optional[ToolExecution]`	`None`	The tool being called

### ### ToolCallCompletedEvent

Attribute	Type	Default	Description
`event`	`str`	`"TeamToolCallCompleted"`	Event type
`tool`	`Optional[ToolExecution]`	`None`	The tool that was called
`content`	`Optional[Any]`	`None`	Result of the tool call
`images`	`Optional[List[Image]]`	`None`	Images produced by the tool
`videos`	`Optional[List[Video]]`	`None`	Videos produced by the tool
`audio`	`Optional[List[Audio]]`	`None`	Audio produced by the tool

### ReasoningStartedEvent

Attribute	Type	Default	Description
`event`	`str`	`"TeamReasoningStarted"`	Event type

### ReasoningStepEvent

Attribute	Type	Default	Description
`event`	`str`	`"TeamReasoningStep"`	Event type
`content`	`Optional[Any]`	`None`	Content of the reasoning step
`content_type`	`str`	`"str"`	Type of the content
`reasoning_content`	`str`	`""`	Detailed reasoning content

### ReasoningCompletedEvent

Attribute	Type	Default	Description
`event`	`str`	`"TeamReasoningCompleted"`	Event type
`content`	`Optional[Any]`	`None`	Content of the reasoning step
`content_type`	`str`	`"str"`	Type of the content

### MemoryUpdateStartedEvent

Attribute	Type	Default	Description
-----	----	-----	-----
`event`	`str`	`"TeamMemoryUpdateStarted"`	Event type

### MemoryUpdateCompletedEvent

Attribute	Type	Default	Description
-----	----	-----	-----
`event`	`str`	`"TeamMemoryUpdateCompleted"`	Event type

### SessionSummaryStartedEvent

Attribute	Type	Default	Description
-----	----	-----	-----
`event`	`str`	`"TeamSessionSummaryStarted"`	Event type

### SessionSummaryCompletedEvent

Attribute	Type	Default	Description
-----	----	-----	-----
`event`	`str`	`"TeamSessionSummaryCompleted"`	Event type
`session_summary`	`Optional[Any]`	`None`	The generated session summary

### ParserModelResponseStartedEvent

Attribute	Type	Default	Description
-----	----	-----	-----
`event`	`str`	`"TeamParserModelResponseStarted"`	Event type

### ParserModelResponseCompletedEvent

Attribute	Type	Default	Description
-----	----	-----	-----
`event`	`str`	`"TeamParserModelResponseCompleted"`	Event type

### OutputModelResponseStartedEvent

Attribute	Type	Default	Description
-----	----	-----	-----
`event`	`str`	`"TeamOutputModelResponseStarted"`	Event type

### OutputModelResponseCompletedEvent

Attribute	Type	Default	Description
-----	----	-----	-----
`event`	`str`	`"TeamOutputModelResponseCompleted"`	Event type

### CustomEvent

Attribute	Type	Default	Description
-----	-----	-----	-----
`event`	`str`	`"CustomEvent"`	Event type

Conditional Steps
```

```
Source: https://docs.agno.com/reference/workflows/conditional-steps
```

Parameter	Type	Default	Description
evaluator	Union[Callable[[StepInput], bool], Callable[[StepInput], Awaitable[bool]], bool]		Required   Function or boolean to evaluate the condition
steps	WorkflowSteps		Required   Steps to execute if the condition is met
name	Optional[str]		
	None		Name of the condition step
description	Optional[str]		
	None		Description of the condition step

```
Loop Steps
```

```
Source: https://docs.agno.com/reference/workflows/loop-steps
```

Parameter	Type	Default	Description
steps	WorkflowSteps		

		Required	Steps to execute in each loop iteration	
`name`	`Optional[str]`			
		`None`	Name of the loop step	
`description`	`Optional[str]`			
		`None`	Description of the loop step	
`max_iterations`	`int`			
		`3`	Maximum number of iterations for the loop	
`end_condition`	`Optional[Union[Callable[[List[StepOutput]], bool], Callable[[List[StepOutput]], Awaitable[bool]]]]`	`None`	Function to evaluate if the loop should end	

## # Parallel Steps

Source: <https://docs.agno.com/reference/workflows/parallel-steps>

Parameter	Type	Default	Description
	-----		-----
-----			
`*steps`	`*WorkflowSteps`	Required	Variable number of steps to execute in parallel
`name`	`Optional[str]`	`None`	Name of the parallel execution block
`description`	`Optional[str]`	`None`	Description of the parallel execution

## # Router Steps

Source: <https://docs.agno.com/reference/workflows/router-steps>

Parameter	Type	Default	Description
	-----		-----
-----			
-----			
-----			
-----			
`selector`	`Union[Callable[[StepInput], Union[WorkflowSteps, List[WorkflowSteps]]], Callable[[StepInput], Awaitable[Union[WorkflowSteps, List[WorkflowSteps]]]]`	Required	Function to select steps dynamically (supports both sync and async functions)
`choices`	`WorkflowSteps`		
		Required	
Available steps for selection			
`name`	`Optional[str]`		
		`None`	
Name of the router step			
`description`	`Optional[str]`		
		`None`	
Description of the router step			

## # Step

Source: <https://docs.agno.com/reference/workflows/step>

Parameter	Type	Default	Description
<code>`name`</code>	<code>`Optional[str]`</code>	<code>`None`</code>	Name of the step for identification
<code>`agent`</code>	<code>`Optional[Agent]`</code>	<code>`None`</code>	Agent to execute for this step
<code>`team`</code>	<code>`Optional[Team]`</code>	<code>`None`</code>	Team to execute for this step
<code>`executor`</code>	<code>`Optional[StepExecutor]`</code>	<code>`None`</code>	Custom function to execute for this step
<code>`step_id`</code>	<code>`Optional[str]`</code>	<code>`None`</code>	Unique identifier for the step (auto-generated if not provided)
<code>`description`</code>	<code>`Optional[str]`</code>	<code>`None`</code>	Description of the step's purpose
<code>`max_retries`</code>	<code>`int`</code>	<code>`3`</code>	Maximum number of retry attempts on failure
<code>`timeout_seconds`</code>	<code>`Optional[int]`</code>	<code>`None`</code>	Timeout for step execution in seconds
<code>`skip_on_failure`</code>	<code>`bool`</code>	<code>`False`</code>	Whether to skip this step if it fails after all retries
<code>`add_workflow_history`</code>	<code>`bool`</code>	<code>`False`</code>	If True, add the workflow history to the step
<code>`num_history_runs`</code>	<code>`int`</code>	<code>`None`</code>	Number of runs to include in the workflow history, if not provided, all history runs are included

#### # StepInput

Source: [https://docs.agno.com/reference/workflows/step\\_inp](https://docs.agno.com/reference/workflows/step_inp)

ut

Parameter	Type	Description
<code>`input`</code>	<code>`Optional[Union[str, Dict[str, Any], List[Any], BaseModel]]`</code>	Primary input message (can be any format)
<code>`previous_step_content`</code>	<code>`Optional[Any]`</code>	Content from the last step
<code>`previous_step_outputs`</code>	<code>`Optional[Dict[str, StepOutput]]`</code>	All previous step outputs by name
<code>`additional_data`</code>	<code>`Optional[Dict[str, Any]]`</code>	Additional context data
<code>`images`</code>	<code>`Optional[List[Image]]`</code>	Media inputs - images (accumulated from workflow input and previous steps)
<code>`videos`</code>	<code>`Optional[List[Video]]`</code>	Media inputs - videos (accumulated from workflow input and previous steps)
<code>`audio`</code>	<code>`Optional[List[Audio]]`</code>	

Media inputs - audio (accumulated from workflow input and previous steps)	
`files`	`Optional[List[File]]`
File inputs (accumulated from workflow input and previous steps)	

### ## Helper Functions

Method	Return Type
Description	
-----	-----
-----	-----
-----	-----
`get_step_output(step_name: str)`	`Optional[StepOutput]`
Get the complete StepOutput object from a specific step by name	
`get_step_content(step_name: str)`	`Optional[Union[str, Dict[str, str]]]`
Get content from a specific step by name	
`get_all_previous_content()`	`str`
Get all previous step content combined	
`get_last_step_content()`	`Optional[str]`
Get content from the immediate previous step	
`get_workflow_history(num_runs: int)`	`List[Tuple[str, str]]`
Get the workflow history as a list of tuples	
`get_workflow_history_context(num_runs: int)`	`str`
Get the workflow history as a formatted context string	

### # StepOutput

Source: [https://docs.agno.com/reference/workflows/step\\_output](https://docs.agno.com/reference/workflows/step_output)

Parameter	Type
Default	Description
-----	-----
-----	-----
-----	-----
-----	-----
`step_name`	`Optional[str]`
`None`	Step identification name
`step_id`	`Optional[str]`
`None`	Unique step identifier
`step_type`	`Optional[str]`
`None`	Type of step (e.g., "Loop", "Condition", "Parallel")
`executor_type`	`Optional[str]`
`None`	Type of executor: "agent", "team", or "function"
`executor_name`	`Optional[str]`
`None`	Name of the executor
`content`	`Optional[Union[str, Dict[str, Any], List[Any], BaseModel, Any]]`
`None`	Primary output (can be any format)
`step_run_id`	`Optional[str]`
`None`	Link to the run ID of the step execution
`images`	`Optional[List[Image]]`
`None`	Media outputs - images (new or passed-through)
`videos`	`Optional[List[Video]]`
`None`	Media outputs - videos (new or passed-through)
`audio`	`Optional[List[Audio]]`

`None`	Media outputs - audio (new or passed-through)		
`files`	`Optional[List[File]]`		
`None`	File outputs (new or passed-through)		
`metrics`	`Optional[Metrics]`		
`None`	Execution metrics and metadata		
`success`	`bool`		
`True`	Execution success status		
`error`	`Optional[str]`		
`None`	Error message if execution failed		
`stop`	`bool`		
`False`	Request early workflow termination		
`steps`	`Optional[List[StepOutput]]`		
`None`	Nested step outputs for composite steps (Loop, Condition, etc.)		

## # Steps

Source: <https://docs.agno.com/reference/workflows/steps-step>

Parameter	Type	Default	Description
-----		-----	
-----		-----	
`name`	`Optional[str]`	`None`	Name of the steps group for identification
`description`	`Optional[str]`	`None`	Description of the steps group's purpose
`steps`	`Optional[List[Any]]`	`[]`	List of steps to execute sequentially (empty list if not provided)

## # Workflow

Source: <https://docs.agno.com/reference/workflows/workflow>

## ## Parameters

Parameter	Type
-----	-----
-----	-----
-----	-----
----	
`name`	`Optional[str]`
`None`	Workflow name
`id`	`Optional[str]`
`None`	Workflow ID (autogenerated if not set)
`description`	`Optional[str]`
`None`	Workflow description
`steps`	`Optional[WorkflowSteps]`

```

| `None` | Workflow steps - can be a callable function, Steps object, or list
of steps
| `db` | `Optional[BaseDb]`
| `None` | Database to use for this workflow
|
| `session_id` | `Optional[str]`
| `None` | Default session_id to use for this workflow (autogenerated if not
set)
|
| `user_id` | `Optional[str]`
| `None` | Default user_id to use for this workflow
|
| `session_state` | `Optional[Dict[str, Any]]`
| `None` | Default session state (stored in the database to persist across
runs)
|
| `debug_mode` | `Optional[bool]`
| `False` | If True, the workflow runs in debug mode
|
| `stream` | `Optional[bool]`
| `None` | Stream the response from the Workflow
|
| `stream_events` | `bool`
| `False` | Stream the intermediate steps from the Workflow
|
| `stream_executor_events` | `bool`
| `True` | Stream the events emitted by the Step executor (the agent/team
events) together with the Workflow events |
| `store_events` | `bool`
| `False` | Persist the events on the run response
|
| `events_to_skip` | `Optional[List[Union[WorkflowRunEvent, RunEvent,
TeamRunEvent]]]` | `None` | Events to skip when persisting the events on the run response
|
| `store_executor_outputs` | `bool`
| `True` | Control whether to store executor responses (agent/team responses)
in flattened runs
|
| `websocket_handler` | `Optional[WebSocketHandler]`
| `None` | WebSocket handler for real-time communication
|
| `input_schema` | `Optional[Type[BaseModel]]`
| `None` | Input schema to validate the input to the workflow
|
| `metadata` | `Optional[Dict[str, Any]]`
| `None` | Metadata stored with this workflow
|
| `add_workflow_history_to_steps` | `bool`
| `False` | If True, add the workflow history to the steps
|
| `num_history_runs` | `int`
| `None` | Number of runs to include in the workflow history, if not provided,
all history runs are included
|
| `cache_session` | `bool`
| `False` | If True, cache the current workflow session in memory for faster

```

```

access |
| `telemetry` | `bool`
 | `True` | Log minimal telemetry for analytics
 |

```

## Functions

### `run`

Execute the workflow synchronously with optional streaming.

**\*\*Parameters:\*\***

- \* `input` (Optional\[Union\[str, Dict\[str, Any], List\[Any], BaseModel]]): The input to send to the workflow
- \* `additional\_data` (Optional\[Dict\[str, Any]]): Additional data to include with the input
- \* `user\_id` (Optional\[str]): User ID to use
- \* `session\_id` (Optional\[str]): Session ID to use
- \* `session\_state` (Optional\[Dict\[str, Any]]): Session state to use
- \* `audio` (Optional\[List\[Audio]]): Audio files to include
- \* `images` (Optional\[List\[Image]]): Image files to include
- \* `videos` (Optional\[List\[Video]]): Video files to include
- \* `files` (Optional\[List\[File]]): Files to include
- \* `stream` (bool): Whether to stream the response
- \* `stream\_events` (Optional\[bool]): Whether to stream intermediate steps

**\*\*Returns:\*\***

- \* `Union[WorkflowRunOutput, Iterator[WorkflowRunOutputEvent]]`: Either a WorkflowRunOutput or an iterator of WorkflowRunOutputEvents, depending on the `stream` parameter

### `arun`

Execute the workflow asynchronously with optional streaming.

**\*\*Parameters:\*\***

- \* `input` (Optional\[Union\[str, Dict\[str, Any], List\[Any], BaseModel, List\[Message]]): The input to send to the workflow
- \* `additional\_data` (Optional\[Dict\[str, Any]]): Additional data to include with the input
- \* `user\_id` (Optional\[str]): User ID to use
- \* `session\_id` (Optional\[str]): Session ID to use
- \* `session\_state` (Optional\[Dict\[str, Any]]): Session state to use
- \* `audio` (Optional\[List\[Audio]]): Audio files to include
- \* `images` (Optional\[List\[Image]]): Image files to include
- \* `videos` (Optional\[List\[Video]]): Video files to include
- \* `files` (Optional\[List\[File]]): Files to include
- \* `stream` (bool): Whether to stream the response
- \* `stream\_events` (Optional\[bool]): Whether to stream intermediate steps
- \* `background` (Optional\[bool]): Whether to run in background

\* `websocket` (Optional\[WebSocket]): WebSocket for real-time communication

**\*\*Returns:\*\***

\* `Union[WorkflowRunOutput, AsyncIterator[WorkflowRunOutputEvent]]`: Either a WorkflowRunOutput or an iterator of WorkflowRunOutputEvents, depending on the `stream` parameter

### `print\_response`

Print workflow execution with rich formatting and optional streaming.

**\*\*Parameters:\*\***

\* `input` (Union\[str, Dict\[str, Any], List\[Any], BaseModel, List\[Message]]): The input to send to the workflow

\* `additional\_data` (Optional\[Dict\[str, Any]]): Additional data to include with the input

\* `user\_id` (Optional\[str]): User ID to use

\* `session\_id` (Optional\[str]): Session ID to use

\* `audio` (Optional\[List\[Audio]]): Audio files to include

\* `images` (Optional\[List\[Image]]): Image files to include

\* `videos` (Optional\[List\[Video]]): Video files to include

\* `files` (Optional\[List\[File]]): Files to include

\* `stream` (Optional\[bool]): Whether to stream the response content

\* `stream\_events` (Optional\[bool]): Whether to stream intermediate steps

\* `markdown` (bool): Whether to render content as markdown

\* `show\_time` (bool): Whether to show execution time

\* `show\_step\_details` (bool): Whether to show individual step outputs

\* `console` (Optional\[Any]): Rich console instance (optional)

### `aprint\_response`

Print workflow execution with rich formatting and optional streaming asynchronously.

**\*\*Parameters:\*\***

\* `input` (Union\[str, Dict\[str, Any], List\[Any], BaseModel, List\[Message]]): The input to send to the workflow

\* `additional\_data` (Optional\[Dict\[str, Any]]): Additional data to include with the input

\* `user\_id` (Optional\[str]): User ID to use

\* `session\_id` (Optional\[str]): Session ID to use

\* `audio` (Optional\[List\[Audio]]): Audio files to include

\* `images` (Optional\[List\[Image]]): Image files to include

\* `videos` (Optional\[List\[Video]]): Video files to include

\* `files` (Optional\[List\[File]]): Files to include

\* `stream` (Optional\[bool]): Whether to stream the response content

\* `stream\_events` (Optional\[bool]): Whether to stream intermediate steps

\* `markdown` (bool): Whether to render content as markdown

\* `show\_time` (bool): Whether to show execution time

\* `show\_step\_details` (bool): Whether to show individual step outputs

\* `console` (Optional\[Any]): Rich console instance (optional)

### `cancel\_run`

Cancel a running workflow execution.

**\*\*Parameters:\*\***

\* `run\_id` (str): The run\\_id to cancel

**\*\*Returns:\*\***

\* `bool`: True if the run was found and marked for cancellation, False otherwise

### `get\_run`

Get the status and details of a background workflow run.

**\*\*Parameters:\*\***

\* `run\_id` (str): The run ID to get

**\*\*Returns:\*\***

\* `Optional[WorkflowRunOutput]`: The workflow run output if found

### `get\_run\_output`

Get a WorkflowRunOutput from the database.

**\*\*Parameters:\*\***

\* `run\_id` (str): The run ID

\* `session\_id` (Optional\[str]): Session ID to use

**\*\*Returns:\*\***

\* `Optional[WorkflowRunOutput]`: The run output

### `get\_last\_run\_output`

Get the last run response from the database for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (Optional\[str]): Session ID to use

**\*\*Returns:\*\***

\* `Optional[WorkflowRunOutput]`: The last run output

### `get\_session`

Get the session for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (Optional\[str]): Session ID to use

**\*\*Returns:\*\***

\* `Optional[WorkflowSession]`: The workflow session

### `get\_session\_state`

Get the session state for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (Optional\[str]): Session ID to use

**\*\*Returns:\*\***

\* `Dict[str, Any]`: The session state

### `get\_session\_name`

Get the session name for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (Optional\[str]): Session ID to use

**\*\*Returns:\*\***

\* `str`: The session name

### `set\_session\_name`

Set the session name and save to storage.

**\*\*Parameters:\*\***

\* `session\_id` (Optional\[str]): Session ID to use

\* `autogenerate` (bool): Whether to autogenerate the name

\* `session\_name` (Optional\[str]): The name to set

**\*\*Returns:\*\***

\* `WorkflowSession`: The updated session

### `get\_session\_metrics`

Get the session metrics for the given session ID.

**\*\*Parameters:\*\***

\* `session\_id` (Optional\[str]): Session ID to use

**\*\*Returns:\*\***

\* `Optional[Metrics]`: The session metrics

### `delete\_session`

Delete a session.

**\*\*Parameters:\*\***

\* `session\_id` (str): Session ID to delete

### `save\_session`

Save the WorkflowSession to storage.

**\*\*Parameters:\*\***

\* `session` (WorkflowSession): The session to save

### `to\_dict`

Convert workflow to dictionary representation.

**\*\*Returns:\*\***

\* `Dict[str, Any]`: Dictionary representation of the workflow

# WorkflowRunOutput

Source: [https://docs.agno.com/reference/workflows/workflow\\_run\\_output](https://docs.agno.com/reference/workflows/workflow_run_output)

## WorkflowRunOutput Attributes

Parameter	Type
Default	Description
-----	-----
-----	-----
-----	
`content`	`Optional[Union[str, Dict[str, Any], List[Any], BaseModel, Any]]`
`None`	Main content/output from the workflow execution
`content_type`	`str`
`"str"`	Type of the content (e.g., "str", "json", etc.)
`workflow_id`	`Optional[str]`

`None`	Unique identifier of the executed workflow
`workflow_name`	`Optional[str]`
`None`	Name of the executed workflow
`run_id`	`Optional[str]`
`None`	Unique identifier for this specific run
`session_id`	`Optional[str]`
`None`	Session UUID associated with this run
`images`	`Optional[List[Image]]`
`None`	List of image artifacts generated
`videos`	`Optional[List[Video]]`
`None`	List of video artifacts generated
`audio`	`Optional[List[Audio]]`
`None`	List of audio artifacts generated
`response_audio`	`Optional[Audio]`
`None`	Audio response from the workflow
`step_results`	`List[Union[StepOutput, List[StepOutput]]]`
`[]`	Actual step execution results as StepOutput objects
`step_executor_runs`	`Optional[List[Union[RunOutput, TeamRunOutput]]]`
`None`	Store agent/team responses separately with parent\`_run\`_id references
`events`	`Optional[List[WorkflowRunOutputEvent]]`
`None`	Events captured during workflow execution
`metrics`	`Optional[WorkflowMetrics]`
`None`	Workflow metrics aggregated from all steps
`metadata`	`Optional[Dict[str, Any]]`
`None`	Additional metadata stored with the response
`created_at`	`int`
`int(time())`	Unix timestamp when the response was created
`status`	`RunStatus`
`RunStatus.pending`	Current status of the workflow run

## WorkflowRunOutputEvent Types and Attributes

### BaseWorkflowRunOutputEvent Attributes

Parameter	Type	Default	Description

```

----- |
| `created_at` | `int` | `int(time())` | Unix timestamp when the event was
created |
| `event` | `str` | `""` | Type of the event (e.g.,
"WorkflowStarted")
| `workflow_id` | `Optional[str]` | `None` | Unique identifier of the workflow
|
| `workflow_name` | `Optional[str]` | `None` | Name of the workflow
|
| `session_id` | `Optional[str]` | `None` | Session UUID associated with the
workflow
|
| `run_id` | `Optional[str]` | `None` | Unique identifier for the workflow
run
|
| `step_id` | `Optional[str]` | `None` | Unique identifier for the current
step
|
| `parent_step_id` | `Optional[str]` | `None` | Unique identifier for the parent
step (for nested steps) |

```

### ### WorkflowStartedEvent Attributes

Parameter	Description	Type	Default
-----	-----	-----	-----
`event`		`str`	
`WorkflowRunEvent.workflow_started.value`	Event type identifier		
*Inherits all fields from `BaseWorkflowRunOutputEvent`*			

### ### WorkflowCompletedEvent Attributes

> \*\*Snippet file:\*\* "workflow-completed-event.mdx"

### ### WorkflowCancelledEvent Attributes

Parameter	Description	Type
Default		
-----	-----	-----
`event`		`str`
`WorkflowRunEvent.workflow_completed.value`	Event type identifier	
`content`		`Optional[Any]`
`None`	Final output content from the workflow	
`content_type`		`str`
`"str"`	Type of the content	
`step_results`		`List[StepOutput]`

``[]``	List of all step execution results
``metadata``	``Optional[Dict[str, Any]]``
``None``	Additional metadata from workflow execution
*Inherits all fields from ``BaseWorkflowRunOutputEvent``*	

### ### StepStartedEvent Attributes

Parameter	Type
Default	Description
-----	-----
-----	-----
``event``	``str``
``WorkflowRunEvent.step_started.value``	Event type identifier
``step_name``	``Optional[str]``
``None``	Name of the step being started
``step_index``	``Optional[Union[int, tuple]]``
``None``	Index or position of the step
*Inherits all fields from ``BaseWorkflowRunOutputEvent``*	

### ### StepCompletedEvent Attributes

Parameter	Type
Default	Description
-----	-----
-----	-----
``event``	``str``
``WorkflowRunEvent.step_completed.value``	Event type identifier
``step_name``	``Optional[str]``
``None``	Name of the step that completed
``step_index``	``Optional[Union[int, tuple]]``
``None``	Index or position of the step
``content``	``Optional[Any]``
``None``	Content output from the step
``content_type``	``str``
``"str"``	Type of the content
``images``	``Optional[List[Image]]``
``None``	Image artifacts from the step
``videos``	``Optional[List[Video]]``
``None``	Video artifacts from the step
``audio``	``Optional[List[Audio]]``
``None``	Audio artifacts from the step
``response_audio``	``Optional[Audio]``
``None``	Audio response from the step
``step_response``	``Optional[StepOutput]``
``None``	Complete step execution result object
*Inherits all fields from ``BaseWorkflowRunOutputEvent``*	

### ConditionExecutionStartedEvent Attributes		
Parameter		Type
Default		Description
-----		
-----   -----   -----		
--   -----		
`event`		`str`
`WorkflowRunEvent.condition_execution_started.value`		
Event type identifier		
`step_name`		`Optional[str]`
`None`		Name of the condition step
`step_index`		`Optional[Union[int, tuple]]`
`None`		Index or position of the
condition		
`condition_result`		`Optional[bool]`
`None`		Result of the condition
evaluation		
*Inherits all fields from `BaseWorkflowRunOutputEvent`*		

### ConditionExecutionCompletedEvent Attributes		
Parameter		Type
Default		Description
-----		
-----   -----   -----		
-----   -----		
`event`		`str`
`WorkflowRunEvent.condition_execution_completed.value`		
Event type identifier		
`step_name`		`Optional[str]`
`None`		Name of the condition step
`step_index`		`Optional[Union[int, tuple]]`
`None`		Index or position of the
condition		
`condition_result`		`Optional[bool]`
`None`		Result of the condition
evaluation		
`executed_steps`		`Optional[int]`
`None`		Number of steps executed based
on condition		
`step_results`		`List[StepOutput]`
`[]`		Results from executed steps

```
| *Inherits all fields from `BaseWorkflowRunOutputEvent`* |
|
|
```

### ParallelExecutionStartedEvent Attributes

Parameter	Type	Description
Default		
-----		
event	str	WorkflowRunEvent.parallel_execution_started.value
step_name	Optional[str]	Name of the parallel step
step_index	Optional[Union[int, tuple]]	Index or position of the parallel step
parallel_step_count	Optional[int]	Number of steps to execute in parallel

```
| *Inherits all fields from `BaseWorkflowRunOutputEvent`* |
|
|
```

### ParallelExecutionCompletedEvent Attributes

Parameter	Type	Description
Default		
-----		
event	str	WorkflowRunEvent.parallel_execution_completed.value
step_name	Optional[str]	Name of the parallel step
step_index	Optional[Union[int, tuple]]	Index or position of the parallel step
parallel_step_count	Optional[int]	Number of steps executed in parallel
step_results	List[StepOutput]	Results from all parallel steps
field(default_factory=list)		

```
| *Inherits all fields from `BaseWorkflowRunOutputEvent`* |
|
|
```

### LoopExecutionStartedEvent Attributes		
Parameter	Type	
Default	Description	
-----		
-----	-----	-----
-----		
`event`	`str`	
`WorkflowRunEvent.loop_execution_started.value`	Event type identifier	
`step_name`	`Optional[str]`	
`None`	Name of the loop step	
`step_index`	`Optional[Union[int, tuple]]`	
`None`	Index or position of the loop	
`max_iterations`	`Optional[int]`	
`None`	Maximum number of iterations allowed	
*Inherits all fields from `BaseWorkflowRunOutputEvent`*		

### ### LoopIterationStartedEvent Attributes

Parameter	Type	
Default	Description	
-----		
-----	-----	-----
-----		
`event`	`str`	
`WorkflowRunEvent.loop_iteration_started.value`	Event type identifier	
`step_name`	`Optional[str]`	
`None`	Name of the loop step	
`step_index`	`Optional[Union[int, tuple]]`	
`None`	Index or position of the loop	
`iteration`	`int`	
`0`	Current iteration number	
`max_iterations`	`Optional[int]`	
`None`	Maximum number of iterations allowed	
*Inherits all fields from `BaseWorkflowRunOutputEvent`*		

### ### LoopIterationCompletedEvent Attributes

Parameter	Type	
Default	Description	
-----		
-----	-----	-----
-----		
`event`	`str`	
`WorkflowRunEvent.loop_iteration_completed.value`	Event type identifier	

`step_name`	`Optional[str]`
`None`	Name of the loop step
`step_index`	`Optional[Union[int, tuple]]`
`None`	Index or position of the loop
`iteration`	`int`
`0`	Current iteration number
`max_iterations`	`Optional[int]`
`None`	Maximum number of iterations allowed
`iteration_results`	`List[StepOutput]`
`[]`	Results from this iteration
`should_continue`	`bool`
`True`	Whether the loop should continue
*Inherits all fields from `BaseWorkflowRunOutputEvent`*	

### ### LoopExecutionCompletedEvent Attributes

Parameter	Type
Default	Description
-----	
-----   -----	
-----	
`event`	`str`
`WorkflowRunEvent.loop_execution_completed.value`	Event type identifier
`step_name`	`Optional[str]`
`None`	Name of the loop step
`step_index`	`Optional[Union[int, tuple]]`
`None`	Index or position of the loop
`total_iterations`	`int`
`0`	Total number of iterations completed
`max_iterations`	`Optional[int]`
`None`	Maximum number of iterations allowed
`all_results`	`List[List[StepOutput]]`
`[]`	Results from all iterations
*Inherits all fields from `BaseWorkflowRunOutputEvent`*	

### RouterExecutionStartedEvent Attributes

```

| Parameter | Type |
| Default | Description |
| ----- | ----- |
| `event` | `str` |
| `WorkflowRunEvent.router_execution_started.value` | Event type identifier |
| `step_name` | `Optional[str]` |
| `None` | Name of the router step |
| `step_index` | `Optional[Union[int, tuple]]` |
| `None` | Index or position of the router |
| `selected_steps` | `List[str]` |
| `field(default_factory=list)` | Names of steps selected by the router |
| *Inherits all fields from `BaseWorkflowRunOutputEvent`* |

```

### RouterExecutionCompletedEvent Attributes

Parameter	Type
Default	Description
-----	
-----   -----	
-   -----	
<code>`event`</code>	<code>`str`</code>
<code>`WorkflowRunEvent.router_execution_completed.value`</code>	
<code>`Event type identifier`</code>	
<code>`step_name`</code>	<code>`Optional[str]`</code>
<code>`None`</code>	Name of the router step
<code>`step_index`</code>	<code>`Optional[Union[int, tuple]]`</code>
<code>`None`</code>	Index or position of the router
<code>`selected_steps`</code>	<code>`List[str]`</code>
<code>`field(default_factory=list)`</code>	Names of steps that were selected
<code>`executed_steps`</code>	<code>`Optional[int]`</code>
<code>`None`</code>	Number of steps executed
<code>`step_results`</code>	<code>`List[StepOutput]`</code>
<code>`field(default_factory=list)`</code>	Results from executed steps
<code>*Inherits all fields from `BaseWorkflowRunOutputEvent`*</code>	

### StepsExecutionStartedEvent Attributes	
Parameter	Type
Default	Description
-----	
-----   -----   -----	
-----	
`event`	`str`
`WorkflowRunEvent.steps_execution_started.value`	Event type identifier
`step_name`	`Optional[str]`
`None`	Name of the steps group
`step_index`	`Optional[Union[int, tuple]]`
`None`	Index or position of the steps group
`steps_count`	`Optional[int]`
`None`	Number of steps in the group
*Inherits all fields from `BaseWorkflowRunOutputEvent`*	

### StepsExecutionCompletedEvent Attributes	
Parameter	Type
Default	Description
-----	
-----   -----   -----	
-----	
`event`	`str`
`WorkflowRunEvent.steps_execution_completed.value`	Event type identifier
`step_name`	`Optional[str]`
`None`	Name of the steps group
`step_index`	`Optional[Union[int, tuple]]`
`None`	Index or position of the steps group
group	
`steps_count`	`Optional[int]`
`None`	Number of steps in the group
`executed_steps`	`Optional[int]`
`None`	Number of steps actually executed
`step_results`	`List[StepOutput]`
`field(default_factory=list)`	Results from all executed steps

```
| *Inherits all fields from `BaseWorkflowRunOutputEvent`* |
| | |
|
```

### ### StepOutputEvent Attributes

Parameter	Default	Type	Description
-----			
-----			
event`		str`	
	"StepOutput"		Event type identifier
step_name`		Optional[str]`	
	None`		Name of the step that produced
output`			
step_index`		Optional[Union[int, tuple]]`	
	None`		Index or position of the step
step_output`		Optional[StepOutput]`	
	None`		Complete step execution result
*Inherits all fields from `BaseWorkflowRunOutputEvent`*			
**Properties (read-only):**			
content`		Optional[Union[str, Dict[str, Any], List[Any], BaseModel, Any]]`	
	-		Content from the step output
images`		Optional[List[Image]]`	
	-		Images from the step output
videos`		Optional[List[Video]]`	
	-		Videos from the step output
audio`		Optional[List[Audio]]`	
	-		Audio from the step output
success`		bool`	
	-		Whether the step succeeded
error`		Optional[str]`	
	-		Error message if step failed
stop`		bool`	
	-		Whether the step requested early
termination`			

# Agent Infra AWS

Source: <https://docs.agno.com/templates/agent-infra-aws/introduction>

The Agent Infra AWS template provides a simple AWS infrastructure for running AgentOS. It contains:

- \* An AgentOS instance, serving Agents, Teams, Workflows and utilities using FastAPI.
- \* A PostgreSQL database for storing sessions, memories and knowledge.

You can run your Agent Infra AWS locally as well as on AWS. This guide goes over the local setup first.

> \*\*Snippet file:\*\* "setup.mdx"

> \*\*Snippet file:\*\* "create-agent-infra-aws-codebase.mdx"

## Next

Congratulations on running your Agent Infra AWS. Next Steps:

# Run Agent Infra AWS on AWS

Source: [https://docs.agno.com/templates/agent-infra-aws/run\\_aws](https://docs.agno.com/templates/agent-infra-aws/run_aws)

> \*\*Snippet file:\*\* "run-agent-infra-aws-prd.mdx"

## Next

Congratulations on running your Agent Infra AWS. Next Steps:

- \* Read how to [update infra settings](/templates/infra-management/infra-settings)
- \* Read how to [create a git repository for your workspace](/templates/infra-management/git-repo)
- \* Read how to [manage the development application](/templates/infra-management/development-app)
- \* Read how to [format and validate your code](/templates/infra-management/format-and-validate)
- \* Read how to [add python libraries](/templates/infra-management/install)
- \* Chat with us on [discord](<https://agno.link/discord>)

# Run Agent Infra AWS Locally

Source: [https://docs.agno.com/templates/agent-infra-aws/run\\_local](https://docs.agno.com/templates/agent-infra-aws/run_local)

> \*\*Snippet file:\*\* "run-agent-infra-aws-local.mdx"

# Next

When you are happy with your AgentOS, its time to deploy it to AWS!

## # Agent Infra Docker

Source: <https://docs.agno.com/templates/agent-infra-docker/introduction>

The Agent Infra Docker template provides a simple Docker Compose file for running AgentOS. It contains:

- \* An AgentOS instance, serving Agents, Teams, Workflows and utilities using FastAPI.
- \* A PostgreSQL database for storing sessions, memories and knowledge.

> **\*\*Snippet file:\*\*** "setup.mdx"

> **\*\*Snippet file:\*\*** "create-agent-infra-docker-codebase.mdx"

After creating your codebase, the next step is to get it up and running locally using docker

## # Run Agent Infra Docker Locally

Source: [https://docs.agno.com/templates/agent-infra-docker/run\\_local](https://docs.agno.com/templates/agent-infra-docker/run_local)

> **\*\*Snippet file:\*\*** "run-agent-infra-docker-local.mdx"

## # Next

Congratulations on running your Agent Infra Docker locally! When you are happy with your AgentOS, you can take it to production.

## # Run Agent Infra Docker in Production

Source: [https://docs.agno.com/templates/agent-infra-docker/run\\_prd](https://docs.agno.com/templates/agent-infra-docker/run_prd)

The Agent Infra Docker template delivers a production-ready Docker Compose configuration and Dockerfile designed to deploy AgentOS reliably across diverse infrastructure environments. Packaged as a standard containerized system, it provides full flexibility to run anywhere containers are supported, including AWS ECS, Google Cloud Compute Engine, Azure virtual machines, and on-premise servers. This template gives you the freedom to deploy AgentOS on any infrastructure of your choice.

For a purpose-built, AWS optimized deployment, refer to the Agent Infra AWS template, which demonstrates how to operationalize AgentOS in production on AWS using ECS.

## # CI/CD

Source: <https://docs.agno.com/templates/infra-management/ci-cd>

Agno templates come pre-configured with [Github Actions](<https://docs.github.com/en/actions>) for CI/CD. We can

1. [Test and Validate on every PR](#test-and-validate-on-every-pr)
2. [Build Docker Images with Github Releases](#build-docker-images-with-github-releases)

### 3. [Build ECR Images with Github Releases](#build-ecr-images-with-github-releases)

#### ## Test and Validate on every PR

Whenever a PR is opened against the `main` branch, a validate script runs that ensures

1. The changes are formatted using ruff
2. All unit-tests pass
3. The changes don't have any typing or linting errors.

Checkout the `.github/workflows/validate.yml` file for more information.

#### **\*\*Note:\*\***

Confirm the image name in the `.github/workflows/docker-images.yml` file before running

```
gh release create v0.1.0 --title "v0.1.0" -n ""
```

```
gh release create v0.1.0 --title "v0.1.0" -n ""
```

#### **\*\*Note:\*\***

You can also run the workflow using `gh workflow run`

#### ## Build ECR Images with Github Releases

If you're using ECR for images, you can build and push the images through a Github Release. This action is defined in the `.github/workflows/ecr-images.yml` file and uses the new OpenID Connect (OIDC) approach to request the access token, without using IAM access keys.

We will follow this [guide](https://aws.amazon.com/blogs/security/use-iam-roles-to-connect-github-actions-to-actions-in-aws/) to create an IAM role which will be used by the github action.

1. Open the IAM console.
2. In the left navigation menu, choose Identity providers.
3. In the Identity providers pane, choose Add provider.
4. For Provider type, choose OpenID Connect.
5. For Provider URL, enter the URL of the GitHub OIDC IdP: [https://token.actions.githubusercontent.com](https://token.actions.githubusercontent.com)
6. Get thumbprint to verify the server certificate
7. For Audience, enter sts.amazonaws.com.

Verify the information matches the screenshot below and Add provider

#### **\*\*Note:\*\***

You can also run the workflow using `gh workflow run`

#### # Database Tables

Source: <https://docs.agno.com/templates/infra-management/database-tables>

Agno templates come pre-configured with [SqlAlchemy](https://www.sqlalchemy.org/) and [Alembic](https://alembic.sqlalchemy.org/en/latest/) to manage databases. You can use these tables to store data for your Agents, Teams and Workflows. The general way to add a table is:

1. Add table definition to the `db/tables` directory.
2. Import the table class in the `db/tables/\_\_init\_\_.py` file.
3. Create a database migration.
4. Run database migration.

## Table Definition

Let's create a `UsersTable`, copy the following code to `db/tables/user.py`

```
from datetime import datetime
from typing import Optional

from sqlalchemy.orm import Mapped, mapped_column
from sqlalchemy.sql.expression import text
from sqlalchemy.types import BigInteger, DateTime, String

from db.tables.base import Base

class UsersTable(Base):
 """Table for storing user data."""

 __tablename__ = "dim_users"

 id_user: Mapped[int] = mapped_column(
 BigInteger, primary_key=True, autoincrement=True, nullable=False, index=True
)
 email: Mapped[str] = mapped_column(String)
 is_active: Mapped[bool] = mapped_column(default=True)
 created_at: Mapped[datetime] = mapped_column(
 DateTime(timezone=True), server_default=text("now()")
)
 updated_at: Mapped[Optional[datetime]] = mapped_column(
 DateTime(timezone=True), onupdate=text("now()")
)
```

Update the `db/tables/\_\_init\_\_.py` file:

```
from db.tables.base import Base
from db.tables.user import UsersTable
```

## Create a database revision

Run the alembic command to create a database migration in the dev container:

```
docker exec -it ai-api alembic -c db/alembic.ini revision --autogenerate -m "Initialize DB"
```

```
Migrate dev database
```

Run the alembic command to migrate the dev database:

```
docker exec -it ai-api alembic -c db/alembic.ini upgrade head
```

```
Optional: Add test user
```

Now let's add a test user. Copy the following code to `db/tables/test\_add\_user.py`

```
from typing import Optional
from sqlalchemy.orm import Session

from db.session import SessionLocal
from db.tables.user import UsersTable
from utils.log import logger

def create_user(db_session: Session, email: str) -> UsersTable:
 """Create a new user."""
 new_user = UsersTable(email=email)
 db_session.add(new_user)
 return new_user

def get_user(db_session: Session, email: str) -> Optional[UsersTable]:
 """Get a user by email."""
 return db_session.query(UsersTable).filter(UsersTable.email == email).first()

if name == "main":
 test_user_email = "test@test.com"
 with SessionLocal() as sess, sess.begin():
 logger.info(f"Creating user: {test_user_email}")
 create_user(db_session=sess, email=test_user_email)
 logger.info(f"Getting user: {test_user_email}")
 user = get_user(db_session=sess, email=test_user_email)
 if user:
 logger.info(f"User created: {user.id_user}")
 else:
 logger.info(f"User not found: {test_user_email}")
```

Run the script to add a test adding a user:

```
docker exec -it ai-api python db/tables/test_add_user.py
```

```
Migrate production database
```

We recommended migrating the production database by setting the environment variable `MIGRATE\_DB = True` and restarting the production service. This runs `alembic -c db/alembic.ini upgrade head` from the entrypoint script at container startup.

### Update the `workspace/prd\_resources.py` file

...

## **-\*- Build container environment**

```
container_env = {
```

```
 ...
```

## **Migrate database on startup using alembic**

```
 "MIGRATE_DB": ws_settings.prd_db_enabled,
```

```
}
```

```
...
```

### Update the ECS Task Definition

Because we updated the Environment Variables, we need to update the Task Definition:

```
ag infra patch --env prd --infra aws --name td
```

```
ag infra patch -e prd -i aws -n td
```

### Update the ECS Service

After updating the task definition, redeploy the production application:

```
ag infra patch --env prd --infra aws --name service
```

```
ag infra patch -e prd -i aws -n service
```

## Manually migrate production database

Another approach is to SSH into the production container to run the migration manually. Your ECS tasks are already enabled with SSH access. Run the alembic command to migrate the production database:

```
ECS_CLUSTER=ai-app-prd-cluster
```

```
TASK_ARN=$(aws ecs list-tasks --cluster ai-app-prd-cluster --query "taskArns[0]" --output text)
```

```
CONTAINER_NAME=ai-api-prd
```

```
aws ecs execute-command --cluster $ECS_CLUSTER \
 --task $TASK_ARN \
```

```
--container $CONTAINER_NAME \
--interactive \
--command "alembic -c db/alembic.ini upgrade head"
```

\*\*\*

## How the migrations directory was created

> **Note:**

These commands have been run and are described for completeness

The migrations directory was created using:

```
docker exec -it ai-api cd db && alembic init migrations
```

\* After running the above command, the `db/migrations` directory should be created.

\* Update `alembic.ini`

  \* set `script\_location = db/migrations`

  \* uncomment `black` hook in `[post\_write\_hooks]`

\* Update `db/migrations/env.py` file following [this link](https://alembic.sqlalchemy.org/en/latest/autogenerate.html)

\* Add the following function to `configure` to only include tables in the target metadata

## **-\*- Only include tables that are in the target\_metadata**

```
def include_name(name, type_, parent_names):
```

```
 if type_ == "table":
```

```
 return name in target_metadata.tables
```

```
 else:
```

```
 return True
```

```
...
```

# Development Application

Source: <https://docs.agno.com/templates/infra-management/development-app>

Your development application runs locally on docker and its resources are defined in the `infra/dev\_resources.py` file. This guide shows how to:

1. [Build a development image](#build-your-development-image)
2. [Restart all docker containers](#restart-all-containers)
3. [Recreate development resources](#recreate-development-resources)

## Infra Settings

The `InfraSettings` object in the `infra/settings.py` file defines common settings used by your Agno Infra apps and resources.

## Build your development image

Your application uses the `agno` docker images by default. To use your own image:

- \* Open `infra/settings.py` file
- \* Update the `image\_repo` to your image repository
- \* Set `build\_images=True`

```
infra_settings = InfraSettings(
 ...
```

## **-\*- Image Settings**

### **Repository for images**

```
 image_repo="local",
```

### **Build images locally**

```
 build_images=True,
)
```

```
Build a new image
```

Build the development image using:

```
ag infra up --env dev --infra docker --type image
```

```
ag infra up -e dev -i docker -t image
```

To `force` rebuild images, use the `--force` or `-f` flag

```
ag infra up --env dev --infra docker --type image --force
```

```
ag infra up -e dev -i docker -t image -f
```

```

```

```
Restart all containers
```

Restart all docker containers using:

```
ag infra restart --env dev --infra docker --type container
```

```
ag infra restart -e dev -c docker -t container
```

```

```

## Recreate development resources

To recreate all dev resources, use the `--force` flag:

```
ag infra up -f
```

```
ag infra up --env dev --infra docker --force
```

```
ag infra up dev:docker -f
```

```
ag infra up -e dev -i docker -f
```

# Use Custom Domain and HTTPS

Source: <https://docs.agno.com/templates/infra-management/domain-https>

## Overview

To add a live AgentOS instance to `os.agno.com`, the endpoint must be HTTPS. Here is how you can add a custom domain and HTTPS to your AWS loadbalancer.

## Use a custom domain

1. Register your domain with [Route 53](<https://us-east-1.console.aws.amazon.com/route53/>).
2. Point the domain to the loadbalancer DNS.

### Custom domain for your AgentOS App

Create a record in the Route53 console to point `app.[YOUR_DOMAIN]` to the AgentOS endpoint.

**Note:** Note the `http` in the domain name.

## Add HTTPS

To add HTTPS:

1. Create a certificate using [AWS ACM](<https://us-east-1.console.aws.amazon.com/acm/>)  
. Request a certificate for `*.[YOUR_DOMAIN]`

**Note:** Make sure the certificate is `Issued` before adding it to your Apps

Update the `infra/prd_resources.py` file and add the `load_balancer_certificate_arn` to the `FastAPI` app.

## -\*- FastAPI running on ECS

```
prd_fastapi = FastApi(
```

```
...
```

## To enable HTTPS, create an ACM certificate and add the ARN below:

```
 load_balancer_enable_https=True,
 load_balancer_certificate_arn="arn:aws:acm:us-east
-1:497891874516:certificate/6598c24a-d4fc-4f17-8ee
0-0d3906eb705f",
 ...
)
```

### 4. Create new Loadbalancer Listeners

Create new listeners for the loadbalancer to pickup the HTTPS configuration.

```
ag infra up --env prd --infra aws --name listener
```

```
ag infra up -e prd -i aws -n listener
```

> **Note:** The certificate should be `Issued` before applying it.

After this, `https` should be working on your custom domain.

### 5. Update existing listeners to redirect HTTP to HTTPS

```
ag infra patch --env prd --infra aws --name listener
```

```
ag infra patch -e prd -i aws -n listener
```

After this, all HTTP requests should redirect to HTTPS automatically.

# Environment variables

Source: <https://docs.agno.com/templates/infra-management/e>

nv-vars

Environment variables can be added to resources using the `env_vars` parameter or the `env_file` parameter pointing to a `yaml` file. Examples

```
dev_fastapi = FastApi(
```

```
...
```

```
 env_vars={
 "RUNTIME_ENV": "dev",
```

## Get the OpenAI API key from the local environment

```
 "OPENAI_API_KEY": getenv("OPENAI_API_KEY"),
```

## Database configuration

```
"DB_HOST": dev_db.get_db_host(),
"DB_PORT": dev_db.get_db_port(),
"DB_USER": dev_db.get_db_user(),
"DB_PASS": dev_db.get_db_password(),
"DB_DATABASE": dev_db.get_db_database(),
```

## Wait for database to be available before starting the application

```
"WAIT_FOR_DB": ws_settings.dev_db_enabled,
```

## Migrate database on startup using alembic

```
"MIGRATE_DB": ws_settings.prn_db_enabled,
},
...
)
```

```
prn_fastapi = FastApi(
```

```
...
env_vars={
 "RUNTIME_ENV": "prn",
```

## Get the OpenAI API key from the local environment

```
"OPENAI_API_KEY": getenv("OPENAI_API_KEY"),
```

## Database configuration

```
"DB_HOST": AwsReference(prn_db.get_db_endpoint),
"DB_PORT": AwsReference(prn_db.get_db_port),
"DB_USER": AwsReference(prn_db.get_master_username),
"DB_PASS": AwsReference(prn_db.get_master_user_password),
"DB_DATABASE": AwsReference(prn_db.get_db_name),
```

## Wait for database to be available before starting the application

```
"WAIT_FOR_DB": ws_settings.prn_db_enabled,
```

## Migrate database on startup using alembic

```
"MIGRATE_DB": ws_settings.prn_db_enabled,
},
...
)
```

The apps in your templates are already configured to read environment variables.

# Format & Validate

Source: <https://docs.agno.com/templates/infra-management/format-and-validate>

## ## Format

Formatting the codebase using a set standard saves us time and mental energy. Agno templates are pre-configured with [ruff](https://docs.astral.sh/ruff/) that you can run using a helper script or directly.

```
./scripts/format.sh
```

```
ruff format .
```

## ## Validate

Linting and Type Checking add an extra layer of protection to the codebase. We highly recommend running the validate script before pushing any changes.

Agno templates are pre-configured with [ruff](https://docs.astral.sh/ruff/) and [mypy](https://mypy.readthedocs.io/en/stable/) that you can run using a helper script or directly. Checkout the `pyproject.toml` file for the configuration.

```
./scripts/validate.sh
```

```
ruff check .
```

```
mypy .
```

## # Create Git Repo

Source: <https://docs.agno.com/templates/infra-management/git-repo>

Create a git repository to share your application with your team.

**\*\*Step: Create a git repository\*\***

Create a new [git repository](https://github.com/new).

**\*\*Step: Push your code\*\***

Push your code to the git repository.

```
git init
git add .
git commit -m "Init LLM App"
git branch -M main
git remote add origin https://github.com/[YOUR_GIT_REPO].git
git push -u origin main
```

**\*\*Step: Ask your team to join\*\***

Ask your team to follow the [setup steps for new users](/templates/infra-management/new-users) to use this workspace.

# Infra Settings

Source: <https://docs.agno.com/templates/infra-management/infra-settings>

The ``InfraSettings`` object in the ``infra/settings.py`` file defines common settings used by your apps and resources. Here are the settings we recommend updating:

```
infra_settings = InfraSettings(
```

## Update this to your project name

```
 infra_name="ai",
```

## Add your AWS subnets

```
 subnet_ids=["subnet-xyz", "subnet-xyz"],
```

## Add your image repository

```
 image_repo="[ACCOUNT_ID].dkr.ecr.us-east-1.amazonaws.com",
```

## Set to True to build images locally

```
 build_images=True,
```

## Set to True to push images after building

```
 push_images=True,
)
```

> **Note:**

``InfraSettings`` can also be updated using environment variables or the ``.env`` file.

Checkout the `example.env`` file for an example.

### Infra Name

The ``infra_name`` is used to name your apps and resources. Change it to your project or team name, for example:

```
* `infra_name="booking-ai"`
* `infra_name="reddit-ai"`
* `infra_name="vantage-ai"`
```

The ``infra_name`` is used to name:

- \* The image for your application
- \* Apps like db, streamlit app and FastAPI server
- \* Resources like buckets, secrets and loadbalancers

Checkout the ``infra/dev_resources.py`` and ``infra/prd_resources.py`` file to see how its

used.

## ## Image Repository

The ``image_repo`` defines the repo for your image.

- \* If using dockerhub it would be something like ``agno``.
- \* If using ECR it would be something like ``[ACCOUNT_ID].dkr.ecr.us-east-1.amazonaws.com``

Checkout the ``dev_image`` in ``infra/dev_resources.py`` and ``prd_image`` in ``infra/prd_resources.py`` to see how its used.

## ## Build Images

Setting ``build_images=True`` will build images locally when running ``ag infra up dev:docker`` or ``ag infra up prd:docker``.

Checkout the ``dev_image`` in ``infra/dev_resources.py`` and ``prd_image`` in ``infra/prd_resources.py`` to see how its used.

Read more about:

- \* [Building your development image](/templates/infra-management/development-app#build-your-development-image)
- \* [Building your production image](/templates/infra-management/production-app#build-your-production-image)

## ## Push Images

Setting ``push_images=True`` will push images after building when running ``ag infra up dev:docker`` or ``ag infra up prd:docker``.

Checkout the ``dev_image`` in ``infra/dev_resources.py`` and ``prd_image`` in ``infra/prd_resources.py`` to see how its used.

Read more about:

- \* [Building your development image](/templates/infra-management/development-app#build-your-development-image)
- \* [Building your production image](/templates/infra-management/production-app#build-your-production-image)

## ## AWS Settings

The ``aws_region`` and ``subnet_ids`` provide values used for creating production resources. Checkout the ``infra/prd_resources.py`` file to see how its used.

## # Install & Setup

Source: <https://docs.agno.com/templates/infra-management/install>

## ## Install Agno

We highly recommend:

- \* Installing `agno` using `pip` in a python virtual environment.
- \* Creating an `ai` directory for your ai infra

**\*\*Step: Create a virtual environment\*\***

Open the `Terminal` and create an `ai` directory with a python virtual environment.

```
mkdir ai && cd ai
```

```
python3 -m venv aienv
source aienv/bin/activate
```

```
mkdir ai; cd ai
```

```
python3 -m venv aienv
aienv/scripts/activate
```

**\*\*Step: Install Agno\*\***

Install `agno` using pip

```
pip install -U agno
```

```
pip install -U agno
```

**\*\*Step: Install Docker\*\***

Install [docker desktop](<https://docs.docker.com/desktop/install/mac-install/>) to run apps locally

<br

> **\*\*Note:\*\***

If you encounter errors, try updating pip using `python -m pip install --upgrade pip`

\*\*\*

## Upgrade Agno

To upgrade `agno`, run this in your virtual environment

```
pip install -U agno --no-cache-dir
```

# Setup infra for new users

Source: <https://docs.agno.com/templates/infra-management/new-users>

Follow these steps to setup an existing infra:

**\*\*Step: Clone git repository\*\***

Clone the git repo and `cd` into the infra directory

```
git clone https://github.com/[YOUR_GIT_REPO].git
```

```
cd your_infra_directory
```

```
git clone https://github.com/[YOUR_GIT_REPO].git
```

```
cd your_infra_directory
```

**\*\*Step: Create and activate a virtual environment\*\***

```
python3 -m venv aienv
source aienv/bin/activate
```

```
python3 -m venv aienv
aienv/scripts/activate
```

**\*\*Step: Install agno\*\***

```
pip install -U agno
```

```
pip install -U agno
```

**\*\*Step: Copy secrets\*\***

Copy `infra/example\_secrets` to `infra/secrets`

```
cp -r infra/example_secrets infra/secrets
```

```
cp -r infra/example_secrets infra/secrets
```

**\*\*Step: Start infra\*\***

> **\*\*Note:\*\***

Install [docker desktop](<https://docs.docker.com/desktop/install/mac-install/>) if needed.

```
ag infra up
```

```
ag infra up --env dev --infra docker
```

```
ag infra up dev:docker
```

**\*\*Step: Stop infra\*\***

```
ag infra down
```

```
ag infra down --env dev --infra docker
```

```
ag infra down dev:docker
```

# Production Application

Source: <https://docs.agno.com/templates/infra-management/production-app>

Your production application runs on AWS and its resources are defined in the ``infra/prd_resources.py`` file. This guide shows how to:

1. [Build a production image](#build-your-production-image)
2. [Update ECS Task Definitions](#ecs-task-definition)
3. [Update ECS Services](#ecs-service)

## Workspace Settings

The ``InfraSettings`` object in the ``infra/settings.py`` file defines common settings used by your workspace apps and resources.

## Build your production image

Your application uses the ``agno`` images by default. To use your own image:

- \* Create a Repository in ``ECR`` and authenticate or use ``Dockerhub``.
- \* Open ``infra/settings.py`` file
- \* Update the ``image_repo`` to your image repository
- \* Set ``build_images=True`` and ``push_images=True``
- \* Optional - Set ``build_images=False`` and ``push_images=False`` to use an existing image in the repository

### Create an ECR Repository

To use ECR, **\*\*create the image repo and authenticate with ECR\*\*** before pushing images.

**\*\*1. Create the image repository in ECR\*\***

The repo name should match the ``infra_name``. Meaning if you're using the default infra name, the repo name would be ``ai``.

**\*\*Note:\*\***

Update the script with your ECR repo before running.

```
./scripts/auth_ecr.sh
```

```
Update the `InfraSettings`
```

```
infra_settings = InfraSettings(
 ...
```

## Subnet IDs in the aws\_region

```
 subnet_ids=["subnet-xyz", "subnet-xyz"],
```

## -\*- Image Settings

## Repository for images

```
 image_repo="your-image-repo",
```

## Build images locally

```
 build_images=True,
```

## Push images after building

```
 push_images=True,
)
```

> **Note:**

The `image\_repo` defines the repo for your image.

\* If using dockerhub it would be something like `agno`.

\* If using ECR it would be something like `[ACCOUNT\_ID].dkr.ecr.us-east-1.amazonaws.com`

```
Build a new image
```

Build the production image using:

```
ag infra up --env prd --infra docker --type image
```

```
ag infra up -e prd -i docker -t image
```

To `force` rebuild images, use the `--force` or `-f` flag

```
ag infra up --env prd --infra docker --type image --force
```

```
ag infra up -e prd -i docker -t image -f
```

Because the only docker resources in the production env are docker images, you can also use:

```
ag infra up prd:docker
```

```
ag infra up prd:docker -f
```

```
ECS Task Definition
```

If you updated the Image, CPU, Memory or Environment Variables, update the Task Definition using:

```
ag infra patch --env prd --infra aws --name td
```

```
ag infra patch -e prd -i aws -n td
```

```
ECS Service
```

To redeploy the production application, update the ECS Service using:

```
ag infra patch --env prd --infra aws --name service
```

```
ag infra patch -e prd -i aws -n service
```

<br

> **Note:**

If you **ONLY** rebuilt the image, you do not need to update the task definition and can just patch the service to pickup the new image.

# Add Python Libraries

Source: <https://docs.agno.com/templates/infra-management/python-packages>

Agno templates are setup to manage dependencies using a [pyproject.toml](<https://packaging.python.org/en/latest/specifications/declaring-project-metadata/#declaring-project-metadata>) file, **which is used to generate the `requirements.txt` file using [uv](<https://github.com/astral-sh/uv>) or [pip-tools](<https://pip-tools.readthedocs.io/en/latest/>).**

Adding or Updating a python library is a 2 step process:

1. Add library to the `pyproject.toml` file
2. Auto-Generate the `requirements.txt` file

> **Warning:**

We highly recommend auto-generating the `requirements.txt` file using this process.

## Update pyproject.toml

- \* Open the `pyproject.toml` file
- \* Add new libraries to the dependencies section.

## Generate requirements

After updating the `dependencies` in the `pyproject.toml` file, auto-generate the `requirements.txt` file using a helper script or running `pip-compile` directly.

`./scripts/generate_requirements.sh`

```
pip-compile \
 --no-annotate \
 --pip-args "--no-cache-dir" \
 -o requirements.txt pyproject.toml
```

If you'd like to upgrade all python libraries to their latest version, run:

`./scripts/generate_requirements.sh upgrade`

```
pip-compile \
 --upgrade \
 --no-annotate \
 --pip-args "--no-cache-dir" \
 -o requirements.txt pyproject.toml
```

## Rebuild Images

After updating the `requirements.txt` file, rebuild your images.

### Rebuild dev images

`ag infra up --env dev --infra docker --type image`

`ag infra up -e dev -i docker -t image`

### Rebuild production images

> **Note:**

Remember to [authenticate with ECR](/templates/infra-management/production-app#ecr-images) if needed.

`ag infra up --env prd --infra aws --type image`

```
ag infra up -e prd -i aws -t image
```

```
Recreate Resources
```

After rebuilding images, recreate the resources.

```
Recreate dev containers
```

```
ag infra restart --env dev --infra docker --type container
```

```
ag infra restart -e dev -c docker -t container
```

```
Update ECS services
```

```
ag infra patch --env prd --infra aws --name service
```

```
ag infra patch -e prd -i aws -n service
```

```
Add Secrets
```

Source: <https://docs.agno.com/templates/infra-management/secrets>

Secret management is a critical part of your application security and should be taken seriously.

Local secrets are defined in the ``infra/secrets`` directory which is excluded from version control (see ``.gitignore``). Its contents should be handled with the same security as passwords.

Production secrets are managed by [AWS Secrets Manager](<https://docs.aws.amazon.com/secretsmanager/latest/userguide/intro.html>).

```
> **Note:**
```

```
 Incase you're missing the secrets dir, copy `infra/example_secrets`
```

```
Development Secrets
```

Apps running locally can read secrets using a ``yaml`` file, for example:

```
dev_fastapi = FastApi(
 ...
```

## Read secrets from secrets/dev\_app\_secrets.yml

```
 secrets_file=infra_settings.infra_root.joinpath("infra/secrets/dev_app_secrets.yml"),
```

```
)

Production Secrets

`AWS Secrets` are used to manage production secrets, which are read by the production apps.
```

## **-\*- Secrets for production application**

```
prd_secret = SecretsManager(
 ...
```

**Create secret from workspace/secrets/prd\_app\_secrets.yml**

```
 secret_files=[
 infra_settings.infra_root.joinpath("infra/secrets/
prd_app_secrets.yml")
],
)
```

## **-\*- Secrets for production database**

```
prd_db_secret = SecretsManager(
 ...
```

**Create secret from workspace/secrets/prd\_db\_secrets.yml**

```
 secret_files=[infra_settings.infra_root.joinpath("
infra/secrets/prd_db_secrets.yml")],
)
```

Read the secret in production apps using:

```
prd_fastapi = FastApi(
 ...
 aws_secrets=[prd_secret],
 ...
)
```

```
prd_db = DbInstance(
 ...
 aws_secret=prd_db_secret,
 ...
)
```

Production resources can also read secrets using yaml files but we highly recommend using [AWS Secrets](<https://docs.aws.amazon.com/secretsmanager/latest/userguide/intro.html>).

## # SSH Access

Source: <https://docs.agno.com/templates/infra-management/sh-access>

SSH Access is an important part of the developer workflow.

## ## Dev SSH Access

SSH into the dev containers using the ``docker exec`` command

```
docker exec -it ai-api zsh
```

## ## Production SSH Access

Your ECS tasks are already enabled with SSH access. SSH into the production containers using:

```
ECS_CLUSTER=ai-app-prd-cluster
```

```
TASK_ARN=$(aws ecs list-tasks --cluster ai-app-prd-cluster --query "taskArns[0]" --output text)
```

```
CONTAINER_NAME=ai-api-prd
```

```
aws ecs execute-command --cluster $ECS_CLUSTER \
```

```
 --task $TASK_ARN \
 --container $CONTAINER_NAME \
 --interactive \
 --command "zsh"
```

## # Overview

Source: <https://docs.agno.com/tutorials/overview>

Guides for Agno

## ## Guides

Agno is a platform for building AI agents. It provides a set of tools and libraries to help you build and deploy AI agents.

### # Build a Social Media Intelligence Agent with Agno, X Tools, and Exa

Source: <https://docs.agno.com/tutorials/social-media-agent>

Create a professional-grade social media intelligence system using Agno.

In this tutorial, we will build a multi-agent intelligence system. It will monitor X (Twitter), perform sentiment analysis, and generate reports using Agno framework.

We will be using the following components:

- \* **Agno** - The fastest framework for building agents.

- \* **X Tools** - Provides real-time, structured data directly from Twitter/X API with

engagement metrics

- \* **Exa Tools** - Deliver semantic web search for broader context discovery across blogs, forums, and news
- \* **GPT-5 Mini** - OpenAI's new model. Well suited for contextually-aware sentiment analysis and strategic pattern detection

This system will combine direct social media data with broader web intelligence, to provide comprehensive brand monitoring that captures both immediate social sentiment and emerging discussions before they reach mainstream attention.

## ## What You'll Build

Your social media intelligence system will:

- \* Track brand and competitor mentions across X and the broader web
- \* Perform weighted sentiment analysis that accounts for influence and engagement
- \* Detect viral content, controversy signals, and high-influence discussions
- \* Generate executive-ready reports with strategic recommendations
- \* Serve insights via [AgentOS](/agent-os/introduction) API for integration with your applications

## ## Prerequisites and Setup

Before we get started, we need to setup our environment:

1. Install Python, Git and get your API keys:

- \* Install **Python >= 3.9** and **Git**
- \* Get API keys for:
  - \* **X (Twitter) Developer Account** ([Apply here](https://developer.twitter.com/en/apply-for-access))
  - \* **OpenAI API** ([Get key](https://platform.openai.com/api-keys))
  - \* **Exa API** ([Sign up](https://exa.ai))

2. Setup your Python environment:

```
mkdir social-intel && cd social-intel
```

```
python3 -m venv venv
```

```
source venv/bin/activate # If you are on Windows, use: venv\Scripts\activate
```

3. Install our Python dependencies:

## Install dependencies

```
pip install "agno[infra]" openai exa_py python-dotenv
```

4. Create a new project with AgentOS (/agent-os/introduction):

```
ag infra create # Choose: [1] agent-infra-docker (default)
```

```
Infra Name: social-intel
```

## 5. Set your environment variables:

```
export OPENAI_API_KEY=sk-your-openai-api-key-here
export X_API_KEY=your-x-api-key
export X_API_SECRET=your-x-api-secret
export X_ACCESS_TOKEN=your-access-token
export X_ACCESS_TOKEN_SECRET=your-access-token-secret
export X_BEARER_TOKEN=your-bearer-token
export EXA_API_KEY=your-exa-api-key
```

Our environment is now ready. Let's start building!

# Building our Social Media Intelligence System

## Step 1: Choose Your AI Model

Which model should I use?: You can choose any model from our supported providers. Normally models are chosen based on costs and performance. In this case, we will be using OpenAI's GPT-5 Mini.

Why GPT-5 Mini?

- \* Cost-effective: Better price/performance ratio than other GPT models
- \* Tool usage: Excellent at deciding when and how to use tools
- \* Complex reasoning: Can follow detailed analysis methodologies
- \* Structured output: Reliable at generating formatted reports

Let's first create the file where we will define our agent:

```
mkdir -p app
touch app/social_media_agent.py
```

Now let's add the basic imports and model setup:

```
from pathlib import Path
from dotenv import load_dotenv
from agno.models.openai import OpenAIChat

Load infrastructure secrets
load_dotenv(dotenv_path=Path(__file__).resolve().parents[1] / "infra" / "secrets" / ".env")

Choose the AI model for your agent
model = OpenAIChat(id="gpt-5-mini")
print(f"Model selected: {model.id}")
```

We can now test our model setup:

```
Quick test to verify model works
if __name__ == "__main__":
 test_response = model.invoke("Explain social media sentiment analysis in one sentence.")
 print(f"Model test: {test_response}")
```

This confirms your model is working, before we add more complexity.

## Step 2: Add Social Media Tools

Which tools should I use? We are adding XTools because we need direct Twitter/X data with engagement metrics, and ExaTools because we need broader web context that social media alone can't provide.

### 2a. Add XTools for Twitter/X Data

Why XTools? Direct access to Twitter/X with engagement metrics is crucial for understanding influence patterns and viral content.

```
from agno.tools.x import XTools

Configure X Tools for social media data
x_tools = XTools(
 include_post_metrics=True, # Critical: gets likes, retweets, replies for influence analysis
 wait_on_rate_limit=True, # Handles API limits gracefully
)

print("XTools configured with post metrics enabled")
```

What `include_post_metrics=True` gives you:

- \* Like counts (engagement volume)
- \* Retweet counts (viral spread)
- \* Reply counts (conversation depth)
- \* Author verification status (influence weighting)

### 2b. Add ExaTools for Web Intelligence

Why ExaTools? Social media discussions often reference broader conversations happening across the web. ExaTools finds this context.

```
from agno.tools.exa import ExaTools

Configure Exa for broader web intelligence
```

```

exa_tools = ExaTools(
 num_results=10, # Comprehensive but not overwhelming
 include_domains=["reddit.com", "news.ycombinator.com", "medium.com"],
)

print("ExaTools configured for web search")

```

Why these specific domains?

- \* Reddit: Early discussion indicators, community sentiment
- \* HackerNews: Tech industry insights, developer opinions
- \* Medium: Thought leadership, analysis articles

## Step 3: Define Intelligence Strategy

Why do we need instructions? We need to describe the strategy that the agent should take to collect and analyze content. Without clear instructions, the agent won't know how to use the tools effectively or what kind of analysis to provide.

### 3a. Define the Data Collection Strategy

```

from textwrap import dedent

Define how the agent should gather data
data_collection_strategy = dedent("""
 DATA COLLECTION STRATEGY:
 - Use X Tools to gather direct social media mentions with full engagement metrics
 - Use Exa Tools to find broader web discussions, articles, and forum conversations
 - Cross-reference findings between social and web sources for comprehensive coverage
""")

print("Data collection strategy defined")

```

### 3b. Define the Analysis Framework

```

Define how the agent should analyze the data
analysis_framework = dedent("""
 ANALYSIS FRAMEWORK:
 - Classify sentiment as Positive/Negative/Neutral/Mixed with detailed reasoning
 - Weight analysis by engagement volume and author influence (verified accounts = 1.5x)
 - Identify engagement patterns: viral advocacy, controversy, influence concentration
 - Extract cross-platform themes and recurring discussion points
""")

print("Analysis framework defined")

```

### 3c. Define the Intelligence Synthesis

```
Define how to turn analysis into actionable insights
intelligence_synthesis = dedent("""
 INTELLIGENCE SYNTHESIS:
 - Detect crisis indicators through sentiment velocity and coordination patterns
 - Identify competitive positioning and feature gap discussions
 - Surface growth opportunities and advocacy moments
 - Generate strategic recommendations with clear priority levels
""")

print("Intelligence synthesis defined")
```

### 3d. Define the Report Format

```
Define the expected output structure
report_format = dedent("""
 REPORT FORMAT:

 ### Executive Dashboard
 - **Brand Health Score**: [1-10] with supporting evidence
 - **Net Sentiment**: [%positive - %negative] with trend analysis
 - **Key Drivers**: Top 3 positive and negative factors
 - **Alert Level**: Normal/Monitor/Crisis with threshold reasoning

 ### Quantitative Metrics
 | Sentiment | Posts | % | Avg Engagement | Influence Score |
 |-----|-----|---|-----|-----|
 -----|
 [Detailed breakdown with engagement weighting]

 ### Strategic Recommendations
 IMMEDIATE (48h): Crisis response, high-impact replies
 SHORT-TERM (1-2 weeks): Content strategy, community engagement
 LONG-TERM (1-3 months): Product positioning, market strategy
""")

print("Report format defined")
```

### 3e. Define Analysis Principles

```
Define the quality standards for analysis
analysis_principles = dedent("""
 ANALYSIS PRINCIPLES:
 - Evidence-based conclusions with supporting metrics
 - Actionable insights that drive business decisions
 - Cross-platform correlation analysis
 - Influence-weighted sentiment scoring
 - Proactive risk and opportunity identification
""")

print("Analysis principles defined")
```

### 3f. Combine Into Complete Instructions

```
Combine all instruction components
complete_instructions = f"""
You are a Senior Social Media Intelligence Analyst specializing in cross-platform
brand monitoring and strategic analysis.

CORE METHODOLOGY:

{data_collection_strategy}

{analysis_framework}

{intelligence_synthesis}

{report_format}

{analysis_principles}
"""

print(f"Complete instructions created: {len(complete_instructions)} characters")
```

## Step 4: Create the Complete Agent

Now let's put all the pieces together - model, tools, and instructions - to create your complete social media intelligence agent.

### 4a. Create the Agent

```
from agno.agent import Agent

Combine model, tools, and instructions into a complete agent
social_media_agent = Agent(
 name="Social Media Intelligence Analyst",
 model=model, # The GPT-5 mini model we chose
 tools=tools, # The X and Exa tools we configured
 instructions=complete_instructions, # The strategy we defined
 markdown=True, # Enable rich formatting for reports
 show_tool_calls=True, # Show transparency in data collection
)

print(f"Agent created: {social_media_agent.name}")
```

For detailed information about each Agent parameter, see the Agent Reference Documentation (</reference/agents/agent>).

### 4b. Create the Analysis Function

```

def analyze_brand_sentiment(query: str, tweet_count: int = 20):
 """
 Execute comprehensive social media intelligence analysis.

 Args:
 query: Brand or topic search query (e.g., "Tesla OR @elonmusk")
 tweet_count: Number of recent tweets to analyze
 """

 # Create a detailed prompt for the agent
 analysis_prompt = f"""
 Conduct comprehensive social media intelligence analysis for: "{query}"

 ANALYSIS PARAMETERS:
 - Twitter Analysis: {tweet_count} most recent tweets with engagement metrics
 - Web Intelligence: Related articles, discussions, and broader context via Exa
 - Cross-Platform Synthesis: Correlate social sentiment with web discussions
 - Strategic Focus: Brand positioning, competitive analysis, risk assessment

 METHODOLOGY:
 1. Gather direct social media mentions and engagement data
 2. Search for related web discussions and broader context
 3. Analyze sentiment patterns and engagement indicators
 4. Identify cross-platform themes and influence networks
 5. Generate strategic recommendations with evidence backing

 Provide comprehensive intelligence report following the structured format.
 """

 # Execute the analysis
 return social_media_agent.print_response(analysis_prompt, stream=True)

print("Analysis function created")

```

#### 4c. Create a Test Function

```

def test_agent():
 """Test the complete agent with a sample query."""
 print("Testing social media intelligence agent...")
 analyze_brand_sentiment("Agno OR AgnoAGI", tweet_count=10)

print("Test function ready")

```

#### 4d. Complete Working Example

Here's your complete app/social\_media\_agent.py file:

```

"""
Complete Social Media Intelligence Agent
Built with Agno framework

```

```

"""
from pathlib import Path
from textwrap import dedent
from dotenv import load_dotenv

from agno.agent import Agent
from agno.models.openai import OpenAIChat
from agno.tools.x import XTools
from agno.tools.exa import ExaTools

Load infrastructure secrets
load_dotenv(dotenv_path=Path(__file__).resolve().parents[1] / "infra" / "secrets" / ".env")

Step 1: Choose the AI model
model = OpenAIChat(id="gpt-5-mini")

Step 2: Configure tools
tools = [
 XTools(
 include_post_metrics=True,
 wait_on_rate_limit=True,
),
 ExaTools(
 num_results=10,
 include_domains=["reddit.com", "news.ycombinator.com", "medium.com"],
 exclude_domains=["spam-site.com"],
)
]

Step 3: Define instructions
complete_instructions = dedent("""
 You are a Senior Social Media Intelligence Analyst specializing in cross-platform
 brand monitoring and strategic analysis.

 CORE METHODOLOGY:

 DATA COLLECTION STRATEGY:
 - Use X Tools to gather direct social media mentions with full engagement metrics
 - Use Exa Tools to find broader web discussions, articles, and forum conversations
 - Cross-reference findings between social and web sources for comprehensive coverage

 ANALYSIS FRAMEWORK:
 - Classify sentiment as Positive/Negative/Neutral/Mixed with detailed reasoning
 - Weight analysis by engagement volume and author influence (verified accounts = 1.5x)
 - Identify engagement patterns: viral advocacy, controversy, influence concentration
 - Extract cross-platform themes and recurring discussion points

 INTELLIGENCE SYNTHESIS:
 - Detect crisis indicators through sentiment velocity and coordination patterns
 - Identify competitive positioning and feature gap discussions
 - Surface growth opportunities and advocacy moments

```

- Generate strategic recommendations with clear priority levels

#### REPORT FORMAT:

##### ### Executive Dashboard

- **Brand Health Score**: [1-10] with supporting evidence
- **Net Sentiment**: [%positive - %negative] with trend analysis
- **Key Drivers**: Top 3 positive and negative factors
- **Alert Level**: Normal/Monitor/Crisis with threshold reasoning

##### ### Quantitative Metrics

Sentiment	Posts	%	Avg Engagement	Influence Score
-----	-----	---	-----	-----

-----|

[Detailed breakdown with engagement weighting]

##### ### Strategic Recommendations

- IMMEDIATE (48h)**: Crisis response, high-impact replies
- SHORT-TERM (1-2 weeks)**: Content strategy, community engagement
- LONG-TERM (1-3 months)**: Product positioning, market strategy

#### ANALYSIS PRINCIPLES:

- Evidence-based conclusions with supporting metrics
- Actionable insights that drive business decisions
- Cross-platform correlation analysis
- Influence-weighted sentiment scoring
- Proactive risk and opportunity identification

""")

# Step 4: Create the complete agent

```
social_media_agent = Agent(
 name="Social Media Intelligence Analyst",
 model=model,
 tools=tools,
 instructions=complete_instructions,
 markdown=True,
 show_tool_calls=True,
)
```

```
def analyze_brand_sentiment(query: str, tweet_count: int = 20):
 """Execute comprehensive social media intelligence analysis."""
 prompt = f"""
 Conduct comprehensive social media intelligence analysis for: "{query}"
```

#### ANALYSIS PARAMETERS:

- Twitter Analysis: {tweet\_count} most recent tweets with engagement metrics
- Web Intelligence: Related articles, discussions, and broader context via Exa
- Cross-Platform Synthesis: Correlate social sentiment with web discussions
- Strategic Focus: Brand positioning, competitive analysis, risk assessment

#### METHODOLOGY:

1. Gather direct social media mentions and engagement data

2. Search for related web discussions and broader context
3. Analyze sentiment patterns and engagement indicators
4. Identify cross-platform themes and influence networks
5. Generate strategic recommendations with evidence backing

Provide comprehensive intelligence report following the structured format.  
"""

```
return social_media_agent.print_response(prompt, stream=True)
```

```
if __name__ == "__main__":
 # Test the complete agent
 analyze_brand_sentiment("Agno OR AgnoAGI", tweet_count=25)
```

#### 4e. Spin-up the infrastructure for our project:

Now that we have completed our agent, we can spin-up the infrastructure for our project:

```
ag infra up
```

Your AgentOS (/agent-os/introduction) API is now running. We are ready to start building!

#### 4f. Test Your Complete Agent

```
python app/social_media_agent.py
```

You should see your agent:

1. Use X Tools to gather Twitter data with engagement metrics
2. Use Exa Tools to find broader web context
3. Generate a structured report following your defined format
4. Provide strategic recommendations based on the analysis

### Step 5: Test and experiment via AgentOS

Why API-first? The AgentOS infrastructure automatically exposes your agent as a REST API, making it ready for production integration without additional deployment work.

Your agent is automatically available via the AgentOS API. Let's test it!

Find your API endpoint:

```
Your AgentOS API is running on localhost:7777
curl http://localhost:7777/v1/agents
```

Test with Postman or curl:

```
curl -X POST http://localhost:7777/v1/agents/social_media_agent
/runs \
-H "Content-Type: application/json" \
-d '{
 "message": "Analyze social media sentiment for: Tesla OR @elonmusk",
 "stream": false
}'
```

Expected response structure:

```
{
 "run_id": "run_123",
 "content": "### Executive Dashboard\n- **Brand Health Score**: 7.2/10...",
 "metrics": {
 "tokens_used": 1250,
 "tools_called": ["x_tools", "exa_tools"],
 "analysis_time": "23.4s"
 }
}
```

## Next Steps

Your social media intelligence system is now live with a production-ready API! Consider these as possible next steps to extend this system:

- \* Specialized Agents: Create focused agents for crisis detection, competitive analysis, or influencer identification
- \* Alert Integration: Connect webhooks to Slack, email, or your existing monitoring systems
- \* Visual Analytics: Build dashboards that consume the API for executive reporting
- \* Multi-Brand Monitoring: Scale to monitor multiple brands or competitors simultaneously

## Conclusion

You've built a comprehensive social media intelligence system that:

- \* Combines direct social data with broader web intelligence
- \* Provides weighted sentiment analysis with strategic recommendations
- \* Serves insights via production-ready AgentOS API
- \* Scales from development through enterprise deployment

This demonstrates Agno's infrastructure-first approach, where your AI agents become immediately deployable services with proper monitoring, scaling, and integration capabilities built-in.
